The relative degree of hazard between different occupancy classifications shall be as set forth in the hazard category classifications of Table 43.7.3.

Table 43.7.3 Hazard Categories and Classifications

Hazard Category	Occupancy Classification
1 (highest hazard)	Industrial or storage occupancies with high hazard contents
2	Health care, detention and correctional, residential board and care
3	Assembly, educational, day care, ambulatory health care, residential, mercantile, business, general and special-purpose industrial, ordinary hazard storage
4 (lowest hazard)	Industrial or storage occupancies with low hazard contents

43.8 Additions.**43.8.1 General Requirements.****43.8.1.1**

Where an addition, as defined in 43.2.2.1.7, is made to a building, both of the following criteria shall be met:

- (1) The addition shall comply with other sections of this *Code* applicable to new construction for the occupancy.
- (2) The existing portion of the building shall comply with the requirements of this *Code* applicable to existing buildings for the occupancy.

43.8.1.2

An addition shall not create or extend any non-conformity with regard to fire safety or the means of egress in the existing building for which the addition is constructed.

43.8.1.3

Any repair, renovation, alteration, or reconstruction work within an existing building to which an addition is being made shall comply with the requirements of Sections 43.3, 43.4, 43.5, and 43.6.

43.8.2 Heights.

No addition shall increase the height of an existing building beyond that permitted under the applicable provisions for new building construction.

43.8.3 Fire Protection Systems.

In other than one- and two-family dwellings, existing compartment areas without an approved separation from the addition shall be protected by an approved automatic sprinkler system where the combined areas would be required to be sprinklered by the provisions applicable to new construction for the occupancy.

43.8.4 Smoke Alarms.

Where an addition is made to a one- or two-family dwelling or a small residential board and care occupancy, interconnected smoke alarms, powered by the electrical system, meeting the requirements of the other sections of this *Code* shall be installed and maintained in the addition.

43.9 Reserved.**43.10 Historic Buildings.****43.10.1 General Requirements.**

Historic buildings undergoing rehabilitation shall comply with the requirements of one of the following:

- (1) Section 43.10
- (2) Sections 43.3, 43.4, 43.5, 43.6, and 43.7, as they relate, respectively, to repair, renovation, modification, reconstruction, and change of use or occupancy classification
- (3) NFPA 914

43.10.2 Evaluation.

A historic building undergoing modification, reconstruction, or change of occupancy classification in accordance with the requirements of Chapter 43 shall be investigated and evaluated as follows:

- (1) A written report shall be prepared for such a building and filed with the authority having jurisdiction by a registered design professional.
- (2) If the subject matter of the report does not require an evaluation by a registered design professional, the authority having jurisdiction shall be permitted to allow the report to be prepared by a licensed building contractor, electrician, plumber, or mechanical contractor responsible for the work.
- (3) The licensed person preparing the report shall be knowledgeable in historic preservation, or the report shall be coauthored by a preservation professional.
- (4) The report shall identify each required safety feature in compliance with Chapter 43 and where compliance with other chapters of this *Code* would be damaging to the contributing historic features.
- (5) The report shall describe each feature not in compliance with this *Code* and demonstrate how the intent of this *Code* is met in providing an equivalent level of safety.
- (6) The local preservation official shall be permitted to review and comment on the written report or shall be permitted to request review comments on the report from the historic preservation officer.
- (7) Unless it is determined by the authority having jurisdiction that a report is required to protect the health and safety of the public, the submission of a report shall not be required for a building that is being rehabilitated for the personal use of the owner or a member of the owner's immediate family and is not intended for any use or occupancy by the public.

43.10.3 Repairs.

Repairs to any portion of a historic building shall be permitted to be made with original or like materials and original methods of construction, except as otherwise provided in Section 43.10.

43.10.4 Repair, Renovation, Modification, or Reconstruction.**43.10.4.1 General.**

Historic buildings undergoing repair, renovation, modification, or reconstruction shall comply with the applicable requirements of Sections 43.3, 43.4, 43.5, and 43.6, except as specifically permitted in 43.10.4.

43.10.4.2 Replacement.

Replacements shall meet the following criteria:

- (1) Replacement of existing or missing features using original or like materials shall be permitted.
- (2) Partial replacement for repairs that match the original in configuration, height, and size shall be permitted.
- (3) Replacements shall not be required to meet the requirements of this *Code* that specify material standards, details of installation and connection, joints, or penetrations; or continuity of any element, component, or system in the building.

43.10.4.3 Means of Egress.

Existing door openings, window openings intended for emergency egress, and corridor and stairway widths narrower than those required for nonhistoric buildings under this *Code* shall be permitted, provided that one of the following criteria is met:

- (1) In the opinion of the authority having jurisdiction, sufficient width and height exists for a person to pass through the opening or traverse the exit, and the capacity of the egress system is adequate for the occupant load.
- (2) Other operational controls to limit the number of occupants are approved by the authority having jurisdiction.

43.10.4.4 Door Swing.

Where approved by the authority having jurisdiction, existing front doors shall not be required to swing in the direction of egress travel, provided that other approved exits have sufficient egress capacity to serve the total occupant load.

43.10.4.5 Transoms.

In fully sprinklered buildings of hotel and dormitory occupancies, apartment occupancies, and residential board and care occupancies, existing transoms in corridors and other fire-resistance-rated walls shall be permitted to remain in use, provided that the transoms are fixed in the closed position.

43.10.4.6 Interior Finishes.**43.10.4.6.1**

Existing interior wall and ceiling finishes, in other than exits, shall be permitted to remain in place where it is demonstrated that such finishes are the historic finish.

43.10.4.6.2

Interior wall and ceiling finishes in exits, other than in one- and two-family dwellings, shall meet one of the following criteria:

- (1) The material shall be Class A, Class B, or Class C in accordance with Section 10.2 of this *Code*.
- (2) Existing materials not meeting the minimum Class C flame spread index shall be surfaced with an approved fire-retardant paint or finish.
- (3) Existing materials not meeting the minimum Class C flame spread index shall be permitted to be continued in use, provided that the building is protected throughout by an approved automatic sprinkler system.

43.10.4.7 Stairway Enclosure.**43.10.4.7.1**

Stairways shall be permitted to be unenclosed in a historic building where such stairways serve only one adjacent floor.

43.10.4.7.2

In buildings of three or fewer stories in height, exit enclosure construction shall limit the spread of smoke by the use of tight-fitting doors and solid elements; however, such elements shall not be required to have a fire rating.

43.10.4.8 One-Hour Fire-Rated Assemblies.

Existing walls and ceilings shall be exempt from the minimum 1-hour fire-resistance-rated construction requirements of other sections of this *Code* where the existing wall and ceiling are of wood lath and plaster construction in good condition.

43.10.4.9 Stairway Handrails and Guards.**43.10.4.9.1**

Existing grand stairways shall be exempt from the handrail and guard requirements of other sections of this *Code*.

43.10.4.9.2

Existing handrails and guards on grand staircases shall be permitted to remain in use, provided that they are not structurally dangerous.

43.10.4.10 Exit Signs.

The authority having jurisdiction shall be permitted to accept alternative exit sign or directional exit sign location, provided that signs installed in compliance with other sections of this *Code* would have an adverse effect on the historic character and such alternative signs identify the exits and egress path.

43.10.4.11 Sprinkler Systems.**43.10.4.11.1**

Historic buildings that do not conform to the construction requirements specified in other chapters of this *Code* for the applicable occupancy or use and that, in the opinion of the authority having jurisdiction, constitute a fire safety hazard shall be protected throughout by an approved automatic sprinkler system.

43.10.4.11.2

The automatic sprinkler system required by 43.10.4.11.1 shall not be used as a substitute for, or serve as an alternative to, the required number of exits from the facility.

43.10.5 Change of Occupancy.**43.10.5.1 General.**

Historic buildings undergoing a change of occupancy shall comply with the applicable provisions of Section 43.7, except as otherwise permitted by 43.10.5.

43.10.5.2 Means of Egress.

Existing door openings, window openings intended for emergency egress, and corridor and stairway widths narrower than those required for nonhistoric buildings under this *Code* shall be permitted, provided that one of the following criteria is met:

- (1) In the opinion of the authority having jurisdiction, sufficient width and height exists for a person to pass through the opening or traverse the exit, and the capacity of the egress system is adequate for the occupant load.
- (2) Other operational controls to limit the number of occupants are approved by the authority having jurisdiction.

43.10.5.3 Door Swing.

Where approved by the authority having jurisdiction, existing front doors shall not be required to swing in the direction of egress travel, provided that other approved exits have sufficient capacity to serve the total occupant load.

43.10.5.4 Transoms.

In corridor walls required to be fire rated by this *Code*, existing transoms shall be permitted to remain in use, provided that the transoms are fixed in the closed position and one of the following criteria is met:

- (1) An automatic sprinkler shall be installed on each side of the transom.
- (2) Fixed wired glass set in a steel frame or other approved glazing shall be installed on one side of the transom.

43.10.5.5 Interior Finishes.

Existing interior wall and ceiling finishes shall meet one of the following criteria:

- (1) The material shall comply with the requirements for flame spread index of other sections of this *Code* applicable to the occupancy.
- (2) Materials not complying with 43.10.5.5(1) shall be permitted to be surfaced with an approved fire-retardant paint or finish.
- (3) Materials not complying with 43.10.5.5(1) shall be permitted to be continued in use, provided that the building is protected throughout by an approved automatic sprinkler system, and the nonconforming materials are substantiated as being historic in character.

43.10.5.6 One-Hour Fire-Rated Assemblies.

Existing walls and ceilings shall be exempt from the minimum 1-hour fire-resistance-rated construction requirements of other sections of this *Code* where the existing wall and ceiling are of wood lath and plaster construction in good condition.

43.10.5.7 Stairs and Handrails.**43.10.5.7.1**

Existing stairs and handrails shall comply with the requirements of this *Code*, unless otherwise specified in 43.10.5.7.2.

43.10.5.7.2

The authority having jurisdiction shall be permitted to accept alternatives for grand stairways and associated handrails where the alternatives are approved as meeting the intent of this *Code*.

43.10.5.8 Exit Signs.

The authority having jurisdiction shall be permitted to accept alternative exit sign or directional exit sign location, provided that signs installed in compliance with other sections of this *Code* would have an adverse effect on the historic character and such alternative signs identify the exits and egress path.

43.10.5.9 Exit Stair Live Load.

Existing historic stairways in buildings changed to hotel and dormitory occupancies and apartment occupancies shall be permitted to be continued in use, provided that the stairway can support a 75 lb/ft² (3600 N/m²) live load.

Annex A Explanatory Material[Save As Word](#) [Show Revisions/Notes](#) [Show P/PC's](#) [Quick Print](#)

Annex A is not a part of the requirements of this NFPA document but is included for informational purposes only. This annex contains explanatory material, numbered to correspond with the applicable text paragraphs.

A.1.1

The following is a suggested procedure for determining the *Code* requirements for a building or structure:

- (1) Determine the occupancy classification by referring to the occupancy definitions in Chapter 6 and the occupancy Chapters 12 through 42. (See 6.1.14 for buildings with more than one use.)
- (2) Determine if the building or structure is new or existing. (See the definitions in Chapter 3.)
- (3) Determine the occupant load. (See 7.3.1.)
- (4) Determine the hazard of contents. (See Section 6.2.)
- (5) Refer to the applicable occupancy chapter of the *Code*, Chapters 12 through 42. [See Chapters 1 through 4 and Chapters 6 through 11, as needed, for general information (such as definitions) or as directed by the occupancy chapter.]
- (6) Determine the occupancy subclassification or special use condition, if any, by referring to Chapters 16 and 17, day care occupancies; Chapters 18 and 19, health care occupancies; Chapters 22 and 23, detention and correctional occupancies; Chapters 28 and 29, hotels and dormitories; Chapters 32 and 33, residential board and care occupancies; Chapters 36 and 37, mercantile occupancies; and Chapter 40, industrial occupancies, which contain subclassifications or special use definitions.
- (7) Proceed through the applicable occupancy chapter to verify compliance with each referenced section, subsection, paragraph, subparagraph, and referenced codes, standards, and other documents.
- (8) Where two or more requirements apply, refer to the occupancy chapter, which generally takes precedence over the base Chapters 1 through 4 and Chapters 6 through 11.
- (9) Where two or more occupancy chapters apply, such as in a mixed occupancy (see 6.1.14), apply the most restrictive requirements.

A.1.1.5

Incidents involving hazardous materials are capable of posing significant life safety challenges in buildings. The *Code* recognizes this potential and includes technical requirements to address concerns related to hazardous material inventories and associated emergencies.

A.1.1.8

Life safety in buildings includes more than safety from fire. Although fire safety has been the long-standing focus of NFPA 101, its widely known title, *Life Safety Code*, and its technical requirements respond to a wider range of concerns, including, for example, crowd safety and providing life safety where security features are provided. *Code* requirements that contribute to the safe movement of people during fire emergencies might also assist in responding to many other hazards that require decisions about where people can be safely located.

A.1.1.9(1)

This *Code* is intended to be adopted and used as part of a comprehensive program of building regulations that include building, mechanical, plumbing, electrical, fuel gas, fire prevention, and land use regulations.

A.1.2

The *Code* endeavors to avoid requirements that might involve unreasonable hardships or unnecessary inconvenience or interference with the normal use and occupancy of a building but provides for fire safety consistent with the public interest.

Protection of occupants is achieved by the combination of prevention, protection, egress, and other features, with due regard to the capabilities and reliability of the features involved. The level of life safety from fire is defined through requirements directed at the following:

- (1) Prevention of ignition
- (2) Detection of fire
- (3) Control of fire development
- (4) Confinement of the effects of fire
- (5) Extinguishment of fire
- (6) Provision of refuge or evacuation facilities, or both
- (7) Staff reaction
- (8) Provision of fire safety information to occupants

A.1.3.1

Various chapters contain specific provisions for existing buildings and structures that might differ from those for new construction.

A.1.4

Before a particular mathematical fire model or evaluation system is used, its purpose and limitations need to be known. The technical documentation should clearly identify any assumptions included in the evaluation. Also, it is the intent of the Committee on Safety to Life to recognize that future editions of this *Code* are a further refinement of this edition and earlier editions. The changes in future editions will reflect the continuing input of the fire protection/life safety community in its attempt to meet the purpose stated in this *Code*.

A.1.4.3

An equivalent method of protection provides an equal or greater level of safety. It is not a waiver or deletion of a *Code* requirement.

The prescriptive provisions of this *Code* provide specific requirements for broad classifications of buildings and structures. These requirements are stated in terms of fixed values, such as maximum travel distance, minimum fire resistance ratings, and minimum features of required systems, such as detection, alarm, suppression, and ventilation, and not in terms of overall building or system performance.

However, the equivalency clause in 1.4.3 permits the use of alternative systems, methods, or devices to meet the intent of the prescribed code provisions where approved as being equivalent. Through the rigor of a performance-based design, it can be demonstrated whether a building design is satisfactory and complies with the implicit or explicit intent of the applicable code requirement.

When employing the equivalency clause, it is important to clearly identify the prescriptive-based code provision being addressed (scope), to provide an interpretation of the intent of the provision (goals and objectives), to provide an alternative approach (proposed design), and to provide appropriate support for the suggested alternative (evaluation of proposed designs).

Performance resulting from proposed designs can be compared to the performance of the design features required by this *Code*. Using prescribed features as a baseline for comparison, it can then be demonstrated in the evaluation whether a proposed design offers the intended level of performance. A comparison of safety provided can be used as the basis for establishing equivalency.

A.2.1(1)

For example, NFPA 10 is referenced in Chapter 2. This does not mean that all buildings must have portable fire extinguishers. Portable fire extinguishers are mandatory only to the extent called for elsewhere in the *Code*.

A.2.1(3)

The Committee on Safety to Life recognizes that it is impractical to continually upgrade existing buildings or installations to comply with all the requirements of the referenced publications included in Chapter 2.

A.2.2

It is possible that governing authorities have adopted a code or standard other than one that is listed in Chapter 2. Where such is the case, and where a provision of a code or standard is referenced by this *Code* but the text of the requirement is not extracted into this *Code*, the code or standard adopted by the governing authority is permitted to be utilized where it is deemed by the authority having jurisdiction to adequately address the issue or condition of concern. Where the adopted code or standard does not address the issue, the requirement from the referenced code or standard should be applied by the authority having jurisdiction, unless the governing authority has established other procedures, policies, or guidelines. Where the text of a requirement is extracted from another NFPA code or standard and appears in this *Code*, it is the intent that the requirement be met as if it had originated in this *Code*, regardless of whether the governing authority has adopted the code or standard from which the text is extracted.

A.3.2.1 Approved.

The National Fire Protection Association does not approve, inspect, or certify any installations, procedures, equipment, or materials nor does it approve or evaluate testing laboratories. In determining the acceptability of installations or procedures, equipment, or materials, the "authority having jurisdiction" may base acceptance on compliance with NFPA or other appropriate standards. In the absence of such standards, said authority may require evidence of proper installation, procedure, or use. The "authority having jurisdiction" may also refer to the listings or labeling practices of an organization that is concerned with product evaluations and is thus in a position to determine compliance with appropriate standards for the current production of listed items.

A.3.2.2 Authority Having Jurisdiction (AHJ).

The phrase "authority having jurisdiction," or its acronym AHJ, is used in NFPA standards in a broad manner because jurisdictions and approval agencies vary, as do their responsibilities. Where public safety is primary, the authority having jurisdiction may be a federal, state, local, or other regional department or individual such as a fire chief; fire marshal; chief of a fire prevention bureau, labor department, or health department; building official; electrical inspector; or others having statutory authority. For insurance purposes, an insurance inspection department, rating bureau, or other insurance company representative may be the authority having jurisdiction. In many circumstances, the property owner or his or her designated agent assumes the role of the authority having jurisdiction; at government installations, the commanding officer or departmental official may be the authority having jurisdiction.

A.3.2.3 Code.

The decision to designate a standard as a "code" is based on such factors as the size and scope of the NFPA standard, its intended use and form of adoption, and whether it contains substantial enforcement and administrative provisions.

A.3.2.5 Listed.

The means for identifying listed equipment may vary for each organization concerned with product evaluation; some organizations do not recognize equipment as listed unless it is also labeled. The authority having jurisdiction should utilize the system employed by the listing organization to identify a listed product.

A.3.3.4 Actuating Member or Bar.

The active surface of the actuating bar needs to be visually and physically distinct from the rest of the device. The actuating bar is also called a cross bar or push pad.

A.3.3.11 Aisle Accessway.

Aisle accessway is the term used for the previously unnamed means of egress component leading to an aisle or other means of egress. For example, circulation space between parallel rows of seats having a width of 12 in. to 24 in. (305 mm to 610 mm) and a length not exceeding 100 ft (30 m) is an aisle accessway. Some of the circulation space between tables or seats in restaurants might be considered aisle accessway.

Depending on the width of aisle accessway, which is influenced by its length and expected utilization, the movement of a person through the aisle accessway might require others to change their individual speed of movement, alter their postures, move their chairs out of the way, or proceed ahead of the person.

A.3.3.16 Alternate Care Site (ACS).

An ACS includes spaces such as, but not limited to, hotels, arenas, barracks and dorms, tents, closed hospitals, large open commercial/private owned spaces, and modular units.

A.3.3.21 Animal Housing Facility.

Animal housing facilities, as used in this *Code*, are subject to local, state, or federal licensing or permitting requirements, and include, but are not limited to, the following:

- (1) Barns and stables
- (2) Kennels
- (3) Racetrack stable/kennel areas including, those stable/kennel areas, barns, and associated buildings at state, county, and local fairgrounds
- (4) Animal shelters
- (5) Animal hospitals and veterinary facilities
- (6) Zoos and special amusement parks
- (7) Laboratories
- (8) Agricultural facilities
- (9) Mercantile or business occupancies with animals

A.3.3.24.2.1 Clear Floor Area.

Clear floor area is intended to provide open floor space that is accessible to all building occupants for the purpose of providing protected spaces, portions of means of egress paths, or waiting spaces that might be occupied as needed.

A.3.3.24.2.2 Gross Floor Area.

Where the term *floor area* is used, it should be understood to be gross floor area, unless otherwise specified.

A.3.3.24.2.3 Gross Floor Area (Health Care and Ambulatory Health Care Occupancies).

Stairs and elevator and building services shafts are not included in determining gross floor areas of health care and ambulatory health care smoke compartments and health care suites.

A.3.3.24.4 Hazardous Area.

Hazardous areas include areas for the storage or use of combustibles or flammables; toxic, noxious, or corrosive materials; or heat-producing appliances.

A.3.3.24.6 Normally Unoccupied Building Service Equipment Support Area.

Normally unoccupied building service support areas are often found in attics, crawl spaces, chases, and interstitial areas where the space is vacant or intended exclusively for routing ductwork, cables, conduits, piping, and similar services and is rarely accessed. In such spaces, it is often difficult or impossible to fully comply with the egress requirements of Chapter 7. Where portions of such spaces are routinely visited for storage, maintenance, testing, or inspection, that portion is excluded from this definition, but the remainder of the space might be considered a normally unoccupied building service equipment support area. Storage and fuel-fired equipment would not be expected to be permitted in these locations. Roofs are not considered to be normally unoccupied building service equipment support areas.

A.3.3.25 Area of Refuge.

An area of refuge has a temporary use during egress. It generally serves as a staging area that provides relative safety to its occupants while potential emergencies are assessed, decisions are made, and mitigating activities are begun. Taking refuge within such an area is, thus, a stage of the total egress process, a stage between egress from the immediately threatened area and egress to a public way.

An area of refuge might be another building connected by a bridge or balcony, a compartment of a subdivided story, an elevator lobby, or an enlarged story-level exit stair landing. An area of refuge is accessible by means of horizontal travel or, as a minimum, via an accessible route meeting the requirements of ICC A117.1, *Accessible and Usable Buildings and Facilities*.

This *Code* recognizes any floor in a building protected throughout by an approved, supervised automatic sprinkler system as an area of refuge. This recognition acknowledges the ability of a properly designed and functioning automatic sprinkler system to control a fire at its point of origin and to limit the production of toxic products to a level that is not life threatening.

The requirement for separated rooms or spaces can be met on an otherwise undivided floor by enclosing the elevator lobby with ordinary glass or other simple enclosing partitions that are smoke resisting.

For some occupancies, one accessible room or space is permitted.

A.3.3.29 Atrium.

As defined in NFPA 92 a large-volume space is an uncompartmented space, generally two or more stories high, within which smoke from a fire either in the space or in a communicating space can move and accumulate without restriction. Atria and covered mall concourses are examples of large-volume spaces.

A.3.3.30 Attic.

The attic space might be used for storage. The concealed rafter space between the ceiling membrane and the roof sheathing that are attached to the rafters is not considered an attic.

A.3.3.32.1 Fire Barrier.

A fire barrier, such as a wall or floor assembly, might be aligned vertically or horizontally. Although the continuity of a fire barrier will often limit the transfer of smoke, it should not be confused with either a smoke barrier or a smoke partition.

A.3.3.32.2 Smoke Barrier.

A smoke barrier might be vertically or horizontally aligned, such as a wall, floor, or ceiling assembly. A smoke barrier might or might not have a fire resistance rating. Application of smoke barrier criteria where required elsewhere in the *Code* should be in accordance with Section 8.3.

A.3.3.32.3 Thermal Barrier.

Finish ratings, as found in UL's online search tool, UL Product iQ™, are one way of determining thermal barrier. A test method was developed to assess whether a material, product, or assembly constitutes a thermal barrier (*see NFPA 275*). It requires thermal barriers to meet both a test for fire resistance (temperature transmission test), which limits temperature rise on the unexposed side, and a test for reaction-to-fire (integrity fire test), intended to demonstrate that the material can prevent or delay ignition of the material on the unexposed side. The reaction to fire test is one of the following: NFPA 286, ANSI/FM Approvals 4880, UL 1040, or UL 1715.

A.3.3.34 Birth Center.

A birth center is a low-volume service for healthy, childbearing women, and their families, who are capable of ambulation in the event of fire or fire-threatening events. Birth center mothers and babies have minimal analgesia, receive no general or regional anesthesia, and are capable of ambulation, even in second-stage labor.

A.3.3.37 Building.

The term *building* is to be understood as if followed by the words *or portions thereof*. (*See also Structure, A.3.3.293.*)

A.3.3.37.3 Apartment Building.

The *Code* specifies that, wherever there are three or more living units in a building, the building is considered an apartment building and is required to comply with either Chapter 30 or Chapter 31, as appropriate. Townhouse units are considered to be apartment buildings if there are three or more units in the building. The type of wall required between units in order to consider them to be separate buildings is normally established by the authority having jurisdiction. If the units are separated by a wall of sufficient fire resistance and structural integrity to be considered as separate buildings, then the provisions of Chapter 24 apply to each townhouse. Condominium status is a form of ownership, not occupancy; for example, there are condominium warehouses, condominium apartments, and condominium offices.

A.3.3.37.5 Existing Building.

With respect to judging whether a building should be considered existing, the deciding factor is not when the building was designed or when construction started but, rather, the date plans were approved for construction by the appropriate authority having jurisdiction.

A.3.3.37.6 Flexible Plan and Open Plan Educational or Day-Care Building.

Flexible plan buildings have movable corridor walls and movable partitions of full-height construction with doors leading from rooms to corridors. Open plan buildings have rooms and corridors delineated by tables, chairs, desks, bookcases, counters, low-height partitions, or similar furnishings. It is the intent that low-height partitions not exceed 60 in. (1525 mm).

A.3.3.37.7 High-Rise Building.

It is the intent of this definition that, in determining the level from which the highest occupiable floor is to be measured, the enforcing agency should exercise reasonable judgment, including consideration of overall accessibility to the building by fire department personnel and vehicular equipment. Where a building is situated on a sloping terrain and there is building access on more than one level, the enforcing agency might select the level that provides the most logical and adequate fire department access.

A.3.3.37.8 Historic Building.

Designation for a historic building might be in an official national, regional, or local historic register, listing, or inventory.

A.3.3.37.9 Special Amusement Building.

Special amusement buildings include amusements typically found in theme parks such as a roller coaster–type ride within a building, a multilevel play structure within a building, a submarine ride, and similar amusements where the occupants are not in the open air and might or might not be confined to a ride vehicle and/or unable to self-evacuate. Examples of temporary special amusement buildings include mobile fun houses typically found in carnivals or a gymnasium converted to a haunted house for Halloween.

Three conditions are essential to the definition of a special amusement building:

First, the area might be either an entire building or a portion of a building. A rollercoaster within a theme park would not be a special amusement building if it is open to the air along its entire length. On the other hand, if portions of the rollercoaster were partially enclosed within buildings that house the show elements, it would then be a special amusement building.

Second, a special amusement building contains either an amusement ride or device, or a walkway over a course intended to provide amusement or entertainment. A theater with fixed seats and a performance platform or stage would typically not be a special amusement building because there is no amusement ride or device, and there is no walkway that is used to provide amusement or entertainment.

Third, a special amusement building is intended to either divert the patron's attention away from the egress path, either through audio or visual distractions or by intentionally confounding the patron, or it contains or restrains the patron such that the patron is unable to self-evacuate when the amusement ride has ceased motion. A carousel or small train inside a shopping mall might not be considered to be a special amusement building if, once ride motion has ceased, the patron can step out of the vehicle without assistance and is aware of the egress path.

Other occupancies might also fall into the classification of special amusement building if the conditions described in the definition apply. Escape rooms are an example of where such conditions might exist. It is incumbent on the authority having jurisdiction to inquire if the conditions in the escape room meet the definition of a special amusement building. Where such conditions exist, escape rooms should be classified as special amusement buildings. Where such conditions do not exist, escape rooms might be classified as another occupancy type, such as business.

It is important for the authority having jurisdiction to recognize that the *Code* requires an occupancy to be classified as a special amusement building if the conditions in the space meet the definition of *special amusement building*, regardless of the occupant load of the space. No minimum occupant load threshold must be met for a space to be classified as a special amusement building. A space could be classified as a special amusement building even where the occupant load is significantly fewer than the 50 occupants required for classification of other assembly occupancies.

The requirements for special amusement buildings are not intended to apply to the design of the actual amusement ride or device, but rather that of the facility that houses the ride or device. The design of an amusement ride or device, including all platforms and stairs that are attached to the ride structure, is governed by other standards, such as ASTM F2291, *Standard Practice for Design of Amusement Rides or and Devices*. The design of facilities elements around the ride, including stairs and platforms that are not part of the ride structure, should be in accordance with the applicable requirements of this *Code*.

A.3.3.38 Building Code.

Where no building code has been adopted, *NFPA 5000* should be used where the building code is referenced in this *Code*.

A.3.3.43 Cellular or Foamed Plastic.

Cellular or foamed plastic might contain foamed and unfoamed polymeric or monomeric precursors (prepolymer, if used), plasticizers, fillers, extenders, catalysts, blowing agents, colorants, stabilizers, lubricants, surfactants, pigments, reaction control agents, processing aids, and flame retardants.

A.3.3.49 Common Path of Travel.

Common path of travel is measured in the same manner as travel distance but terminates at that point where two separate and distinct routes become available. Paths that merge are common paths of travel.

A.3.3.50.1 Fire Compartment.

Additional fire compartment information is contained in 8.2.2.

In the provisions for fire compartments utilizing the outside walls of a building, it is not intended that the outside wall be specifically fire resistance rated, unless required by other standards. Likewise, it is not intended that outside windows or doors be protected, unless specifically required for exposure protection by another section of this *Code* or by other standards.

A.3.3.50.2 Smoke Compartment.

Where smoke compartments using the outside walls or the roof of a building are provided, it is not intended that outside walls or roofs, or any openings therein, be capable of resisting the passage of smoke. Application of smoke compartment criteria where required elsewhere in the *Code* should be in accordance with Section 8.5.

A.3.3.53 Critical Radiant Flux.

Critical radiant flux is the property determined by the test procedure of NFPA 253 or by ASTM E648, *Standard Test Method for Critical Radiant Flux of Floor-Covering Systems Using a Radiant Heat Energy Source*. The unit of measurement of critical radiant flux is watts per square centimeter (W/cm^2).

A.3.3.54.2 Fire Damper.

Some such devices are listed in UL *Heating, Cooling, Ventilating and Cooking Equipment Directory* under the category of "Fire Dampers for Fire Barrier and Smoke Applications (EMME)." Fire dampers are classified for use in either static systems or for dynamic systems, where the dampers are rated for closure under airflow. [90A,2024 2024]

A.3.3.54.3 Smoke Damper.

Smoke dampers are subjected to various pressure differentials, are exposed to elevated temperatures, and can be required to open or close against mechanically induced airflow. Some such devices are listed in UL *Heating, Cooling, Ventilating and Cooking Equipment Directory* under the category "Dampers for Fire Barrier and Smoke Applications (EMME)." [90A,2024 2024]

A.3.3.65.1 Emergency Stair Travel Device.

An emergency stair travel device should be designed, constructed, and operated in accordance with ANSI/RESNA ED-1, *Emergency Stair Travel Devices Used by Individuals with Disabilities*. The device typically requires the assistance of a trained operator.

A.3.3.68 Dormitory.

Rooms within dormitories intended for the use of individuals for combined living and sleeping purposes are guest rooms or guest suites. Examples of dormitories are college dormitories, fraternity and sorority houses, and military barracks.

A.3.3.70 Dwelling Unit.

It is not the intent of the *Code* that the list of spaces in the definition of the term *dwelling unit* in 3.3.70 is to be all inclusive. It is the intent of the *Code* that the list of spaces is a minimal set of criteria that must be provided to be considered a dwelling unit, and, therefore, the dwelling unit can contain other spaces that are typical to a single-family dwelling.

A.3.3.70.1 One- and Two-Family Dwelling Unit.

The application statement of 24.1.1.1 limits each dwelling unit to being “occupied by members of a single family with not more than three outsiders.” The *Code* does not define the term *family*. The definition of *family* might be subject to federal, state, and local regulations and might not be restricted to a person or a couple (two people) and their children. The following examples aid in differentiating between a single-family dwelling and a lodging or rooming house:

- (1) An individual or a couple (two people) who rent a house from a landlord and then sublease space for up to three individuals should be considered a family renting to a maximum of three outsiders, and the house should be regulated as a single-family dwelling in accordance with Chapter 24.
- (2) A house rented from a landlord by an individual or a couple (two people) in which space is subleased to four or more individuals, but not more than 16, should be considered and regulated as a lodging or rooming house in accordance with Chapter 26.
- (3) A residential building that is occupied by four or more individuals, but not more than 16, each renting from a landlord, without separate cooking facilities, should be considered and regulated as a lodging or rooming house in accordance with Chapter 26.

It is not the intent of the *Code* to restrict occupancy to persons related by blood, marriage, or adoption as in the traditional opinion of a family. Regulations affecting occupant safety under the *Life Safety Code* differ greatly from zoning regulations that attempt to control who may, and who may not, live in a residential area designated a “single family” zone. Community zoning regulations address problems of noise, pollution, littering, overcrowding, and traffic. Restricting occupancy of single-family housing based on the biological or legal relationships between its inhabitants bears no reasonable relationship to the goals of life safety.

A group of nonrelatives living together in a nontraditional group can be the “functional equivalent” of a more traditional family unit. The factors that must be considered by the authority having jurisdiction are whether the group shares the entire house other than individual bedrooms, lives, cooks, and functions together as a single housekeeping unit and is primarily nontransient.

A.3.3.72 Electroluminescent.

This light source is typically contained inside the device.

A.3.3.83 Evacuation Capability.

The evacuation capability of the residents and staff is a function of both the ability of the residents to evacuate and the assistance provided by the staff. It is intended that the evacuation capability be determined by the procedure acceptable to the authority having jurisdiction. It is also intended that the timing of drills, the rating of residents, and similar actions related to determining the evacuation capability be performed by persons approved by or acceptable to the authority having jurisdiction. The evacuation capability can be determined by the use of the definitions in 3.3.83, the application of NFPA 101A Chapter 6, or a program of drills (timed).

Evacuation does not include the relocation of occupants within a building.

Where drills are used in determining evacuation capability, it is suggested that the facility conduct and record fire drills six times per year on a bimonthly basis, with a minimum of two drills conducted during the night when residents are sleeping, and that the facility conduct the drills in consultation with the authority having jurisdiction. Records should indicate the time taken to reach a point of safety, date and time of day, location of simulated fire origin, escape paths used, and comments relating to residents who resisted or failed to participate in the drills.

Translation of drill times to evacuation capability is determined as follows:

- (1) 3 minutes or less — prompt
- (2) Over 3 minutes, but not in excess of 13 minutes — slow
- (3) More than 13 minutes — impractical

Evacuation capability, in all cases, is based on the time of day or night when evacuation of the facility would be most difficult, such as when residents are sleeping or fewer staff are present.

Evacuation capability determination is considered slow if the following conditions are met:

- (1) All residents are able to travel to centralized dining facilities without continuous staff assistance.
- (2) There is continuous staffing whenever there are residents in the facility.

A.3.3.86 Existing.

See *Existing Building*, A.3.3.37.5.

A.3.3.88 Exit.

Exits include exterior exit doors, exit passageways, horizontal exits, exit stairs, and exit ramps. In the case of a stairway, the exit includes the stair enclosure, the door to the stair enclosure, the stairs and landings inside the enclosure, the door from the stair enclosure to the outside or to the level of exit discharge, and any exit passageway and its associated doors, if such are provided, so as to discharge the stair directly to the outside. In the case of a door leading directly from the street floor to the street or open air, the exit comprises only the door. (*See also 7.2.2.6.3.1 and A.7.2.2.6.3.1.*)

Doors of small individual rooms, as in hotels, while constituting exit access from the room, are not referred to as exits, except where they lead directly to the outside of the building from the street floor.

A.3.3.88.1 Horizontal Exit.

Horizontal exits should not be confused with egress through doors in smoke barriers. Doors in smoke barriers are designed only for temporary protection against smoke, whereas horizontal exits provide protection against serious fire for a relatively long period of time in addition to providing immediate protection from smoke. (*See 7.2.4.*)

A.3.3.90.1 Level of Exit Discharge.

Low occupancy, ancillary spaces with exit doors discharging directly to the outside, such as mechanical equipment rooms or storage areas, that are located on levels other than main occupiable floors should not be considered in the determination of level of exit discharge.

A.3.3.93 Exposure Fire.

An exposure fire usually refers to a fire that starts outside a building, such as a wildlands fire or vehicle fire, and that, consequently, exposes the building to a fire.

A.3.3.95.2 Limited Care Facility.

Limited care facilities and residential board and care occupancies both provide care to people with physical and mental limitations. However, the goals and programs of the two types of occupancies differ greatly. The requirements in this *Code* for limited care facilities are based on the assumption that these are medical facilities, that they provide medical care and treatment, and that the patients are not trained to respond to the fire alarm; that is, the patients do not participate in fire drills but, rather, await rescue. (*See Section 18.7.*)

The requirements for residential board and care occupancies are based on the assumption that the residents are provided with personal care and activities that foster continued independence, that the residents are encouraged and taught to overcome their limitations, and that most residents, including all residents in prompt and slow homes, are trained to respond to fire drills to the extent they are able. Residents are required to participate in fire drills. (*See Section 32.7.*)

Persons with Alzheimer’s and related illnesses might be located in a nursing home, limited care facility, or board and care facility. For such persons, it is the level of care provided, not the medical diagnosis, that matters for the purposes of determining whether the facility should meet the requirements for limited care. Where personal care is provided but medical or custodial care is not, the limited care definition does not typically apply. It is the intent of this definition that it not apply to persons not receiving medical or custodial care, provided they are able to assist in their own evacuation, regardless of their medical diagnosis.

A.3.3.97.2 Interior Finish.

Interior finish is not intended to apply to surfaces within spaces such as those that are concealed or inaccessible. Furnishings that, in some cases, might be secured in place for functional reasons should not be considered as interior finish.

A.3.3.97.3 Interior Floor Finish.

Interior floor finish includes coverings applied over a normal finished floor or stair treads and risers.

A.3.3.97.4 Interior Wall Finish.

Such partitions are intended to include washroom water closet partitions.

A.3.3.101 Fire Code.

Where no fire code has been adopted, NFPA 1 should be used where the fire code is referenced in this *Code*.

A.3.3.106 Fire Model.

Due to the complex nature of the principles involved, models are often packaged as computer software. Any relevant input data, assumptions, and limitations needed to properly implement the model will be attached to the fire models.

A.3.3.109 Fire Scenario.

A fire scenario defines the conditions under which a proposed design is expected to meet the fire safety goals. Factors typically include fuel characteristics, ignition sources, ventilation, building characteristics, and occupant locations and characteristics. The term *fire scenario* includes more than the characteristics of the fire itself but excludes design specifications and any characteristics that do not vary from one fire to another; the latter are called assumptions. The term *fire scenario* is used here to mean only those specifications required to calculate the fire's development and effects, but, in other contexts, the term might be used to mean both the initial specifications and the subsequent development and effects (i.e., a complete description of fire from conditions prior to ignition to conditions following extinguishment).

A.3.3.117 Flame Spread.

See Section 10.2.

[See SR-65.](#)

A.3.3.128 Fuel-Burning Appliance.

Fuel-burning appliances include, but are not limited to, devices used for cooking, heating, lighting, or decorative purposes. Examples are wood stoves, portable space heaters, ranges, furnaces, water heaters, clothes dryers, gas refrigerators, gas lamps, and fuel-burning fireplaces.

A.3.3.134 Grade Plane.

See 4.6.17 for provisions for establishing the grade plane. Vertical measurements might be used in determining the number of stories or building height.

A.3.3.135 Grandstand.

Where the term *grandstand* is preceded by an adjective denoting a material, it means a grandstand the essential members of which, exclusive of seating, are of the material designated.

A.3.3.149 Heat Release Rate (HRR).

The heat release rate of a fuel is related to its chemistry, physical form, and availability of oxidant and is ordinarily expressed as British thermal units per second (Btu/s) or kilowatts (kW).

Chapters 40 and 42 include detailed provisions on high hazard industrial and storage occupancies.

A.3.3.154.1 Day-Care Home.

A day care home is generally located within a dwelling unit.

A.3.3.157 Hotel.

So-called apartment hotels should be classified as hotels, because they are potentially subject to the same transient occupancy as hotels. Transients are those who occupy accommodations for less than 30 days.

A.3.3.158.1 Externally Illuminated.

The light source is typically a dedicated incandescent or fluorescent source.

A.3.3.158.2 Internally Illuminated.

The light source is typically incandescent, fluorescent, electroluminescent, photo-luminescent, or self-luminous or is a light-emitting diode(s).

A.3.3.177.1 Fuel Load.

Fuel load includes interior finish and trim.

A.3.3.182.1 Open Mall Concourse.

An open mall concourse is permitted to serve as the public way provided the open mall concourse meets the definition of public way in accordance with this *Code*.

It is intended that the open mall concourse be designed, constructed, and arranged to permit the natural venting of smoke and other products of combustion to the outside air through openings in the walls, roof, or combination thereof of the mall concourse.

The solid area of the mall concourse walls and the horizontal projection of the solid area of any roof structures, including shade structures, awnings, and canopies, that cover the mall concourse should be summed to determine the aggregate area of solid construction associated with the mall concourse. A mall concourse can be considered an open mall concourse where at least 50 percent of the aggregate area of solid construction is open to the atmosphere. Open areas can include entrances to the mall concourse (e.g., barred gates that allow air to pass through versus an entrance storefront), clearstory spaces between the mall building (structure that houses tenants) and the roof above, and openings in the roof assembly. For the openings to be effective, they must also be distributed uniformly over the length of the mall concourse. Caution must be exercised in the design and construction so as to not create areas of possible congestion for smoke and hot gases to accumulate, such as a pitched (steep slope) roof assembly within the mall concourse.

Roof assemblies are permitted to have holes or open areas that represent openings to the outside. The roof assembly is also permitted to consist of a structure or assembly that allows the venting of the mall concourse. Examples of these vented roof structures include a roof trellis or an exposed roof structural frame only with no roofing materials. Structures that would permit the omission of automatic sprinkler protection, in accordance with NFPA 13, could be included to serve as open space for the purposes of the calculation of areas open to the outside air. Caution should be taken not to allow vegetation to grow into and around these structures that could reduce or impede the venting capabilities.

A.3.3.185 Means of Egress.

A means of egress comprises the vertical and horizontal travel and includes intervening room spaces, doorways, hallways, corridors, passageways, balconies, ramps, stairs, elevators, enclosures, lobbies, escalators, horizontal exits, courts, and yards.

A.3.3.188 Membrane.

For the purpose of fire protection features, a membrane can consist of materials such as gypsum panel products, plywood, glass, or fabric. For the purpose of membrane structures, a membrane consists of thin, flexible, water-impervious material capable of being supported by an air pressure of 1½ in. (38 mm) water column.

A.3.3.194 Modification.

Modification does not include repair or replacement of interior finishes.

A.3.3.204 Objective.

Objectives define a series of actions necessary to make the achievement of a goal more likely. Objectives are stated in more specific terms than goals and are measured on a more quantitative, rather than qualitative, basis.

A.3.3.205.1 Ambulatory Health Care Occupancy.

It is not the intent that occupants be considered to be incapable of self-preservation just because they are in a wheelchair or use assistive walking devices, such as a cane, a walker, or crutches. Rather, it is the intent to address treatment centers that receive patients who have been rendered incapable of self-preservation, such as being rendered unconscious as a result of an accident or being unable to move due to sudden illness.

It is not the intent that the term *anesthesia* be limited to general anesthesia.

[PCs \[1\]](#)[SR-6598](#)[Hide Legislati...](#)**A.3.3.205.2 Assembly Occupancy.**

Assembly occupancies might include the following:

- (1) Armories
- (2) Assembly halls
- (3) Auditoriums
- (4) Bowling lanes
- (5) Club rooms
- (6) College and university classrooms, 50 persons and over
- (7) Conference rooms
- (8) Courtrooms
- (9) Dance halls
- (10) Drinking establishments
- (11) Exhibition halls
- (12) Gymnasiums
- (13) Libraries
- (14) Mortuary chapels
- ~~Motion picture theaters~~
- (15) Museums
- (16) Nightclubs
- (17) Passenger stations and terminals of air, surface, underground, and marine public transportation facilities
- (18) Places of religious worship
- (19) Pool rooms
- (20) Recreation piers
- (21) Restaurants
- (22) Skating rinks
- (23) Special amusement buildings, regardless of occupant load
- (24) Theaters

Assembly occupancies are characterized by the presence or potential presence of crowds with attendant panic hazard in case of fire or other emergency. They are generally open or occasionally open to the public, and the occupants, who are present voluntarily, are not ordinarily subject to discipline or control. Such buildings are ordinarily not used for sleeping purposes. Special conference rooms, snack areas, and other areas incidental to, and under the control of, the management of other occupancies, such as offices, fall under the 50-person limitation.

Restaurants and drinking establishments with an occupant load of fewer than 50 persons should be classified as mercantile occupancies.

Occupancy of any room or space for assembly purposes by fewer than 50 persons in another occupancy, and incidental to such other occupancy, should be classified as part of the other occupancy and should be subject to the provisions applicable thereto.

For special amusement buildings, see 12.4.9 and 13.4.9.

A.3.3.205.3 Business Occupancy.

Business occupancies include the following:

- (1) Airport traffic control towers (ATCTs)
- (2) City halls
- (3) College and university instructional buildings, classrooms under 50 persons, and instructional laboratories
- (4) Courthouses
- (5) Dentists' offices
- (6) Doctors' offices
- (7) General offices
- (8) Outpatient clinics (ambulatory)
- (9) Town halls

Doctors' and dentists' offices are included, unless of such character as to be classified as ambulatory health care occupancies. (*See 3.3.205.1.*)

Birth centers should be classified as business occupancies if they are occupied by fewer than four patients, not including infants, at any one time; do not provide sleeping facilities for four or more occupants; and do not provide treatment procedures that render four or more patients, not including infants, incapable of self-preservation at any one time. For birth centers occupied by patients not meeting these parameters, see Chapter 18 or Chapter 19, as appropriate.

Service facilities common to city office buildings, such as newsstands, lunch counters serving fewer than 50 persons, barber shops, and beauty parlors are included in the business occupancy group.

City halls, town halls, and courthouses are included in this occupancy group, insofar as their principal function is the transaction of public business and the keeping of books and records. Insofar as they are used for assembly purposes, they are classified as assembly occupancies.

A.3.3.205.4 Day-Care Occupancy.

Day care occupancies include the following:

- (1) Adult day care occupancies, except where part of a health care occupancy
- (2) Child day care occupancies
- (3) Day care homes
- (4) Kindergarten classes that are incidental to a child day care occupancy
- (5) Nursery schools

In areas where public schools offer only half-day kindergarten programs, many child day care occupancies offer state-approved kindergarten classes for children who need full-day care. Because these classes are normally incidental to the day care occupancy, the requirements of the day care occupancy should be followed.

A.3.3.205.5 Detention and Correctional Occupancy.

Detention and correctional occupancies include the following:

- (1) Adult and juvenile substance abuse centers
- (2) Adult and juvenile work camps
- (3) Adult community residential centers
- (4) Adult correctional institutions
- (5) Adult local detention facilities
- (6) Juvenile community residential centers
- (7) Juvenile detention facilities
- (8) Juvenile training schools

Detention and correctional occupancies do not include psychiatric and dementia units in hospitals, emergency rooms in hospitals, ambulatory health care occupancies, nursing homes, and residential board and care occupancies where persons can be lawfully detained.

See A.22.1.1.1.6 and A.23.1.1.1.6.

A.3.3.205.6 Educational Occupancy.

Educational occupancies include the following:

- (1) Academies
- (2) Kindergartens
- (3) Schools

An educational occupancy is distinguished from an assembly occupancy in that the same occupants are regularly present.

A.3.3.205.7 Health Care Occupancy.

Health care occupancies include the following:

- (1) Hospitals
- (2) Limited care facilities
- (3) Nursing homes

Occupants of health care occupancies typically have physical or mental illness, disease, or infirmity. They also include infants, convalescents, or infirm aged persons. It is not the intent to consider occupants incapable of self-preservation because they are in a wheelchair or use assistive walking devices, such as a cane, a walker, or crutches.

A.3.3.205.8 Industrial Occupancy.

Industrial occupancies include the following:

- (1) Drycleaning plants
- (2) Factories of all kinds
- (3) Food processing plants
- (4) Gas plants
- (5) Hangars (for servicing/maintenance)
- (6) Laundries
- (7) Power plants
- (8) Pumping stations
- (9) Refineries
- (10) Sawmills
- (11) Telephone exchanges

In evaluating the appropriate classification of laboratories, the authority having jurisdiction should treat each case individually, based on the extent and nature of the associated hazards. Some laboratories are classified as occupancies other than industrial; for example, a physical therapy laboratory or a computer laboratory.

A.3.3.205.8.1 General Industrial Occupancy.

General industrial occupancies include multistory buildings where floors are occupied by different tenants or buildings suitable for such occupancy and, therefore, are subject to possible use for types of industrial processes with a high density of employee population.

A.3.3.205.8.2 High Hazard Industrial Occupancy.

A high hazard industrial occupancy includes occupancies where gasoline and other Class I liquids [flash point < 100°F (37.8°C)] are handled, used, or stored under such conditions that involve possible release of flammable vapors; where grain dust, wood flour or plastic dust, aluminum or magnesium dust, or other explosive dusts are produced; where hazardous chemicals or explosives are manufactured, stored, or handled; where materials are processed or handled under conditions that might produce flammable flyings; and where other situations of similar hazard exist. Chapters 40 and 42 include detailed provisions on high hazard industrial and storage occupancies.

A.3.3.205.9 Mercantile Occupancy.

Mercantile occupancies include the following:

- (1) Auction rooms
- (2) Department stores
- (3) Drugstores
- (4) Restaurants with fewer than 50 persons
- (5) Shopping centers
- (6) Supermarkets

Office, storage, and service facilities incidental to the sale of merchandise and located in the same building should be considered part of the mercantile occupancy classification.

A.3.3.205.12 Residential Board and Care Occupancy.

The following are examples of facilities that are classified as residential board and care occupancies:

- (1) Group housing arrangement for persons with physical or intellectual disabilities who normally attend school in the community, attend worship in the community, or otherwise use community facilities
- (2) Group housing arrangement for persons with physical or intellectual disabilities who are undergoing training in preparation for independent living, for paid employment, or for other normal community activities
- (3) Group housing arrangement for the elderly that provides personal care services but that does not provide nursing care
- (4) Facility for social rehabilitation of individuals with alcohol or substance use disorders or mental health conditions that contains a group housing arrangement and that provides personal care services but does not provide acute care
- (5) Assisted living facilities
- (6) Other group housing arrangements that provide personal care services but not nursing care

A.3.3.205.13 Residential Occupancy.

Residential occupancies are treated as separate occupancies in this *Code* as follows:

- (1) One- and two-family dwellings (Chapter 24)
- (2) Lodging or rooming houses (Chapter 26)
- (3) Hotels, motels, and dormitories (Chapters 28 and 29)
- (4) Apartment buildings (Chapters 30 and 31)

A.3.3.205.15 Storage Occupancy.

Storage occupancies include the following:

- (1) Barns
- (2) Bulk oil storage
- (3) Cold storage
- (4) Freight terminals
- (5) Grain elevators
- (6) Hangars (for storage only)
- (7) Parking structures
- (8) Truck and marine terminals
- (9) Warehouses

Storage occupancies are characterized by the presence of relatively small numbers of persons in proportion to the area.

A.3.3.221 Performance Criteria.

Performance criteria are stated in engineering terms. Engineering terms include temperatures, radiant heat flux, and levels of exposure to fire products. Performance criteria provide threshold values used to evaluate a proposed design.

A.3.3.223 Personal Care.

Personal care involves responsibility for the safety of the resident while inside the building. Personal care might include daily awareness by management of the resident's functioning and whereabouts, making and reminding a resident of appointments, the ability and readiness for intervention in the event of a resident experiencing a crisis, supervision in the areas of nutrition and medication, and actual provision of transient medical care, including limited periodic skilled nursing care.

A.3.3.224 Photoluminescent.

The released light is normally visible for a limited time if the ambient light sources are removed or partially obscured. [301,2018 2023]

A.3.3.227 Platform.

Platforms also include the head tables for special guests; the raised area for lecturers and speakers; boxing and wrestling rings; theater-in-the-round; and for similar purposes wherein there are no overhead drops, pieces of scenery, or stage effects other than lighting and a screening valance.

A platform is not intended to be prohibited from using a curtain as a valance to screen or hide the electric conduit, lighting track, or similar fixtures, nor is a platform prohibited from using curtains that are used to obscure the back wall of the stage; from using a curtain between the auditorium and the stage (grand or house curtain); from using a maximum of four leg drops; or from using a valance to screen light panels, plumbing, and similar equipment from view.

A.3.3.231.1 Low-Energy Power-Operated Door.

A pedestrian action might include pressing a push plate or waving a hand in front of a sensor.

A.3.3.231.2 Power-Assisted Door.

A provision used to prevent entrapment might include sensors.

A.3.3.235 Proposed Design.

The design team might develop a number of trial designs that will be evaluated to determine whether they meet the performance criteria. One of the trial designs will be selected from those that meet the performance criteria for submission to the authority having jurisdiction as the proposed design.

The proposed design is not necessarily limited to fire protection systems and building features. It also includes any component of the proposed design that is installed, established, or maintained for the purpose of life safety, without which the proposed design could fail to achieve specified performance criteria. Therefore, the proposed design often includes emergency procedures and organizational structures that are needed to meet the performance criteria specified for the proposed design.

A.3.3.237 Public Way.

The intent of the definition of public way is to establish an end point at which the means of egress terminates, is not under the jurisdiction of the *Code*, and to which the *Code*'s requirements do not apply. As such, the *Code* intends a situation where occupants egressing from a building ultimately reach a point where they can move away from the building unimpeded and no longer need the protections of the *Code*.

A.3.3.238 Ramp.

See 7.2.5.

A.3.3.240.1 Fire Protection Rating.

The acceptance criteria for determining fire protection ratings for fire door assemblies are described in NFPA 252 and those for fire window assemblies are described in NFPA 257.

A.3.3.241 Reconstruction.

It is not the intent that a corridor, an aisle, or a circulation space within a suite be considered as a corridor that is shared by more than one occupant space. The suite should be considered as only one occupant space. The following situations should be considered to involve more than one occupant space:

- (1) Work affecting a corridor that is common to multiple guest rooms on a floor of a hotel occupancy
- (2) Work affecting a corridor that is common to multiple living units on a floor of an apartment building occupancy
- (3) Work affecting a corridor that is common to multiple tenants on a floor of a business occupancy

PCs [1]

A.3.3.257.1 Festival Seating.

Festival seating describes situations in assembly occupancies where live entertainment events are held that are expected to result in overcrowding and high audience density that can compromise public safety. It is not the intent to apply the term *festival seating* to exhibitions; sports events; conventions; and bona fide political, religious, and educational events. Assembly occupancies with 15 ft² (1.4 m²) or more per person should not be considered festival seating.

A.3.3.259 Self-Luminous.

An example of a self-contained power source is tritium gas. Batteries do not qualify as a self-contained power source. The light source is typically contained inside the device.

A.3.3.261 Self-Preservation (Day-Care Occupancy).

Examples of clients who are incapable of self-preservation include infants, clients who are unable to use stairs because of confinement to a wheelchair or other physical disability, and clients who cannot follow directions or a group to the outside of a facility due to mental or behavioral disorders. It is the intent of this *Code* to classify children under the age of 30 months as incapable of self-preservation. Examples of direct intervention by staff members include carrying a client, pushing a client outside in a wheelchair, and guiding a client by direct hand-holding or continued bodily contact. If clients cannot exit the building by themselves with minimal intervention from staff members, such as verbal orders, classification as incapable of self-preservation should be considered.

A.3.3.268 Situation Awareness.

Situation awareness (also called situational awareness), described in a simpler fashion, is being aware of what is happening around you and understanding what that information means to you now and in the future. This definition, and the more formal definition, come from the extensive work of human factors (ergonomics) experts in situation awareness, most notably Mica R. Endsley (Endsley, Bolte and Jones, *Designing for Situation Awareness: An approach to user-centered design*, CRC Press, Taylor and Francis, Boca Raton, FL, 2003). Within the *Code*, and the standards it references, are long-standing requirements for systems and facilities that enhance situation awareness. Included are fire/smoke detection, alarm, and communication systems plus the system status panels in emergency command centers; supervisory systems for various especially critical components (e.g., certain valves) of fire protection systems; waterflow indicators; certain signs; and the availability of trained staff, notably in health care occupancies. Serious failures of situation awareness have been identified as central to unfortunate outcomes in various emergencies; for example, typical responses of people to developing fires also exhibit situation awareness problems as incorrect assumptions are made about the rapidity of fire growth or the effect of opening a door. Good situation awareness is critical to decision making, which, in turn, is critical to performance during an emergency.

A.3.3.276 Smoke Partition.

A smoke partition is not required to have a fire resistance rating.

A.3.3.277 Smokeproof Enclosure.

For further guidance, see the following publications:

- (1) ASHRAE *Handbook and Product Directory — Fundamentals*
- (2) *Principles of Smoke Management*, by Klote and Milke
- (3) NFPA 105, *Standard for Smoke Door Assemblies and Other Opening Protectives*

A.3.3.282.1 Design Specification.

Design specifications include both hardware and human factors, such as the conditions produced by maintenance and training. For purposes of performance-based design, the design specifications of interest are those that affect the ability of the building to meet the stated goals and objectives.

A.3.3.286 Stair.

See 7.2.2.6.

A.3.3.289 Stories in Height.

Stories below the level of exit discharge are not counted as stories for determining the stories in height of a building.

A.3.3.290 Story.

Stories used exclusively for mechanical equipment rooms, elevator penthouses, and similar spaces are not occupiable stories.

A.3.3.292 Street Floor.

Where, due to differences in street levels, two or more stories are accessible from the street, each is a street floor. Where there is no floor level within the specified limits for a street floor above or below the finished ground level, the building has no street floor.

A.3.3.293 Structure.

The term *structure* is to be understood as if followed by the words *or portion thereof*. (See also *Building*, A.3.3.37.)

A.3.3.293.2 Air-Supported Structure.

A cable-restrained air-supported structure is one in which the uplift is resisted by cables or webbing that is anchored by various methods to the membrane or that might be an integral part of the membrane. An air-supported structure is not a tensioned-membrane structure.

A.3.3.293.4 Mall Structure.

A mall structure might enclose one or more uses, such as retail and wholesale stores, drinking and dining establishments, entertainment and amusement facilities, transportation facilities, offices, and other similar uses.

A.3.3.293.7 Open Structure.

Open structures are often found in oil refining, chemical processing, or power plants. Roofs or canopies without enclosing walls are not considered an enclosure.

A.3.3.293.8 Parking Structure.

A parking structure is permitted to be enclosed or open, use ramps, and use mechanical control push-button-type elevators to transfer vehicles from one floor to another. Motor vehicles are permitted to be parked by the driver or an attendant or are permitted to be parked mechanically by automated facilities. Where automated-type parking is provided, the operator of those facilities is permitted either to remain at the entry level or to travel to another level. Motor fuel is permitted to be dispensed, and motor vehicles are permitted to be serviced in a parking structure in accordance with NFPA 30A. [88A,20192023]

A.3.3.293.12 Underground Structure.

In determining openings in exterior walls, doors or access panels are permitted to be included. Windows are also permitted to be included, provided that they are openable or provide a breakable glazed area.

Floor levels that are located not more than 30 ft (9.1 m) below the lowest level with an exit discharge can be considered a basement. See 3.3.33.

A.3.3.301 Tent.

A tent might also include a temporary tensioned-membrane structure.

A.3.3.309 Vertical Opening.

Vertical openings might include items such as stairways; hoistways for elevators, dumbwaiters, and inclined and vertical conveyors; shaftways used for light, ventilation, or building services; or expansion joints and seismic joints used to allow structural movements.

A.3.3.313 Wall or Ceiling Covering.

Wall or ceiling coverings with ink or top coat layers added as part of the manufacturing process are included in this definition. The term "polymeric" is intended to include "vinyl."

A.4.1

The goals in Section 4.1 reflect the scope of this *Code* (see *Section 1.1*). Other fire safety goals that are outside the scope of this *Code* might also need to be considered, such as property protection and continuity of operations. Compliance with this *Code* can assist in meeting goals outside the scope of the *Code*.

A.4.1.1

Reasonable safety risk is further defined by subsequent language in this *Code*.

A.4.1.1(1)

The phrase "intimate with the initial fire development" refers to the person(s) at the ignition source or first materials burning, not to all persons within the same room or area.

A.4.1.2

"Comparable emergencies" refers to incidents where the hazard involves thermal attributes similar to fires or airborne contaminants similar to smoke, such that features mandated by this *Code* can be expected to mitigate the hazard. Examples of such incidents might be explosions and hazardous material releases. The *Code* recognizes that features mandated by this *Code* might be less effective against such hazards than against fires.

A.4.1.3

See Annex C for referenced documents on hazardous materials. The reference to *NFPA 72* in 4.1.3 relates to requirements for carbon monoxide detection.

A.4.1.4

An assembly occupancy is an example of an occupancy where the goal of providing for reasonably safe emergency and nonemergency crowd movement has applicability. A detention or correctional occupancy is an example of an occupancy where emergency and nonemergency crowd movement is better addressed by detention and correctional facilities specialists than by this *Code*.

A.4.2.3

See 4.1.4 and Annex C for documents on hazardous materials.

A.4.2.4

Additional information on building security is provided in NFPA 730 and NFPA 731.

A.4.3

Additional assumptions that need to be identified for a performance-based design are addressed in Chapter 5.

A.4.3.1

Protection against certain terrorist acts will generally require protection methods beyond those required by this *Code*.

A.4.4.2.3(1)

As an example, Table 7.2.2.2.1(a) limits a new stair to having a maximum riser height of 7 in. (180 mm) and 12.2.5.8.6 limits a new aisle stair in an assembly occupancy to having a maximum riser height of 8 in. (205 mm), 9 in. (230 mm), or 11 in. (280 mm). The specific provisions of 12.2.5.8.6 are intended to govern the maximum riser height for the new aisle stairs in assembly occupancies, not the general riser height requirement of Table 7.2.2.2.1(a).

A.4.4.2.3(2)

As an example, 7.1.3.2.1 requires an exit stair to be enclosed and separated from the remainder of the building by fire-resistance-rated construction of at least 1 hour and 8.6.5 requires a minimum fire resistance rating of ½ hour for the enclosure of an existing floor opening. A existing hole in a floor used for a stair creates a vertical opening subject to the enclosure and protection requirements of 8.6.5. Where such stair is used as an exit stair, it is subject to the requirements of 7.1.3.2.1 for the separation and enclosure of exits. The case of a stair used as an exit stair is more specific than the case of a non-exit stair that creates a vertical opening. The provision of 7.1.3.2.1 governs with respect to the required fire resistance rating of the exit stair enclosure.

A.4.4.2.3(3)

As an example, the provision of 11.8.2.2 that prohibits elevator lobby door locking in new high-rise buildings is more specific than the provision of 38.2.2.2.4 that permits elevator lobby exit access door-locking arrangements in accordance with 7.2.1.6.4 in new business occupancies. New high-rise business occupancy buildings are a specific subset of the general category of new business occupancy buildings. Extra provisions and limitations are mandated for new high-rise business occupancy buildings that are not mandated for new non-high-rise business occupancy buildings. The specific provision of 11.8.2.2 is intended to govern the locking of elevator lobby doors, not the general provision of 38.2.2.2.4.

A.4.5.4

Fire alarms alert occupants to initiate emergency procedures, facilitate orderly conduct of fire drills, and might initiate response by emergency services.

A.4.5.5

Systems encompass facilities or equipment and people. Included are fire/smoke detection, alarm, and communication systems plus the system status panels in emergency command centers; supervisory systems for various especially critical components (e.g., certain valves) of fire protection systems; certain signs; and the availability of trained staff, notably in health care occupancies.

A.4.6.4.2

See A.4.6.5.

A.4.6.5

In existing buildings, it is not always practical to strictly apply the provisions of this *Code*. Physical limitations can cause the need for disproportionate effort or expense with little increase in life safety. In such cases, the authority having jurisdiction needs to be satisfied that reasonable life safety is ensured.

In existing buildings, it is intended that any condition that represents a serious threat to life be mitigated by the application of appropriate safeguards. It is not intended to require modifications for conditions that do not represent a significant threat to life, even though such conditions are not literally in compliance with the *Code*.

An example of what is intended by 4.6.5 would be a historic ornamental guardrail baluster with spacing that does not comply with the 4 in. (100 mm) requirement. Because reducing the spacing would have minimal impact on life safety but could damage the historic character of the guardrail, the existing spacing might be approved by the authority having jurisdiction.

A.4.6.6

In some cases, appreciable cost might be involved in bringing an existing occupancy into compliance. It would be appropriate for the authority having jurisdiction to prescribe a schedule determined jointly with the building owner(s), or even the local building owners trade association, allowing suitable periods of time for the correction of the various deficiencies.

The AHJ and building owner should consider, before establishing a time limit, the amount of time required for the building owner to secure the services of a design professional to execute construction documents; secure the necessary funding; secure tax credits/deductions and adjust insurance premiums; solicit and contact a general contractor; execute the permit process; execute the project while the building is occupied and operating; perform testing and final inspection, and receive a certificate of occupancy.

In addition, the AHJ should consider the building stock (i.e., building sizes and quantity) in the jurisdiction. For example, the size of the buildings should be taken into consideration as the automatic sprinkler system retrofit of a high-rise building eight stories tall versus a high-rise building 40 stories tall will require significantly different lengths of time to execute corrective action as a result of the shear volume of each of the buildings.

A.4.6.7.4

In some cases, the requirements for new construction are less restrictive, and it might be justifiable to permit an existing building to use the less restrictive requirements. However, extreme care needs to be exercised when granting such permission, because the less restrictive provision might be the result of a new requirement elsewhere in the *Code*. For example, in editions of the *Code* prior to 1991, corridors in new health care occupancies were required to have a 1-hour fire resistance rating. Since 1991, such corridors have been required only to resist the passage of smoke. However, this provision is based on the new requirement that all new health care facilities be protected throughout by automatic sprinklers. (See A.4.6.7.5.)

A.4.6.7.5

An example of what is intended by 4.6.7.4 and 4.6.7.5 follows. In a hospital that has 6 ft (1830 mm) wide corridors, such corridors cannot be reduced in width, even though the provisions for existing hospitals do not require 6 ft (1830 mm) wide corridors. However, if a hospital has 10 ft (3050 mm) wide corridors, they are permitted to be reduced to 8 ft (2440 mm) in width, which is the requirement for new construction. If the hospital corridor is 36 in. (915 mm) wide, it would have to be increased to 48 in. (1220 mm), which is the requirement for existing hospitals.

A.4.6.10.1

Fatal fires have occurred when, for example, a required stair has been closed for repairs or removed for rebuilding, or when a required automatic sprinkler system has been shut off to change piping.

A.4.6.10.3

See also NFPA 241.

A.4.6.12.3

Examples of such features include automatic sprinklers, fire alarm systems, standpipes, and portable fire extinguishers. The presence of a life safety feature, such as sprinklers or fire alarm devices, creates a reasonable expectation by the public that these safety features are functional. When systems are inoperable or taken out of service but the devices remain, they present a false sense of safety. Also, before taking any life safety features out of service, extreme care needs to be exercised to ensure that the feature is not required, was not originally provided as an alternative or equivalent, or is no longer required due to other new requirements in the current *Code*. It is not intended that the entire system or protection feature be removed. Instead, components such as sprinklers, initiating devices, notification appliances, standpipe hose, and exit systems should be removed to reduce the likelihood of relying on inoperable systems or features. Conversely, equipment, such as fire or smoke dampers, that is not obvious to the public should be able to be taken out of service if no longer required by this *Code*. Where a door that is not required to be fire protection rated is equipped with a fire protection listing label, it is not the intent of 4.6.12.3 to require such door to be subject to the annual fire door inspection and testing requirement of Chapter 8 or to require such door to be self- or automatic-closing due merely to the presence of the label.

A.4.6.12.4

See A.4.6.12.3.

A.4.6.13

The provisions of 4.6.13 do not require inherently noncombustible materials to be tested in order to be classified as noncombustible materials. [5000:A.7.1.4.1]

A.4.6.13.1(1)

Examples of such materials include steel, concrete, masonry, and glass.

A.4.6.14

Material subject to increase in combustibility or flame spread index beyond the limits herein established through the effects of age, moisture, or other atmospheric condition is considered combustible. (See NFPA 259 and NFPA 220.) [5000:A.7.1.4.2]

A.4.7

The purpose of emergency egress and relocation drills is to educate the participants in the fire safety features of the building, the egress facilities available, and the procedures to be followed. Speed in emptying buildings or relocating occupants, while desirable, is not the only objective. Prior to an evaluation of the performance of an emergency egress and relocation drill, an opportunity for instruction and practice should be provided. This educational opportunity should be presented in a nonthreatening manner, with consideration given to the prior knowledge, age, and ability of audience.

The usefulness of an emergency egress and relocation drill, and the extent to which it can be performed, depends on the character of the occupancy.

In buildings where the occupant load is of a changing character, such as hotels or department stores, no regularly organized emergency egress and relocation drill is possible. In such cases, the emergency egress and relocation drills are to be limited to the regular employees, who can be thoroughly schooled in the proper procedure and can be trained to properly direct other occupants of the building in case of emergency evacuation or relocation. In occupancies such as hospitals, regular employees can be rehearsed in the proper procedure in case of fire; such training is always advisable in all occupancies, regardless of whether regular emergency egress and relocation drills can be held.

A.4.7.2

If an emergency egress and relocation drill is considered merely as a routine exercise from which some persons are allowed to be excused, there is a grave danger that, in an actual emergency, the evacuation and relocation will not be successful. However, there might be circumstances under which all occupants do not participate in an emergency egress and relocation drill; for example, infirm or bedridden patients in a health care occupancy.

A.4.7.4

Fire is always unexpected. If the drill is always held in the same way at the same time, it loses much of its value. When, for some reason during an actual fire, it is not possible to follow the usual routine of the emergency egress and relocation drill to which occupants have become accustomed, confusion and panic might ensue. Drills should be carefully planned to simulate actual fire conditions. Not only should drills be held at varying times, but different means of exit or relocation areas should be used, based on an assumption that fire or smoke might prevent the use of normal egress and relocation avenues.

A.4.7.6

The written record required by this paragraph should include such details as the date, time, participants, location, and results of that drill.

A.4.8.2.1

Items to be considered in preparing an emergency action plan should include the following:

- (1) Purpose of plan
- (2) Building description, including certificate of occupancy
- (3) Appointment, organization, and contact details of designated building staff to carry out the emergency duties
- (4) Identification of events (man-made and natural) considered life safety hazards impacting the building
- (5) Responsibilities matrix (role-driven assignments)
- (6) Policies and procedures for those left behind to operate critical equipment
- (7) Specific procedures to be used for each type of emergency
- (8) Requirements and responsibilities for assisting people with disabilities
- (9) Procedures for accounting for employees
- (10) Training of building staff, building emergency response teams, and other occupants in their responsibilities
- (11) Documents, including diagrams, showing the type, location, and operation of the building emergency features, components, and systems
- (12) Practices for controlling life safety hazards in the building
- (13) Inspection and maintenance of building facilities that provide for the safety of occupants
- (14) Conducting fire and evacuation drills
- (15) Interface between key building management and emergency responders
- (16) Names or job titles of persons who can be contacted for further information or explanation of duties
- (17) Post-event (including drill) critique/evaluation, as addressed in Chapter 9 of *NFPA 1600*
- (18) Means to update the plan, as necessary

A.4.8.2.1(3)

It is assumed that a majority of buildings will use a total evacuation strategy during a fire. It should be noted that evacuation from a building could occur for reasons other than a fire, but such other reasons are not the primary focus of the *Code*. As used herein, total evacuation is defined as the process in which all, or substantially all, occupants leave a building or facility in either an unmanaged or managed sequence or order. An alternative to total evacuation is partial evacuation, which can be defined as the process in which a select portion of a building or facility is cleared or emptied of its occupants while occupants in other portions mostly carry on normal activity. In either case, the evacuation process can be ordered or managed in accordance with an established priority in which some or all occupants of a building or facility clear their area and utilize means of egress routes. This is typically done so that the more-endangered occupants are removed before occupants in less-endangered areas. Alternative terms describing this sequencing or ordering of evacuation are *staged evacuation* and *phased evacuation*.

Table A.4.8.2.1(3) illustrates options for extent of management and extent of evacuation. Some of the options shown might not be appropriate. As noted in Table A.4.8.2.1(3), either total or partial evacuation can include staged (zoned) evacuation or phased evacuation, which is referred to as managed or controlled evacuation. It should also be noted that the evacuation process might not include relocation to the outside of the building but might instead include relocation to an area of refuge or might defend the occupants in place to minimize the need for evacuation.

Table A.4.8.2.1(3) Occupant Evacuation Strategies

	Managed Sequence	Unmanaged Sequence
Shelter in place	No movement — Shelter in place upon direction	No movement — Shelter in place per prior instruction
Relocation or partial evacuation	Managed or controlled partial evacuation • In-building relocation on same floor • In-building relocation to different floors • Occupants of some floors leave building	Unmanaged movement
Total evacuation	Managed or controlled total evacuation	Unmanaged or uncontrolled total evacuation

The different methods of evacuation are also used in several contexts throughout the *Code*. Though most of the methods of evacuation are not specifically defined or do not have established criteria, various sections of the *Code* promulgate them as alternatives to total evacuation. The following sections discuss these alternatives in more detail:

- (1) Section 4.7 — Provides requirements for fire and relocation drills
- (2) 7.2.12 — Provides requirements for area of refuge
- (3) 7.2.4 — Provides requirements for horizontal exits
- (4) 9.6.3.7 — Provides the alarm signal requirements for different methods of evacuation
- (5) 9.6.3.10 — Permits automatically transmitted or live voice evacuation or relocation instructions to occupants and requires them in accordance with *NFPA 72*
- (6) 14.3.4.2.3 (also Chapter 15) — Describes alternative protection systems in educational occupancies
- (7) 18.1.1.2/18.1.1.3/Section 18.7 (also Chapter 19) — Provide methods of evacuation for health care occupancies
- (8) Chapters 22 and 23 — Provide methods of evacuation for detention and correctional occupancies, including the five groups of resident user categories
- (9) Chapters 32 and 33 — Provide methods of evacuation for residential board and care occupancies
- (10) 32.1.5/33.1.5 — For residential board and care occupancies, state that “no means of escape or means of egress shall be considered as complying with the minimum criteria for acceptance, unless emergency evacuation drills are regularly conducted”
- (11) 40.2.5.2.2 — For industrial occupancies, states that “ancillary facilities in special-purpose industrial occupancies where delayed evacuation is anticipated shall have not less than a 2-hour fire-resistance-rated separation from the predominant industrial occupancy and shall have one means of egress that is separated from the predominant industrial occupancy by 2-hour fire-resistance-rated construction”

The method of evacuation should be accomplished in the context of the physical facilities, the type of activities undertaken, and the provisions for the capabilities of occupants (and staff, if available). Therefore, in addition to meeting the requirements of the *Code*, or when establishing an equivalency or a performance-based design, the following recommendations and general guidance information should be taken into account when designing, selecting, executing, and maintaining a method of evacuation:

- (1) When choosing a method of evacuation, the available safe egress time (ASET) must always be greater than the required safe egress time (RSET).
- (2) The occupants’ characteristics will drive the method of evacuation. For example, occupants might be incapable of evacuating themselves because of age, physical or mental disabilities, physical restraint, or a combination thereof. However, some buildings might be staffed with people who could assist in evacuating. Therefore, the method of evacuation is dependent on the ability of occupants to move as a group, with or without assistance. For more information, see the definitions under the term *Evacuation Capability* in Chapter 3.
- (3) An alternative method of evacuation might or might not have a faster evacuation time than a total evacuation. However, the priority of evacuation should be such that the occupants in the most danger are given a higher priority. This prioritization will ensure that occupants more intimate with the fire will have a faster evacuation time.
- (4) Design, construction, and compartmentation are also variables in choosing a method of evacuation. The design, construction, and compartmentation should limit the development and spread of a fire and smoke and reduce the need for occupant evacuation. The fire should be limited to the room or compartment of fire origin. Therefore, the following factors need to be considered:
 - (a) Overall fire resistance rating of the building
 - (b) Fire-rated compartmentation provided with the building
 - (c) Number and arrangement of the means of egress
- (5) Fire safety systems should be installed that complement the method of evacuation and should include consideration of the following:
 - (a) Detection of fire
 - (b) Control of fire development
 - (c) Confinement of the effects of fire
 - (d) Extinguishment of fire
 - (e) Provision of refuge or evacuation facilities, or both
- (6) One of the most important fire safety systems is the fire alarm and communications system, particularly the notification system. The fire alarm system should be in accordance with *NFPA 72* and should take into account the following:
 - (a) Initial notification of only the occupants in the affected zone(s) (e.g., zone of fire origin and adjacent zones)
 - (b) Provisions to notify occupants in other unaffected zones to allow orderly evacuation of the entire building
 - (c) Need for live voice communication
 - (d) Reliability of the fire alarm and communications system
- (7) The capabilities of the staff assisting in the evacuation process should be considered in determining the method of evacuation.
- (8) The ability of the fire department to interact with the evacuation should be analyzed. It is important to determine if the fire department can assist in the evacuation or if fire department operations hinder the evacuation efforts.
- (9) Evacuation scenarios for hazards that are normally outside of the scope of the *Code* should be considered to the extent practicable. (See 4.3.1.)

- (10) Consideration should be given to the desire of the occupants to self-evacuate, especially if the nature of the building or the fire warrants evacuation in the minds of the occupants. Self-evacuation might also be initiated by communication between the occupants themselves through face-to-face contact, mobile phones, and so forth.
- (11) An investigation period, a delay in the notification of occupants after the first activation of the fire alarm, could help to reduce the number of false alarms and unnecessary evacuations. However, a limit to such a delay should be established before a general alarm is sounded, such as positive alarm sequence, as defined in *NFPA 72*.
- (12) Consideration should be given to the need for an evacuation that might be necessary for a scenario other than a fire (e.g., bomb threat, earthquake).
- (13) Contingency plans should be established in the event the fire alarm and communications system fail, which might facilitate the need for total evacuation.
- (14) The means of egress systems should be properly maintained to ensure the dependability of the method of evacuation.
- (15) Fire prevention policies or procedures, or both, should be implemented that reduce the chance of a fire (e.g., limiting smoking or providing fire-safe trash cans).
- (16) The method of evacuation should be properly documented, and written forms of communication should be provided to all of the occupants, which might include sign postings throughout the building. Consideration should be given to the development of documentation for an operation and maintenance manual or a fire emergency action plan, or both.
- (17) Emergency egress drills should be performed on a regular basis. For more information, see Section 4.7.
- (18) The authority having jurisdiction should also be consulted when developing the method of evacuation.

Measures should be in place and be employed to sequence or control the order of a total evacuation, so that such evacuations proceed in a reasonably safe, efficient manner. Such measures include special attention to the evacuation capabilities and needs of occupants with disabilities, either permanent or temporary. For comprehensive guidance on facilitating life safety for such populations, go to www.nfpa.org. For specific guidance on emergency stair travel devices, see ANSI/RESNA ED-1, *Emergency Stair Travel Devices Used by Individuals with Disabilities*.

In larger buildings, especially high-rise buildings, it is recommended that all evacuations — whether partial or total — be managed to sequence or control the order in which certain occupants are evacuated from their origin areas and to make use of available means of egress. In high-rise buildings, the exit stairs, at any level, are designed to accommodate the egress flow of only a very small portion of the occupants — from only one or a few stories, and within a relatively short time period — on the order of a few minutes. In case of a fire, only the immediately affected floor(s) should be given priority use of the means of egress serving that floor(s). Other floors should then be given priority use of the means of egress, depending on the anticipated spread of the fire and its combustion products and for the purpose of clearing certain floors to facilitate eventual fire service operations. Typically, this means that the one or two floors above and below a fire floor will have secondary priority immediately after the fire floor. Depending on where combustion products move — for example, upward through a building with cool-weather stack effect — the next priority floors will be the uppermost occupied floors in the building.

Generally, in order to minimize evacuation time for most or all of a relatively tall building to be evacuated, occupants from upper floors should have priority use of exit stairs. For people descending many stories of stairs, this priority will maximize their opportunity to take rest stops without unduly extending their overall time to evacuate a building. Thus, the precedence behavior of evacuees should be that people already in an exit stair should normally not defer to people attempting to enter the exit stair from lower floors, except for those lower floors most directly impacted by a fire or other imminent danger. Notably, this is contrary to the often observed behavior of evacuees in high-rise building evacuations where lower floor precedence behavior occurs. (Similarly, in the most commonly observed behavior of people normally disembarking a passenger airliner, people within the aisle defer to people entering the aisle, so that the areas closest to the exit typically clear first.) Changing, and generally managing, the sequence or order in which egress occurs will require effectively informing building occupants and evaluating resulting performance in a program of education, training, and drills.

When designing the method of evacuation for a complex building, all forms of egress should be considered. For example, consideration could be given to an elevator evacuation system. An elevator evacuation system involves an elevator design that provides protection from fire effects so that elevators can be used safely for egress. See 7.2.13 and A.7.2.12.2.4 for more information.

For further guidance, see the following publications:

- (1) *SFPE Engineering Guide to Human Behavior in Fire*, which provides information on occupant characteristics, response to fire cues, decision making in fire situations, and methods for predicting evacuation times
- (2) *NFPA Fire Protection Handbook*, 20th edition, Section 1, Chapter 9, which provides good methodology for managing exposures and determining the method of evacuation
- (3) *NFPA Fire Protection Handbook*, 20th edition, Section 20, which provides further commentary on methods of evacuation for different occupancies
- (4) *SFPE Handbook of Fire Protection Engineering*, Volume II, Chapters 58–61, which provide an overview of some of the research on methods of evacuation and methods for predicting evacuation times

A.4.8.2.3

Emergency action plans are a critical component of assuring life safety in buildings. Life safety is the result of an interaction of technical and social systems within the building and in the community. Gathering information to evaluate the performance and effectiveness of emergency action plans is important for verifying system performance and as a basis for improvement. Such reports should be retained by building management and used to inform the process for revision of the building emergency action plan.

Following any drill or actual emergency or reported emergency occurring in the building, an after action report should be prepared by the building owner or designated representative to document the function of the building's life safety hardware, procedures, and occupant emergency organization.

For ordinary drills and reported emergencies, areas of success and areas for improvement should be identified.

For actual emergencies in the building, where there is major occupant movement, damage, or casualties, additional information should be collected. This includes questions concerning the event, as well as performance of life safety systems. It also identifies improvements in areas such as training, maintenance, interaction with local emergency response organizations, or occupant management. The reports from these significant events should be shared with the local emergency response organization.

A.5.1.1

Chapter 5 provides requirements for the evaluation of a performance-based life safety design. The evaluation process is summarized in Figure A.5.1.1.

Code Criteria. On the left side of Figure A.5.1.1 is input from the *Code*. The life safety goals have been stated in Section 4.1. The objectives necessary to achieve these goals are stated in Section 4.2. Section 5.2 specifies the performance criteria that are to be used to determine whether the objectives have been met.

Input. At the top of Figure A.5.1.1 is the input necessary to evaluate a life safety design.

The design specifications are to include certain retained prescriptive requirements, as specified in Section 5.3. All assumptions about the life safety design and the response of the building and its occupants to a fire are to be clearly stated as indicated in Section 5.4. Scenarios are used to assess the adequacy of the design. Eight sets of initiating events are specified for which the ensuing outcomes are to be satisfactory.

Performance Assessment. Appropriate methods for assessing performance are to be used per Section 5.6. Safety factors are to be applied to account for uncertainties in the assessment, as stated in Section 5.7. If the resulting predicted outcome of the scenarios is bounded by the performance criteria, the objectives have been met, and the life safety design is considered to be in compliance with this *Code*. Although not part of this *Code*, a design that fails to comply can be changed and reassessed, as indicated on the right side of Figure A.5.1.1.

Documentation. The approval and acceptance of a life safety design are dependent on the quality of the documentation of the process. Section 5.8 specifies a minimum set of documentation that is to accompany a submission.

Figure A.5.1.1 Performance-Based Life Safety Code Compliance Process.

The performance option of this *Code* establishes acceptable levels of risk to occupants of buildings and structures as addressed in Section 1.1. While the performance option of this *Code* does contain goals, objectives, and performance criteria necessary to provide an acceptable level of risk to occupants, it does not describe how to meet the goals, objectives, and performance criteria. Design and engineering are needed to develop solutions that meet the provisions of Chapter 5. The *SFPE Engineering Guide to Performance-Based Fire Protection* provides a framework for these assessments. Other useful references include the *Australian Fire Engineering Guidelines* and the *British Standard Firesafety Engineering in Buildings*.

A.5.1.4

A third-party reviewer is a person or group of persons chosen by the authority having jurisdiction to review proposed performance-based designs. The *SFPE Guidelines for Peer Review in the Fire Protection Design Process* provides a method for the initiation, scope, conduct, and report of a peer review of a fire protection engineering design.

A.5.1.6

For guidance on reviewing performance-based designs, see the *SFPE Code Official's Guide to Performance-Based Design Review*. Additional guidance on reviewing designs in which fire risk assessment is used can be found in NFPA 551.

A.5.1.7

Continued compliance with the goals and objectives of the *Code* involves many factors. The building construction — including openings, interior finish, and fire- and smoke-resistive construction — and the building and fire protection systems need to retain at least the same level of performance as is provided for the original design parameters. The use and occupancy should not change to the degree that assumptions made about the occupant characteristics, combustibility of furnishings, and existence of trained personnel are no longer valid. In addition, actions provided by other personnel, such as emergency responders, should not be diminished below the documented assumed levels. Also, actions needed to maintain reliability of systems at the anticipated level need to meet the initial design criteria.

A.5.2.2

One of the methods that follows can be used to avoid exposing occupants to untenable conditions.

Method 1. The design team can set detailed performance criteria that ensure that occupants are not incapacitated by fire effects. The *SFPE Engineering Guide to Performance-Based Fire Protection* describes a process of establishing tenability limits.

The guide references D. A. Purser, "Assessment of Hazards to Occupants from Smoke, Toxic Gasses, and Heat," Chapter 63, *SFPE Handbook of Fire Protection Engineering*, which describes a fractional effective dose (FED) calculation approach, which is also contained in NFPA 269. FED addresses the effects of carbon monoxide, hydrogen cyanide, carbon dioxide, hydrogen chloride, hydrogen bromide, and anoxia. It is possible to use the test data, combined with laboratory experience, to estimate the FED value that leads to the survival of virtually all people. This value is about 0.8.

There is a relationship between exposures leading to death and those leading to incapacitation. Kaplan [Kaplan and Hartzell, *Journal of Fire Sciences*, 2:286–305 (1984)] found that rodent susceptibility is similar to that of humans and that for the narcotic gases, CO and HCN, incapacitation is estimated to occur at one-third to one-half of the lethal exposure. A set of very large statistical studies on human lethality associated with carbon monoxide involving almost 5000 fatalities (Hirschler et al., "Carbon monoxide and human lethality: Fire and non-fire studies," Elsevier, 1993) showed that the vast majority of fire deaths are attributable to carbon monoxide poisoning, which results in lethality at levels as low as 25 percent carboxyhemoglobin (much lower than previously believed) without requiring the effect of additional toxicants. This work was also confirmed by Gann [Gann et al., *Fire and Materials*, 18:193 (1994)], who also found that carbon monoxide dominates the lethality of fire smoke, since most fire deaths occur remote from the fire room in fires that have proceeded past flashover. Thus, if an FED value of 0.8 were used for a nonlethal exposure, an FED of 0.3 would be reasonable for a nonincapacitating exposure.

If the authority having jurisdiction or the design professional is concerned with potential toxic fire effects, other than those addressed by the FED procedure as documented, the calculation procedure can be expanded by adding additional terms to the FED equation, with each term expressed as a ratio. The numerator of the ratio is the cumulative exposure to that fire effect, measured as an integral of the product of instantaneous exposure (concentration for toxic products) and time. The denominator of the ratio is the quantity of cumulative exposure for which FED equals the chosen threshold value (i.e., 0.8 or 0.3) based on that fire effect alone. A complete analysis of tenability requires consideration of tenability criteria for thermal effects (convected heat and radiated heat) and smoke obscuration, as well as those for smoke toxicity, and an example of the application of such criteria is shown in ASTM E2280, *Standard Guide for Fire Hazard Assessment of the Effect of Upholstered Seating Furniture Within Patient Rooms of Health Care Facilities*.

For buildings where an unusually large fraction of the occupants are especially vulnerable, the calculation procedure for the smoke toxicity incapacitating criterion should be modified to use FED values lower than 0.8 or 0.3.

Method 2. For each design fire scenario and the design specifications, conditions, and assumptions, the design team can demonstrate that each room or area will be fully evacuated before the smoke and toxic gas layer in that room descends to a level lower than 6 ft (1830 mm) above the floor. The timing of such an evacuation means that no occupant is exposed to fire effects. Such an evacuation requires calculation of the locations, movement, and behavior of occupants, because fire effects and occupants are separated by moving the occupants. A level of 60 in. (1525 mm) is often used in calculations, but, at that level, a large fraction of the population would not be able to stand, walk, or run normally and still avoid inhalation of toxic gases. They would have to bend over or otherwise move their heads closer to the floor level.

Method 3. For each design fire scenario and the design specifications and assumptions, the design team can demonstrate that the smoke and toxic gas layer will not descend to a level lower than 6 ft (1830 mm) above the floor in any occupied room. The advantage of this procedure is that it conservatively ensures that no occupant is exposed to fire effects, regardless of where occupants are located or where they move. This eliminates the need for calculations regarding occupants, including those for their behavior, movement locations, pre-fire characteristics, and reactions to fire effects. This procedure is even more conservative and simpler than the procedure in Method 2, because it does not allow fire effects in occupied rooms to develop to a point where people could be affected at any time during the fire.

Method 4. For each design fire scenario and the design specifications and assumptions, the design team can demonstrate that no fire effects will reach any occupied room. The advantage of this procedure is that it eliminates the need for calculations regarding occupants, including those for their behavior, movement, locations, pre-fire characteristics, and reactions to fire effects. A further advantage is that it also eliminates the need for some of the modeling of fire effects, because it is not necessary to model the filling of rooms, only the spread of fire effects to those rooms. This procedure is even more conservative and simpler than the procedures in Methods 2 and 3, because it does not allow any fire effects in occupied rooms.

A.5.3.1

This requirement applies both to systems and features required by the *Code* that reference applicable standards and to any additional systems or features included in the design at the discretion of the design team. The referenced standards are hereby expected to state maintenance, testing, and other requirements needed to provide positive assurance of an acceptable level of reliability. The referenced standards themselves might be prescriptive- or performance-based.

A.5.4.1

The design specifications and other conditions form the input to evaluation of proposed designs (*see Section 5.6*). Where a specification or condition is not known, a reasonable estimation is permitted. However, the design team must take steps to ensure that the estimation is valid during the life of the building. Any estimations need to be documented. (*See Section 5.8*)

A.5.4.4

Systems addressed by this requirement include automatic fire suppression systems and fire alarm systems. Performance issues that need to be documented might include response time indexes, discharge densities, and distribution patterns. Calculations should not include an unlimited supply of extinguishing agent if only a limited supply will be provided in the actual structure or building.

Emergency procedures addressed by this requirement might be of two types. The design team could include documentation from buildings that are operationally very similar, along with documented operational performance measures tied to the recruitment and training of emergency team personnel. Where such data are unavailable, or where the proposed design differs significantly from other buildings, the design could be based on detailed analyses of the decisions and tasks that need to be performed by emergency personnel, using plausible conservative assumptions about the occupant characteristics and training of those personnel.

A.5.4.5.1

Examples of design features that might be incorporated to modify expected occupant characteristics include training, use of staff to assist with notification and movement, or type of notification appliance used.

A.5.4.5.2

The four basic characteristics — sensibility, reactivity, mobility, and susceptibility — comprise a minimum, exhaustive set of mutually exclusive performance characteristics of people in buildings that can affect a fire safety system's ability to meet life safety objectives. The characteristics are briefly described as follows:

- (1) Sensibility to physical cues, which is the ability to sense the sounding of an alarm and can also include discernment and discrimination of visual and olfactory cues in addition to auditory emanations from the fire itself
- (2) Reactivity, which is the ability to interpret cues correctly and take appropriate action and can be a function of cognitive capacity, speed of instinctive reaction, or group dynamics; might need to consider reliability or likelihood of a wrong decision, as in situations where familiarity with the premises influences wayfinding
- (3) Mobility (speed of movement), which is determined by individual capabilities, as well as crowding phenomena, such as arching at doorways
- (4) Susceptibility to products of combustion, which includes metabolism, lung capacity, pulmonary disease, allergies, or other physical limitations that affect survivability in a fire environment

In application, as with the use of computer evacuation models, assumptions can address a larger number of factors that are components of the basic performance characteristics, including the following:

- (1) Alertness — condition of being awake/asleep, can depend on time of day
- (2) Responsiveness — ability to sense cues and react
- (3) Commitment — degree to which occupant is committed to an activity underway before the alarm
- (4) Focal point — point at which an occupant's attention is focused (e.g., to front of classroom, stage, or server in business environment)
- (5) Physical and mental capabilities — influence on ability to sense, respond, and react to cues; might be related to age or disability
- (6) Role — influence on whether occupant will lead or follow others
- (7) Familiarity — influence of time spent in building or participation in emergency training
- (8) Social affiliation — extent to which an occupant will act/react as an individual or as a member of a group
- (9) Condition over the course of the fire — effects, both physiological and psychological, of the fire and its combustion products on each occupant

For a more detailed explanation of occupant characteristics, see the *SFPE Engineering Guide to Human Behavior in Fire*. Occupant characteristics that are discussed in the guide include the following:

- (1) Population numbers and density
- (2) Condition of being alone or with others
- (3) Familiarity with the building
- (4) Distribution and activities
- (5) Alertness
- (6) Physical and cognitive ability
- (7) Social affiliation
- (8) Role and responsibility
- (9) Location
- (10) Commitment
- (11) Focal point
- (12) Occupant condition
- (13) Gender
- (14) Culture
- (15) Age

A.5.4.5.4

The number of people expected to be contained in a room or area should be based on the occupant load factor specified in Table 7.3.1.2 or other approved sources.

A.5.4.5.5

For example, in hospitals, staff characteristics such as number, location, quality, and frequency of training should be considered.

A.5.4.7

Design proposals need to state explicitly any design specifications or estimations regarding building fire safety plans, inspection programs, or other ongoing programs whose performance is necessary for the building, when occupied and operational, to meet the stated goals and objectives. Programs of interest include any maintenance, training, labeling, or certification programs required to ensure operational status or reliability in building systems or features.

A.5.4.9

The design elements required to be excluded by 5.4.9 include those regarding the interrelations between the performance of building elements and systems, occupant behavior, or emergency response actions that conflict with each other. For each fire scenario, care needs to be taken to ensure that conflicts in actions do not occur. Typical conflicts could include the following:

- (1) Assuming a fire door will remain closed during the fire to contain smoke while this same door is used by occupants during egress from the area
- (2) Assuming fire apparatus will arrive immediately from a distant location to provide water to fire department connections and similar situations

For example, an assumption that compartmentation blocking the passage of fire and smoke will be maintained at the door to a stairwell cannot be paired with an assumption that evacuation through that door will extend over many minutes.

A.5.4.10

The provisions required by 5.4.10 to be documented include those that are in excess of basic requirements covered by referenced codes and standards, typical design requirements, and operating procedures. Such provisions include the following:

- (1) More frequent periodic testing and maintenance to increase the reliability of fire protection systems
- (2) Redundant systems to increase reliability
- (3) On-site guard service to enhance detection of fires and aid in fire response procedures
- (4) Staff training
- (5) Availability and performance of emergency response personnel
- (6) Other factors

A.5.5

Design fire scenarios define the challenge a building is expected to withstand. Design fire scenarios capture and limit value judgments on the type and severity of the fire challenge to which a proposed fire safety system needs to respond. The system includes any and all aspects of the proposed design that are intended to mitigate the effects of a fire, such as egress system, automatic detection and suppression, barriers, staff training, and placement of manual extinguishers.

Design fire scenarios come from two sources: those that are specified in 5.5.3.1 through 5.5.3.8, and those that are developed by the design team based on the unique characteristics of the building as required by 5.5.2. In most, if not all, cases, more than one design fire scenario will be developed to meet the requirements of 5.5.2.

Once the set of design fire scenarios is established, both those specified by 5.5.3.1 through 5.5.3.8 and those that are developed as required by 5.5.2, they need to be quantified into a format that can be used for the evaluation of proposed designs. The *SFPE Engineering Guide to Performance-Based Fire Protection* outlines a process and identifies tools and references that can be used at each step of this process.

A.5.5.2

The protection systems and features used to meet the challenge of the design fire scenario should be typical of, and consistent with, those used for other similar areas of the building. They should not be designed to be more effective in the building area addressed than in similar areas not included and that are, therefore, not explicitly evaluated.

A.5.5.3

It is desirable to consider a wide variety of different fire scenarios to evaluate the complete life safety capabilities of the building or structure. Fire scenarios should not be limited to a single or a couple of worst-case fire scenarios.

The descriptive terms used to indicate the rate of fire growth for the scenarios are intended to be generic. Use of *t*-squared fires is not required for any scenario.

A.5.5.3.1

An example of Design Fire Scenario 1 for a health care occupancy would involve a patient room with two occupied beds with a fire initially involving one bed and the room door open. This is a cursory example in that much of the explicitly required information indicated in 5.5.3.1 can be determined from the information provided in the example. Note that it is usually necessary to consider more than one scenario to capture the features and conditions typical of an occupancy.

A.5.5.3.2

Design Fire Scenario 2 examples include a fire involving ignition of gasoline as an accelerant in a means of egress, clothing racks in corridors, renovation materials, or other fuel configurations that can cause an ultrafast fire. The means of egress chosen is the doorway with the largest egress capacity among doorways normally used in the ordinary operation of the building. The baseline occupant characteristics for the property are assumed. At ignition, doors are assumed to be open throughout the building.

A.5.5.3.3

An example of Design Fire Scenario 3 is a fire in a storage room adjacent to the largest occupiable room in the building. The contents of the room of fire origin are specified to provide the largest fuel load and the most rapid growth in fire severity consistent with the normal use of the room. The adjacent occupiable room is assumed to be filled to capacity with occupants. Occupants are assumed to be somewhat impaired in whatever form is most consistent with the intended use of the building. At ignition, doors from both rooms are assumed to be open. Depending on the design, doorways connect the two rooms or they connect via a common hallway or corridor.

For purposes of this scenario, an occupiable room is a room that might contain people; that is, a location within a building where people are typically found.

A.5.5.3.4

An example of Design Fire Scenario 4 is a fire originating in a concealed wall or ceiling space adjacent to a large, occupied function room. Ignition involves concealed combustibles, including wire or cable insulation and thermal or acoustical insulation. The adjacent function room is assumed to be occupied to capacity. The baseline occupant characteristics for the property are assumed. At ignition, doors are assumed to be open throughout the building.

A.5.5.3.5

An example of Design Fire Scenario 5 is a cigarette fire in a trash can. The trash can is close enough to room contents to ignite more substantial fuel sources but is not close enough to any occupant to create an intimate-with-ignition situation. If the intended use of the property involves the potential for some occupants to be incapable of movement at any time, the room of origin is chosen as the type of room likely to have such occupants, filled to capacity with occupants in that condition. If the intended use of the property does not involve the potential for some occupants to be incapable of movement, the room of origin is chosen to be an assembly or function area characteristic of the use of the property, and the trash can is placed so that it is shielded by furniture from suppression systems. At ignition, doors are assumed to be open throughout the building.

A.5.5.3.6

An example of Design Fire Scenario 6 is a fire originating in the largest fuel load of combustibles possible in normal operation in a function or assembly room, or in a process/manufacturing area, characteristic of the normal operation of the property. The configuration, type, and geometry of the combustibles are chosen so as to produce the most rapid and severe fire growth or smoke generation consistent with the normal operation of the property. The baseline occupant characteristics for the property are assumed. At ignition, doors are assumed to be closed throughout the building.

This scenario includes everything from a big couch fire in a small dwelling to a rack fire in combustible liquids stock in a big box retail store.

A.5.5.3.7

An example of Design Fire Scenario 7 is an exposure fire. The initiating fire is the closest and most severe fire possible consistent with the placement and type of adjacent properties and the placement of plants and combustible adornments on the property. The baseline occupant characteristics for the property are assumed.

This category includes wildlands/urban interface fires and exterior wood shingle problems, where applicable.

A.5.5.3.8

Design Fire Scenario 8 addresses a set of conditions with a typical fire originating in the building with any one passive or active fire protection system or feature being ineffective. Examples include unprotected openings between floors or between fire walls or fire barrier walls, failure of rated fire doors to close automatically, shutoff of sprinkler system water supply, nonoperative fire alarm system, inoperable smoke management system, or automatic smoke dampers blocked open. This scenario should represent a reasonable challenge to the other building features provided by the design and presumed to be available.

The concept of a fire originating in ordinary combustibles is intentionally selected for this scenario. This fire, although presenting a realistic challenge to the building and the associated building systems, does not represent the worst-case scenario or the most challenging fire for the building. Examples include the following:

- (1) Fire originating in ordinary combustibles in the corridor of a patient wing of a hospital under the following conditions:
 - (a) Staff is assumed not to close any patient room doors upon detection of fire.
 - (b) The baseline occupant characteristics for the property are assumed, and the patient rooms off the corridor are assumed to be filled to capacity.
 - (c) At ignition, doors to patient rooms are not equipped with self-closing devices and are assumed to be open throughout the smoke compartment.
- (2) Fire originating in ordinary combustibles in a large assembly room or area in the interior of the building under the following conditions:
 - (a) The automatic suppression systems are assumed to be out of operation.
 - (b) The baseline occupant characteristics for the property are assumed, and the room of origin is assumed to be filled to capacity.
 - (c) At ignition, doors are assumed to be closed throughout the building.
- (3) Fire originating in ordinary combustibles in an unoccupied small function room adjacent to a large assembly room or area in the interior of the building under the following conditions:
 - (a) The automatic detection systems are assumed to be out of operation.
 - (b) The baseline occupant characteristics for the property are assumed, the room of origin is assumed to be unoccupied, and the assembly room is assumed to be filled to capacity.
 - (c) At ignition, doors are assumed to be closed throughout the building.

A.5.5.3.8(3)

The exemption is applied to each active or passive fire protection system individually and requires two different types of information to be developed by analysis and approved by the authority having jurisdiction. System reliability is to be analyzed and accepted. Design performance in the absence of the system is also to be analyzed and accepted, but acceptable performance does not require fully meeting the stated goals and objectives. It might not be possible to meet fully the goals and objectives if a key system is unavailable, and yet no system is totally reliable. The authority having jurisdiction will determine which level of performance, possibly short of the stated goals and objectives, is acceptable, given the very low probability (i.e., the system's unreliability probability) that the system will not be available.

A.5.6

The *SFPE Engineering Guide to Performance-Based Fire Protection* outlines a process for evaluating whether trial designs meet the performance criteria during the design fire scenarios. Additional information on reviewing the evaluation of a performance-based design can be found in the *SFPE Code Official's Guide to Performance-Based Design Review*.

The procedures described in Sections 5.2 and 5.4 identify required design fire scenarios among the design fire scenarios within which a proposed fire safety design is required to perform and the associated untenable conditions that are to be avoided in order to maintain life safety. Section 5.6 discusses methods that form the link from the scenarios and criteria to the goals and objectives.

Assessment methods are used to demonstrate that the proposed design will achieve the stated goals/objectives by providing information indicating that the performance criteria of Section 5.2 can be adequately met. Assessment methods are permitted to be either tests or modeling.

Tests. Test results can be directly used to assess a fire safety design when they accurately represent the scenarios developed by using Section 5.4 and provide output data matching the performance criteria in Section 5.2. Because the performance criteria for this *Code* are stated in terms of human exposure to lethal fire effects, no test will suffice. However, tests will be needed to produce data for use in models and other calculation methods.

Standardized Tests. Standardized tests are conducted on various systems and components to determine whether they meet some predetermined, typically prescriptive criteria. Results are given on a pass/fail basis — the test specimen either does or does not meet the pre-established criteria. The actual performance of the test specimen is not usually recorded.

Scale. Tests can be either small, intermediate, or full scale. Small-scale tests are used to test activation of detection and suppression devices and the flammability and toxicity of materials. Usually, the item to be tested is placed within the testing device or apparatus. Intermediate-scale tests can be used to determine the adequacy of system components — for example, doors and windows — as opposed to entire systems. The difference between small- and intermediate-scale tests is usually one of definition provided by those conducting the test. Full-scale tests are typically used to test building and structural components or entire systems. The difference between intermediate- and large-scale tests is also subject to the definition of those performing the test. Full-scale tests are intended to most closely depict performance of the test subject as installed in the field; that is, most closely represent real world performance.

Full-scale building evacuations can provide information on how the evacuation of a structure is likely to occur for an existing building with a given population without subjecting occupants to the real physical or psychological effects of a fire.

Data Uses. The data obtained from standardized tests have three uses for verification purposes. First, the test results can be used instead of a model. This use is typically the role of full-scale test results. Second, the test results can be used as a basis for validating the model. The model predictions match well with the test results. Therefore, the model can be used in situations similar to the test scenario. Third, the test results can be used as input to models. This is typically the use of small-scale tests, specifically flammability tests.

Start-Up Test. Start-up test results can be used to demonstrate that the fire safety system performs as designed. The system design might be based on modeling. If the start-up test indicates a deficiency, the system needs to be adjusted and retested until it can be demonstrated that the design can meet the performance criteria. Typically, start-up tests apply only to the installation to which they are designed.

Experimental Data. Experimental data from nonstandardized tests can be used when the specified scenario and the experimental setup are similar. Typically, experimental data are applicable to a greater variety of scenarios than are standardized test results.

Human and Organizational Performance Tests. Certain tests determine whether inputs used to determine human performance criteria remain valid during the occupancy of a building. Tests of human and organizational performance might include any of the following:

- (1) Measuring evacuation times during fire drills
- (2) Querying emergency response team members to determine whether they know required procedures
- (3) Conducting field tests to ensure that emergency response team members can execute tasks within predetermined times and accuracy limits

The *SFPE Handbook of Fire Protection Engineering*, Chapter 64 (Engineering Data) provides a listing of data sets that are available to quantify human performance.

Design proposals should include descriptions of any tests needed to determine whether stated goals, objectives, and performance criteria are being met.

Modeling. Models can be used to predict the performance criteria for a given scenario. Because of the limitations on using only tests for this purpose, models are expected to be used in most, if not all, performance-based design assessments.

The effect of fire and its toxic products on the occupants can be modeled, as can the movement and behavior of occupants during the fire. The term *evacuation model* will be used to describe models that predict the location and movements of occupants, and the term *tenability model* will be used to describe models that predict the effects on occupants of specified levels of exposure to fire effects.

Types of Fire Models. Fire models are used to predict fire-related performance criteria. Fire models can be either probabilistic or deterministic. Several types of deterministic models are available: computational fluid dynamics (CFD or field) models, zone models, purpose-built models, and hand calculations. Probabilistic fire models are also available but are less likely to be used for this purpose.

Probabilistic fire models use the probabilities as well as the severity of various events as the basis of evaluation. Some probabilistic models incorporate deterministic models but are not required to do so. Probabilistic models attempt to predict the likelihood or probability that events or severity associated with an unwanted fire will occur, or they predict the "expected loss," which can be thought of as the probability-weighted average severity across all possible scenarios. Probabilistic models can be manifested as fault or event trees or other system models that use frequency or probability data as input. These models tend to be manifested as computer software, but are not required to do so. Furthermore, the discussion that follows under "Sources of Models" can also be applied to probabilistic models, although it concentrates on deterministic models.

CFD models can provide more accurate predictions than other deterministic models, because they divide a given space into many smaller-volume spaces. However, since they are still models, they are not absolute in their depiction of reality. In addition, they are much more expensive to use, because they are computationally intensive. Because of their expense, complexity, and intensive computational needs, CFD models require much greater scrutiny than do zone models.

It is much easier to assess the sensitivity of different parameters with zone models because they generally run much faster and the output is much easier to interpret. Prediction of fire growth and spread has a large number of variables associated with it.

Purpose-built models (also known as stand-alone models) are similar to zone models in their ease of use. However, purpose-built models do not provide a comprehensive model. Instead, they predict the value of one variable of interest. For example, such a model can predict the conditions of a ceiling jet at a specified location under a ceiling, but a zone model would "transport" those conditions throughout the enclosure.

Purpose-built models might or might not be manifested as computer software. Models that are not in the form of software are referred to as hand calculations. Purpose-built models are, therefore, simple enough that the data management capabilities of a computer are not necessary. Many of the calculations are found in the *SFPE Handbook of Fire Protection Engineering*.

Types of Evacuation Models. Four categories of evacuation models can be considered: single-parameter estimation methods, movement models, behavioral simulation models, and tenability models.

Single-parameter estimation methods are generally used for simple estimates of movement time. They are usually based on equations derived from observations of movement in nonemergency situations. They can be hand calculations or simple computer models. Examples include calculation methods for flow times based on widths of exit paths and travel times based on travel distances. Sources for these methods include the *SFPE Handbook of Fire Protection Engineering* and the *NFPA Fire Protection Handbook*.

Movement models generally handle large numbers of people in a network flow similar to water in pipes or ball bearings in chutes. They tend to optimize occupant behavior, resulting in predicted evacuation times that can be unrealistic and far from conservative. However, they can be useful in an overall assessment of a design, especially in early evaluation stages where an unacceptable result with this sort of model indicates that the design has failed to achieve the life safety objectives.

Behavioral simulation models take into consideration more of the variables related to occupant movement and behavior. Occupants are treated as individuals and can have unique characteristics assigned to them, allowing a more realistic simulation of the design under consideration. However, given the limited availability of data for the development of these models, for their verification by their authors, or for input when using them, their predictive reliability is questionable.

Tenability Models. In general, tenability models will be needed only to automate calculations for the time-of-exposure effect equations referenced in A.5.2.2.

Other Models. Models can be used to describe combustion (as noted, most fire models only characterize fire effects), automatic system performance, and other elements of the calculation. There are few models in common use for these purposes, so they are not further described here.

Sources of Models. A compendia of computer fire models are found in the *SFPE Handbook of Fire Protection Engineering* and in Olenick, S. and Carpenter, D., "An Updated International Survey of Computer Models for Fire and Smoke," *Journal of Fire Protection Engineering*, 13, 2, 2003, pp. 87–110. Within these references are models that were developed by the Building Fire Research Laboratory of the National Institute of Standards and Technology, which can be downloaded from the Internet at <http://www.bfrl.nist.gov/864/fmabs.html>. Evacuation models are discussed in the *SFPE Handbook of Fire Protection Engineering*, *SFPE Guide to Human Behavior in Fire*, and *NFPA Fire Protection Handbook*.

Verification and validation. Models should undergo verification and validation to ensure that they are appropriate for their intended use. "Verification" is a check of the math used in the models. "Validation" is a check of the physics used in the model. The *SFPE Guidelines for Substantiating a Fire Model for a Given Application* provides a process for verifying and validating models.

The design professional should present the proposal, and the authority having jurisdiction, when deciding whether to approve a proposal, should consider the strength of the evidence presented for the validity, accuracy, relevance, and precision of the proposed methods. An element in establishing the strength of scientific evidence is the extent of external review and acceptance of the evidence by peers of the authors of that evidence.

Models have limitations. Most are not user friendly, and experienced users are able to construct more reasonable models and better interpret output than are novices. For these reasons, the third-party review and equivalency provisions of 5.1.4 and 5.3.3 are provided. The intent is not to discourage the use of models, only to indicate that they should be used with caution by those who are well versed in their nuances.

Input Data. The first step in using a model is to develop the input data. The heat release rate curve specified by the user is the driving force of a fire effects model. If this curve is incorrectly defined, the subsequent results are not usable. In addition to the smoldering and growth phases that will be specified as part of the scenario definition, two additional phases are needed to complete the input heat release rate curve — steady burning and burnout.

Steady burning is characterized by its duration, which is a function of the total amount of fuel available to be burned. In determining the duration of this phase, the designer needs to consider how much fuel has been assumed to be consumed in the smoldering and growth phases and how much is assumed to be consumed in the burnout phase that follows. Depending on the assumptions made regarding the amount of fuel consumed during burnout, the time at which this phase starts is likely to be easy to determine.

The preceding discussion assumes that the burning objects are solid (e.g., tables and chairs). If liquid or gaseous fuels are involved, the shape of the curve will be different. For example, smoldering is not relevant for burning liquids or gases, and the growth period is very short, typically measured in seconds. Peak heat release rate can depend primarily on the rate of release, on the leak rate (gases and liquid sprays), or on the extent of spill (pooled liquids). The steady burning phase is once again dependent on the amount of fuel available to burn. Like the growth phase, the burnout phase is typically short (e.g., closing a valve), although it is conceivable that longer times might be appropriate, depending on the extinguishment scenario.

Material properties are usually needed for all fuel items, both initial and secondary, and the enclosure surfaces of involved rooms or spaces.

For all fires of consequence, it is reasonable to assume that the fire receives adequate ventilation. If there is insufficient oxygen, the fire will not be sustained. An overabundance of oxygen is only a concern in special cases (e.g., hermetically sealed spaces) where a fire might not occur due to dilution of the fuel (i.e., a flammable mixture is not produced). Therefore, given that the scenarios of interest will occur in nonhermetically sealed enclosures, it is reasonable to assume that adequate ventilation is available and that, if a fire starts, it will continue to burn until it either runs out of fuel or is extinguished by other means. The only variable that might need to be assumed is the total vent width.

Maximum fire extent is affected by two geometric aspects: burning object proximity to walls and overall enclosure dimensions.

The room dimensions affect the time required for a room to flashover. For a given amount and type of fuel, under the same ventilation conditions, a small room will flashover before a large room. In a large room with a small amount of fuel, a fire will behave as if it is burning outside — that is, adequate oxygen for burning and no concentration of heat exist. If the fuel package is unchanged but the dimensions of the room are decreased, the room will begin to have an effect on the fire, assuming adequate ventilation. The presence of the relatively smaller enclosure results in the buildup of a hot layer of smoke and other products of combustion under the ceiling. This buildup, in turn, feeds more heat back to the seat of the fire, which results in an increase in the pyrolysis rate of the fuel and, thus, increases the amount of heat energy released by the fire. The room enclosure surfaces themselves also contribute to this radiation feedback effect.

Probabilistic data are expressed as either a frequency (units of inverse time) or a probability (unitless, but applicable to a stated period of time). An example of the former is the expected number of failures per year, and the range of the latter is between zero and one, inclusive. Probabilities can be either objective or subjective. Subjective probabilities express a degree of belief that an event will occur. Objective probabilities are based on historical data and can be expressed as a reliability of an item, such as a component or a system.

A.5.6.3.3

Procedures used to develop required input data need to preserve the intended conservatism of all scenarios and assumptions. Conservatism is only one means to address the uncertainty inherent in calculations and does not eliminate the need to consider safety factors, sensitivity analysis, and other methods of dealing with uncertainty. The *SFPE Guidelines for Substantiating a Fire Model for a Given Application* outlines a process for identifying and treating uncertainty and other inaccuracies introduced through the use of fire models.

A.5.6.4

An assessment method translates input data, which might include test specifications, parameters, or variables for modeling, or other data, into output data, which are measured against the performance criteria. Computer fire models should be evaluated to ensure that they are appropriate for their intended use in accordance with the *SFPE Guidelines for Substantiating a Fire Model for a Given Application*.

A.5.7

The assessment of precision required in 5.8.2 will require a sensitivity and uncertainty analysis, which can be translated into safety factors.

Sensitivity Analysis. The first run a model user makes should be labeled as the base case, using the nominal values of the various input parameters. However, the model user should not rely on a single run as the basis for any performance-based fire safety system design. Ideally, each variable or parameter that the model user made to develop the nominal input data should have multiple runs associated with it, as should combinations of key variables and parameters. Thus, a sensitivity analysis should be conducted that provides the model user with data that indicate how the effects of a real fire might vary and how the response of the proposed fire safety design might also vary.

The interpretation of a model's predictions can be a difficult exercise if the model user does not have knowledge of fire dynamics or human behavior.

Reasonableness Check. The model user should first try to determine whether the predictions actually make sense; that is, whether they do not upset intuition or preconceived expectations. Most likely, if the results do not pass this test, an input error has been committed.

Sometimes the predictions appear to be reasonable but are, in fact, incorrect. For example, a model can predict higher temperatures farther from the fire than closer to it. The values themselves might be reasonable; for example, they are not hotter than the fire, but they do not "flow" down the energy as expected.

A margin of safety can be developed using the results of the sensitivity analysis in conjunction with the performance criteria to provide the possible range of time during which a condition is estimated to occur.

Safety factors and margin of safety are two concepts used to quantify the amount of uncertainty in engineering analyses. Safety factors are used to provide a margin of safety and represent, or address, the gap in knowledge between the theoretically perfect model — reality — and the engineering models that can only partially represent reality.

Safety factors can be applied either to the predicted level of a physical condition or to the time at which the condition is predicted to occur. Thus, a physical or a temporal safety factor, or both, can be applied to any predicted condition. A predicted condition (i.e., a parameter's value) and the time at which it occurs are best represented as distributions. Ideally, a computer fire model predicts the expected or nominal value of the distribution. Safety factors are intended to represent the spread of the distributions.

Given the uncertainty associated with data acquisition and reduction, and the limitations of computer modeling, any condition predicted by a computer model can be thought of as an expected or nominal value within a broader range. For example, an upper layer temperature of 1110°F (600°C) is predicted at a given time. If the modeled scenario is then tested (i.e., full-scale experiment based on the computer model's input data), the actual temperature at that given time could be 1185°F or 1085°F (640°C or 585°C). Therefore, the temperature should be reported as 1110°F + 75°F/–25°F (600°C + 40°C/–15°C) or as a range of 1085°F to 1185°F (585°C to 640°C).

Ideally, predictions are reported as a nominal value, a percentage, or an absolute value. As an example, an upper layer temperature prediction could be reported as "1110°F (600°C), 55°F (30°C)," or "1110°F (600°C), 5 percent." In this case, the physical safety factor is 0.05 (i.e., the amount by which the nominal value should be degraded and enhanced). Given the state-of-the-art of computer fire modeling, this is a very low safety factor. Physical safety factors tend to be on the order of tens of percent. A safety factor of 50 percent is not unheard of.

Part of the problem in establishing safety factors is that it is difficult to state the percentage or range that is appropriate. These values can be obtained when the computer model predictions are compared to test data. However, using computer fire models in a design mode does not facilitate this comparison, due to the following:

- (1) The room being analyzed has not been built yet.
- (2) Test scenarios do not necessarily depict the intended design.

A sensitivity analysis should be performed, based on the assumptions that affect the condition of interest. A base case that uses all nominal values for input parameters should be developed. The input parameters should be varied over reasonable ranges, and the variation in predicted output should be noted. This output variation can then become the basis for physical safety factors.

The temporal safety factor addresses the issue of when a condition is predicted and is a function of the rate at which processes are expected to occur. If a condition is predicted to occur 2 minutes after the start of the fire, this prediction can be used as a nominal value. A process similar to that already described for physical safety factors can also be employed to develop temporal safety factors. In such a case, however, the rates (e.g., rates of heat release and toxic product generation) will be varied instead of absolute values (e.g., material properties).

The margin of safety can be thought of as a reflection of societal values and can be imposed by the authority having jurisdiction for that purpose. Because the time for which a condition is predicted will most likely be the focus of the authority having jurisdiction (e.g., the model predicts that occupants will have 5 minutes to safely evacuate), the margin of safety will be characterized by temporal aspects and tacitly applied to the physical margin of safety.

Escaping the harmful effects of fire (or mitigating them) is, effectively, a race against time. When assessing fire safety system designs based on computer model predictions, the choice of an acceptable time is important. When an authority having jurisdiction is faced with the predicted time of untenability, a decision needs to be made regarding whether sufficient time is available to ensure the safety of building occupants. The authority having jurisdiction is assessing the margin of safety. Is there sufficient time to get everyone out safely? If the authority having jurisdiction feels that the predicted egress time is too close to the time of untenability, the authority having jurisdiction can impose an additional period of time that the designer will have to incorporate into the system design. In other words, the authority having jurisdiction can impose a greater margin of safety than that originally proposed by the designer.

A.5.8.1

The *SFPE Engineering Guide to Performance-Based Fire Protection* describes the documentation that should be provided for a performance-based design.

Proper documentation of a performance-based design is critical to design acceptance and construction. Proper documentation will also ensure that all parties involved understand the factors necessary for the implementation, maintenance, and continuity of the fire protection design. If attention to details is maintained in the documentation, there should be little dispute during approval, construction, start-up, and use.

Poor documentation could result in rejection of an otherwise good design, poor implementation of the design, inadequate system maintenance and reliability, and an incomplete record for future changes or for testing the design forensically.

A.5.8.2

The sources, methodologies, and data used in performance-based designs should be based on technical references that are widely accepted and used by the appropriate professions and professional groups. This acceptance is often based on documents that are developed, reviewed, and validated under one of the following processes:

- (1) Standards developed under an open consensus process conducted by recognized professional societies, codes or standards organizations, or governmental bodies
- (2) Technical references that are subject to a peer review process and published in widely recognized peer-reviewed journals, conference reports, or other publications
- (3) Resource publications, such as the *SFPE Handbook of Fire Protection Engineering*, which are widely recognized technical sources of information

The following factors are helpful in determining the acceptability of the individual method or source:

- (1) Extent of general acceptance in the relevant professional community, including peer-reviewed publication, widespread citation in the technical literature, and adoption by or within a consensus document
- (2) Extent of documentation of the method, including the analytical method itself, assumptions, scope, limitations, data sources, and data reduction methods
- (3) Extent of validation and analysis of uncertainties, including comparison of the overall method with experimental data to estimate error rates, as well as analysis of the uncertainties of input data, uncertainties and limitations in the analytical method, and uncertainties in the associated performance criteria
- (4) Extent to which the method is based on sound scientific principles
- (5) Extent to which the proposed application is within the stated scope and limitations of the supporting information, including the range of applicability for which there is documented validation, and considering factors such as spatial dimensions, occupant characteristics, and ambient conditions, which can limit valid applications

In many cases, a method will be built from, and will include, numerous component analyses. Such component analyses should be evaluated using the same acceptability factors that are applied to the overall method, as outlined in items (1) through (5).

A method to address a specific fire safety issue, within documented limitations or validation regimes, might not exist. In such a case, sources and calculation methods can be used outside of their limitations, provided that the design team recognizes the limitations and addresses the resulting implications.

The technical references and methodologies to be used in a performance-based design should be closely evaluated by the design team and the authority having jurisdiction, and possibly by a third-party reviewer. The strength of the technical justification should be judged using criteria in items (1) through (5). This justification can be strengthened by the presence of data obtained from fire testing.

A.5.8.11

Documentation for modeling should conform to ASTM E1472, *Standard Guide for Documenting Computer Software for Fire Models*, although most, if not all, models were originally developed before this standard was promulgated. Information regarding the use of the model DETACT-QS can be found in the *SFPE Engineering Guide — Evaluation of the Computer Fire Model DETACT-QS*.

[SCR-5](#) [Hide Legislation](#)

A.6.1.2.1 Assembly Occupancy.

Assembly occupancies might include the following:

- (1) Armories
- (2) Assembly halls
- (3) Auditoriums
- (4) Bowling lanes
- (5) Club rooms
- (6) College and university classrooms, 50 persons and over
- (7) Conference rooms
- (8) Courtrooms
- (9) Dance halls
- (10) Drinking establishments
- (11) Exhibition halls
- (12) Gymnasiums
- (13) Libraries
- (14) Mortuary chapels
- (15) ~~Motion picture theaters~~
- (16) Museums
- (17) ~~Nightclubs~~
- (18) Passenger stations and terminals of air, surface, underground, and marine public transportation facilities
- (19) Places of religious worship
- (20) Pool rooms
- (21) Recreation piers
- (22) Restaurants
- (23) Skating rinks
- (24) Special amusement buildings, regardless of occupant load
- (25) Theaters

Assembly occupancies are characterized by the presence or potential presence of crowds with attendant panic hazard in case of fire or other emergency. They are generally or occasionally open to the public, and the occupants, who are present voluntarily, are not ordinarily subject to discipline or control. Such buildings are ordinarily not used for sleeping purposes. Special conference rooms, snack areas, and other areas incidental to, and under the control of, the management of other occupancies, such as offices, fall under the 50-person limitation.

Restaurants and drinking establishments with an occupant load of fewer than 50 persons should be classified as mercantile occupancies.

Occupancy of any room or space for assembly purposes by fewer than 50 persons in another occupancy, and incidental to such other occupancy, should be classified as part of the other occupancy and should be subject to the provisions applicable thereto.

For special amusement buildings, see 12.4.9 and 13.4.9.

A.6.1.3.1 Educational Occupancy.

Educational occupancies include the following:

- (1) Academies
- (2) Kindergartens
- (3) Schools

An educational occupancy is distinguished from an assembly occupancy in that the same occupants are regularly present.

A.6.1.4.1 Day-Care Occupancy.

Day care occupancies include the following:

- (1) Adult day care occupancies, except where part of a health care occupancy
- (2) Child day care occupancies
- (3) Day care homes
- (4) Kindergarten classes that are incidental to a child day care occupancy
- (5) Nursery schools

In areas where public schools offer only half-day kindergarten programs, many child day care occupancies offer state-approved kindergarten classes for children who need full-day care. As these classes are normally incidental to the day care occupancy, the requirements of the day care occupancy should be followed.

A.6.1.5.1 Health Care Occupancy.

Health care occupancies include the following:

- (1) Hospitals
- (2) Limited care facilities
- (3) Nursing homes

Occupants of health care occupancies typically have physical or mental illness, disease, or infirmity. They also include infants, convalescents, or infirm aged persons.

A.6.1.6.1 Ambulatory Health Care Occupancy.

It is not the intent that occupants be considered to be incapable of self-preservation just because they are in a wheelchair or use assistive walking devices, such as a cane, a walker, or crutches. Rather, it is the intent to address emergency care centers that receive patients who have been rendered incapable of self-preservation due to the emergency, such as being rendered unconscious as a result of an accident or being unable to move due to sudden illness.

A.6.1.7.1 Detention and Correctional Occupancy.

Detention and correctional occupancies include the following:

- (1) Adult and juvenile substance abuse centers
- (2) Adult and juvenile work camps
- (3) Adult community residential centers
- (4) Adult correctional institutions
- (5) Adult local detention facilities
- (6) Juvenile community residential centers
- (7) Juvenile detention facilities
- (8) Juvenile training schools

Detention and correctional occupancies do not include psychiatric and dementia units in hospitals, emergency rooms in hospitals, ambulatory health care occupancies, nursing homes, and residential board and care occupancies where persons can be lawfully detained.

See A.22.1.1.1.6 and A.23.1.1.1.6.

A.6.1.7.2

Chapters 22 and 23 address the residential housing areas of the detention and correctional occupancy as defined in 3.3.205.5. Examples of uses, other than residential housing, include gymnasiums or industries.

A.6.1.8.1.1 One- and Two-Family Dwelling Unit.

The application statement of 24.1.1.1 limits each dwelling unit to being "occupied by members of a single family with not more than three outsiders." The *Code* does not define the term *family*. The definition of family is subject to federal, state, and local regulations and might not be restricted to a person or a couple (two people) and their children. The following examples aid in differentiating between a single-family dwelling and a lodging or rooming house:

- (1) An individual or a couple (two people) who rent a house from a landlord and then sublease space for up to three individuals should be considered a family renting to a maximum of three outsiders, and the house should be regulated as a single-family dwelling in accordance with Chapter 24.
- (2) A house rented from a landlord by an individual or a couple (two people) in which space is subleased to four or more individuals, but not more than 16, should be considered and regulated as a lodging or rooming house in accordance with Chapter 26.
- (3) A residential building that is occupied by four or more individuals, but not more than 16, each renting from a landlord, without separate cooking facilities, should be considered and regulated as a lodging or rooming house in accordance with Chapter 26.

A.6.1.8.1.3 Hotel.

So-called apartment hotels should be classified as hotels, because they are potentially subject to the same transient occupancy as hotels. Transients are those who occupy accommodations for less than 30 days.

A.6.1.8.1.4 Dormitory.

Rooms within dormitories intended for the use of individuals for combined living and sleeping purposes are guest rooms or guest suites. Examples of dormitories include college dormitories, fraternity and sorority houses, and military barracks.

A.6.1.9.1 Residential Board and Care Occupancy.

The following are examples of facilities classified as residential board and care occupancies:

- (1) Group housing arrangement for persons with physical or intellectual disabilities who normally attend school in the community, attend worship in the community, or otherwise use community facilities
- (2) Group housing arrangement for persons with physical or intellectual disabilities who are undergoing training in preparation for independent living, for paid employment, or for other normal community activities
- (3) Group housing arrangement for the elderly that provides personal care services but that does not provide nursing care
- (4) Facility for social rehabilitation of individuals with alcohol or substance use disorders or mental health conditions that contains a group housing arrangement and that provides personal care services but does not provide acute care
- (5) Assisted living facilities
- (6) Other group housing arrangements that provide personal care services but not nursing care

A.6.1.10.1 Mercantile Occupancy.

Mercantile occupancies include the following:

- (1) Auction rooms
- (2) Department stores
- (3) Drugstores
- (4) Restaurants with fewer than 50 persons
- (5) Shopping centers
- (6) Supermarkets

Office, storage, and service facilities incidental to the sale of merchandise and located in the same building should be considered part of the mercantile occupancy classification.

A.6.1.11.1 Business Occupancy.

Business occupancies include the following:

- (1) Airport traffic control towers (ATCTs)
- (2) City halls
- (3) College and university instructional buildings, classrooms under 50 persons, and instructional laboratories
- (4) Courthouses
- (5) Dentists' offices
- (6) Doctors' offices
- (7) General offices
- (8) Outpatient clinics (ambulatory)
- (9) Town halls

Doctors' and dentists' offices are included, unless of such character as to be classified as ambulatory health care occupancies. (See 3.3.205.1)

Birth centers should be classified as business occupancies if they are occupied by fewer than four patients, not including infants, at any one time; do not provide sleeping facilities for four or more occupants; and do not provide treatment procedures that render four or more patients, not including infants, incapable of self-preservation at any one time. For birth centers occupied by patients not meeting these parameters, see Chapter 18 or Chapter 19, as appropriate.

Service facilities common to city office buildings, such as newsstands, lunch counters serving fewer than 50 persons, barber shops, and beauty parlors are included in the business occupancy group.

City halls, town halls, and courthouses are included in this occupancy group, insofar as their principal function is the transaction of public business and the keeping of books and records. Insofar as they are used for assembly purposes, they are classified as assembly occupancies.

A.6.1.12.1 Industrial Occupancy.

Industrial occupancies include the following:

- (1) Drycleaning plants
- (2) Factories of all kinds
- (3) Food processing plants
- (4) Gas plants
- (5) Hangars (for servicing/maintenance)
- (6) Laundries
- (7) Power plants
- (8) Pumping stations
- (9) Refineries
- (10) Sawmills
- (11) Telephone exchanges

In evaluating the appropriate classification of laboratories, the authority having jurisdiction should treat each case individually, based on the extent and nature of the associated hazards. Some laboratories are classified as occupancies other than industrial; for example, a physical therapy laboratory or a computer laboratory.

A.6.1.13.1 Storage Occupancy.

Storage occupancies include the following:

- (1) Barns
- (2) Bulk oil storage
- (3) Cold storage
- (4) Freight terminals
- (5) Grain elevators
- (6) Hangars (for storage only)
- (7) Parking structures
- (8) Truck and marine terminals
- (9) Warehouses

Storage occupancies are characterized by the presence of relatively small numbers of persons in proportion to the area.

A.6.1.14.1.1

Where a building is subdivided for occupancy by multiple tenants, the presence of rated fire barriers between occupancies and independent exit access for each occupancy does not mandate the use of the separated occupancy provisions of 6.1.14.4.

A.6.1.14.1.3

Examples of uses that might be incidental to another occupancy include the following:

- (1) Newsstand (mercantile) in an office building
- (2) Giftshop (mercantile) in a hotel
- (3) Small storage area (storage) in any occupancy
- (4) Minor office space (business) in any occupancy
- (5) Maintenance area (industrial) in any occupancy

A.6.1.14.1.3(2)

Examples of uses that have occupant loads below the occupancy classification threshold levels include the following:

- (1) Assembly use with fewer than 50 persons within a business occupancy
- (2) Educational use with fewer than 6 persons within an apartment building.

A.6.1.14.3.2

For example, a common path of travel that occurs wholly in a business tenant space, in a multiple occupancy building containing assembly and business occupancies, should not have to meet the assembly occupancy common path of travel limitation.

A.6.1.14.4.5

Where the *Code* text states that the provision has applicability to the building, rather than just to the occupancy, the provision applies to the entire building, regardless of whether the separated occupancies form of protection is used. For example, the provision of 18.3.5.1 requires that the entire building housing a health care occupancy be sprinklered. Contrast that with the requirement of 20.3.4.1, which requires an ambulatory health care facility, and not the entire building, to be provided with a fire alarm system.

A.6.2.1.3

Under the provision of 6.2.1.3, any violation of the requirements of Chapters 11 through 42 for separation or protection of hazardous operation or storage would inherently involve violation of the other sections of the *Code*, unless additional egress facilities appropriate to high hazard contents were provided.

A.6.2.2.1

These classifications do not apply to the application of sprinkler protection classifications. See NFPA 13. Depending on the use of the space, the area might require special hazard protection in accordance with Section 8.7.

Also, these classifications do not apply to the application of hazardous materials classifications within NFPA 400. NFPA 101 primarily classifies hazards based on fire severity. NFPA 400 regulates contents through a different classification system, which takes into consideration physical hazards, health hazards, quantities, storage conditions, and use conditions.

See 4.1.3 and Annex C for referenced documents on hazardous materials.

A.6.2.2.2

Chapter 42 recognizes storage of noncombustible materials as low hazard. In other occupancies, it is assumed that, even where the actual contents hazard is normally low, there is sufficient likelihood that some combustible materials or hazardous operations will be introduced in connection with building repair or maintenance, or some psychological factor might create conditions conducive to panic, so that the egress facilities cannot safely be reduced below those specified for ordinary hazard contents.

A.6.2.2.3

Ordinary hazard classification represents the conditions found in most buildings and is the basis for the general requirements of this *Code*.

The fear of poisonous fumes or explosions is necessarily a relative matter to be determined on a judgment basis. All smoke contains some toxic fire gases but, under conditions of ordinary hazard, there should be no unduly dangerous exposure during the period necessary to escape from the fire area, assuming there are proper exits.

A.6.2.2.4

High hazard contents include occupancies where flammable liquids are handled or used or are stored under conditions involving possible release of flammable vapors; where grain dust, wood flour or plastic dust, aluminum or magnesium dust, or other explosive dusts are produced; where hazardous chemicals or explosives are manufactured, stored, or handled; where materials are processed or handled under conditions producing flammable flyings; and other situations of similar hazard.

Chapters 40 and 42 include detailed provisions on high hazard contents.

A.7.1.1

An installation of supplemental evacuation equipment is not recognized as a means of egress. Consequently, such equipment does not satisfy any requirement for minimum number of, capacity of, travel distance to, or remoteness of, means of egress.

A.7.1.3.2.1(1)

In existing buildings, existing walls in good repair and consisting of lath and plaster, gypsum panel products, or masonry units can usually provide satisfactory protection for the purposes of this requirement where a 1-hour fire resistance rating is required. Further evaluation might be needed where a 2-hour fire resistance rating is required. Additional guidelines can be found in Annex O of NFPA 914 and in the *SFPE Handbook of Fire Protection Engineering*.

A.7.1.3.2.1(3)

In existing buildings, existing walls in good repair and consisting of lath and plaster, gypsum panel products, or masonry units can usually provide satisfactory protection for the purposes of this requirement where a 1-hour fire resistance rating is required. Further evaluation might be needed where a 2-hour fire resistance rating is required. Additional guidelines can be found in Annex O of NFPA 914 and in the *SFPE Handbook of Fire Protection Engineering*.

A.7.1.3.2.1(5)

It is not the intent to require the structural elements supporting outside stairs, or structural elements that penetrate within exterior walls or any other wall not required to have a fire resistance rating, to be protected by fire-resistance-rated construction.

A.7.1.3.2.1(8)

Means of egress from the level of exit discharge is permitted to pass through an exit stair enclosure or exit passageway serving other floors. Doors for convenience purposes and unrelated to egress also are permitted to provide access to and from exit stair enclosures and exit passageways, provided that such doors are from corridors or normally occupied spaces. It is also the intent of this provision to prohibit exit enclosure windows, other than approved vision panels in doors, that are not mounted in an exterior wall.

A.7.1.3.2.1(9)(b)

The intent of this provision is to prevent the exit enclosure from being used as a vertical chase for building services. Penetrations for electrical wiring are permitted where the wiring serves equipment permitted by the authority having jurisdiction to be located within the exit enclosure.

A.7.1.3.2.1(9)(d)

This provision will allow security cameras, public address systems, emergency communication systems, telephone repeaters and similar life safety devices in the exit enclosure, and wiring and similar pathways for such devices, to penetrate the fire barrier serving the exit enclosure. It is the intent of this provision to prevent the exit enclosure from being used as a vertical chase for building services.

A.7.1.3.2.3

This provision prohibits the use of exit enclosures for storage or for installation of equipment not necessary for safety. Occupancy is prohibited other than for egress, refuge, and access. The intent is that the exit enclosure essentially be "sterile" with respect to fire safety hazards.

A.7.1.4.1

See Chapters 12 through 42 for further limitations on interior wall and ceiling finish.

A.7.1.4.2

See Chapters 12 through 42 for further limitations on interior floor finish.

A.7.1.5

For the purpose of this requirement, projections include devices such as lighting equipment, emergency signaling equipment, environmental controls and equipment, security devices, signs, and decorations that are typically limited in area.

A.7.1.6.4

The foreseeable slip conditions are those that are likely to be present at the location of the walking surface during the use of the building or area. Examples of foreseeable conditions include a swimming pool deck and exterior means of egress, generally, that are likely to be wet.

Regarding the slip resistance of treads, it should be recognized that, when walking up or down stairs, a person's foot exerts a smaller horizontal force against treads than is exerted when walking on level floors. Therefore, materials used for floors that are acceptable as slip resistant (as described by ASTM F1637, *Standard Practice for Safe Walking Surfaces*) provide adequate slip resistance where used for stair treads. Such slip resistance includes the important leading edges of treads, the part of the tread that the foot first contacts during descent, which is the most critical direction of travel. If stair treads are wet, there is an increased danger of slipping, just as there is an increased danger of slipping on wet floors of similar materials. A small wash or drainage slope on exterior stair treads is, therefore, recommended to shed water. (*See Templer, J. A., The Staircase: Studies of Hazards, Falls, and Safer Design, Cambridge, MA: MIT Press, 1992.*)

A.7.1.7.2

Aside from the problems created for persons who use wheelchairs or other mobility devices, small changes of elevations in floors are best avoided because of the increased occurrence of missteps where the presence of single steps, a series of steps, or a ramp is not readily apparent. Although small changes of elevation pose significant fall risks in the case of individual movement, they are even more undesirable where crowds traverse the area.

A contrasting marking stripe on each stepping surface can be helpful at the nosing or leading edge so that the location of each step is readily apparent, especially when viewed in descent. Such stripes should be not less than 1 in. (25 mm), but should not exceed 2 in. (51 mm), in width. Other methods could include a relatively higher level of lighting, contrasting colors, contrasting textures, highly prominent handrails, warning signs, a combination thereof, or other similar means. The construction or application of marking stripes should be such that slip resistance is consistent over the walking surface and no tripping hazard is created (*see also A.7.2.2.3.3.2*). Depending on the distractions of the surroundings, the familiarity of users with a particular small change of level, and especially the number of people that might be in a group traversing the change of level (thereby reducing visibility of the level changes), a strong argument can be made for the elimination of steps and ramps that might pose a risk of missteps.

A.7.1.8

Elements of the means of egress that might require protection with guards include stairs, landings, escalators, moving walks, balconies, corridors, passageways, floor or roof openings, ramps, aisles, porches, and mezzanines.

Escalators and moving walks, other than previously approved existing escalators and moving walks, are prohibited from serving as components of the required means of egress. Building occupants using the escalator at the time of fire or similar emergency must traverse some portion of the escalator to gain access to a required egress route. For those building occupants using the escalator, such travel along the escalator is part of their means of egress. The requirement that guards be provided at the open side of means of egress that exceed 30 in. (760 mm) above the floor or grade below is meant to be applied to escalators and moving walks.

A.7.1.10.1

A proper means of egress allows unobstructed travel at all times. Any type of barrier including, but not limited to, the accumulations of snow and ice in those climates subject to such accumulations is an impediment to free movement in the means of egress. Another example of an obstruction or impediment to full instant use of means of egress is any security device or system that emits any medium that could obscure a means of egress. It is, however, recognized that obstructions occur on a short-duration basis. In these instances, awareness training should be provided to ensure that blockages are kept to a minimum and procedures are established for the control and monitoring of the area affected.

A.7.2.1.2.1

Figure A.7.2.1.2.1(a) and Figure A.7.2.1.2.1(b) illustrate the method of measuring clear width for doors.

In cases where a chapter requires a door width, for example, of not less than 36 in. (915 mm), this requirement can be met by a door leaf of the minimum specified width if the term *clear width* does not appear as part of the minimum width requirement. A pair of cross-corridor doors subject to such a requirement would be judged under the following criteria:

- (1) Each door leaf is required to be not less than 36 in. (915 mm) in width.
- (2) The pair of doors is required to provide sufficient, clear, unobstructed width (which will be less than the door leaf width measurement) to handle its assigned occupant load, based on a calculation using the appropriate egress capacity factor in Table 7.3.3.1.

Where swinging doors do not open at least 90 degrees, the clear width of the doorway should be measured between the face of the door and the stop.

It is not the intent to regulate projections above the 6 ft 8 in. (2030 mm) height.

Figure A.7.2.1.2.1(a) Minimum Clear Width.

Figure A.7.2.1.2.1(b) Minimum Clear Width with Permitted Obstructions.

A.7.2.1.2.2

Figure A.7.2.1.2.2(a) and Figure A.7.2.1.2.2(b) illustrate the method of measuring egress capacity width for purposes of calculating door egress capacity.

Figure A.7.2.1.2.2(a) Door Width — Egress Capacity.

Figure A.7.2.1.2.2(b) Door Width — Egress Capacity with Permitted Obstructions.

**A.7.2.1.2.3.2(2)**

An example of a room that is “not required to be accessible to persons with severe mobility impairments” is one that is not required to be accessible by *NFPA 5000*, Chapter 12.

A.7.2.1.2.3.2(3)

An example of a room that is “not required to be accessible to persons with severe mobility impairments” is one that is not required to be accessible by *NFPA 5000*, Chapter 12.

A.7.2.1.2.3.2(9)

The relative egress carrying capacity of door openings and stairs is based on the two-to-three ratio used in Table 7.3.3.1 to help balance the capacity of various egress elements and ensure that downstream egress facilities do not form a bottleneck or constriction to flow. For example, a stairway with a nominal width of 56 in. (1420 mm) should be served by an exit discharge door with a minimum width opening of 37 in. (940 mm) if only one discharge door is provided. It might be advantageous for two discharge doors to serve such a stairway, each with a more typical clear opening width of 32 in. (810 mm). This would facilitate access, into the exit, of firefighters and other emergency responders without causing undue interference to evacuees attempting to transition from the stair to the exit discharge door.

A.7.2.1.4.1

Where doors are subject to two-way traffic, or where their opening can interfere with pedestrian traffic, an appropriately located vision panel can reduce the chance of accidents.

Swinging doors in horizontal- or vertical-rolling partitions should be permitted in a means of egress where the following criteria are met:

- (1) The door or doors comply with 7.2.1.4.
- (2) The partition in which the doors are mounted complies with the applicable fire protection rating and closes upon smoke detection or power failure at a speed not exceeding 9 in./s (230 mm/s) and not less than 6 in./s (150 mm/s).
- (3) The doors mounted in the partition are self-closing or automatic-closing in accordance with 7.2.1.8.

Pivoted-swinging-type doors include balanced doors.

A.7.2.1.4.2

See 7.4.2.1.2 and 7.4.2.2.2 for door swing direction requirements for working space about electrical equipment.

A.7.2.1.4.3

The requirements of 7.2.1.4.3 are not intended to apply to the swing of cross-corridor doors, such as smoke barrier doors and horizontal exits. Neither are the requirements intended to apply to doors from rooms that are typically unoccupied, such as janitor’s closets, electrical closets, or telecommunications closets.

A.7.2.1.5.3

Examples of devices that might be arranged to release locks and latches include knobs, levers, and bars. This requirement is permitted to be satisfied by the use of conventional types of hardware, whereby the door is released by turning a lever, knob, or handle or by pushing against a bar, but not by unfamiliar methods of operation, such as a blow to break glass. It is also within the intent of this requirement that switches integral to traditional doorknobs, lever handles, or bars, and that interrupt the power supply to an electrical lock, be permitted, provided that they are affixed to the door leaf.

Many doors in means of egress are equipped with access control systems, which allow only authorized personnel to enter a building, room, or space. These access control systems might be key-operated locks, electric locks released by entering a code via keypad, electric locks released by retinal scans, locks operated by remote personnel interacting by video and voice, or other access control configurations. Regardless of the complexity of the access control system controlling ingress, occupants of a building must be able to egress the building as required by Chapter 7.

Egress for the most common situation of mechanical locks controlling access (ingress) would be by turning a lever-operated latchset or by operating panic hardware or fire exit hardware. This egress-side hardware and its operation must comply with the requirements of Chapter 7 to facilitate immediate and unimpeded egress.

Also common are electrical access control systems such as an electric lock or electric strike controlled by the input of a card reader or keypad. On the egress side of these doors, the lever-operated hardware, panic hardware, or fire-exit hardware must provide for immediate and unimpeded egress.

It is also relatively common for doors with electrical access control systems controlling ingress to incorporate one of the special locking arrangements of 7.2.1.6. In these situations, the access control system is typically integrated into the egress-side special locking arrangement. Regardless of the complexity of the access control system, egress must be facilitated as required and permitted by one of the special locking arrangements.

A.7.2.1.5.3.2

An example of a releasing motion in a single linear direction, as described in ANSI/BHMA A156.41, *Standard for Door Hardware Single Motion to Egress*, is pushing on a panic bar to release the locking/latching hardware to allow a door to be opened. An example of a releasing motion in a single rotational direction is turning a lever-operated handle of a door lockset in either a clockwise direction or a counterclockwise direction, but not both directions, to unlock/unlatch the door.

A.7.2.1.5.3.4

Examples of devices that, when used with a latch, can be arranged to require not more than one additional releasing operation include dead bolts, security chains, swing door locks, and privacy door guards.

A door with a thumb-turn operated dead bolt complying with 7.2.1.5.3.3 in addition to a lever operated latchset would be permitted by 7.2.1.5.3.7 as the dead bolt could be retracted with the first motion of rotating the thumb turn (one operation), and then the latch bolt would be retracted by the second motion of rotating the lever handle (other operation).

A door with two lever operated latchsets would not be permitted because the first operation of rotating the lever to retract one of the latch bolts would also require that lever to be manually maintained, or held, in the turned position while the second operation of the rotating the other lever to retract the second latch bolt is performed.

Swing bar door locks and privacy door guards are commonly used in hotel guest rooms and many other applications permitted by this section.

A.7.2.1.5.3.7

A door with a thumb-turn operated dead bolt complying with 7.2.1.5.3.3 in addition to a lever operated latchset would be permitted per 7.2.1.5.3.7 as the dead bolt could be retracted with the first motion of rotating the thumb turn (one operation), and then the latch bolt would be retracted by the second motion of rotating the lever handle (other operation).

A door with two lever operated latchsets would not be permitted because the first operation of rotating the lever to retract one of the latch bolts would also require that lever to be manually maintained, or held, in the turned position while the second operation of the rotating the other lever to retract the second latch bolt is performed.

A.7.2.1.5.5

Some fire door assemblies are listed for use with fire pins or fusible links that render the door leaf release inoperative upon exposure to elevated temperature during a fire. The door leaf release mechanism is made inoperative where conditions in the vicinity of the door opening become untenable for human occupancy, and such door opening no longer provides a viable egress path.

A.7.2.1.5.6.2

Where the entrance consists of an exterior vestibule, the locking arrangement should be permitted on the egress side of either the interior or exterior door of the vestibule.

A.7.2.1.5.7

It is intended that the re-entry provisions apply only to enclosed exit stairs, not to outside stairs. This arrangement makes it possible to leave the stairway at such floor if the fire renders the lower part of the stair unusable during egress or if the occupants seek refuge on another floor.

See SR-65

PCs [1]

A.7.2.1.5.7(2)(c)

The electrical locking hardware might be a component of an electrical locking system (e.g., an access control system), or the electrical locking hardware might be a device with an individual listing. Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

A.7.2.1.5.10

Examples of devices prohibited by this requirement include locks, padlocks, hasps, bars, chains, or combinations thereof.

A.7.2.1.6

None of the special locking arrangements addressed in 7.2.1.6 are intended to allow *credentialed egress* or similar provisions, where an occupant cannot leave the building without swiping a card through a reader. Where such an arrangement is desired to keep track of occupants, the swiping of cards needs to be procedural but not necessary for releasing the door lock or latch. Egress needs to be available at all times as required by this Code.

A.7.2.1.6.1

Delayed-egress electrical locking systems function as the name suggests: these electrical locking systems delay egress through the door. However, 7.2.1.6.1.1(1) and 7.2.1.6.1.1(2) identify situations where the delay of these locking systems must be deactivated, facilitating immediate and unobstructed egress. Delayed-egress electrical locking systems are most commonly installed where there are concerns for internal security, such as theft from a store through required perimeter exits. Delayed-egress electrical locking systems might also be installed where occupants might benefit by being protected from their actions.

A.7.2.1.6.1.1(3)

It is not the intent to require a direct physical or electrical connection between the door release device and the lock. It is the intent to allow door movement initiated by operating the door release device required in 7.2.1.5.3 as the primary option to initiate the irreversible process.

Delayed-egress electrical locking systems commonly employ a mechanical latch and/or lock in addition to an electrical lock. The use of a mechanical latch/lock in addition to an electrical lock such as a magnetic lock allows a door to be mechanically locked preventing uncontrolled ingress should the electrical lock be de-energized as in a power failure.

Several factors need to be considered in approving an increase in delay time from 15 seconds to 30 seconds. Some of the factors include occupancy, occupant density, ceiling height, fire hazards present, fire protection features provided, and the location of the delayed-egress locks. An example of a location where the increase in delay time might not be approved is at an exit stair discharge door.

PCs [1]

A.7.2.1.6.1.1(4)

In the event that the authority having jurisdiction has permitted increased operation time, the sign should reflect the appropriate time.

See SR-65:

A.7.2.1.6.1.1(6)

The electrical locking hardware might be a component of an electrical locking system, or it might be a device with an individual listing. Depending on the electrical locking system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

PCs [2]

A.7.2.1.6.2

Doors with a sensor-release electrical locking system are equipped with an electrical locking system that is released by a sensor activated by the normal motions of an occupant egressing through that door. The activation of the sensor to cause the electrical lock to release is usually by passive action by the occupant, such as walking to the door. A manual release device, such as a push-button switch that directly interrupts the power to the electrical lock, is required by item (3) as a backup. With most sensor-release electrical locking systems, the occupant might not notice the door is electrically locked in the direction of egress. Doors equipped with these locking systems provide unobstructed, immediate egress.

These provisions were previously titled “Access-Controlled Egress Door Assemblies” as these doors typically have some type of access control system, such as a key pad, card scanner, or fob scanner controlling access (ingress) into the building or space. Because access control systems can be installed on essentially any door, the previous title resulted in differing interpretations, applications, and enforcement of permitted locking systems, and they were retitled in the 2018 edition of the Code.

See SR-65:

A.7.2.1.6.2.1(8)

The electrical locking hardware might be a component of an electrical locking system, or it might be a device with an individual listing. Depending on the electrical locking system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

PCs [1]

A.7.2.1.6.3.1(5)

It is critical that the electrical lock be arranged to release upon loss of power to the releasing hardware to ensure occupants can egress in the event of a power failure.

See SR-65:

A.7.2.1.6.3.1(6)

The electrical locking hardware might be a component of an electrical locking system, or it might be a device with an individual listing. Depending on the electrical locking system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

PCs [1]

A.7.2.1.6.4

The electrical locking provisions of 7.2.1.6.4 for elevator lobby exit access door assemblies are similar to, but different from, the electrical locking systems of 7.2.1.6.1, 7.2.1.6.2, and 7.2.1.6.3.

On doors to tenant spaces from the elevator lobby, it is not the intent to prohibit these doors from being equipped with access control systems, such as card readers controlling access to the tenant spaces, provided that the door leading from the elevator lobby is not in the path to the exit access required by 7.4.1.6.1.

It is acceptable to use a sensor-release electrical locking system from a tenant space into the elevator lobby with the sensor on the tenant (egress) side of the door to allow free access to the elevator lobby.

See SR-65:

A.7.2.1.6.4.1(1)

The electrical locking hardware might be a component of an electrical locking system, or it might be a device with an individual listing. Depending on the electrical locking system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

A.7.2.1.7

See 7.4.2.1.2 and 7.4.2.2.2 for door unlatching requirements for working space about electrical equipment.

A.7.2.1.7.3

The presence of fire exit hardware on a door does not imply the door is required to be a fire-protection-rated door.

A.7.2.1.8.1

Examples of doors designed to normally be kept closed include those to a stair enclosure or horizontal exit.

A.7.2.1.9

Special-purpose horizontally sliding accordion or folding door assemblies installed in accordance with 7.2.1.13 should not be considered powered doors subject to the provisions of 7.2.1.9.

Powered doors are divided into two categories — power-assisted or low-energy power-operated doors, and power-operated doors. Doors that conform to ANSI/BHMA A156.19, *Power Assist and Low Energy Power Operated Doors*, or ANSI/BHMA A156.38, *Low Energy Power Operated Sliding and Folding Doors*, use limited power to operate the door. These door operators are for swinging, sliding, or folding doors. Power-assisted and low-energy power-operated doors require fewer safeguards as compared to power-operated doors. Doors that conform to ANSI/BHMA A156.10, *Power Operated Pedestrian Doors*, require more power to operate the door and require additional safeguards to provide protection against personal injury. Power-operated doors can be swinging, sliding, or folding doors.

A.7.2.1.9.1

An example of the type of door addressed by 7.2.1.9.1 is one actuated by a motion-sensing device upon the approach of a person.

A.7.2.1.9.1.8

Although a single power-operated door leaf located within a two-leaf opening might alone not provide more than 30 in. (760 mm) of clear width in the emergency breakout mode, where both leaves are broken out to become side hinged, the required egress width is permitted to be provided by the width of the entire opening.

A.7.2.1.11.1.3

Security access turnstiles are designed to control security access into and out of buildings. Security access turnstiles might utilize physical barriers consisting of arms, wings, gates, or panels. The subject physical barriers come in various heights and function by retracting or opening in the direction of travel.

A.7.2.1.14.1

Door assemblies within the required means of egress (e.g., door assemblies that discharge from exit enclosures) require a higher level of care and maintenance throughout the life of their installations to ensure they perform as intended by the *Code*. Annual inspection and functional testing of these door assemblies is necessary to verify that they are maintained in proper working condition. Panic hardware and fire exit hardware devices are specifically required to be used in assembly and educational occupancies. However, door leaves that are equipped with panic hardware or fire exit hardware, in areas not specifically required by the *Code* (e.g., stairwell entry doors and double-egress cross-corridor door assemblies not serving an assembly occupancy), should be subject to annual inspection and functional testing to ensure that the operating hardware functions correctly in accordance with 7.2.1.7, since the presence of panic hardware and fire exit hardware implies it is required by the *Code*.

Additionally, door assemblies that are door hardware release of electrically locked egress door assemblies in accordance with 7.2.1.6.3 and door assemblies that are equipped with special locking arrangements in accordance with 7.2.1.6 are outfitted with electrified hardware and devices that are susceptible to wear and abuse. Consequently, these door assemblies need to be inspected and tested on an annual basis, regardless of the occupant load being served.

In cases where the authority having jurisdiction determines there is a distinct hazard to building occupant safety, the inspection requirements of 7.2.1.14 should be applied to other exit access, exit, and exit discharge door assemblies.

A.7.2.1.14.2

See NFPA 80, Annex J, for information pertaining to performance-based inspection, testing, and maintenance of fire door assemblies. See NFPA 105, Annex B, for information pertaining to performance-based inspection, testing, and maintenance of smoke door assemblies.

A.7.2.1.14.7

Performing corrective action work on door assemblies frequently requires ordering replacement components that might take time to produce, ship, and install. Consideration of the time it takes to procure and install components should be included in the timeline for restoring the door assemblies to normal working condition.

A.7.2.1.15

The provisions of 7.2.1.15 addressing the inspection of grille assemblies are not intended to override the requirements of 7.2.1.4.1(3).

A.7.2.2.2.1.1(2)

It is the intent of 7.2.2.2.1.1(2) to permit the use of Table 7.2.2.2.1.1(b) in existing buildings, even where there is a change in occupancy per 4.6.11. Safety improvements should be made that are reasonable and feasible at minimal cost. Improvements include removal, repair, or replacement of step coverings, as described in A.7.2.2.3.5, particularly Figure A.7.2.2.3.5(e), and addition of functional handrails and guardrails in place of, or in conjunction with, other rails, as described in 7.2.2.4.

A.7.2.2.2.1.2

In some cases, the egress capacity provisions of 7.3.3 will require a stair to have a greater width than the minimum specified in 7.2.2.2.1.2.

A.7.2.2.2.1.2(B)

The stair width requirement of 7.2.2.2.1.2(B) is based on accumulating the occupant load on each story the stair serves.

The accumulating of occupant load is done for the purposes of the requirements of 7.2.2.2.1.2 only. The egress capacity requirements of Section 7.3 are NOT cumulative on a story-by-story basis.

If additional exits provide egress capacity, the occupant load served by such additional exits, up to the limit permitted for the egress capacity of such additional exits, is not added to the total occupant load considered for the minimum stair width requirements of 7.2.2.2.1.2.

If horizontal exits are provided on any of the stories, the total occupant load of all compartments on the story with the horizontal exits is used in the calculation of the minimum stair width requirements of 7.2.2.2.1.2. The number of stairs permitted through application of horizontal exit requirements in 7.2.4 is not affected by the minimum stair width requirements of 7.2.2.2.1.2.

The examples that follow illustrate applications of the minimum stair width requirement.

A stair in a building two stories in height above grade plane that has 2000 persons on the second story, among 10 equally sized stairs that serve the second story, would be considered to have an occupant load of 200 persons for the purposes of applying Table 7.2.2.2.1.2(B). The minimum width of such a stair would be 44 in. (1120 mm).

For a building with a relatively large floor area, a typical 44 in. (1120 mm) stair would not be required to be increased in width until it serves a building approximately 14 stories in height above grade plane, calculated as follows:

$$\frac{2000 \text{ persons}}{147 \text{ persons per floor for a } 44 \text{ in. (1120 mm) width stair}} \approx 14 \text{ stories} \quad \text{[A.7.2.2.2.1.2(B)]}$$

For egress in the descending direction, only the stair width below the 14 stories with the total occupant load of 2000 persons per stair, or 4000 persons if served by two equally sized stairs, would need to be increased to 56 in. (1420 mm). If the building is 20 stories in height above grade plane, only the stairs on the lowest 7 stories would be required to have the 56 in. (1420 mm) width.

For a building 41 stories in height above grade plane with 200 persons on each story (or 8000 persons overall, not including the level of exit discharge), with two equally sized stairs, each stair would be considered to have an occupant load of 4000 persons for the purposes of applying Table 7.2.2.2.1.2(B). Only the portion of the stair serving 2000 persons would be required to have the wider width. If each story provides the same floor area for occupancy, the upper 20 stories would have 44 in. (1120 mm) stairs, and the lowest 20 stories would have the 56 in. (1420 mm) stairs, as a minimum.

A.7.2.2.2.4

If properly designed and constructed, stairs with winders are not necessarily more dangerous than other stairs. Attention to the factors that follow helps to make winders generally more effective for egress and safety. Handrails should be continuous, without breaks at newel posts, from story to story. Handrails located at a greater than normal distance from the inner turn of winders can improve safety by constraining stair users to walk on the portion of the treads providing deeper treads, which should have not less than 11 in. (280 mm) of depth. Combinations of straight flights and winders are best arranged with winders located only below the straight flight. This arrangement is best because the winders provide larger tread dimensions over much of their width than do typical treads on straight flights. A descending person will, thus, be unlikely to experience a reduction of tread depth during descent, a condition of nonuniformity that is best avoided.

A.7.2.3.3.2

The tripping hazard referred to in 7.2.3.3.2 occurs especially during descent, where the tread walking surface has projections such as strips of high-friction materials or lips from metal pan stairs that are not completely filled with concrete or other material. In addition, the installation of a retrofit, surface-mounted stair nosing or a strip of high-friction material onto an existing stair tread might produce a projection that creates a tripping hazard. For example, the slight elevation difference between the new stair tread nosing and the stair tread might create enough of an elevation change to trip the stair user. Tread nosings that project over adjacent treads can also be a tripping hazard. ICC A117.1, *Accessible and Usable Buildings and Facilities*, illustrates projecting nosing configurations that minimize the hazard.

A.7.2.2.3.3.3

Consistent surface traction means that slip resistance is reasonably uniform and adequate to minimize risk of slipping across the treads where users' feet contact the tread surface.

For the front-to-back direction, particular attention should be given to consistency of slip resistance in the front two-thirds of the tread, but preferably the entire tread surface. For descent, initial foot contact occurs at the nosing; for ascent, it occurs in the middle of the tread.

For the side-to-side direction, particular attention should be given to consistency of slip resistance within the clear width of the stair between handrails, especially on the portion contacted by users' feet. For most users, this will extend to within about 6 in. (150 mm), measured horizontally, of the handrails; however, some vulnerable stair users might place the front portions of their feet below the handrails.

Consistency is important because misleading user expectation of underfoot conditions is a major factor in missteps and falls involving slipping.

Regarding the slip resistance of treads, it should be recognized that, when walking up or down stairs, a person's foot exerts a smaller horizontal force against treads than is exerted when walking on level floors, including on landings. Therefore, materials used for floors that are acceptable as slip resistant (as described by ASTM F1637, *Standard Practice for Safe Walking Surfaces* and standards specifically addressing tribology, including ANSI/ASSP A1264.2, *Standard for the Provision of Slip Resistance Reducing Slip Missteps on Walking/ - Working Surfaces*) provide adequate slip resistance where used for stair treads. Such slip resistance includes the important leading edges of treads, the part of the tread that the foot first contacts during descent, which is the most critical direction of travel. If stair treads are wet, there is an increased danger of slipping, just as there is an increased danger of slipping on wet floors of similar materials. A small wash or drainage slope on exterior stair treads is, therefore, recommended to shed water. (See Templer, J. A., *The Staircase: Studies of Hazards, Falls, and Safer Design*, Cambridge, MA: MIT Press, 1992.)

A.7.2.2.3.4

A small drainage slope for stair treads subject to wetting can improve tread slip resistance (*see also* A.7.2.2.3.3.2). A consistent slope to a side of the stair, where drainage is possible, might be preferable to a front-to-back slope of the treads. Providing a pitch of $\frac{1}{8}$ in./ft to $\frac{1}{4}$ in./ft (10 mm/m to 21 mm/m) aids the shedding of water from a nominally horizontal surface.

A.7.2.2.3.5

Figure A.7.2.2.3.5(a), Figure A.7.2.2.3.5(b), Figure A.7.2.2.3.5(c), and Figure A.7.2.2.3.5(d) illustrate the method for measuring riser height and tread depth. Stairs that are covered with resilient floor coverings might need additional tread depth beyond the minimum specified in the *Code*. Any horizontal projection of resilient covering materials beyond the tread nosing and riser, such as carpet and underlayment, can interfere with users' feet and thereby reduce usable tread depth. At the tread nosing, such resilient covering materials might not be capable of providing stable support for users' feet. Generally, effective tread depth is reduced by the uncompressed thickness of such resilient coverings, and might be further reduced over time if coverings are not well secured, and, consequently, might move forward at the nosings. [See Figure A.7.2.2.3.5(e).]

Figure A.7.2.2.3.5(a) Riser Measurement with Tread Slope to Front.

Figure A.7.2.2.3.5(b) Riser Measurement with Tread Slope to Back.

Figure A.7.2.2.3.5(c) Tread Depth.

Figure A.7.2.2.3.5(d) Tread Measurement with Stable Support at Leading Edge.

Figure A.7.2.2.3.5(e) Tread Measurement with Unstable Stepping Surface at Leading Edge.

A.7.2.2.3.6

A relatively common error in much of home stair construction and, more rarely, in other stair construction is a failure to make the landing nosing projection consistent with the projection of all other nosings in the stair flight. Such an error can easily occur if the stair flight is installed as a prefabricated unit where the top landing does not have a comparable nosing and the unit includes nosing projections. This heightens the risk of an overstepping misstep, at the second or third step down, by a person who is descending.

A fairly reliable test of step dimension uniformity is the crouch and sight test, in which the inspector crouches on the landing above a flight of stairs to confirm that all of the nosings, including the landing nosing, line up. Unless there is a rare matched variation in the height of a step riser and in the tread depth, both proportionally larger or smaller than other steps in the flight, such that the internosing slope or pitch is maintained consistent in the flight, the visual alignment of the nosings in the crouch and sight test will indicate dimensional uniformity. Thus, as a first task in any stair inspection, the crouch and sight test should be routinely performed. If the stair does not pass this visual test, careful measurements performed in accordance with 7.2.2.3.5 are essential. If the stair appears to pass this test, indicating that the internosing slope or pitch is consistent, a prudent second, quick test is to measure the internosing distances for each step to confirm their consistency.

Step dimensions or their uniformity should not be measured by simply laying a measuring tape or stick on the tread or against the riser. Such measurements could be misleading and erroneous relative to the criteria set out in 7.2.2.3.5, particularly if nosing projections are not uniform (as addressed in 7.2.2.3.6.5), if treads slope, or if the slopes vary within a stair flight.

A.7.2.2.3.6.5

"Safety yellow" is the widely used, standard color (described in ANSI/NEMA Z535.1, *American National Standard for Safety Colors*) to be used for a "caution" function, as a solid color or in alternating, angled yellow-black bars or other geometric combination that draws attention beyond merely designating a nosing. Other nosings, not located above nonuniform risers, need only contrast with the remainder of the step and can be of any color providing contrast relative to the remainder of the tread. Note that similar specification of distinctive and contrasting nosing markings is called for in assembly seating aisle stairs (*see, respectively, 12.2.5.8.6(7) and 12.2.5.8.10.1*). The safety problems of exterior stairs in assembly aisles and adjacent to a sloping public way are similar, as each individual step has to be visually detected in a reliable fashion. In addition, the presence and location of steps with unavoidably nonuniform risers must be effectively communicated, especially when viewed in the descent direction. Widely varying light conditions further heighten the need for such markings.

A.7.2.2.4.1.4

The intent of this provision is to place handrails for the required egress width only, regardless of the actual width. The required egress width is provided along the natural path of travel to and from the building. Examples of this requirement are shown in Figure A.7.2.2.4.1.4. The reduced intermediate handrail spacing of 60 in. (1525 mm), along with a handrail height within the permissible height limits, allows users to reach and grasp one handrail. Except as noted in 7.2.2.4.2 and 7.2.2.4.4, handrails are not required on stair landings.

Figure A.7.2.2.4.1.4 Assumed Natural Paths of Travel on Monumental Stairs with Various Handrail Locations.

A.7.2.2.4.5

Figure A.7.2.2.4.5 illustrates some of the requirements of 7.2.2.4.4.

Figure A.7.2.2.4.5 Handrail Details.

**A.7.2.2.4.5.4**

Additional handrails, beyond those required by the Code, are permitted at heights other than those stipulated. For example, where children under the age of five are major users of a facility, an additional handrail at a height in the range of 28 in. to 32 in. (710 mm to 810 mm) might be useful. Generally, children prefer to use, and can effectively use, handrails that are located at shoulder to head height due to their developmental characteristics and their less developed balance and walking abilities. At age 3, head height ranges from 35 in. to 40 in. (890 mm to 1015 mm); shoulder height averages 29 in. (735 mm). At age 5, head height ranges from 39 in. to 46 in. (990 mm to 1170 mm); shoulder height ranges from 31 in. to 37 in. (785 mm to 940 mm).

A.7.2.2.4.5.6(2)

Handrails should be designed so they can be grasped firmly with a comfortable grip and so the hand can be slid along the rail without encountering obstructions. The profile of the rail should comfortably match the hand grips. For example, a round profile, such as is provided by the simplest round tubing or pipe having an outside diameter of 1 1/2 in. to 2 in. (38 mm to 51 mm), provides good graspability for adults. Factors such as the use of a handrail by small children and the wall-fixing details should be taken into account in assessing handrail graspability. The most functional, as well as the most preferred, handrail shape and size is circular with a 1 1/2 in. (38 mm) outside diameter (according to research conducted using adults). Handrails used predominantly by children should be designed at the lower end of the permitted dimensional range.

Handrails are one of the most important components of a stair; therefore, design excesses such as oversized wood handrail sections should be avoided, unless there is a readily perceived and easily grasped handhold provided. In handrail design, it is useful to remember at all times the effectiveness of a simple round profile that allows some locking action by fingers as they curl around and under the handrail.

Perimeter dimension, referred to in 7.2.2.4.5.6(2), is the length of the shortest loop that wraps completely around the railing.

A.7.2.2.4.6.2(3)

This reduction in required height applies only to the stair, not to the landings.

A.7.2.2.4.6.3

Vertical intermediate rails are preferred to reduce climbability.

A.7.2.2.5.2

The purpose of this provision is to protect the exterior wall of a stairway from fires in other portions of the building. If the exterior wall of the stair is flush with the building exterior wall, the fire would need to travel around 180 degrees in order to impact the stair. This has not been a problem in existing buildings, so no protection is required. However, if the angle of exposure is less than 180 degrees, protection of either the stair wall or building wall is required.

Figure A.7.2.2.5.2(a), Figure A.7.2.2.5.2(b), and Figure A.7.2.2.5.2(c) illustrate the requirement, assuming nonrated glass on the exterior wall of the stair is used.

Figure A.7.2.2.5.2(a) Stairway with Nonrated Exterior Wall in Same Plane as Building Exterior Wall.

Figure A.7.2.2.5.2(b) Stairway with Unprotected Exterior Perimeter Protruding Past Building Exterior Wall.

Figure A.7.2.2.5.2(c) Stairway with Nonrated Exterior Wall Exposed by Adjacent Exterior Wall of Building.

**A.7.2.2.5.3**

An example of a use with the potential to interfere with egress is storage.

A.7.2.2.5.4

Figure A.7.2.2.5.4 shows an example of a stairway marking sign.

Figure A.7.2.2.5.4 Example of a Stairway Marking Sign.

**A.7.2.2.5.4.1(M)**

It is not the intent to require a sign that reads ROOF ACCESS, as such message might be misinterpreted by building occupants as an alternative egress route. However signs that read ROOF ACCESS are not prohibited, as many such signs have been installed in existing buildings so as to make a requirement for removal impractical. Historically, the ROOF ACCESS sign has provided information for the fire department. Where there is no roof access, such information will be posted via a NO ROOF ACCESS sign. The absence of the NO ROOF ACCESS sign should be understood by the fire department to mean that roof access is possible.

A.7.2.2.5.4.3

Where environmental conditions (such as illumination levels and directionality or a complex visual field that draws a person's attention away from stair treads) lead to a hazardous reduction in one's ability to perceive stair treads, they should be made of a material that allows ready discrimination of the number and position of treads. In all cases, the leading edges of all treads should be readily visible during both ascent and descent. A major factor in injury-producing stair accidents, and in the ability to use stairs efficiently in conditions such as egress, is the clarity of the stair treads as separate stepping surfaces.

For stair nosing marking, surface-applied material, such as adhesive-backed tape and magnetic strips, should not be used, as it is not durable under the scuffing from users' feet and, in coming loose, it creates a tripping hazard. While a carefully applied and consistently maintained coating is acceptable, contrasting color or photoluminescent material integral with the nosings is preferable because of its permanence. It is also the intent of 7.2.2.5.4.3 to require the contrasting stairway tread marking to be a material integral with the stair tread and not a material integral with a stair nosing product that is installed on the stair tread. See also 7.1.6.4 and 7.2.2.3.6 for slip resistance uniformity requirements, as well as prohibition of projections on the treads.

Guidance on the use of photoluminescent marking is provided by ASTM E2030, *Standard Guide for Recommended Uses of Photoluminescent (Phosphorescent) Safety Markings*. Additional marking, for example, at the side boundaries of the stair, should be applied in accordance with the guidance provided therein.

A.7.2.2.5.4.4

Coatings and other applied markings, if used, should be durable for the expected usage, especially at end terminations of the marking and at changes in stair direction where usage is more extensive and hand forces are larger.

A.7.2.2.5.5.1

Exit stair treads are required to incorporate a marking stripe that is applied as a paint/coating or be a material that is integral with the nosing of each step. It is the intent of this provision to require the contrasting stairway tread marking to be a material integral with the stair tread and not a material integral with a stair nosing product that is installed on the stair tread. See also 7.1.6.4 and 7.2.2.3.6 for slip resistance requirements, as well as 7.2.2.3.3.2, which prohibits tread projections.

A.7.2.2.5.5.5

Examples of obstacles addressed by 7.2.2.5.5.5 are standpipes, hose cabinets, and wall projections.

A.7.2.2.5.5.7(B)(1)

The marking stripe for door hardware should be of sufficient size to adequately mark the door hardware. This marking could be located behind, immediately adjacent to, or on the door handle or escutcheon.

A.7.2.2.6.2

The guards that are required by 7.1.8 and detailed in 7.2.2.4.5 will usually meet this requirement where the stair is not more than 36 ft (11 m) above the finished ground level. Special architectural treatment, including application of such devices as metal or masonry screens and grilles, will usually be necessary to comply with the intent of this requirement for stairs over 36 ft (11 m) above the finished ground level.

A.7.2.2.6.3.1

Where outside stairs are not required to be separated from interior portions of the building in accordance with 7.2.2.6.3.1(1) through 7.2.2.6.3.1(5), such stairs are considered exits and not exit access.

A.7.2.2.6.5

See A.7.2.2.3.4.

A.7.2.3.9.1

The design pressure differences required by 7.2.3.9.1 are based on specific gas temperatures and ceiling heights. The system is required to be approved, because anticipated conditions might be different from those on which the design pressure differences were calculated and, thus, different design pressure differences might be needed. For additional information on necessary minimum design pressure differences, including calculational techniques, or maximum pressure differences across doors to ensure reasonable operating forces, see NFPA 92.

A.7.2.3.9.2

Control wiring for pressurization systems requiring separation includes wiring from the VFD to the fan unit. Where this wiring is not located in the same fire-resistance-rated room, protection of this wiring is needed to ensure proper fan operation.

A.7.2.4.1.2

An example of one way to provide the required egress capacity from the upper floor of a department store building measuring 350 ft × 200 ft (107 m × 61 m), with an occupant load of 1166 per floor, would be to furnish eight 44 in. (1120 mm) stairs. [See Figure A.7.2.4.1.2(a).]

The building is assumed to be divided into two sections by a fire barrier meeting the requirements for a horizontal exit, one 130 ft × 200 ft (40 m × 61 m), and the other 220 ft × 200 ft (67 m × 61 m), with two pairs of 46 in. (1170 mm) double egress doors, with each door providing 44 in. (1120 mm) of clear egress width [see Figure A.7.2.4.1.2(b)]. The smaller section, considered separately, will require the equivalent of three 44 in. (1120 mm) exit stairs, and the larger section will require five such exits. The horizontal exits will serve as one of the three exits required for the smaller section and two of the five exits required for the larger section. Therefore, only two 44 in. (1120 mm) exit stairs from the smaller section and three 44 in. (1120 mm) exit stairs from the larger section will be required if the exits can be arranged to meet the requirements for the 150 ft (46 m) travel distance permitted from any point in a nonsprinklered building. Thus, the total number of exit stairs required for the building will be five, as compared to eight if no horizontal exit had been provided.

Another option would be the use of two 56 in. (1420 mm) exit stairs from the larger section, which would reduce the total number of stairways required from the floor to four [see Figure A.7.2.4.1.2(c)]. However, if the building were further subdivided by a second fire wall meeting the requirements for a horizontal exit, no further reduction in stairways would be permitted in order to comply with the requirement that horizontal exits provide a maximum of one-half of egress capacity.

It is not the intent of 7.2.4.1.2 to limit the number of doors in the fire barrier forming the horizontal exit. Where doors other than those serving as horizontal exits are provided, such doors are to be considered as convenience openings that are not credited with satisfying any means of egress requirements.

Figure A.7.2.4.1.2(a) Eight Exits, Required to Provide Necessary Egress Capacity, with None via Horizontal Exit.

Figure A.7.2.4.1.2(b) Number of Stairs Reduced by Three Through Use of Two Horizontal Exits; Egress Capacity Not Reduced.

Figure A.7.2.4.1.2(c) Number of Stairs Further Reduced by Widening Stairs in Larger Compartment, But Not to Less than One-Half the Required Number and Capacity of Exits from That Compartment.

**A.7.2.4.3.1**

The continuity requirement of 7.2.4.3.1 does not prohibit the horizontal exit fire barrier from being offset on various floors. Where the floor assembly has a minimum 2-hour fire resistance rating and horizontal exit fire barrier walls are provided on all floors to the finished ground level, the continuity provision might be achieved by a combination of horizontal and vertical assemblies. For requirements regarding the alignment of fire barriers separating buildings of differing construction types, see 8.2.1.3.

A.7.2.4.3.2

Figure A.7.2.4.3.2 depicts an example of the use of the exemption provided by 7.2.4.3.2.

Figure A.7.2.4.3.2 Example of Horizontal Exit Termination.

**A.7.2.4.3.5**

The requirements of 7.2.4.3.5 are meant to apply to the horizontal and vertical portions of the fire barrier forming the horizontal exit.

A.7.2.4.3.10

Fusible-link-actuated automatic-closing doors do not qualify for use in horizontal exits under these provisions, because smoke might pass through the opening before there is sufficient heat to release the hold-open device. Such doors are also objectionable because, once closed, they are difficult to open and would inhibit orderly egress.

A.7.2.5.7.1

The guards required by 7.1.8 and detailed in 7.2.2.4.5 for the unenclosed sides of ramps will usually meet this requirement where the ramp is not more than 36 ft (11 m) above the finished ground level. Special architectural treatment, including application of such devices as metal or masonry screens and grilles, will usually be necessary to comply with the intent of the requirements for ramps over 36 ft (11 m) above the finished ground level.

A.7.2.5.7.2

Providing a pitch of $\frac{1}{4}$ in./ft to $\frac{1}{4}$ in./ft (10 mm/m to 21 mm/m) will aid the shedding of water from a nominally horizontal surface.

A.7.2.6

An exit passageway serves as a horizontal means of exit travel that is protected from fire in a manner similar to an enclosed interior exit stair. Where it is desired to offset exit stairs in a multistory building, an exit passageway can be used to preserve the continuity of the protected exit by connecting the bottom of one stair to the top of the stair that continues to the street floor. Probably the most important use of an exit passageway is to satisfy the requirement that at least 50 percent of the exit stairs discharge directly outside from multistory buildings (see 7.7.2). Thus, if it is impractical to locate the stair on an exterior wall, an exit passageway can be connected to the bottom of the stair to convey the occupants safely to an outside exit door. In buildings of extremely large area, such as shopping mall concourses and some factories, the exit passageway can be used to advantage where the travel distance to reach an exit would otherwise be excessive.

A.7.2.6.1

Examples of building elements that might be arranged as exit passageways include hallways, corridors, passages, tunnels, underfloor passageways, or overhead passageways.

A.7.2.6.4.1(1)

Where an exit passageway serves occupants on the level of exit discharge as well as other floors, it should not be required that the occupant loads be added, thus increasing the width of the exit passageway. The situation is the same as that in which occupants from the level of exit discharge join occupants from upper floors for a few feet of horizontal travel through a stair enclosure.

A.7.2.8.6.2

Structural evaluations of fire escape stairs, platforms, landings, and ladders should include a careful examination for the integrity of all fastened or welded joints as well as the manner of attachment to the building. Evaluations can be performed by a registered design professional with training and experience in structural analysis or by performing a load test to document the stairs' ability to support 100 lb/ft² (4.8 kN/m²) typically required by the building code.

A.7.2.8.7

Swinging stairs, although superior to fire escape ladders, are generally unsatisfactory, even for emergency use. Although such stairs are permitted by this Code, they should not be used where it is reasonably possible to terminate the fire escape stair at the finished ground level.

A.7.2.8.7.9

A latch is desirable for holding swinging stairs down after they have swung to the finished ground level.

A.7.2.11

Special consideration should be given prior to the application of such devices where children, the elderly, or physically disabled persons use such devices. These devices present obstacles in ascent and descent that differ from those for stairs and ladders.

A.7.2.12.2.3

A clear width of not less than 48 in. (1220 mm) is needed for a three-person carry of an occupied wheelchair up or down a stair. This procedure, as well as the more difficult two-person wheelchair carry or roll, requires training and experience. Safer alternative stair descent measures for transporting a person who normally requires a wheelchair, or otherwise cannot use stairs, include emergency stair travel devices designed, constructed, and operated in accordance with ANSI/RESNA ED-1, *Emergency Stair Travel Devices Used by Individuals with Disabilities*. In addition to having such devices available where needed, and having persons trained and experienced in their use, it is important to have people trained and experienced in wheelchair transfer techniques.

In view of the logistical difficulties, as well as the dangers inherent in carrying occupied wheelchairs or otherwise transferring and transporting their occupants on stairs, the preferred means of egress from an area of refuge consists of facilities normally employed for ingress and egress by people using wheelchairs. Foremost among these options are elevators meeting the firefighters' emergency operations requirements of ASME A17.1/CSA B44, *Safety Code for Elevators and Escalators*.

A.7.2.12.2.4

The use of elevators for egress, especially during an emergency such as a fire, is not an approach to be taken without considerable planning, ongoing effort, and a high degree of understanding by everyone involved with the evacuation of persons with mobility impairments. Due in part to the limited capacity of elevators, as well as to the conflicting demands for elevator use for fire-fighting activities, even elevators in accordance with 7.2.12.2.4 cannot be considered as satisfying any of the Code's requirements for egress capacity, number of means of egress, or travel distance to an exit.

A.7.2.12.2.7

The instructions should include the following:

- (1) Directions to find other means of egress
- (2) Advice that persons able to use exit stairs do so as soon as possible, unless they are assisting others
- (3) Information on planned availability of assistance in the use of stairs or supervised operation of elevators and how to summon such assistance
- (4) Directions for use of the emergency communications system

To facilitate an adequate degree of understanding of the use of areas of refuge and of the associated assisted egress procedures, information should be provided to those using the facilities. The exact content of the information, its organization (e.g., as a set of instructions), and its format (e.g., either posted instructions in the area of refuge or information otherwise transmitted to facility users) should be determined on a case-by-case basis. The information should be tailored to the specific facility, its emergency action plan, the intended audience, and the intended presentation format. Suggested information content addressing two situations follows.

Refuge with Elevator Use. An area of refuge provided in the elevator lobby serves as a staging area for persons unable to use stairs and needing assistance for their evacuation during an emergency. The elevator(s) will be taken out of automatic service and operated by emergency service personnel. Persons unable to evacuate down the exit stairs without assistance and needing transportation by elevator should make certain the elevator lobby doors are closed while they wait in the elevator lobby for assistance. The two-way communication system should be used if there is a delay of more than several minutes in the arrival of an elevator that will provide transportation to the level of exit discharge. Alternatively, another refuge area, and assistance with evacuation, is available in the designated exit stair.

Refuge with Stair Use. An area of refuge within the designated exit stair serves as a staging area for persons needing assistance for their evacuation during an emergency. Persons unable to use the stairs unassisted, or who wish to move down the stairs at a slower pace, should wait on the stair landing. The two-way communication system should be used if assistance is needed.

A.7.2.12.3.1

Figure A.7.2.12.3.1 illustrates the application of the minimum space requirement to an area of refuge located within an exit stair enclosure. Note that each of the two required spaces is sufficient to allow the parking of a standard wheelchair. Preferably, such spaces should be provided adjacent to each other in a location where the presence of people taking temporary shelter in an area of refuge will be immediately apparent to rescue personnel and other evacuees.

Figure A.7.2.12.3.1 Exit Stair Used as an Area of Refuge.

**A.7.2.12.3.2**

The method of meeting the tenability performance criteria required of an area of refuge of less than 1000 ft² (93 m²) can involve controlling the exposing fire (e.g., via automatic sprinkler protection), installing smoke-resisting doors in the smoke-resisting barriers (*see NFPA 105*) providing smoke control to prevent or limit smoke migration through cracks or other leakage paths (*see NFPA 92*) or providing other means or a combination of these means.

Calculations, if used, need to be based on established engineering relationships and equations. Such calculational procedures are described in NFPA 92 and the *SFPE Handbook of Fire Protection Engineering*. Tenable conditions are those that maintain the temperature of any smoke in the area of refuge at less than 200°F (93°C) if the smoke is more than 60 in. (1525 mm) above the floor, and at less than 120°F (49°C) if the smoke descends below the 60 in. (1525 mm) level in the area of refuge. Also, if the smoke descends below the 60 in. (1525 mm) level, tenable conditions require not less than 16 percent oxygen and not more than 30,000 ppm/min exposure to carbon monoxide. The exposing conditions used in the calculations should be in accordance with the following:

- (1) The exposing space is sprinkler protected, and the following conditions also exist:
 - (a) The temperature of the exposing smoke is 200°F (93°C).
 - (b) The smoke layer extends to the floor.
 - (c) The oxygen content is 16 percent.
 - (d) The carbon monoxide concentration is 2000 ppm (0.2 percent).
- (2) The exposing space is a nonsprinklered corridor finished with Class A interior wall and ceiling finish, and the following conditions also exist:
 - (a) The temperature of the exposing smoke is 600°F (316°C).
 - (b) The smoke layer extends to a level 24 in. (610 mm) above the floor.
 - (c) The oxygen content is 3 percent.
 - (d) The carbon monoxide concentration is 50,000 ppm (5 percent).
- (3) The exposing space is either not a corridor or, if a corridor, the corridor is not finished with a Class A interior wall and ceiling finish, and the following conditions also exist:
 - (a) The temperature of the exposing smoke is 1500°F (815°C).
 - (b) The smoke layer extends to a level 24 in. (610 mm) above the floor.
 - (c) The oxygen content is 3 percent.
 - (d) The carbon monoxide concentration is 50,000 ppm (5 percent).

A.7.2.12.3.4

Requirements for fire resistance ratings in excess of 1 hour, fire protection ratings in excess of 20 minutes, and prohibitions on duct penetrations appear in other *Code* sections. For example, if the barrier creating the area of refuge is also part of an exit stair enclosure that connects two or more stories, or is a horizontal exit, a minimum 2-hour fire resistance rating for the barrier and a minimum 1½-hour fire protection rating for opening protectives, such as doors, would be required for most occupancies.

For further information on door openings in smoke-resisting barriers, see NFPA 105.

Generally, by providing one barrier that subdivides a floor area, two areas of refuge can be created. This subdivision method and the possibility of creating areas of refuge within compartmented elevator lobbies or on enlarged stair landings of exit stair enclosures make less onerous any requirement for a story to have more than one accessible means of egress.

A.7.2.13.1

It is the intent of 7.2.13.1 that elevators serving as a means of egress serve only independent towers or the tower portion of any integral structure. For elevators that are used as a component in the means of egress, the elevator lobbies, elevator shaft, and machine room need to be protected from the effects of fire.

A.7.2.13.6

One or more of the following approaches can be used to restrict exposure of elevator equipment to water:

- (1) A combination of sealed elevator lobby doors, sloped floors, floor drains, and sealed elevator shaft walls is used.
- (2) The elevator is mounted on the building exterior that normally operates in the elements, and seals are used on the elevator lobby doors.
- (3) The elevator shaft is separated from the building at each floor by an exterior elevator lobby designed to prevent water entry into the elevator shaft.

Information gained from ongoing research concerning waterflow and elevators could lead to the development of water-resistive or water-protected elevator equipment specifically for fire applications. Such equipment should be used only with the building elements (e.g., sealed elevator lobby doors, sloped floors, floor drains) for which it is developed. Further information is available from NISTIR 5445, *Feasibility of Fire Evacuation by Elevators at FAA Control Towers*.

A.7.2.13.7

Cooling equipment dedicated to the elevator machine room can be used to minimize requirements for standby power.

A.7.2.13.8

Communication between elevator lobbies and a central control point can be by telephone or intercom. Auditory alarms should be designed so that they do not interfere with people talking on communications systems.

A.7.2.13.9

Smoke detection in the elevator lobby will result in a Phase I recall of the elevators. The elevators will then be automatically taken out of normal service and will be available to be operated by emergency service personnel.

PCs.[1]

A.7.3.1.2

When using Table 7.3.1.2, the actual use of the space and not the occupancy classification should be considered.

The normal occupant load is not necessarily a suitable criterion, because the greatest hazard can occur when an unusually large crowd is present, which is a condition often difficult for authorities having jurisdiction to control by regulatory measures. The principle of this Code is to provide means of egress for the maximum probable number of occupants, rather than to attempt to limit occupants to a number commensurate with available means of egress. However, limits of occupancy are specified in certain special cases for other reasons.

Suggested occupant load factors for components of large airport terminal buildings are given in Table A.7.3.1.2. However, the authority having jurisdiction might elect to use different occupant load factors, provided that egress requirements are satisfied.

Table A.7.3.1.2 Airport Terminal Occupant Load Factors

Airport Terminal Area	ft ² (gross)	m ² (gross)
Concourse	100	9.3
Waiting areas	15	1.4
Baggage claim	20	1.9
Baggage handling	300	27.9

The figure used in determining the occupancy load for mall shopping centers of varying sizes was arrived at empirically by surveying over 270 mall shopping centers, by studying mercantile occupancy parking requirements, and by observing the number of occupants per vehicle during peak seasons.

These studies show that, with an increase in shopping center size, there is a decrease in the number of occupants per square foot of gross leasable area.

This phenomenon is explained when one considers that, above a certain shopping center gross leasable area [approximately 600,000 ft² (56,000 m²)], there exists a multiplicity of the same types of stores. The purpose of duplicate types of stores is to increase the choices available to a customer for any given type of merchandise. Therefore, when shopping center size increases, the occupant load increases as well, but at a declining rate. In using Figure 7.3.1.2(a) or Figure 7.3.1.2(b), the occupant load factor is applied only to the gross leasable area that uses the mall concourse as a means of egress.

The value for concentrated business use is intended to address business use spaces with a higher density of occupants than would normally be expected in a general business occupancy. Where furnishings and floor layouts are arranged to maximize the number of occupants in the space, the value for concentrated business use should be applied. Examples of concentrated business use areas are call centers, trading floors, and data processing centers.

Collaboration rooms/spaces are common to office buildings. Their principal function is to permit collaboration among occupants in the privacy of a small room/space. These rooms/spaces are primarily used by occupants of the business occupancy to transition temporarily from their regular workstation area in order to obtain privacy and to avoid disturbing other employees located in the open office environment. Collaboration rooms/spaces have been commonly referred to as quiet rooms, focus rooms, huddle rooms, and team rooms.

Collaboration rooms/spaces are not considered conference rooms, since a conference room's principal function is to be used for assembly purposes.

A.7.3.3

In egress capacity calculations, standard rounding should be used.

A.7.3.3.2

The effective capacity of stairways has been shown by research to be proportional to the effective width of the stairway, which is the nominal width minus 12 in. (305 mm). This phenomenon, and the supporting research, were described in Chapter 59, "Employing the Hydraulic Model in Assessing Emergency Movement," in the fifth edition of the *SFPE Handbook of Fire Protection Engineering* and was also addressed in Appendix D of the 1985 edition of NFPA 101, among several other publications. In 1988, this appendix was moved to form Chapter 2 of the 1988 edition of NFPA 101M. (This document was later designated as NFPA 101A, and this chapter remained in the document through the 1998 edition.) In essence, the effective width phenomenon recognizes that there is an edge or boundary effect at the sides of a circulation path. It has been best examined in relation to stairway width, where the edge effect was estimated to be 6 in. (150 mm) on each side, but a similar phenomenon occurs with other paths, such as corridors and doors, although quantitative estimates of their edge effect are not as well established as they have been for stairways, at least those stairways studied in Canada during the late 1960s through the 1970s in office building evacuation drills and in crowd movement in a variety of buildings with assembly occupancy.

More recent studies have not been performed to determine how the edge effect might be changing (or has changed) with demographic changes to larger, heavier occupants moving more slowly, and thus swaying laterally, to maintain balance when walking. The impact of such demographic changes, which are significant and influential for evacuation flow and speed of movement on stairs, for example, has the effect of increasing the time of evacuation in a way that affects all stair widths but will be most pronounced for nominal widths less than 56 in. (1422 mm).

Without taking into account occupant demographic changes in the last few decades that affect evacuation performance, especially on stairs, the formula for enhanced capacity of stairways wider than 44 in. (1120 mm) assumes that any portion of the nominal width greater than 44 in. (1120 mm) is as effective proportionally as the effective width of a nominal 44 in. (1120 mm) stair, that is, 32 in. (810 mm). Thus, the denominator (0.218) in the equation is simply the effective width of 32 in. (810 mm) divided by the capacity of 147 persons that is credited, by the 0.3 in. (7.6 mm) capacity factor in Table 7.3.3.1, to the corresponding nominal width, 44 in. (1120 mm).

The resulting permitted stairway capacities, based on occupant load of single stories (in accordance with 7.3.1.4), for several stairway widths are shown in Table A.7.3.3.2.

Table A.7.3.3.2 Stairway Capacities

Permitted Capacity (no. of persons)	Nominal Width		Clear Width Between Handrails ^a		Effective Width	
	in.	mm	in.	mm	in.	mm
120 ^b	36	915	28	710	24	610
147	44	1120	36	915	32	810
202	56	1420	48	1220	44	1120
257	68	1725	60 ^c	1525 ^c	56	1420

^aA reasonable handrail incursion of only 4 in. (100 mm) into the nominal width is assumed on each side of the stair, although 7.3.2.2 permits a maximum incursion of 4½ in. (114 mm) on each side.

^bOther Code sections limit the occupant load for such stairs more severely (e.g., 50 persons in 7.2.2.1.2). Such lower limits are partly justified by the relatively small effective width of such stairs, which, if taken into account by Table 7.3.3.1, would result in a correspondingly low effective capacity of only 110 persons (24 divided by 0.218) or a more realistic capacity factor of 0.327, applicable to nominal width.

^cA clear width of 60 in. (1525 mm) is the maximum permitted by the handrail reachability criteria of 7.2.2.4.1.2. Although some prior editions of the Code permitted wider portions of stairs [up to 88 in. (2240 mm) between handrails], such wider portions are less effective for reasonably safe crowd flow and generally should not be used for major crowd movement. To achieve the maximum possible, reasonably safe egress capacity for such stairs, retrofit of an intermediate — not necessarily central — handrail is recommended; for example, with an intermediate handrail located 36 in. (915 mm) from the closest side handrail. In this case, the effective capacity would be 358 persons for the formerly permitted, now retrofitted, stair. This is based on a retrofitted effective width of about 78 in. (1980 mm) [subtracting 2 in. (51 mm) from each usable side of a handrail and assuming a 2 in. (51 mm) wide retrofitted intermediate handrail].

A.7.3.4.1.1

The criteria of 7.3.4.1.1, as initially written, were intended to provide for minimum widths for small spaces such as individual offices. The intent is that these reductions in required width apply to spaces formed by furniture and movable walls, so that accommodations can easily be made for individuals using wheelchairs or other mobility devices. One side of a path could be a fixed wall, provided that the other side is movable. This does not exempt the door widths or widths of fixed-wall corridors, regardless of the number of people or length. The allowance for reduction in width has been expanded to include all exit accesses serving not more than six people where the travel length along the reduced-width path does not exceed 50 ft (15 m), regardless of occupancy or use of the space.

Figure A.7.3.4.1.1(a) and Figure A.7.3.4.1.1(b) present selected anthropometric data for adults. The male and female figures depicted in the figures are average, 50th percentile, in size. Some dimensions apply to very large, 97.5 percentile, adults (noted as 97.5 P).

Figure A.7.3.4.1.1(a) Anthropometric Data (in in.) for Adults; Males and Females of Average, 50th Percentile, Size; Some Dimensions Apply to Very Large, 97.5 Percentile (97.5 P), Adults.

A.7.4

Section 7.4 requires a minimum number of means of egress, unless otherwise specified by an occupancy chapter in subsection _____.2.4, which addresses number of means of egress. Several occupancy chapters establish not only the minimum number of means of egress but also the minimum number of actual exits that must be provided on each floor. For example, for new educational occupancies, 14.2.4 requires access to two exits and further requires that both of the exits be provided on the floor. In contrast, for industrial occupancies, 40.2.4.1.1 requires access to two exits and further requires that at least one of the exits be located on the floor. Access to the other exit can involve traveling to another floor via an egress component such as an open stair, provided that such open stair is permitted by the occupancy chapter's provisions for the protection of vertical openings.

In most occupancy chapters, meeting the requirements for egress capacities and travel distances means the required minimum number of means of egress will automatically be met. However, in occupancies characterized by high occupant loads, such as assembly and mercantile occupancies, compliance with requirements for more than two exits per floor might require specific attention.

A.7.5.1.1.1

See A.7.5.1.2.1.

A.7.5.1.2.1

The terms *dead end* and *common path of travel* are commonly used interchangeably. Although the concepts of each are similar in practice, they are two different concepts.

A common path of travel exists where a space is arranged so that occupants within that space are able to travel in only one direction to reach any of the exits or to reach the point at which the occupants have the choice of two paths of travel to remote exits. Part (a) of Figure A.7.5.1.2.1 is an example of a common path of travel.

Figure A.7.5.1.2.1 Common Paths of Travel and Dead-End Corridors.

While a dead end is similar to a common path of travel, a dead end can exist where there is no path of travel from an occupied space but can also exist where an occupant enters a corridor thinking there is an exit at the end and, finding none, is forced to retrace his or her path to reach a choice of exits. Part (b) of Figure A.7.5.1.2.1 is an example of such a dead-end arrangement.

Combining the two concepts, part (c) of Figure A.7.5.1.2.1 is an example of a combined dead-end/common path of travel problem.

Common paths of travel and dead-end travel are measured using the same principles used to measure travel distance as described in Section 7.6. Starting in the room shown in part (d) of Figure A.7.5.1.2.1, measurement is made from the most remote point in the room, A, along the natural path of travel and through the doorway along the centerline of the corridor to point C, located at the centerline of the corridor, which then provides the choice of two different paths to remote exits; this is common path of travel. The space between point B and point C is a dead end. (See 3.3.49 for the definition of common path of travel.)

A.7.5.1.3.2

Figure A.7.5.1.3.2(a) through Figure A.7.5.1.3.2(e) illustrate the method of measurement intended by 7.5.1.3.2.

Figure A.7.5.1.3.4 illustrates the method of measuring exit separation distance along the line of travel within a minimum 1-hour fire-resistance-rated corridor.

Figure A.7.5.1.3.4 Exit Separation Measured Along Corridor Path.

**A.7.5.1.4.2**

It is difficult in actual practice to construct scissor stairs so that products of combustion that have entered one stairway do not penetrate into the other. Their use as separate required exits is discouraged. The term *limited-combustible* is intentionally not included in 7.5.1.4.2. The user's attention is directed to the provisions for limited-combustible and noncombustible in 4.6.13 and 4.6.14, respectively.

A.7.5.2.1

It is not the intent that an area with equipment such as a beverage brew pot, microwave oven, and a toaster be considered a kitchen.

A.7.5.2.2

Doors that lead through wall paneling, and that harmonize in appearance with the rest of the wall to avoid detracting from some desired aesthetic or decorative effect, are not acceptable, because casual occupants might not be aware of such means of egress even though it is visible.

A.7.5.4.1

An accessible means of egress should comply with the accessible route requirements of ICC A117.1, *Accessible and Usable Buildings and Facilities*.

A.7.6

Table A.7.6 is a compilation of the requirements of the individual occupancy chapters (Chapters 12 through 42) for permissible length of common path of travel, dead-end corridors, and travel distance to not less than one of the required exits.

A dead end exists where an occupant enters a corridor thinking there is an exit at the end and, finding none, is forced to retrace the path traveled to reach a choice of egress travel paths. Although relatively short dead ends are permitted by this *Code*, it is better practice to eliminate them wherever possible, as they increase the danger of persons being trapped in case of fire. Compliance with the dead-end limits does not necessarily mean that the requirements for remoteness of exits have been met. Such lack of compliance is particularly true in small buildings or buildings with short public hallways. Adequate remoteness can be obtained in such cases by further reducing the length of dead ends. (*See also A.7.5.1.2.1.*)

^pSee Chapters 40 and 42 for special requirements on spacing of doors in aircraft hangars.

^qSee 42.8.2.6.2 for special travel distance considerations in open parking structures.

A.7.6.1

The natural exit access (path of travel) is influenced by the contents and occupancy of the building. Furniture, fixtures, machinery, or storage can serve to increase the length of travel. It is good practice in building design to recognize the influence of contents and occupancy by spacing exits for a completely open floor area at closer intervals than are required, thus reducing the hazard of excessive travel distances due to the introduction of furniture, fixtures, machinery, or storage and minimizing the possibility of violating the travel distance requirements of this *Code*.

A.7.6.3

Examples of locations where open stairways might exist include between mezzanines or balconies and the floor below.

A.7.7.1

An exit from the upper stories in which the direction of egress travel is generally downward should not be arranged so that it is necessary to change to travel in an upward direction at any point before discharging to the outside. A similar prohibition of reversal of the vertical component of travel should be applied to exits from stories below the floor of exit discharge. However, an exception is permitted in the case of stairs used in connection with overhead or underfloor exit passageways that serve the street floor only.

It is important that ample roadways be available from buildings in which there are large numbers of occupants so that exits will not be blocked by persons already outside. Two or more avenues of departure should be available for all but very small places. Location of a larger theater — for example, on a narrow dead-end street — might be prohibited by the authority having jurisdiction under this rule, unless some alternate way of travel to another street is available.

Exterior walking surfaces within the exit discharge are not required to be paved and often are provided by grass or similar surfaces. Where discharging exits into yards, across lawns, or onto similar surfaces, in addition to providing the required width to allow all occupants safe access to a public way, such access also is required to meet the following:

- (1) Provisions of 7.1.7 with respect to changes in elevation
- (2) Provisions of 7.2.2 for stairs, as applicable
- (3) Provisions of 7.2.5 for ramps, as applicable
- (4) Provisions of 7.1.10 with respect to maintaining the means of egress free of obstructions that would prevent its use, such as snow and the need for its removal in some climates

A.7.7.3.3

Examples include partitions and gates. The design should not obstruct the normal movement of occupants to the exit discharge. Signs, graphics, or pictograms, including tactile types, might be permitted for existing exit enclosures where partitions or gates would obstruct the normal movement of occupants to the exit discharge.

A.7.8.1.1

Illumination provided outside the building should be to either a public way or a distance away from the building that is considered safe, whichever is closest to the building being evacuated.

A.7.8.1.2.2

Photoluminescent materials and battery-powered luminaires require some period of time to restore themselves to full operational capacity after being de-energized.

Photoluminescent products rely on nearby luminaires to maintain their full capacity. When those luminaires are de-energized, the photoluminescent product will gradually deplete its capacity. Listed photoluminescent exit signs and path markers are restored to full rated capacity within one hour, and there is no known limit to the number of times they can be discharged and recharged, nor any known degradation of overall capacity or lifetime as a result of discharge/charge cycles.

De-energizing the normal (utility) power source will automatically begin the battery discharge cycle of emergency luminaires, unit equipment, and exit signs provided with battery backup. Once drained, these batteries will typically require between 24 and 72 hours, depending on the battery technology and charging circuitry design, to regain full capacity. Frequent discharge/charge cycles can reduce overall battery lifetime and, depending on battery technology, might also prematurely reduce overall battery capacity.

A.7.8.1.2.3

A consideration for the approval of automatic, motion sensor–type lighting switches, controls, timers, or controllers is whether the equipment is listed as a fail-safe device for use in the means of egress.

A.7.8.1.3(4)

Some processes, such as manufacturing or handling of photosensitive materials, cannot be performed in areas provided with the minimum specified lighting levels. The use of spaces with lighting levels below 1 ft-candle (10.8 lux) might necessitate additional safety measures, such as written emergency action plans, training of new employees in emergency evacuation procedures, and periodic fire drills.

A.7.8.1.4

Failure of a lighting unit is deemed to have occurred when the light output drops below 70 percent of its original level.

A.7.9.1.1

Emergency lighting outside the building should provide illumination to either a public way or a distance away from the building that is considered safe, whichever is closest to the building being evacuated.

A.7.9.2.3

Where emergency lighting is provided by automatic transfer between normal power service and an emergency generator, it is the intent to prohibit the installation, for any reason, of a single switch that can interrupt both energy sources.

A.7.9.3.1.1(2)

Technical justification for extending test intervals past 30 days should be based on recorded event history (data) and should include evaluation of the following criteria:

- (1) Number of egress lighting units
- (2) Number of 30-second tests for analysis
- (3) Re-evaluation period (confirm or adjust intervals)
- (4) Number of fixtures found obstructed
- (5) Number of fixtures found misaligned
- (6) Fixtures found to be missing
- (7) Fixtures found damaged
- (8) Battery design
- (9) Type of light source
- (10) Fixture design (manufacturer)
- (11) Number of light fixtures per exit path
- (12) Existence of fire, smoke, and thermal barriers
- (13) Evacuation capability
- (14) Maximum egress time
- (15) Hours of occupancy
- (16) Number of recorded bulb failures
- (17) Number of recorded fixture failures
- (18) Single fixture reliability
- (19) Repairs — mean time to repair
- (20) Lighted egress path probability of success or failure — monthly upper tolerance limit
- (21) Lighted egress path probability of success or failure — quarterly upper tolerance limit (estimated)

A.7.10.1.2.1

Where a main entrance also serves as an exit, it will usually be sufficiently obvious to occupants so that no exit sign is needed.

The character of the occupancy has a practical effect on the need for signs. In any assembly occupancy, hotel, department store, or other building subject to transient occupancy, the need for signs will be greater than in a building subject to permanent or semipermanent occupancy by the same people, such as an apartment house where the residents are presumed to be familiar with exit facilities by reason of regular use thereof. Even in a permanent residence-type building, however, there is a need for signs to identify exit facilities, such as outside stairs that are not subject to regular use during the normal occupancy of the building.

The requirement for the locations of exit signs visible from any direction of exit access is illustrated in Figure A.7.10.1.2.1.

Figure A.7.10.1.2.1 Location of Exit Signs.

**A.7.10.1.2.2**

The direction of travel to the exit discharge within a stair enclosure with horizontal components in excess of the typical landings might need additional signage to be readily visible or obvious. Exit signs should be installed above doors through which the egress path leads. Directional exit signs should be installed where the horizontal egress path changes directions. The stairway marking signs required by 7.2.2.5.4, provided within the stair enclosure at each floor landing, indicate the vertical direction to exit discharge.

A.7.10.1.5.2

For externally illuminated signs in accordance with 7.10.6 and internally illuminated signs listed without a marked viewing distance, the rated viewing distance should be considered to be 100 ft (30 m). Where placing signs at their rated viewing distance requires them to be placed above the line of sight, consideration should be given to proportionally increasing the size of the exit legend to compensate for the additional straight-line distance between the viewer and the sign.

A.7.10.1.6

See A.7.10.3.

A.7.10.1.7

See 3.3.158.2 for the definition of the term *internally illuminated*.

A.7.10.1.8

In stores, for example, an otherwise adequate exit sign could be rendered inconspicuous by a high-intensity illuminated advertising sign located in the immediate vicinity.

Red is the traditional color for exit signs and is required by law in many places. However, at an early stage in the development of the *Code*, a provision made green the color for exit signs, following the concept of traffic lights in which green indicates safety and red is the signal to stop. During the period when green signs were specified by the *Code*, many such signs were installed, but the traditional red signs also remained. In 1949, the Fire Marshals Association of North America voted to request that red be restored as the required exit sign color, because it was found that the provision for green involved difficulties in law enactment that were out of proportion to the importance of safety. Accordingly, the 10th edition of the *Code* specified red where not otherwise required by law. The present text avoids any specific requirement for color, based on the assumption that either red or green will be used in most cases and that there are some situations in which a color other than red or green could actually provide better visibility.

A.7.10.2

Directional signage that has the capability to change the displayed information based on real-time conditions presents a series of tradeoffs. The potential benefit of a changing message sign would be to deter occupants from a direction of travel that might be blocked or otherwise unavailable due to adverse conditions such as fire, structural collapse, or other unsafe conditions that might warrant avoidance. However, the potential problems of such a "solution" include the reliability and likely partial level of the information available; the decision-making ability of the individual (if human) or algorithm (if machine) responsible for changing the sign's message; the capacity and condition of the remaining egress paths; the training and habitual behavior of some building occupants who might not detect the change or might choose to ignore the sign's information and thus create conflicting movement patterns; the increased probability of sign failure or malfunction due to its enhanced electronics; and the uncertainty for liability if the sign's change of information leads to injuries or other adverse impacts that otherwise might have been avoided.

Directional signs for egress are used at all times of building occupancy. Only a very small percentage of building evacuations would likely benefit from this sign information enhancement. It is also likely that an unavailable egress path will make itself known through other means (such as smoke or other occupants moving away from it), although this might not provide as much advance notice to some occupants approaching from a distance.

The product standard for listing exit signs, UL 924, *Emergency Lighting and Power Equipment*, referenced by 7.10.7.1, does not currently permit this feature; it requires (clause 41.7c) that a directional indicator be "...secured in a manner that cannot readily be changed." This requirement deters changes to the building evacuation plan after approval by the authority having jurisdiction. A system that can change based on changing conditions modifies the role of the authority having jurisdiction by inserting a new intermediary responsible for providing occupant egress information.

A.7.10.3

Where graphics are used, the symbols provided in NFPA 170 should be used. Such signs need to provide equal visibility and illumination and are to comply with the other requirements of Section 7.10.

A.7.10.3.2

Pictograms are permitted to be used in lieu of, or in addition to, signs with text.

A.7.10.4

It is not the intent of this paragraph to require emergency lighting but only to have the sign illuminated by emergency lighting if emergency lighting is required and provided.

It is not the intent to require that the entire stroke width and entire stroke height of all letters comprising the word EXIT be visible per the requirements of 7.10.6.3 under normal or emergency lighting operation, provided that the sign is visible and legible at a 100 ft (30 m) distance under all room illumination conditions.

A.7.10.5.1

See A.7.8.1.3(4).

A.7.10.5.2

It is the intent to prohibit the use of a freely accessible light switch to control the illumination of either an internally or externally illuminated exit sign.

A.7.10.5.2.2

The flashing repetition rate should be approximately one cycle per second, and the duration of the off-time should not exceed ¼ second per cycle. During on-time, the illumination levels need to be provided in accordance with 7.10.6.3. Flashing signs, when activated with the fire alarm system, might be of assistance.

A.7.10.6.1

Experience has shown that the word EXIT, or other appropriate wording, is plainly legible at 100 ft (30 m) if the letters are as large as specified in 7.10.6.1.

A.7.10.6.2

Figure A.7.10.6.2 shows examples of acceptable locations of directional indicators with regard to left and right orientation. Directional indicators are permitted to be placed under the horizontal stroke of the letter T, provided that spacing of not less than ¾ in. (10 mm) is maintained from the horizontal and vertical strokes of the letter T.

Figure A.7.10.6.2 Directional Indicators.

A.7.10.6.3

Colors providing a good contrast are red or green letters on matte white background. Glossy background and glossy letter colors should be avoided. The average luminance of the letters and background is measured in footlamberts or candela per square meter. The contrast ratio is computed from these measurements by the following formula:

$$\text{Contrast} = \frac{L_g - L_e}{L_g} \quad [\text{A.7.10.6.3}]$$

Where L_g is the greater luminance and L_e is the lesser luminance, either the variable L_g or L_e is permitted to represent the letters, and the remaining variable will represent the background. The average luminance of the letters and background can be computed by measuring the luminance at the positions indicated in Figure A.7.10.6.3 by numbered circles.

Figure A.7.10.6.3 Measurement of Exit Sign Luminance.

**A.7.10.7.2**

Photoluminescent signs need a specific minimum level of light on the face of the sign to ensure that the sign is charged for emergency operation and legibility in both the normal and emergency modes. Additionally, the type of light source (e.g., incandescent, fluorescent, halogen, metal halide) is important. Each light source produces different types of visible and invisible light (e.g., UV) that might affect the ability of some photoluminescent signs to charge and might also affect the amount of light output available during emergency mode. This type of sign would not be suitable where the illumination levels are permitted to decline. The charging light source should not be connected to automatic timers, because continuous illumination of the sign is needed; otherwise, the sign illumination would not be available, because it would be discharged.

A.7.10.8.1.1

Special signs require sufficient illumination in order for them to be readable at close proximity. They are not expected to be of a size or illumination level necessary to be readable from a distance, as is the case for an exit sign.

A.7.10.8.3

The likelihood of occupants mistaking passageways or stairways that lead to dead-end spaces for exit doors and becoming trapped governs the need for exit signs. Thus, such areas should be marked with a sign that reads as follows:

NO EXIT

Supplementary identification indicating the character of the area, such as TO BASEMENT, STOREROOM, LINEN CLOSET, or the like, is permitted to be provided.

A.7.10.8.4(1)

These signs are to be used in place of signs that indicate that elevators are not to be used during fires. Examples of these signs include the following:

In the Event of Fire, This Elevator Will Be Used

by the Fire Department for Evacuation of People.

PROTECTED ELEVATOR —

USABLE IN EMERGENCIES

A.7.10.8.4(2)

The wording of these signs should reflect human behavior in fires and the control specifics of the elevator system. Subparagraph 7.10.8.4 addresses signs, but provisions for notification of the vision impaired need to be considered. For information about human behavior with respect to elevator evacuation, see Groner and Levin, "Human Factor Considerations in the Potential for Using Elevators in Building Emergency Evacuation Plans"; Levin and Groner, "Human Behavior Aspects of Staging Areas for Fire Safety in GSA Buildings"; and Levin and Groner, "Human Factor Considerations for the Potential Use of Elevators for Fire Evacuation of FAA Air Traffic Control Towers." Some examples of messages on signs that could be displayed are shown in Table A.7.10.8.4(2).

Table A.7.10.8.4(2) Elevator Status Messages

Elevator Status	Message
Normal use	Elevator in Service
Elevators recalled and waiting for fire service	Please Wait for Fire Department or Use Stairs
Elevator out of service	Elevator Out of Service

A.7.10.8.5

Egress paths with multiple turns can often be confusing with respect to which exit route will lead to the closest exit door. Floor evacuation diagrams can eliminate the guesswork by giving the occupant a point of reference by the YOU ARE HERE symbol. The entire floor plan should be shown with the primary and secondary exit routes, exit stairs, and elevators clearly identified. For further information, see ASTM E2238, *Standard Guide for Evacuation Route Diagrams*.

A.7.11.1

Seventy-five feet (23 m) can be traversed in approximately 10 seconds to 15 seconds, even when allowing for a momentary delay to decide which way to go, during which it can be assumed that the average individual can hold his or her breath.

A.7.12

See 4.1.3 and Annex C for referenced documents on hazardous materials.

A.7.14.1

29 CFR 1910.146 of the OSHA regulations describes the aspects of normally unoccupied areas. For example, hazardous atmosphere criteria are presented, and asphyxiation risk due to an entrance becoming engulfed are addressed. The areas described by 29 CFR 1910.146, "Permit-Required Confined Spaces," would be considered hazardous if located within a building or structure regulated by NFPA 101.

A.7.14.2.1

Egress from normally unoccupied building service equipment support areas not exceeding 45,000 ft² (4180 m²) is permitted to be by access panels or other hardware not complying with the door requirements of 7.2.1.

A.7.15.1.1

The Phase I emergency recall operation mandated by the firefighters' emergency operation provisions of ASME A17.1/CSA B 44, *Safety Code for Elevators and Escalators*, recalls elevators upon detection of smoke by smoke detectors installed in the following locations:

- (1) At each floor served by the elevator in the lobby (landing) adjacent to the hoistway doors
- (2) In the associated elevator machine/control room or machinery/control space
- (3) In the elevator hoistway where sprinklers are located in the hoistway

Where smoke from a fire remote from the elevator lobby (landing), elevator machine/control room or machinery/control space, and elevator hoistway can be kept from reaching the elevator lobby (landing), elevator machine/control room or machinery/control space, and elevator hoistway, the associated elevators can continue to operate in a fire emergency. The provisions of Section 7.15 address the features that need to be provided to make such elevator operation safe for evacuation.

A.7.15.1.3

The occupant evacuation operation requirements of ASME A17.1/CSA B44, *Safety Code for Elevators and Escalators*, address the elevator-related features for occupant evacuation elevators — features for which an elevator code has jurisdiction. The requirements were written assuming that necessary and complementary provisions that are not within the purview of an elevator code would be addressed in building, life safety, and fire codes. ASME A17.1/CSA B44 Annex T, titled "Building Features for Elevator Occupant Evacuation Operation (OEO)," lists the building construction features assumed to be present for coordinated use with its provisions for OEO.

A.7.15.3.1

Building occupants have traditionally been taught not to use elevators in fire or similar emergencies. The emergency action plan should include more than notification that the elevators can be used for emergency evacuation. The plan should include training to make occupants aware that the elevators will be available only for the period of time prior to elevator recall via smoke detection in the elevator lobby, elevator machine/control room or machinery/control space, or elevator hoistway. Occupants should be prepared to use the exit stairs, which are required to be directly accessible from the elevator lobby by 7.15.9.3, where the elevator has been called out of service.

A.7.15.4.2

The emergency voice/alarm communication system with the ability to provide voice directions on a selective basis to any building floor might be used to instruct occupants of the fire floor who are able to use stairs to relocate to a floor level below. The selective voice notification feature might be used to provide occupants of a given elevator lobby with a status report or supplemental instructions.

A.7.15.4.3

An audible notification appliance will need to be positioned in the elevator lobby in order to meet the requirement of 7.15.3.4. The continued use of the occupant evacuation elevator system is predicated on elevator lobby doors that are closed to keep smoke from reaching the elevator lobby smoke detector that is arranged to initiate the Phase I emergency recall operation.

A.7.15.5.2

The presence of sprinklers in the elevator machine/control room or machinery/control space would necessitate the installation of a shunt trip for automatically disconnecting the main line power for compliance with ASME A17.1/CSA B44, *Safety Code for Elevators and Escalators*, as it is unsafe to operate elevators while sprinkler water is being discharged in the elevator machine/control room or machinery/control space. The presence of a shunt trip conflicts with the needs of the occupant evacuation elevator, as it disconnects the power without ensuring that the elevator is first returned to a safe floor so as to prevent trapping occupants.

A.7.15.5.3

NFPA 13 permits sprinklers to be omitted from the top of the elevator hoistway where the hoistway for passenger elevators is noncombustible and the car enclosure materials meet the requirements of ASME A17.1/CSA B44, *Safety Code for Elevators and Escalators*. The provision of 7.15.5.3 restricts occupant evacuation elevators to passenger elevators that are in noncombustible hoistways and for which the car enclosure materials meet the requirements of ASME A17.1/CSA B 44.

A.7.15.6.2

Elevator shunt breakers are intended to disconnect the electric power to an elevator prior to sprinkler system waterflow impairing the functioning of the elevator. The provision of 7.15.5.2 prohibits the installation of sprinklers in the elevator machine/control room or machinery/control space and at the top of the elevator hoistway, obviating the need for shunt breakers. The provision of 7.15.6.2 is not actually an exemption to the provisions of ASME A17.1/CSA B44, *Safety Code for Elevators and Escalators*, as ASME A17.1/CSA B44 requires the automatic main line power disconnect (shunt trip) only where sprinklers are located in the elevator machine/control room or machinery/control space or in the hoistway where it could cause unsafe elevator operation. The provision of 7.15.5.2 prohibits sprinklers in the elevator machine/control room and machinery/control space. The provision of 7.15.5.3 prohibits sprinklers at the top of the hoistway and at other points in the hoistway more than 24 in. (610 mm) above the pit floor in recognition of the limitations on combustibility established by 7.15.6.3.

A.7.15.7.1

The minimum 2-hour fire-resistance-rated separation is based on the omission of sprinklers from the elevator machine room in accordance with 7.15.5.3.

A.7.15.7.2

The requirement of 7.15.7.2 is consistent with that in ASME A17.1/CSA B44, *Safety Code for Elevators and Escalators*, which permits only machinery and equipment used in conjunction with the function or use of the elevator to be in the elevator machine/control room or machinery/control space. An inspection program should be implemented to ensure that the elevator machine/control room or machinery/control space is kept free of storage.

A.7.15.8.3

Wiring or cables that provide control signals are exempt from the protection requirements of 7.15.8.2, provided that such wiring or cables, where exposed to fire, will not disable Phase II emergency in-car operation once such emergency operation has been activated.

A.7.15.9.2

Elevator lobbies provide a safe place for building occupants to await the elevators and extend the time available for such use by providing a barrier to smoke and heat that might threaten the elevator car or hoistway. Smoke detectors within the elevator lobbies are arranged to initiate a Phase I emergency recall operation if the lobby is breached by smoke.

A.7.15.9.6

The performance-based language of 7.15.9.6 permits alternate design options to prevent water from an operating sprinkler system from infiltrating the hoistway enclosure. For example, such approved means might include drains and sloping the floor. The objective of the water protection requirement is to limit water discharged from sprinklers operating on the floor of fire origin from entering the hoistway, as it might by flowing into the lobby and under the landing doors, interfering with safety controls normally located on the front of the elevator car. A small flow of water (of the order of the flow from a single sprinkler) should be able to be diverted by the landing doorway nose plate to the sides of the opening, where it can do little harm. The requirement is intended to protect from water from sprinklers outside the elevator lobby, since the activation of sprinklers in the lobby would be expected to be preceded by activation of the lobby smoke detector that recalls the elevators.

Water protection can be achieved in any of several ways. Mitigation features that should be effective in keeping the waterflow from a sprinkler out of the hoistway include the following:

- (1) Raised lip in accordance with 7.1.6.2 and a floor drain
- (2) Sloped floor and a floor drain
- (3) Sealed sill plates and baseboards on both sides of the lobby partitions and along the perimeter of the hoistway shaft

A.7.16

Devices that comply with ANSI/RESNA ED-1, *Emergency Stair Travel Devices Used by Individuals with Disabilities*, have been evaluated and are intended for use on stairs that comply with Table 7.2.2.2.1.1(a) that are not steeper than 32.5 degrees [maximum 7 in. (180 mm) riser height, minimum 11 in. (280 mm) tread depth]. Such devices have not been evaluated for use on steeper, older stairs that comply with Table 7.2.2.2.1.1(b) and are not steeper than 41.6 degrees [maximum 8 in. (205 mm) riser height, minimum 9 in. (230 mm) tread depth]. Where the building has stairs that are steeper than 32.5 degrees, the device manufacturer should be consulted.

A.8.2.1.2

Table A.8.2.1.2 is from *NFPA 5000* and is reproduced in this annex for the convenience of users of this *Code*.

It is not the intent to require exterior walls to be protected against exterior fire exposure except where specifically required by NFPA 220 or *NFPA 5000*. Other building codes might also require protection from the exterior in some circumstances. The presence of fire sprinklers or an occupiable exterior space, such as a porch or balcony, does not require protection against exterior fire exposure unless specifically required elsewhere.

Table A.8.2.1.2 Fire Resistance Ratings for Type I Through Type V Construction (hours)

Construction Element	Type I		Type II			Type III		Type IV	Type V		
	442	332	222	111	000	211	200	2HH	111	000

[5000:Table 7.2.1.1]

A.8.2.2.5

Acceptable wording can read as follows:

2-HOUR FIRE BARRIER, SMOKE BARRIER —

PROTECT ALL OPENINGS

A.8.2.3.1

ASTM E119, *Standard Test Methods for Fire Tests of Building Construction and Materials*, and UL 263, *Fire Tests of Building Construction and Materials*, are considered nationally recognized methods of determining fire resistance and have been found to yield equivalent test results. Materials used to construct fire-resistance-rated elements and assemblies might include spray fire-resistive materials (SFRM), intumescent fire-resistive materials (IFRM), and other materials or systems conforming to 8.2.3.1. The materials or systems are installed and inspected in accordance with the listed design, construction documents, and the manufacturer's installation instructions that describe the thickness, type, or other characteristics of materials or systems required to meet the fire resistance rating.

A.8.2.4

Performance-based design methods using design fires other than those specified in ASTM E119, *Standard Test Methods for Fire Tests of Building Construction and Materials*, or UL 263, *Fire Tests of Building Construction and Materials*, are permitted to be used when approved by the authority having jurisdiction.

Methodologies such as Appendix E ("Performance-Based Design Procedures for Fire Effects on Structures") of ASCE/SEI 7-46, *Minimum Design Loads for Buildings and Other Structures*, provide a structured framework for conducting such analyses. Additional tools include SFPE S.01, *Standard on Calculating Fire Exposures to Structures*, which provides a methodology on how to estimate the thermal exposure to a structure from a resulting fire and SFPE S.02, *Engineering Standard on Calculation Methods to Predict the Thermal Performance of Structural and Fire Resistive Assemblies*, which provides a methodology on how to determine the temperature history with a structure.

Other alternative methods based upon sound engineering principles can also be considered as appropriate for the structure based upon more severe design conditions.

A.8.2.4.2

The intent of this provision is to allow the provisions of either ASCE/SEI/SFPE 29, *Standard Calculation Methods for Structural Fire Protection*, or ACI 216.1/TMS-0246.4, *Code Requirements for Determining Fire Resistance of Concrete and Masonry Construction Assemblies*, for the calculation for fire resistance of concrete or masonry elements or assemblies.

A.8.3.1.1(4)

Walls in good condition with lath and plaster, or gypsum board of not less than ½ in. (13 mm) on each side, can be considered as providing a minimum ½-hour fire resistance rating. Additional information on archaic material assemblies can be found in Annex O of NFPA 914.

A.8.3.1.2

To ensure that a fire barrier is continuous, it is necessary to seal completely all openings where the fire barrier abuts other fire barriers, the exterior walls, the floor below, and the floor or ceiling above. In 8.3.1.2(2), the fire resistance rating of the bottom of the interstitial space is provided by that membrane alone. Ceilings of rated floor/ceiling and roof/ceiling assemblies do not necessarily provide the required fire resistance.

A.8.3.2.1.1

Fire-resistance-rated glazing complying with 8.3.2, where not installed in a door, is considered a wall, not an opening protective.

A.8.3.3.2.1

Some door assemblies have been tested to meet the conditions of acceptance of ASTM E119, *Standard Test Methods for Fire Tests of Building Construction and Materials*, or UL 263, *Fire Tests of Building Construction and Materials*. Where such assemblies are used, the provisions of 8.3.2 should be applied instead of those of 8.3.3.2.1.

A.8.3.3.2.2

Longer ratings might be required where opening protectives are provided for property protection as well as life safety. NFPA 80 should be consulted for standard practice in the selection and installation of fire door assemblies and fire window assemblies.

A vision panel in a fire door is not a fire window, and, thus, it is not the intent of the "NP" notations in the "Fire Window Assemblies" column of Table 8.3.3.2.2 to prohibit vision panels in fire doors.

Table 8.3.3.2.2 with regard to glazing is intended for new construction and could have limited application to existing glazing installations. For example, existing vision panels of 100 in.² (0.065 m²) of wired glass in 60-minute and 90-minute doors and existing vision panels of 1296 in.² (0.84 m²) wired glass in doors 45 minutes or less have been accepted.

Historically, installations of wired glass did not require marking. There could be existing installations of other glazing products used as opening protectives (e.g., vision panels, side lights, or transom panels) that also might not have markings. It is the building owner's responsibility to provide documentation acceptable to the AHJ regarding the product used and its compliance with the applicable provisions of this *Code*.

Existing fire windows, where permitted, were traditionally allowed to have up to 1296 in.² (0.84 m²) of wired glass per panel.

A.8.3.3.3

Some door assemblies have been tested to meet the conditions of acceptance of ASTM E119, *Standard Test Methods for Fire Tests of Building Construction and Materials*, or UL 263, *Fire Tests of Building Construction and Materials*. Where such assemblies are used, the provisions of 8.3.2 should be applied instead of those of 8.3.3.3.

In existing installations, steel door frames that are well set in the wall might be judged as acceptable even if the frame label is not legible.

A.8.3.3.3.1

Where a door or door frame is not required to be fire protection rated and is equipped with a fire protection listing label, the door and the door frame is not required to comply with NFPA 80.

A.8.3.3.5.3

Some doors and glazing assemblies have been tested to meet the conditions of acceptance of ASTM E119, *Standard Test Methods for Fire Tests of Building Construction and Materials*, or UL 263, *Fire Tests of Building Construction and Materials*. Where such assemblies are used, the provisions of 8.3.2 should be applied instead of those of 8.3.3.6.6.

A.8.3.3.6.6

Some window assemblies have been tested to meet the conditions of acceptance of ASTM E119, *Standard Test Methods for Fire Tests of Building Construction and Materials*, or UL 263, *Fire Tests of Building Construction and Materials*. Where such assemblies are used, the provisions of 8.3.2 should be applied instead of those of 8.3.3.6.6.

A.8.3.4.2

Firestop materials become systems when installed to the listed firestop system design from an accredited testing laboratory. Installation of firestop materials to the listed system should meet all limitations of the system.

There are management-system-based contractor approval or qualification programs offered by third-party, independent companies that quantifiably qualify a company to install firestop materials that become systems after proper installation. In each program, there is an industry firestop exam that gives the company a basis to appoint a "Designated Responsible Individual."

Then, the third-party firm audits the firestop company's product and systems documentation records in conjunction with the company's management system operational policies and procedures to verify company compliance. An audit also takes place on a project site to verify that the management system is working.

Where the configuration of a penetrating item or group of items is such that a listed system is determined to be nonexistent and reconfiguration of the penetrations or fire-resistance-rated assembly is determined to be impractical or impossible, alternative methods for maintaining the integrity of the required fire resistance rating of the assembly should be permitted to be established using an engineering analysis based on a comparison of listed systems prepared by a manufacturer's technical representative of the systems specified, by the laboratory that conducted the original test, or by a professional engineer.

ASTM E2174, *Standard Practice for On-Site Inspection of Installed Fire-Stops Firestop Systems*, provides guidance for the inspection of through-penetration firestop systems tested in accordance with ASTM E814, *Standard Test Method for Fire Tests of Through-Penetration Fire-Stops Firestop Systems*, and UL 1479, *Fire Tests of Through-Penetration Firestops*.

Independent inspection paid for by the owner is in many specifications and referenced in this annex using ASTM E2174 and ASTM E2393, *Standard Practice for On-Site Inspection of Installed Fire Resistive Joint Systems and Perimeter Fire Barriers*. As a result, there is an accreditation program available for firestop special inspection agencies.

A.8.3.4.7.3(1)(c)

Criteria associated with fireblocking can be found in 8.14.2 of *NFPA 5000*.

A.8.3.5.2.1

Materials used to protect joints become systems when installed to the listed joint system design from an accredited testing laboratory. Installation of joint materials to the listed system should meet all limitations of the system.

There are management-system-based contractor approval or qualification programs offered by third-party, independent companies that quantifiably qualify a company to install firestop materials that become systems after proper installation. In each program, there is an industry firestop exam that gives the company a basis to appoint a "Designated Responsible Individual."

Then, the third-party firm audits the firestop company's product and systems documentation records in conjunction with the company's management system operational policies and procedures to verify company compliance. An audit also takes place on a project site to verify that the management system is working.

Where the configuration of a joint is such that a listed system is determined to be nonexistent and reconfiguration of the joint or fire-resistance-rated assembly is determined to be impractical or impossible, alternative methods for maintaining the integrity of the required fire resistance rating of the assembly should be permitted to be established using an engineering analysis based on a comparison of listed systems prepared by a manufacturer's technical representative of the systems specified, by the laboratory that conducted the original test, or by a professional engineer.

On-site inspection of firestopping is important in maintaining the integrity of any vertical or horizontal fire barrier. Two standard practice documents were developed with the ASTM process to allow inspections of through-penetration firestops, joints, and perimeter fire barrier systems. ASTM E2393, *Standard Practice for On-Site Inspection of Installed Fire Resistive Joint Systems and Perimeter Fire Barriers*, provides guidance for the inspection of fire-resistive joints and perimeter fire barrier joint systems tested in accordance with the requirements of ASTM E1966, *Standard Test Method for Fire-Resistive Joint Systems*, or with UL 2079, *Tests for Fire Resistance of Building Joint Systems*. ASTM E2393 contains a standardized report format, which would lead to greater consistency for inspections.

Independent inspection paid for by the owner is in many specifications and referenced in this annex using ASTM E2393. As a result, there is an accreditation program available for firestop special inspection agencies.

A.8.3.5.4

The provisions of 8.3.5.4 are intended to restrict the interior vertical passage of flame and hot gases from one floor to another at the location where the floor intersects the exterior wall assembly. The requirements of 8.3.5.4 mandate sealing the opening between a floor and an exterior wall assembly to provide the same fire performance as that required for the floor. ASTM E2307, *Standard Test Method for Determining Fire Resistance of Perimeter Fire Barrier Systems Using Intermediate-Scale, Multi-Story story Test Apparatus*, is a test method for evaluating the performance of perimeter fire barrier systems. Some laboratories have tested and listed perimeter fire barrier systems essentially in accordance with the ASTM method. The ASTM test method evaluates the performance of perimeter fire barrier systems in terms of heat transfer and fire spread inside a building through the floor/exterior wall intersection. The current test method does not assess the ability of perimeter fire barrier systems to prevent the spread of fire from story to story via the exterior. However, some laboratories have included additional temperature measurement criteria in their evaluation of the exterior wall and evaluation of vision glass breakage as additional pass/fail criteria in an attempt to at least partially address this "leapfrog" effect.

A.8.4.1

Although a smoke partition is intended to limit the free movement of smoke, it is not intended to provide an area that would be free of smoke.

A.8.4.2(2)

The provision for terminating the smoke partition at the ceiling is not intended to prevent the wall from extending above the ceiling.

An architectural, exposed, suspended-grid acoustical tile ceiling with penetrations for sprinklers, ducted HVAC supply and return-air diffusers, speakers, and recessed light fixtures is capable of limiting the transfer of smoke.

A.8.4.3.4

Gasketing of doors should not be necessary, as the clearances in NFPA 80 effectively achieve resistance to the passage of smoke if the door is relatively tight-fitting.

A.8.4.6.2

An air-transfer opening, as defined in NFPA 90A is an opening designed to allow the movement of environmental air between two contiguous spaces.

A.8.5.1

Wherever smoke barriers and doors therein require a degree of fire resistance, as specified by requirements in the various occupancy chapters (Chapters 12 through 42), the construction should be a fire barrier that has been specified to limit the spread of fire and restrict the movement of smoke.

Although a smoke barrier is intended to restrict the movement of smoke, it might not result in tenability throughout the adjacent smoke compartment. The adjacent smoke compartment should be safer than the area on the fire side, thus allowing building occupants to move to that area. Eventually, evacuation from the adjacent smoke compartment might be required.

A.8.5.2

To ensure that a smoke barrier is continuous, it is necessary to seal completely all openings where the smoke barrier abuts other smoke barriers, fire barriers, exterior walls, the floor below, and the floor or ceiling above. It is not the intent to prohibit a smoke barrier from stopping at a fire barrier if the fire barrier meets the requirements of a smoke barrier (i.e., the fire barrier is a combination smoke barrier/fire barrier).

A.8.5.4.1

For additional information on the installation of smoke control door assemblies, see NFPA 105.

A.8.5.4.4

Where, because of operational necessity, it is desired to have smoke barrier doors that are usually open, such doors should be provided with hold-open devices that are activated to close the doors by means of the operation of smoke detectors and other alarm functions.

A.8.6.2

Openings might include items such as stairways; hoistways for elevators, dumbwaiters, and inclined and vertical conveyors; shaftways used for light, ventilation, or building services; or expansion joints and seismic joints used to allow structural movements.

A.8.6.5

The application of the 2-hour rule in buildings not divided into stories is permitted to be based on the number of levels of platforms or walkways served by the stairs.

A.8.6.6(7)

Given that a mezzanine meeting the maximum one-third area criterion of 8.6.10.2.1 is not considered a story, it is permitted, therefore, to have 100 percent of its exit access within the communicating area run back through the story below.

A.8.6.7

Where atriums are used, there is an added degree of safety to occupants because of the large volume of space into which smoke can be dissipated. However, there is a need to ensure that dangerous concentrations of smoke are promptly removed from the atrium, and the exhaust system needs careful design. For information about systems that can be used to provide smoke protection in these spaces, see the following:

(1) NFPA 92, *Standard for Smoke Control Systems*

(2) *Principles of Smoke Management*

A.8.6.7(1)(c)

The intent of the requirement for closely spaced sprinklers is to wet the atrium glass wall to ensure that the surface of the glass is wet upon operation of the sprinklers, with a maximum spacing of sprinklers of 6 ft (1830 mm) on centers. Provided that it can be shown that the glass can be wet by the sprinklers using a given discharge rate, and that the 6 ft (1830 mm) spacing is not exceeded, the intent of the requirement is met. It is important that the entire glass area surface is wet. Due consideration should be given to the height of the glass panels and any horizontal members that might interfere with sprinkler wetting action.

A.8.6.7(1)(c)iii.

If the glass is in a location hazardous to human impact, it should comply with 16 CFR 1201 or ANSI Z97.1, *Safety Glazing Materials Used in Buildings — Safety Performance Specifications and Methods of Test*. A retention system can include gasketing, framing, or fixed framing.

A.8.6.7(5)

See NFPA 92. The engineering analysis should include the following elements:

- (1) Fire dynamics, including the following:
 - (a) Fire size and location
 - (b) Materials likely to be burning
 - (c) Fire plume geometry
 - (d) Fire plume or smoke layer impact on means of egress
 - (e) Tenability conditions during the period of occupant egress
- (2) Response and performance of building systems, including passive barriers, automatic detection and extinguishing, and smoke control
- (3) Response time required for building occupants to reach building exits, including any time required to exit through the atrium as permitted by 8.6.7(2)

A.8.6.7(6)

Activation of the ventilation system by manual fire alarms, extinguishing systems, and detection systems can cause unwanted operation of the system, and it is suggested that consideration be given to zoning of the activation functions so the ventilation system operates only when actually needed.

A.8.6.9.1(3)

The intent of this requirement is to provide the same separation as required for corridor walls of the applicable occupancy chapter. For example, a convenience opening on one floor in a health care occupancy would be required to be separated from the corridor and areas open to the corridor on the adjacent floor by a barrier that limits the transfer of smoke in accordance with 18.3.6.2.3, not a 1-hour rated wall with opening protectives.

A.8.6.9.1(4)

The intent of this requirement is to prohibit a communication of two compartments on the same floor via two convenience openings. This is represented in Figure A.8.6.9.1(4).

Figure A.8.6.9.1(4) Examples of Convenience Openings That Communicate with Two Compartments on Same Floor in Violation of 8.6.9.1(4).

**A.8.6.9.1(6)**

This requirement prohibits means of egress down or up the convenience opening. It does not prohibit means of escape from running down or up the convenience opening within residential dwelling units.

A.8.6.9.2(3)

Draftstops protecting vertical openings that are defined in the requirements of NFPA 13 are curtain style descending from the ceiling surface or plane.

A.8.6.9.7(2)

The intent is to place a limitation on the size of the opening to which the protection applies. The total floor opening should not exceed twice the projected area of the escalator or moving walk at the floor. Also, the arrangement of the opening is not intended to circumvent the requirements of 8.6.7.

As with any opening through a floor, the openings around the outer perimeter of the escalators should be considered as vertical openings.

A.8.6.11.2(2)

See NFPA 90A.

A.8.6.11.3

A wood structural panel is a panel manufactured from veneers, or wood strands or wafer, or a combination of veneer and wood strands or wafers bonded together with waterproof synthetic resins or other suitable bonding systems, including composite panels, oriented strand board, and plywood.

A.8.7.1.1

Areas requiring special hazard protection include, but are not limited to, areas such as those used for storage of combustibles or flammables, areas housing heat-producing appliances, or areas used for maintenance purposes.

A.8.7.2

For details, see NFPA 68.

A.8.7.3.2

NFPA 58 permits the use of portable butane-fueled appliances in restaurants and in attended commercial food catering operations where fueled by a maximum of two 10 oz (0.28 kg) LP-Gas capacity, nonrefillable butane containers with a water capacity not in excess of 1.08 lb (0.4 kg) per container. Containers are required to be directly connected to the appliance, and manifolding of containers is not permitted. Storage of cylinders is limited to 24 containers, with an additional 24 permitted where protected by a 2-hour fire-resistance-rated barrier. (See 4.1.3 and Annex C for referenced documents on hazardous materials.)

A.8.7.3.3

The total quantities of ignitable (flammable or combustible) liquids in any area should comply with the provisions of other recognized codes, including NFPA 1 and NFPA 30. In addition, special consideration should be given to the following:

- (1) Obstructions created by the installation of hand-rub solution dispensers
- (2) Location of dispensers with regard to adjacent combustible materials and potential sources of ignition, especially where dispensers are mounted on walls of combustible construction
- (3) Requirements for other fire protection features, including complete automatic sprinkler protection, to be installed throughout the compartment
- (4) Amount and location of the flammable solutions, both in use and in storage, particularly with respect to potential for leakage or failure of the dispenser

A.8.7.5

While the scope of NFPA 99 is limited to health care occupancies, it is the intent that this requirement be applied to hyperbaric facilities used in all occupancies.

A.8.8

Doors covered by this section include smoke barrier doors, doors in smoke partitions, and doors serving hazardous areas. Paragraph 7.2.1.14 addresses inspection and testing of means of egress doors. Paragraph 8.2.2.4 addresses maintenance of doors required to be smoke leakage. Paragraph 8.3.3.3 addresses the inspection and testing of fire doors.

A.9.4.1

Under certain conditions, elevators are recognized as means of egress.

The use of elevators for emergency evacuation purposes, where operated by trained emergency service personnel (e.g., building personnel, fire personnel), should be incorporated into the building evacuation program. Elevators are normally capable of manual, in-car firefighter operation (Phase II) after elevator recall (Phase I). In addition, there usually are two or more shafts wherever there are more than three elevators, which further enhances the possibilities for elevator use during an emergency evacuation where operated by trained personnel.

In high-rise buildings, in towers, or in deep underground spaces where travel over considerable vertical distance on stairs can cause persons incapable of such physical effort to collapse before they reach the street exit, stairways are permitted to be used for initial escape from the immediate area of danger, and elevators are permitted to be used to complete the travel to the street.

It can be reasonably assumed that, in all buildings of sufficient height to indicate the need for elevators, elevators will be provided for normal use; for this reason, no requirements for mandatory installation of elevators are included in the *Code*.

For additional information on elevators, see ASME A17.1/CSA B44, *Safety Code for Elevators and Escalators*, and ASME A17.3, *Safety Code for Existing Elevators and Escalators*.

A.9.4.5

Continued operation of solid-state elevator equipment is contingent on maintaining the ambient temperature in the range specified by the elevator manufacturer. If the machine room ventilation/air-conditioning is connected to the general building system, and that system is shut down during a fire, the fire department might lose the use of elevators due to excessive heat in the elevator machine room.

A.9.6.1

The provisions of Section 9.6 cover the basic functions of a complete fire alarm system, including fire detection, alarm, and communications. These systems are primarily intended to provide the indication and warning of abnormal conditions, the summoning of appropriate aid, and the control of occupancy facilities to enhance protection of life.

Some of the provisions of Section 9.6 originated with *NFPA 72*. For purposes of this *Code*, some provisions of Section 9.6 are more stringent than those of *NFPA 72*, which should be consulted for additional details.

A.9.6.1.5

Records of conducted maintenance and testing and a copy of the certificate of compliance should be maintained.

A.9.6.2.5

It is not the intent of 9.6.2.5 to require manual fire alarm boxes to be attached to movable partitions or to equipment, nor is it the intent to require the installation of permanent structures for mounting purposes only.

A.9.6.2.6

The manual fire alarm box required by 9.6.2.6 is intended to provide a means to manually activate the fire alarm system when the automatic fire detection system or waterflow devices are out of service due to maintenance or testing, or where human discovery of the fire precedes automatic sprinkler system or automatic detection system activation. Where the fire alarm system is connected to a monitoring facility, the manual fire alarm box required by 9.6.2.6 should be connected to a separate circuit that is not placed "on test" when the detection or sprinkler system is placed "on test." The manual means is only intended for use by the system technician or the building owner and should be located by the sprinkler riser or fire alarm control unit.

A.9.6.2.7

Manual fire alarm boxes can include those with key-operated locks for detention areas or psychiatric hospitals, manual fire alarm boxes in areas where explosive vapors or dusts might be a hazard, or manual fire alarm boxes in areas with corrosive atmospheres. The appearance of manual fire alarm boxes for special uses often differs from those used in areas of normal occupancy. Manual fire alarm boxes, such as those with locks, that are located in areas where the general public has limited access might need to have signage advising persons to seek assistance from staff in the event a fire is noted.

[See CC-654](#)

A.9.6.2.10.5

Figure A.9.6.2.10.5(a) Example of Zone of Exclusion (gray area) Within Typical Residential Kitchen. [72: Figure A.29.8.3.4(4)(a)]

Figure A.9.6.2.10.5(d) Example of Exception Placement of Photoelectric Smoke Alarm or Smoke Detector at 72 in. (1.83 m) from Stationary or Fixed Cooking Appliance. [72: Figure A.29.8.3.4(4)(d)]

See CC-654

PCs [2]

A.9.6.2.10.7

Studies indicate that smoke alarms and smoke detectors that use ionization detection, photoelectric detection, or a combination of ionization and photoelectric detection are susceptible to nuisance alarms caused by steam. Little research has been done on the comparative response of these types of detection to steam. Steam particles, in general, are visible, reflect light easily, and are typically produced in a size range that would be more likely to activate a photoelectric sensor. Thus, it is required that smoke alarms and smoke detectors be installed greater than 36 in. (914 mm) from the bathroom door where possible. Increasing the distance between the smoke alarm or smoke detector and the bathroom door can reduce the frequency of nuisance alarms from bathroom steam. Frequent nuisance alarms can result in the occupant disabling the smoke alarm. Each incremental increase in separation, up to 10 ft (3.0 m), between the bathroom door and the smoke alarm or smoke detector is expected to reduce the frequency of nuisance alarms. [72: A.29.8.3.4(6)]

See SCR

PCs [1]

A.9.6.2.10.7.1

NFPA 72 mandates smoke alarms in all sleeping rooms, and interconnection of smoke alarms is required for both new and existing installations. Per 9.6.2.10.1, the residential occupancy chapters determine whether smoke alarms are needed within sleeping rooms. Paragraph 9.6.2.10.4 9.6.2.10.7.1 limits the requirement for interconnection of smoke alarms to those in new construction. This Code does not intend to require compliant, existing smoke alarm installations to be interconnected. This Code is periodically revised to add retrospective requirements only where the need is clearly substantiated.

PCs [1]

A.9.6.2.10.7.2

A dwelling unit is that structure, area, room, or combination of rooms, including hotel rooms/suites, in which a family or individual lives. A dwelling unit includes living areas only and not common usage areas in multifamily buildings, such as corridors, lobbies, and basements.

A.9.6.3.2.1

Elevator lobbies have been considered areas subject to unwanted alarms due to factors such as low ceilings and smoking. In the past several years, new features have become available to reduce this problem. These features are, however, not necessarily included in any specific installation.

A.9.6.3.2.2

The concept addressed is that detectors used for releasing service, such as door or damper closing and fan shutdown, are not required to sound the building alarm.

A.9.6.3.2.3

The concept addressed is that detectors used for releasing service, such as door or damper closing and fan shutdown, are not required to sound the building alarm.

A.9.6.3.6.7

Visual notification appliances installed in large-volume spaces, such as arenas, stadiums, mall concourses, and atriums, can be alternative devices that are not listed as visible notification appliances for fire alarm systems, provided that the notification objective of the visual signal is reasonably achieved. Examples of alternative devices include, but are not limited to, scoreboards, message boards, and other electronic devices that meet the performance objectives of visible fire alarm appliances in large-volume spaces.

It is the intent to permit the omission of visible notification appliances as identified in 9.6.3.6.7, provided that the adjacent areas that have not been specifically designated as exempt are provided with visible notification as required by 9.6.3.6.

A.9.6.3.6.8

Documentation should be maintained with the as-built drawings so that inspection and testing personnel understand that the visible appliances have been exempted from certain areas and, therefore, can note the deviation on the acceptance test documentation and ongoing inspection reports. This will provide inspection and testing personnel with necessary details regarding the omission of visible notification appliances.

A.9.6.3.7.2

To approve an evacuation plan to selectively notify building occupants, the authority having jurisdiction should consider several building parameters, including building compartmentation, detection and suppression system zones, occupant loads, and the number and arrangement of the means of egress.

In high-rise buildings, it is typical to evacuate the fire floor, the floor(s) above, and the floor immediately below. Other areas are then evacuated as the fire develops.

A.9.6.3.10.2

The provisions of 9.6.3.10.2 offer an alternative to the emergency voice alarm and communications system provisions (live voice or recorded voice announcements) of *NFPA 72*. Occupancies such as large-venue assembly occupancies and mercantile mall structures are occupancies in which the physical configuration (e.g., large-volume spaces), function, and human behavior (including elevated levels of occupant-generated noise) present challenges with respect to effective occupant notification by standard means in accordance with *NFPA 72*. Because the routine operation of these occupancies demands highly reliant, acoustically capable, and sufficiently audible public address systems, properly trained staff can be relied on to use these public address systems to effect occupant evacuation, relocation, or both.

As 9.6.3.10.2 specifically permits an alternative means of notification to that prescribed by *NFPA 72*, it does not mandate that the secondary power supply and the intelligibility and audibility facets of the public address system comply with *NFPA 72* or suggest that equivalency with the related provisions of *NFPA 72* is required. However, it is anticipated that, when approving the secondary power and audibility capabilities of public address systems, authorities having jurisdiction will ensure that these systems are conceptually comparable to the emergency voice alarm and communications system provisions of *NFPA 72*, such that a reliable and effective occupant notification system is provided.

A.9.6.5

The intent is to prevent unwanted alarms from directly reporting to the emergency forces call center. MIY systems are not intended to be an alternative to a supervising station connection.

A.9.7.1.1

For a discussion of the effectiveness of automatic sprinklers, as well as a general discussion of automatic sprinklers, see the *NFPA Fire Protection Handbook*. Where partial sprinkler protection is permitted by another section of this *Code*, the limited area systems provisions of *NFPA 13* should apply.

A.9.7.1.4

Properly designed automatic sprinkler systems provide the dual function of both automatic alarms and automatic extinguishment. Dual function is not provided in those cases where early detection of incipient fire and early notification of occupants are needed to initiate actions in behalf of life safety earlier than can be expected from heat-sensitive fire detectors.

A.9.8.1

There are typically two different ways that extinguishing systems other than fire sprinkler systems are used. The first is when the entire building is protected with one of these alternate systems. When this is the case, the exceptions, reductions, and alternative code provisions that are offered as options when fire sprinkler systems are installed should not be granted to the other extinguishing system unless the other system has demonstrated the same temperature control during a fire and reliability of operation as a fire sprinkler system. Reliability of operation needs to extend to the long-term use of the other system and an analysis of the reliability of the component parts. Some component of other extinguishing systems can show reliability data from their use in systems outside of fire protection where they get exercised on a regular basis, but acceptance on this basis is cautioned because many mechanical parts that sit for a long time without being exercised, as fire protection systems need to do, might not have the same reliability. A reliability analysis should also take into account inspection, testing, and maintenance criteria and the likelihood of a building owner knowing and understanding what needs to be performed to keep the other system operational.

The second manner in which other systems are used as alternatives to fire sprinkler systems are in individual rooms or spaces of otherwise sprinklered occupancies. Here the authority having jurisdiction needs to use some judgment in the application of exceptions, reductions, and alternative code provisions that are offered for sprinklered occupancies. The permission to utilize such exceptions, reductions, and alternative code provisions far from the space with the other fire protection system should be granted. Closer to the space with the alternate system, exceptions, reductions, and alternate code provisions for sprinklers could be granted if the system was analyzed as discussed above and found to be equivalent to a fire sprinkler system.

A.9.9

For a description of standard types of extinguishers and their installation, maintenance, and use, see *NFPA 10*. The labels of recognized testing laboratories on extinguishers provide evidence of tests indicating the reliability and suitability of the extinguisher for its intended use. Many unlabeled extinguishers are offered for sale that are substandard by reason of insufficient extinguishing capacity, questionable reliability, or ineffective extinguishing agents for fires in ordinary combustible materials or because they pose a personal hazard to the user.

A.9.11.4.2

It is intended that the requirements in 9.11.4.1.2 be applied to retesting of any integrated systems following repair or replacement of equipment in lieu of applying retesting provisions in *NFPA 4*.

A.9.12.1

At present there is no product performance listing for duct-mounted carbon monoxide detectors because there is no peer-reviewed research to determine what the alarm thresholds for duct-mounted carbon monoxide detectors should be. There are considerable differences between the operation of a spot-type carbon monoxide detector and a duct-mounted carbon monoxide detector. The environment in ducts can be very harsh and could impact the carbon monoxide detector's sensing element. Furthermore, in most buildings, there are periods when the HVAC system is not moving significant quantities of air from the compartments it serves. As a result, the carbon monoxide detection system cannot be designed to rely on the HVAC system operation for the transport of carbon monoxide to the carbon monoxide detectors. [72:A.17.12.3]

A.9.14

This section does not require mass notification systems, it only provides direction for the risk analysis. Where the risk analysis and resulting action plan identifies a need for a mass notification system, *NFPA 72* should be used for design and installation requirements.

A.9.14.1

A risk analysis will determine whether a mass notification system is required in addition to the life safety emergency communication systems required by this *Code*. The risk analysis might show that no additional notification is required.

A.9.15

In-building emergency responder communications enhancement systems provide for greater flexibility and safety for emergency responders during in-building operations relating to fire and non-fire emergencies.

A.9.15.3

In existing buildings, it might be difficult to meet the minimum signal strength required by *NFPA 1225*. The authority having jurisdiction might determine that certain areas of a building do not need to meet the signal strength coverage required by *NFPA 1225*. The authority having jurisdiction might also determine that compliance with the minimum in-building emergency responder communications enhancement system outlined in *NFPA 1225* is appropriate.

A.10.2

The requirements pertaining to interior finish are intended to restrict the spread of fire over the continuous surface forming the interior portions of a building.

The requirements are based on fire testing to *NFPA 286* (with the criteria of 10.2.3.2), which apply to all interior finish materials. Many interior finish materials are permitted to be tested based on other fire tests, such as ASTM E84, *Standard Test Method for Surface Burning Characteristics of Building Materials*, UL 723, *Test for Surface Burning Characteristics of Building Materials*, or *NFPA 265* as provided in the relevant subsection of Section 10.2.

A.10.2.1

The requirements pertaining to interior finish are intended to restrict the spread of fire over the continuous surface forming the interior portions of a building. The presence of multiple paint layers has the potential for paint delamination and bubbling or blistering of paint. Testing (NFPA *Fire Technology*, August 1974, "Fire Tests of Building Interior Covering Systems," David Waksman and John Ferguson, Institute for Applied Technology, National Bureau of Standards) has shown that adding up to two layers of paint with a dry film thickness of about 0.007 in. (0.18 mm) will not change the fire properties of surface-covering systems. Testing has shown that the fire properties of the surface-covering systems are highly substrate dependent and that thin coatings generally take on the characteristics of the substrate. When exposed to fire, the delamination, bubbling, and blistering of paint can result in an accelerated rate of flame spread.

A.10.2.2

Table A.10.2.2 provides a compilation of the interior finish requirements of 7.1.4 and the occupancy chapters (Chapters 12 through 42) of this Code.

Table A.10.2.2 Interior Finish Classification Limitations

Occupancy	Exits	Exit Access Corridors	Other Spaces
Assembly — new			
>300 occupant load	A I or II	A or B I or II	A or B NA
≤300 occupant load	A I or II	A or B I or II	A, B, or C NA
Assembly — existing			
>300 occupant load	A	A or B	A or B
≤300 occupant load	A	A or B	A, B, or C
Educational — new	A I or II	A or B I or II	A or B; C on low partitions* NA
Educational — existing	A	A or B	A, B, or C
Day-care centers — new	A I or II	A I or II	A or B NA
Day-care centers — existing	A or B	A or B	A or B
Day-care homes — new	A or B or II	A or B	A, B, or C NA
Day-care homes — existing	A or B	A, B, or C	A, B, or C
Health care — new	A I or II	A B on lower portion of corridor wall*	A B in small individual rooms*
Health care — existing	A or B	A or B	A or B
Detention and correctional — new (sprinklers mandatory)	A or B I or II	A or B I or II	A, B, or C NA
Detention and correctional — existing	A or B I or II	A or B I or II	A, B, or C NA
One- and two-family dwellings and lodging or rooming houses	A, B, or C	A, B, or C	A, B, or C
Hotels and dormitories — new	A I or II	A or B I or II	A, B, or C NA
Hotels and dormitories — existing	A or B I or II*	A or B I or II*	A, B, or C NA
Apartment buildings — new	A I or II	A or B I or II	A, B, or C NA
Apartment buildings — existing	A or B I or II*	A or B I or II*	A, B, or C NA
Residential board and care — (See Chapters 32 and 33.)			
Mercantile — new	A or B I or II	A or B	A or B NA
Mercantile — existing			
Class A or class B stores	A or B	A or B	Ceilings — A or B; walls — A, B, or C
Class C stores	A, B, or C	A, B, or C	A, B, or C
Business and ambulatory health care — new	A or B I or II	A or B	A, B, or C NA
Business and ambulatory health care — existing	A or B	A or B	A, B, or C
Industrial	A or B I or II	A, B, or C I or II	A, B, or C NA
Storage	A or B I or II	A, B, or C	A, B, or C NA

*See corresponding chapters for details.

NA: Not applicable.

Notes:

(1) Class A interior wall and ceiling finish — flame spread index, 0–25 (new applications); smoke developed index, 0–450.

(2) Class B interior wall and ceiling finish — flame spread index, 26–75 (new applications); smoke developed index, 0–450.

(3) Class C interior wall and ceiling finish — flame spread index, 76–200 (new applications); smoke developed index, 0–450.

(4) Class I interior floor finish — critical radiant flux, not less than 0.45 W/cm².

(5) Class II interior floor finish — critical radiant flux, not less than 0.22 W/cm², but less than 0.45 W/cm².

(6) Automatic sprinklers — where a complete standard system of automatic sprinklers is installed, interior wall and ceiling finish with a flame spread rating not exceeding Class C is permitted to be used in any location where Class B is required, and Class B interior wall and ceiling finish is permitted to be used in any location where Class A is required; similarly, Class II interior floor finish is permitted to be used in any location where Class I is required, and no interior floor finish classification is required where Class II is required. These provisions do not apply to new detention and correctional occupancies.

(7) Exposed portions of structural members complying with the requirements for heavy timber construction are permitted.

A.10.2.2.2

This paragraph recognizes that traditional finish floors and floor coverings, such as wood flooring and resilient floor coverings, have not proved to present an unusual hazard.

A.10.2.3

ASTM E84, *Standard Test Method of Surface Burning Characteristics of Building Materials*, and UL 723, *Test for Surface Burning Characteristics of Building Materials*, are considered nationally recognized consensus standard test methods for determining the flame spread index and smoke developed index of building materials and are likely to yield equivalent test results. (*See also A.10.2.4.4.*)

A.10.2.3.1.2

Materials tested per NFPA 286 and meeting the criteria of 10.2.3.2 are considered Class A materials. However, not all materials that meet the requirements for Class A based on testing per ASTM E84 or UL 723 will meet the requirements of this *Code* for testing in accordance with NFPA 286.

A.10.2.3.3

It has been shown that the method of mounting interior finish materials usually affects actual performance. The use of standard mounting methods will be helpful in determining appropriate fire test results. Where materials are tested in intimate contact with a substrate to determine a classification, such materials should be installed in intimate contact with a similar substrate. Such details are especially important for "thermally thin" materials. For further information, see ASTM E84, *Standard Test Method for Surface Burning Characteristics of Building Materials*.

Some interior wall and ceiling finish materials, such as fabrics not applied to a solid backing, do not lend themselves to a test made in accordance with ASTM E84. In such cases, the large-scale test outlined in NFPA 701 is permitted to be used. In 1989 the NFPA Technical Committee on Fire Tests eliminated the so-called "small-scale test" from NFPA 701 because the results had been shown not to represent a fire performance that corresponded to what happened in real scale. Since then, NFPA 701 no longer contains a "small-scale test" but it now contains two tests (Test 1 and Test 2), which apply to materials as a function of their areal density. Thus NFPA 701 Test 1 applies to fabrics (other than vinyl-coated fabric blackout linings) having an areal density less than or equal to 21 oz/yd² (700 g/m²), while NFPA 701 Test 2 applies to fabrics with an areal density greater than 21 oz/yd² (700 g/m²), vinyl-coated fabric blackout linings, decorative objects, and films. Representations that materials or products have been tested to the small-scale test in NFPA 701 normally refer to the pre-1989 small-scale test, which no longer exists and which does not represent acceptable fire performance.

Prior to 1978, the test report described by ASTM E84 included an evaluation of the fuel contribution as well as the flame spread index and the smoke developed index. However, it is now recognized that the measurement on which the fuel contribution is based does not provide a valid measure. Therefore, although the data are recorded during the test, the information is no longer normally reported. Classification of interior wall and ceiling finish thus relies only on the flame spread index and smoke developed index.

The 450 smoke developed index limit is based solely on obscurity. (*See A.10.2.4.4.*)

A.10.2.4

Surface nonmetallic raceway products, as permitted by *NFPA 70* are not interior finishes and are not subject to the provisions of Chapter 10.

A.10.2.4.2

Paragraph 10.2.4.2 does not require Type IV (2HH), heavy timber, other than that used in interior exit stairs, interior exit ramps, and exit passageways be tested by either ASTM E84 or UL 723 to determine a flame spread rating. Taller wood buildings and new technology, primarily new "mass timber," make taller buildings of Type IV possible. To that end, the requirements for Type IV have been changed to require the testing for components in the egress system such that they too need to be tested and meet the appropriate classification required in this section. This means that Type IV is "presumed" to comply with the finish requirements in this section for the purpose of meeting the requirements of this section for any wall or ceiling finish of elements other than interior exit stairways, interior exit ramps, and exit passageways.

A.10.2.4.3.3

See A.10.2.4.3.3.2.

A.10.2.4.3.3.2

Both NFPA 286 and UL 1715, *Fire Test of Interior Finish Material*, contain smoke obscurity criteria. UL 1040, *Fire Test of Insulated Wall Construction*, and ANSI/FM Approvals 4880, *American National Standard for Evaluating the Fire Performance of Insulated Building Panel Assemblies and Interior Finish Materials*, do not. Smoke obscurity is an important component of the fire performance of cellular or foamed plastic materials.

A.10.2.4.4

Previous editions of the *Code* have regulated textile materials on walls and ceilings using ASTM E84, *Standard Test Method for Surface Burning Characteristics of Building Materials*, or UL 723, *Test for Surface Burning Characteristics of Building Materials*. Full-scale room/corner fire test research has shown that flame spread indices produced by ASTM E84 or UL 723 might not reliably predict all aspects of the fire behavior of textile wall and ceiling coverings.

NFPA 265 and NFPA 286, both known as room/corner tests, were developed for assessing the fire and smoke obscurity performance of textile wall coverings and interior wall and ceiling finish materials, respectively. As long as an interior wall or ceiling finish material is tested by NFPA 265 or NFPA 286, as appropriate, using a mounting system, substrate, and adhesive (if appropriate) that are representative of actual use, the room/corner test provides an adequate evaluation of a product's flammability and smoke obscurity behavior. Manufacturers, installers, and specifiers should be encouraged to use NFPA 265 or NFPA 286, as appropriate (but not both), because each of these standard fire tests has the ability to characterize actual product behavior, as opposed to data generated by tests using ASTM E84 or UL 723, which only allow comparisons of one product's performance with another. If a manufacturer or installer chooses to test a wall finish in accordance with NFPA 286, additional testing in accordance with ASTM E84 or UL 723 is not necessary.

The test results from ASTM E84 or UL 723 are suitable for classification purposes but should not be used as input into fire models, because they are not generated in units suitable for engineering calculations. Actual test results for heat, smoke, and combustion product release from NFPA 265, and from NFPA 286, are suitable for use as input into fire models for performance-based design.

A.10.2.4.4.1

The methodology specified in NFPA 265 includes provisions for measuring smoke obscurity.

A.10.2.4.4.2

See A.10.2.4.4.1 and A.10.2.4.4.

A.10.2.4.5

Expanded vinyl wall covering consists of a woven textile backing, an expanded vinyl base coat layer, and a nonexpanded vinyl skin coat. The expanded base coat layer is a homogeneous vinyl layer that contains a blowing agent. During processing, the blowing agent decomposes, which causes this layer to expand by forming closed cells. The total thickness of the wall covering is approximately 0.055 in. to 0.070 in. (1.4 mm to 1.8 mm).

A.10.2.4.15

Light-transmitting plastics are used for a variety of purposes, including light diffusers, exterior wall panels, skylights, canopies, glazing, and the like. Previous editions of the *Code* have not addressed the use of light-transmitting plastics. Light-transmitting plastics will not normally be used in applications representative of interior finishes. Accordingly, ASTM E84, *Standard Test Method for Surface Burning Characteristics of Building Materials*, or UL 723, *Test for Surface Burning Characteristics of Building Materials*, can produce test results that might or might not apply.

Light-transmitting plastics are regulated by model building codes such as *NFPA 5000*. Model building codes provide adequate regulation for most applications of light-transmitting plastics. Where an authority having jurisdiction determines that a use is contemplated that differs from uses regulated by model building codes, light-transmitting plastics in such applications can be substantiated by fire tests that demonstrate the combustibility characteristics of the light-transmitting plastics for the use intended under actual fire conditions.

For additional information on light transmitting plastics, see Section 48.7 of *NFPA 5000*.

A.10.2.6

Fire-retardant coatings need to be applied to surfaces properly prepared for the material, and application needs to be consistent with the product listing. Deterioration of coatings applied to interior finishes can occur due to repeated cleaning of the surface or painting over applied coatings.

A.10.2.6.1

It is the intent of the *Code* to mandate interior wall and ceiling finish materials that obtain their fire performance and smoke developed characteristics in their original form. However, in renovations, particularly those involving historic buildings, and in changes of occupancy, the required fire performance or smoke developed characteristics of existing surfaces of walls, partitions, columns, and ceilings might have to be secured by applying approved fire-retardant coatings to surfaces having higher flame spread ratings than permitted. Such treatments should comply with the requirements of NFPA 703. When fire-retardant coatings are used, they need to be applied to surfaces properly prepared for the material, and application needs to be consistent with the product listing. Deterioration of coatings applied to interior finishes can occur due to repeated cleaning of the surface or painting over applied coatings, but permanency must be assured in some appropriate fashion. Fire-retardant coatings must possess the desired degree of permanency and be maintained so as to retain the effectiveness of the treatment under the service conditions encountered in actual use.

[See SR-65;](#)

[PCs \[1\]](#)

A.10.2.6.1.1

Chapter 5 of NFPA 703 ~~deals with~~ [addresses](#) fire-retardant coatings for ~~any building material and not just for building materials, including, but not limited to,~~ wood materials.

A.10.2.6.2

The intent of this section is that factory-applied fire-retardant-coated products, such as panels or tiles applied to walls or ceilings, replace the existing finish and are not applied on top of the existing finish.

A.10.2.7

The flooring radiant panel provides a measure of a floor covering's tendency to spread flames when located in a corridor and exposed to the flame and hot gases from a room fire. The flooring radiant panel test method is to be used as a basis for estimating the fire performance of a floor covering installed in the building corridor. Floor coverings in open building spaces and in rooms within buildings merit no further regulation, provided that it can be shown that the floor covering is at least as resistant to spread of flame as a material that meets the U.S. federal flammability standard 16 CFR 1630, "Standard for the Surface Flammability of Carpets and Rugs" (FF 1-70). All carpeting sold in the United States since 1971 is required to meet this standard and, therefore, is not likely to become involved in a fire until a room reaches or approaches flashover. Therefore, no further regulations are necessary for carpet, other than carpet in exitways and corridors.

It has not been found necessary or practical to regulate interior floor finishes on the basis of smoke development.

Full-scale fire tests and fire experience have shown that floor coverings in open building spaces merit no regulation beyond the U.S. federally mandated DOC FF 1-70 "pill test." This is because floor coverings meeting the pill test will not spread flame significantly until a room fire approaches flashover. At flashover, the spread of flame across a floor covering will have minimal impact on the already existing hazard. The minimum critical radiant flux of a floor covering that will pass the FF 1-70 test has been determined to be approximately 0.04 W/cm^2 (Tu, King-Mon and Davis, Sanford, "Flame Spread of Carpet Systems Involved in Room Fires," NFSIR 76-1013, Center for Fire Research, National Bureau of Standards, June 1976). The flooring radiant panel is only able to determine critical radiant flux values to 0.1 W/cm^2 . This provision will prevent use of a noncomplying material, which can create a problem, especially when the *Code* is used outside the United States where U.S. federal regulation FF 1-70 (16 CFR 1630) is not mandated.

A.10.2.7.1

Compliance with 16 CFR 1630, "Standard for the Surface Flammability of Carpets and Rugs" (FFI-70), is considered equivalent to compliance with ASTM D2859, *Standard Test Method for Ignition Characteristics of Finished Textile Floor Covering Materials*.

A.10.2.7.2

The fire performance of some floor finishes has been tested, and traditional finish floors and floor coverings, such as wood flooring and resilient floor coverings, have not proved to present an unusual hazard.

A.10.2.7.3

ASTM E648, *Standard Test Method for Critical Radiant Flux of Floor-Covering Systems Using a Radiant Heat Energy Source*, and NFPA 253 are considered nationally recognized consensus standard test methods for determining the critical radiant flux from floor covering systems and are likely to yield equivalent test results.

A.10.3.1

Testing per NFPA 701 applies to textiles and films used in a hanging configuration. If the textiles are to be applied to surfaces of buildings or backing materials as interior finishes for use in buildings, they should be treated as interior wall and ceiling finishes in accordance with Section 10.2 of this *Code*, and they should then be tested for flame spread index and smoke developed index values in accordance with ASTM E84, *Standard Test Method for Surface Burning Characteristics of Building Materials*, or UL 723, *Test for Surface Burning Characteristics of Building Materials*, or for flame spread and flashover in accordance with NFPA 265. Films and other materials used as interior finish applied to surfaces of buildings should be tested for flame spread index and smoke developed index values in accordance with ASTM E84 or UL 723 or for heat and smoke release and flashover in accordance with NFPA 286.

The test results from NFPA 701 are suitable for classification purposes but should not be used as input into fire models, because they are not generated in units suitable for engineering calculations.

A.10.3.2.1

The Class I requirement associated with testing in accordance with NFPA 260 and the char length of not more than $1\frac{1}{2}$ in. (38 mm) required with testing in accordance with NFPA 261 are indicators that the furniture item or mattress is resistant to a cigarette ignition. A fire that smolders for an excessive period of time without flaming can reduce the tenability within the room or area of fire origin without developing the temperatures necessary to operate automatic sprinklers.

The test results from NFPA 260 and from NFPA 261 are suitable for classification purposes but should not be used as input into fire models because they are not generated in units suitable for engineering calculations.

Traditionally, NFPA 260 was equivalent to ASTM E1353, *Standard Test Methods for Cigarette Ignition Resistance of Components of Upholstered Furniture*, and NFPA 261 was equivalent to ASTM E1352, *Standard Test Method for Cigarette Ignition Resistance of Mock-Up Upholstered Furniture Assemblies*. However, that changed temporarily when NFPA 260 and NFPA 261 adopted the new NIST standard reference material (SRM 1196) as the igniting cigarette and ASTM E1352 and ASTM E1353 did not, meaning that ASTM E1352 and ASTM E1353 were using commercial cigarettes that are low-ignition propensity and have a low likelihood of properly assessing smoldering potential. The 2016 editions of ASTM E1352 and ASTM E1353 adopted the NIST SRM 1196 cigarette as the igniting cigarette, making them, once more, equivalent to NFPA 261 and NFPA 260, respectively.

A.10.3.2.2

The intent of the provisions of 10.3.2.2 is as follows:

- (1) The peak heat release rate of not more than 80 kW by a single upholstered furniture item was chosen based on maintaining a tenable environment within the room of fire origin, and the sprinkler exception was developed because the sprinkler system helps to maintain tenable conditions, even if the single upholstered furniture item were to have a peak rate of heat release in excess of 80 kW.
- (2) The total heat release of not more than 25 MJ by the single upholstered furniture item during the first 10 minutes of the test was established as an additional safeguard to protect against the adverse conditions that would be created by an upholstered furniture item that released its heat in other than the usual measured scenario, and the following should also be noted:
 - (a) During the test for measurement of rate of heat release, the instantaneous heat release value usually peaks quickly and then quickly falls off, so as to create a triangle-shaped curve.
 - (b) In the atypical case, if the heat release were to peak and remain steady at that elevated level, as opposed to quickly falling off, the 80 kW limit would not ensure safety.
 - (c) Only a sprinkler exception is permitted in lieu of the test because of the ability of the sprinkler system to control the fire.

Actual test results for heat, smoke, and combustion product release from ASTM E1537, *Standard Test Method for Fire Testing of Upholstered Furniture*, might be suitable for use as input into fire models for performance-based design. Furthermore, California Technical Bulletin 133, "Flammability Test Procedure for Seating Furniture for Use in Public Occupancies," includes pass/fail criteria for a single upholstered furniture item of 80 kW peak heat release rate and 25 MJ total heat release over the first 10 minutes of the test.

A.10.3.3.1

The char length of not more than 2 in. (51 mm) required in 16 CFR 1632, "Standard for the Flammability of Mattresses and Mattress Pads" (FF 4-72), is an indicator that the mattress is resistant to a cigarette ignition. United States federal regulations require mattresses in this country to comply with 16 CFR 1632.

A.10.3.3.2

The intent of the provisions of 10.3.3.2 is as follows:

- (1) The peak heat release rate of not more than 100 kW by a single mattress was chosen based on maintaining a tenable environment within the room of fire origin, and the sprinkler exception was developed because the sprinkler system helps to maintain tenable conditions, even if the single mattress were to have a peak rate of heat release in excess of 100 kW.
- (2) The total heat release of not more than 25 MJ by the single mattress during the first 10 minutes of the test was established as an additional safeguard to protect against the adverse conditions that would be created by a mattress that released its heat in other than the usual measured scenario, and the following should also be noted:
 - (a) During the test for measurement of rate of heat release, the instantaneous heat release value usually peaks quickly and then quickly falls off, so as to create a triangle-shaped curve.
 - (b) In the atypical case, if the heat release were to peak and remain steady at that elevated level, as opposed to quickly falling off, the 100 kW limit would not ensure safety.
 - (c) Only a sprinkler exception is permitted in lieu of the test because of the ability of the sprinkler system to control the fire.

Actual test results for heat, smoke, and combustion product release from ASTM E1590, *Standard Test Method for Fire Testing of Mattresses*, might be suitable for use as input into fire models for performance-based design. Furthermore, California Technical Bulletin 129, "Flammability Test Procedure for Mattresses for Use in Public Buildings," includes pass/fail criteria for a single mattress of 100 kW peak heat release rate and 25 MJ total heat release over the first 10 minutes of test.

See SR-65f

A.10.3.3.2.2

The fire test in Annex A3 of ASTM F1085, *Standard Specification for Mattress and Box Springs for Use in Berths in Marine Vessels*, is known as the Michigan Roll-up Test, and it is the same test described briefly in Section 10 (on Tests and Specifications Designed for Detention and Correction Facilities) of ASTM F1870, *Standard Guide for Selection of Fire Test Methods for the Assessment of Upholstered Furnishings in Detention and Correctional Facilities*.

A.10.3.4

Natural cut Christmas trees that are not effectively treated to improve fire performance, ordinary crepe paper decorations, and pyroxylin plastic decorations might be classified as highly flammable. See 10.3.9 for requirements for combustible artificial decorative vegetation. See NFPA 1, Section 10.13, for provisions for natural cut Christmas trees.

A.10.3.6

Neither UL 1975, *Fire Tests for Foamed Plastics Used for Decorative Purposes*, nor NFPA 289 is intended for evaluating interior wall and ceiling finish materials. Actual test results for heat, smoke, and combustion product release from UL 1975 or from NFPA 289 might be suitable for use as input into fire models intended for performance-based design.

A.10.4.1

Benches are an example of outdoor furniture.

A.10.5.1

The distance is measured from the closest portion of the vegetation to any portion of the building.

See SCR

A.10.7

Modular rooms such as lactation stations and other small privacy enclosures, including sleep pods, are showing up being installed in an increasing number of indoor locations. These include airports, convention centers, businesses, and government buildings. These are typically factory-built products that are required to be listed to UL 962, *Household and Commercial Furnishings*, rather than being constructed as a structure in accordance with the local building code.

A.10.7.1

The maximum size limits in 10.7.2.1 are designed to delineate factory build products that can be listed, versus larger size units that should comply with all applicable building code requirements, including structural design. These products are intended to comply with Section 10.7 and other applicable sections of the Code. This includes complying with requirements such as obstructions of automatic sprinkler system flow, not impacting means of egress requirements, and other criteria.

A.10.7.4

Because modular rooms and sleep pods are factory built products, it might not be easy for the authority having jurisdiction to determine if the materials used in the products comply with applicable Chapter 10 interior finish and foamed plastic requirements. As part of the UL 962, *Household and Commercial Furnishings*, listing the ratings specified will be marked on the modular rooms and sleep pods, simplifying compliance for the specifier, occupant, and authority having jurisdiction.

A.11.2.2

Escape chutes, controlled descent devices, and elevators are permitted to provide escape routes in special structures; however, they should not be substituted for the provisions of this Code.

A.11.2.2.4.1

The grade level of open structures, which by their very nature contain an infinite number of means of egress, are exempt from the requirements for number of means of egress.

A.11.3.1.3.1(2)

The incidental accessory uses are intended to apply to small office spaces or lounge areas and similar uses that are used by tower employees.

A.11.3.2.4

The Washington Monument in Washington, DC, is an example of a tower where it would be impracticable to provide a second stairway.

A.11.3.4.2(2)

The incidental accessory uses are intended to apply to small office spaces or lounge areas and similar uses that are used by tower employees.

A.11.3.4.4.1

Smoke detection in single exit airport traffic control towers is intended to include the following:

- (1) Tower cab area
- (2) Along all means of egress from the tower including exit access paths, lobbies, and other egress components
- (3) All rooms containing equipment serving the ATCT
- (4) Small office spaces or lounge areas and similar spaces used by tower employees
- (5) Utility shafts that provide access for maintenance

Smoke detection should be provided except where environmental conditions dictate other detection methods.

A.11.3.4.4.8.2(2)

Occupants of airport traffic control towers might be required by administrative controls to remain in the facility when a fire occurs so they can perform orderly transfer of operations. Methods to limit compromising the means of egress might include a fire-resistance-rated separation between discharge paths or smoke control in large spaces.

A.11.5

For further information on pier fire protection, see NFPA 307.

A.11.6

Fire safety information for manufactured home parks is found in NFPA 501A.

A.11.7.3.1.2(2)(a)

The intent of the 50 percent requirement is to ensure a design where the emergency access openings are located remotely from one another on each story and provide access to a greater percentage of the building. This provision addresses those buildings that are irregularly shaped as well as rectangular in design.

A.11.7.3.2

It is not the intent that emergency access openings be readily openable from the exterior by the public but that they be easily opened with normal fire department equipment.

A.11.8.3.1

Where an occupancy chapter (Chapters 12 through 42) permits the omission of sprinklers in specific spaces, such as small bathrooms and closets in residential occupancies, the building is still considered to be protected throughout for the purposes of 11.8.3.1.

A.11.8.4.1

The need for voice communication can be based on a decision regarding staged or partial evacuation versus total evacuation of all floors. The determination of need is a function of occupancy classification and building height.

[SR-6506](#) [Hide Legislati](#)

A.11.8.4.2.2

First responders depend on the use of portable radios during incidents for operational and safety purposes. Equivalent coverage occurs when the public safety two-way communications system utilized by the agency provides coverage throughout the building's general areas and critical areas as identified by NFPA 4224 [1225](#) , with or without a two-way radio enhancement system.

A.11.8.6

It is not the intent of the paragraph to require any of the equipment in the list, other than the telephone for fire department use, but only to provide the controls, panels, annunciators, and similar equipment at this location if the equipment is provided or required by another section of the *Code*.

A.11.8.8.1

With video systems, such as standard CCTV security systems typically installed in high-rise buildings, real-time images of occupants' and emergency responders' presence and movement (or lack thereof) in exits, especially at multiple locations of the same exit stairway, can provide critical information about current and developing conditions that should be taken into account in emergency management in accordance with the building's Emergency Action Plan.

Having video cameras positioned to capture images of an exit stairway, including just prior to the discharge doorway from the exit, provides information on the number and flow (in persons per minute, for example) of the occupants, among other information, including access by responding firefighters using stairs if elevators are not available. It is not essential that the camera views and image resolution be sufficient to identify specific individuals. Depending on the context (including security applications), such specific-person identification might be essential, desirable, undesirable or forbidden. For post-incident evaluation and analysis of egress performance, it is helpful to have image quality and camera angle such that the lateral and front-to-back positions of individuals, relative to the stair width, are clear.

For example, a high-rise building could have cameras at the ground level (assuming this is the level of exit discharge) and at every fifth floor above, and perhaps below grade, for each of the exit stairs. As well as providing a reasonable sampling of evacuee presence and movement within the exit stair system (information important for real-time situation awareness), a comparison of times at which particular individuals pass different cameras provides important data on evacuation movement speed and (indirectly) average occupant density, in addition to flow and number of evacuees overall.

When designing and installing a video monitoring system, and in conjunction with the authority having jurisdiction, the following items should be considered in the operation of the system:

- (1) Inspection, testing, and maintenance of equipment
- (2) Duration/hours of operation
- (3) Storage and retention of information
- (4) Activation of the system
- (5) Integration with the building's emergency action plan

A.11.9.3.3.1

The requirements of this paragraph can be considered as a Class 4, Type 60, system per NFPA 110.

A.12.1.2

Assembly occupancy requirements should be determined on a room-by-room basis, a floor-by-floor basis, and a total building basis. The requirements for each room should be based on the occupant load of that room, and the requirements for each floor should be based on the occupant load of that floor, but the requirements for the assembly building overall should be based on the total occupant load. Therefore, it is quite feasible to have several assembly occupancies with occupant loads of 300 or less grouped together in a single building. Such a building would be an assembly occupancy with an occupant load of over 1000.

A.12.1.3.3

For example, an assembly room for the residents of a detention occupancy will not normally be subject to simultaneous occupancy.

A.12.1.4.2

An understanding of the term *accessory room* might be useful to the enforcer of the *Code*, although the term is not used within the *Code*. An accessory room includes a dressing room, the property master's work and storage rooms, the carpenter's room, or similar rooms necessary for legitimate stage operations.

A.12.1.7.1

The increase in occupant load above that calculated using occupant load factors from Table 7.3.1.2 is permitted if the provisions of 12.1.7.1 are followed. The owner or operator has the right to submit plans and to be permitted an increase in occupant load if the plans comply with the *Code*. The authority having jurisdiction is permitted to reject the plan for increase in occupant load if the plan is unrealistic, inaccurate, or otherwise does not properly reflect compliance with other *Code* requirements. It is not the intent of the provisions of 12.1.7.1 to prohibit an increase in occupant load solely on the basis of exceeding the limits calculated using occupant load factors from Table 7.3.1.2.

To assist in preventing serious overcrowding incidents in sports arenas, stadia, and similar occupancies, spectator standing room should not be permitted between the seating areas and the playing areas, except in horse race and dog track facilities.

Where a capacity or near-capacity audience is anticipated, all seating should be assigned with tickets showing the section, row, and seat number.

Where standing room is permitted, the capacity of the standing area should meet the following criteria:

- (1) The capacity should be determined on the basis of 5 ft² (0.46 m²) per person.
- (2) The capacity should be added to the seating capacity in determining egress requirements.
- (3) The capacity should be located to the rear of the seating area.
- (4) The capacity should be assigned standing-room-only tickets according to the area designated for the purpose.

The number of tickets sold, or otherwise distributed, should not exceed the aggregate number of seats plus the approved standing room numbers.

A.12.2.3.1(1)

The seating plan and the means of egress should be reviewed each time the seating is substantially rearranged.

A.12.2.3.2

The provisions of 12.2.3.2 should be applied within the audience seating chamber and to the room doors. The capacity of means of egress components encountered after leaving the audience seating chamber, such as concourses, lobbies, exit stair enclosures, and the exit discharge, should be calculated in accordance with Section 7.3.

A.12.2.3.6.6

The original *Code* wording exempted sports arenas and railway stations. If an assembly occupancy was not similar to a sports arena or railway station, it was often judged ineligible to use the provision of 12.2.3.6.6. A list of exempted assembly venues also raises the question of why other occupancies are not included and necessitates additions to the list. For example, an exhibit hall of very large size might have several main entrances/exits. A theater extending the width of a block cannot really have a main entrance/exit in one confined location. A restaurant might have a main entrance serving the parking lot and another main entrance for those entering from the street. The authority having jurisdiction needs to determine where such arrangements are acceptable.

A.12.2.4

It is not the intent to require four means of egress from each level of an assembly occupancy building having a total occupant load of more than 1000 where, individually, the floors have occupant loads of less than 1000.

A.12.2.5.6.2

This requirement and the associated requirement of 12.2.5.6.3 have the effect of prohibiting festival seating, unless it truly is a form of seating, such as lawn seating, where generous spaces are commonly maintained between individuals and small groups so that people can circulate freely at any time. Such lawn seating is characterized by densities of about one person per 15 ft² (1.4 m²). Both requirements prohibit uncontrolled crowd situations, such as in front of stages at rock music concerts where the number and density of people is uncontrolled by architectural or management features.

A.12.2.5.6.3

This requirement is intended to facilitate rapid emergency access to individuals who are experiencing a medical emergency, especially in the case of cardiopulmonary difficulties, where there is a need for rapid medical attention from trained personnel. The requirement also addresses the need for security and law enforcement personnel to reach individuals whose behavior is endangering themselves and others.

A.12.2.5.6.4

The catchment area served by an aisle accessway or aisle is the portion of the total space that is naturally served by the aisle accessway or aisle. Hence, the requirement for combining the required capacity where paths converge is, in effect, a restatement of the idea of a catchment area. The establishment of catchment areas should be based on a balanced use of all means of egress, with the number of persons in proportion to egress capacity.

A.12.2.5.7

For purposes of the means of egress requirements of this *Code*, tablet-arm chair seating is not considered seating at tables. Dinner theater-style configurations are required to comply with the aisle accessway provisions applying to seating at tables and the aisle requirements of 12.2.5.8, if the aisles contain steps or are ramped. (*See also 7.1.7 and A.7.1.7.2.*)

A.12.2.5.7.1

Seats having reclining backs are assumed to be in their most upright position when unoccupied.

A.12.2.5.7.5

The system known as *continental seating* has one pair of egress doors provided for every five rows that is located close to the ends of the rows. In previous editions of the *Code*, such egress doors were required to provide a clear width of not less than 66 in. (1675 mm) discharging into a foyer, into a lobby, or to the exterior of the building. This continental seating arrangement can result in egress flow times (i.e., with nominal flow times of approximately 100 seconds, rather than 200 seconds) that are approximately one-half as long as those resulting where side aisles lead to more remote doors. Such superior egress flow time performance is desirable in some situations; however, special attention should be given either to a comparably good egress capacity for other parts of the egress system or to sufficient space to accommodate queuing outside the seating space.

A.12.2.5.8.3

It is the intent to permit handrails to project not more than 3½ in. (90 mm) into the clear width of aisles required by 12.2.5.8.3.

A.12.2.5.8.4.1

Technical information about the convenience and safety of ramps and stairs having gradients in the region of 1 in 8 clearly suggests that the goal should be slopes for ramps that are less steep and combinations of stair risers and treads that are, for example, superior to 4 in. (100 mm) risers and 32 in. (865 mm) treads. This goal should be kept in mind by designers in establishing the gradient of seating areas to be served by aisles.

A.12.2.5.8.5(3)

Tread depth is more important to stair safety than is riser height. Therefore, in cases where the seating area gradient is less than 5 in 11, it is recommended that the tread dimension be increased beyond 11 in. (280 mm), rather than reducing the riser height. Where the seating area gradient exceeds 8 in 11, it is recommended that the riser height be increased while maintaining a tread depth of not less than 11 in. (280 mm).

A.12.2.5.8.9

Failure to provide a handrail within a 30 in. (760 mm) horizontal distance of all required portions of the aisle stair width means that the egress capacity calculation is required to be modified as specified by 12.2.3.3(3). This modification might lead to an increase in the aisle width. Although this increase will compensate for reduced egress efficiency, it does not help individuals walking on such portions of stairs to recover from missteps, other than by possibly marginally reducing the crowding that might exacerbate the problem of falls. (See also 7.2.2.4.)

A.12.2.5.8.10

Certain tread cover materials such as plush carpets, which are often used in theaters, produce an inherently well-marked tread nosing under most lighting conditions. On the other hand, concrete treads have nosings with a sharp edge and, especially under outdoor lighting conditions, are difficult to discriminate. Therefore, concrete treads require an applied marking stripe. The slip resistance of such marking stripes should be similar to the rest of the treads, and no tripping hazard should be created; luminescent, self-luminous, and electroluminescent tread markings have the advantage of being apparent in reduced light or in the absence of light.

A.12.2.5.9

For purposes of the means of egress requirements of this Code, seating at counters or at other furnishings is considered to be the same as seating at tables.

A.12.2.5.9.2

Effectively, where the aisle accessway is bounded by movable seating, the 12 in. (305 mm) minimum width might be increased by about 15 in. to 30 in. (380 mm to 760 mm) as seating is pushed in toward tables. Moreover, it is such movement of chairs during normal and emergency egress situations that makes the zero-clearance allowance workable. The allowance also applies to booth seating where people sitting closest to the aisle normally move out ahead of people farthest from the aisle.

A.12.2.5.9.3

See A.12.2.5.10.3.

A.12.2.5.9.4

The minimum width requirement as a function of accessway length is as follows:

- (1) 0 in. (0 mm) for the first 6 ft (1830 mm) of length toward the exit
- (2) 12 in. (305 mm) for the next 6 ft (1830 mm); that is, up to 12 ft (3660 mm) of length
- (3) 12 in. to 24 in. (305 mm to 610 mm) for lengths from 12 ft to 36 ft (3.7 m to 11 m), the maximum length to the closest aisle or egress doorway permitted by 12.2.5.9.5

Any additional width needed for seating is to be added to these widths, as described in 12.2.5.10.3.

A.12.2.5.10.1

See 7.1.7 and A.7.1.7.2 for special circulation safety precautions applicable where small elevation differences occur.

A.12.2.5.10.2

It is important to make facilities accessible to people using wheelchairs. See ICC A117.1, *Accessible and Usable Buildings and Facilities*, which provides guidance on appropriate aisle widths.

A.12.2.5.10.3

Figure A.12.2.5.10.3 shows typical measurements involving seating and tables abutting an aisle. For purposes of the means of egress requirements of this Code, seating at counters or other furnishings is considered to be the same as seating at tables.

Figure A.12.2.5.10.3 Seating at Tables Abutting an Aisle.

**A.12.2.11.1.1**

This requirement includes provisions of guards and rails at the front of boxes, galleries, and balconies, and at aisle accessways adjacent to vomitories and orchestra pits.

A.12.2.11.1.6.2

The written plan should identify the unguarded areas and should include precautions and provisions to mitigate the fall hazard. Such precautions and provisions might include the following:

- (1) Training
- (2) Choreography
- (3) Blocking
- (4) Rehearsal
- (5) Restricted access to the stage
- (6) Restricted access to unguarded edges
- (7) Warning lights
- (8) Audible warnings
- (9) Tactile edges
- (10) Warning barriers
- (11) Signage
- (12) Temporary barriers
- (13) Personal fall protection
- (14) Fall restraint
- (15) Spotters

A.12.3.1(1)

The allowance for unenclosed stairs or ramps presumes the balcony or mezzanine complies with the other provisions of the *Code*, such as travel distance to exits in accordance with 12.2.6 and number of exits in accordance with 12.2.4. For the purposes of this exception, a balcony with glazing that provides a visual awareness of the main assembly area is considered open.

A.12.3.4.2.3

The intent is to require detectors only in nonsprinklered hazardous areas that are unoccupied. When the building is occupied, the detectors in the unoccupied, unsprinklered hazardous areas will initiate occupant notification. If the building is unoccupied, the fire in the nonsprinklered hazardous area is not a life safety issue, and the detectors, upon activation, are not required to notify anyone. The signal from a detector is permitted to be sent to a control panel in an area that is occupied when the building is occupied, but that is unoccupied when the building is unoccupied, without the need for central station monitoring or the equivalent.

A.12.3.4.3.5

Examples of devices that might be used to provide alternative visible means include scoreboards, message boards, and other electronic devices.

A.12.3.4.4.1(3)

The intent is to require CO detectors in occupiable spaces immediately adjacent, vertically or horizontally, to attached garages, regardless of the presence of openings between the garage and the adjacent occupiable spaces. Other occupiable spaces that are not adjacent to the attached garage do not require CO detectors.

A.12.3.5.3(1)

It is the intent to permit a single multipurpose room of less than 12,000 ft² (1115 m²) to have certain small rooms as part of the single room. These rooms could be a kitchen, an office, an equipment room, and the like. It is also the intent that an addition could be made to an existing building, without requiring that the existing building be sprinklered, where both the new and existing buildings have independent means of egress and a fire-rated separation is provided to isolate one building from the other.

A school gymnasium with egress independent of, and separated from, the school would be included in this exception, as would a function hall attached to a church with a similar egress arrangement.

A.12.3.5.3(3)

Examples of low fire hazard uses include spectator sporting events, concerts, and performances on platforms.

The following uses are not low fire hazard uses: concerts and performances on stages; tradeshow; exhibitions and display of combustible items; displays of vehicles, boats, or similar items; or events using open flames or pyrotechnic effects.

A.12.4.2.1

Life safety evaluations are examples of performance-based approaches to life safety. In this respect, significant guidance in the form and process of life safety evaluations is provided by Chapter 5, keeping in mind the fire safety emphasis in Chapter 5. Performance criteria, scenarios, evaluation, safety factors, documentation, maintenance, and periodic assessment (including a warrant of fitness) all apply to the broader considerations in a life safety evaluation. A life safety evaluation deals not only with fire but also with storms, collapse, crowd behavior, and other related safety considerations for which a checklist is provided in A.12.4.2.3. Chapter 5 provides guidance, based on fire safety requirements, for establishing a documented case showing that products of combustion in all conceivable fire scenarios will not significantly endanger occupants using means of egress in the facility (e.g., due to fire detection, automatic suppression, smoke control, large-volume space, or management procedures). Moreover, means of egress facilities plus facility management capabilities should be adequate to cope with scenarios where certain egress routes are blocked for some reason.

In addition to making realistic assumptions about the capabilities of persons in the facility (e.g., an assembled crowd including many disabled persons or persons unfamiliar with the facility), the life safety evaluation should include a factor of safety of not less than 2.0 in all calculations relating to hazard development time and required egress time (the combination of flow time and other time needed to detect and assess an emergency condition, initiate egress, and move along the egress routes). The factor of safety takes into account the possibility that half of the egress routes might not be used (or be usable) in certain situations.

Regarding crowd behavior, the potential hazards created by larger masses of people and greater crowd densities (which can be problematic during ingress, occupancy, and egress) demand that technology be used by designers, managers, and authorities responsible for buildings to compensate for the relaxed egress capacity provisions of Table 12.4.3.3. In very large buildings for assembly use, the hazard of crowd crushes can exceed that of fire or structural failure. Therefore, the building designers, managers, event planners, security personnel, police authorities, and fire authorities, as well as the building construction authorities, should understand the potential problems and solutions, including coordination of their activities. For crowd behavior, this understanding includes factors of design, information, management, and expectations during ingress, circulation, and egress. Published guidance on these factors and techniques is found in ANSI ES1.9, *Crowd Management*; the *SFPE Handbook of Fire Protection Engineering*, in Chapter 56, Egress Concepts and Design Approaches; Chapter 58, Human Behavior in Fire; and Chapter 59, Employing the Hydraulic Model in Assessing Emergency Movement; and the *SFPE Guide to Human Behavior in Fire* and the publications referenced therein.

Table 12.2.3.2 and Table 12.4.3.3 are based on a linear relationship between number of seats and nominal flow time, with not less than 200 seconds (3.3 minutes) for 2,000 seats plus 1 second for every additional 50 seats up to 25,000. Beyond 25,000 total seats, the nominal flow time is limited to 660 seconds (11 minutes). Nominal flow time refers to the flow time for the most able group of patrons; some groups less familiar with the premises or less able groups might take longer to pass a point in the egress system. Although three or more digits are noted in the tables, the resulting calculations should be assumed to provide only two significant figures of precision.

A.12.4.2.3

Factors to be considered in a life safety evaluation include the following:

- (1) Nature of the events being accommodated, including the following:
 - (a) Ingress, intra-event movement, and egress patterns
 - (b) Ticketing and seating policies/practices
 - (c) Event purpose (e.g., sports contest, religious meeting)
 - (d) Emotional qualities (e.g., competitiveness) of event
 - (e) Time of day when event is held
 - (f) Time duration of single event
 - (g) Time duration of attendees' occupancy of the building
- (2) Occupant characteristics and behavior, including the following:
 - (a) Homogeneity
 - (b) Cohesiveness
 - (c) Familiarity with building
 - (d) Familiarity with similar events
 - (e) Capability (as influenced by factors such as age, physical abilities)
 - (f) Socioeconomic factors
 - (g) Small minority involved with recreational violence
 - (h) Emotional involvement with the event and other occupants
 - (i) Use of alcohol or drugs
 - (j) Food consumption
 - (k) Washroom utilization
- (3) Management, including the following:
 - (a) Clear, contractual arrangements for facility operation/use as follows:
 - i. Between facility owner and operator
 - ii. Between facility operator and event promoter
 - iii. Between event promoter and performer
 - iv. Between event promoter and attendee
 - v. With police forces
 - vi. With private security services
 - vii. With ushering services
 - (b) Experience with the building
 - (c) Experience with similar events and attendees
 - (d) Thorough, up-to-date operations manual
 - (e) Training of personnel
 - (f) Supervision of personnel
 - (g) Communications systems and utilization
 - (h) Ratios of management and other personnel to attendees
 - (i) Location/distribution of personnel
 - (j) Central command location
 - (k) Rapport between personnel and attendees
 - (l) Personnel support of attendee goals
 - (m) Respect of attendees for personnel due to the following:
 - i. Dress (uniform) standards
 - ii. Age and perceived experience
 - iii. Personnel behavior, including interaction
 - iv. Distinction between crowd management and control
 - v. Management concern for facility quality (e.g., cleanliness)
 - vi. Management concern for entire event experience of attendees (i.e., not just during occupancy of the building)
- (4) Emergency management preparedness, including the following:
 - (a) Complete range of emergencies addressed in operations manual
 - (b) Power loss
 - (c) Fire
 - (d) Severe weather
 - (e) Earthquake
 - (f) Crowd incident
 - (g) Terrorism
 - (h) Hazardous materials
 - (i) Transportation accident (e.g., road, rail, air)
 - (j) Communications systems available
 - (k) Personnel and emergency forces ready to respond
 - (l) Attendees clearly informed of situation and proper behavior
- (5) Building systems, including the following:
 - (a) Structural soundness
 - (b) Normal static loads

- (c) Abnormal static loads (e.g., crowds, precipitation)
- (d) Dynamic loads (e.g., crowd sway, impact, explosion, wind, earthquake)
- (e) Stability of nonstructural components (e.g., lighting)
- (f) Stability of movable (e.g., telescoping) structures
- (g) Fire protection
- (h) Fire prevention (e.g., maintenance, contents, housekeeping)
- (i) Compartmentation
- (j) Automatic detection and suppression of fire
- (k) Smoke control
- (l) Alarm and communications systems
- (m) Fire department access routes and response capability
- (n) Structural integrity
- (o) Weather protection
- (p) Wind
- (q) Precipitation (attendees rush for shelter or hold up egress of others)
- (r) Lightning protection
- (s) Circulation systems
- (t) Flowline or network analysis
- (u) Waywinding and orientation
- (v) Merging of paths (e.g., precedence behavior)
- (w) Decision/branching points
- (x) Route redundancies
- (y) Counterflow, crossflow, and queuing situations
- (z) Control possibilities, including metering
- (aa) Flow capacity adequacy
- (ab) System balance
- (ac) Movement time performance
- (ad) Flow times
- (ae) Travel times
- (af) Queuing times
- (ag) Route quality
- (ah) Walking surfaces (e.g., traction, discontinuities)
- (ai) Appropriate widths and boundary conditions
- (aj) Handrails, guardrails, and other rails
- (ak) Ramp slopes
- (al) Step geometries
- (am) Perceptual aspects (e.g., orientation, signage, marking, lighting, glare, distractions)
- (an) Route choices, especially for vertical travel
- (ao) Resting/waiting areas
- (ap) Levels of service (overall crowd movement quality)
- (aq) Services
- (ar) Washroom provision and distribution
- (as) Concessions
- (at) First aid and EMS facilities
- (au) General attendee services

A scenario-based approach to performance-based fire safety is addressed in Chapter 5. In addition to using such scenarios and, more generally, the attention to performance criteria, evaluation, safety factors, documentation, maintenance, and periodic assessment required when the Chapter 5 option is used, life safety evaluations should consider scenarios based on characteristics important in assembly occupancies. These characteristics include the following:

- (1) Whether there is a local or mass awareness of an incident, event, or condition that might provoke egress
- (2) Whether the incident, event, or condition stays localized or spreads
- (3) Whether or not egress is desired by facility occupants
- (4) Whether there is a localized start to any egress or mass start to egress
- (5) Whether exits are available or not available

Examples of scenarios and sets of characteristics that might occur in a facility follow.

Scenario 1. Characteristics: mass start, egress desired (by management and attendees), exits not available, local awareness.

Normal egress at the end of an event occurs just as a severe weather condition induces evacuees at the exterior doors to retard or stop their egress. The backup that occurs in the egress system is not known to most evacuees, who continue to press forward, potentially resulting in a crowd crush.

Scenario 2. Characteristics: mass start, egress not desired (by management), exits possibly not available, mass awareness.

An earthquake occurs during an event. The attendees are relatively safe in the seating area. The means of egress outside the seating area are relatively unsafe and vulnerable to aftershock damage. Facility management discourages mass egress until the means of egress can be checked and cleared for use.

Scenario 3. Characteristics: local start, incident stays local, egress desired (by attendees and management), exits available, mass awareness.

A localized civil disturbance (e.g., firearms violence) provokes localized egress, which is seen by attendees, generally, who then decide to leave also.

Scenario 4. Characteristics: mass start, egress desired (by attendees), incident spreads, exits not available, mass awareness.

In an open-air facility unprotected from wind, precipitation, and lightning, sudden severe weather prompts egress to shelter, but not from the facility. The means of egress congest and block quickly as people in front stop once they are under shelter, while people behind them continue to press forward, potentially resulting in a crowd crush.

These scenarios illustrate some of the broader factors to be taken into account when assessing the capability of both building systems and management features on which reliance is placed in a range of situations, not just fire emergencies. Some scenarios also illustrate the conflicting motivations of management and attendees, based on differing perceptions of danger and differing knowledge of hazards, countermeasures, and capabilities. Mass egress might not be the most appropriate life safety strategy in some scenarios, such as Scenario 2.

Table A.12.4.2.3 summarizes the characteristics in the scenarios and provides a framework for developing other characteristics and scenarios that might be important for a particular facility, hazard, occupant type, event, or management.

Table A.12.4.2.3 Life Safety Evaluation Scenario Characteristics Matrix

Scenario	Local Awareness	Mass Awareness	Incident Localized	Incident Spreads	Management		Occupants		Local Start	Mass Start	Exits Available	Exits Not Available	Other
					Egress Desired	Egress Not Desired	Egress Desired	Egress Not Desired					
1	X	—	—	—	X	—	X	—	—	X	—	X	—
2	—	X	—	—	—	X	—	—	—	X	—	X	—
3	—	X	X	—	X	—	X	—	X	—	X	—	—
4	—	X	—	X	—	—	X	—	—	X	—	X	—

A.12.4.3

Outdoor facilities are not accepted as inherently smoke-protected but must meet the requirements of smoke-protected assembly seating in order to utilize the special requirements for means of egress.

A.12.4.9

Special amusement buildings are unique structures that can present challenges not common in assembly or other occupancies. Hazards in special amusement buildings can include industrial, electrical, pneumatic, stored energy systems, or other systems and equipment associated with the ride and/or show systems. Occupants are typically not familiar with their surroundings, and the provided exit access might not be apparent while the building is operating in show conditions.

Additionally, special amusement buildings might present design challenges, which the authority having jurisdiction might need to consider. For example, a ride building containing a roller coaster might meet the height requirements for a high-rise structure but only contain one story of height and mezzanines or catwalks at upper levels for evacuation. Portions of a ride might exit and return into the building, traverse to an open structure, be surrounded by water, or contain an atrium. Each of these conditions presents challenges to the design of fire protection, fire alarm, and life safety systems, as well as the emergency action plan required in 12.7.13.

Where a special amusement building is installed inside another building on a temporary basis, such as within an exhibit hall, the special amusement building requirements apply only to the portions of the building used as a special amusement. For example, the smoke detectors required by 12.4.9.4.3 are not required to be connected to the building's fire alarm system. Where installed in an exhibit hall, such smoke detectors are also required to comply with the provisions applicable to an exhibit.

A.12.4.9.1.1

The aggregate horizontal projections of a multilevel play structure are indicative of the number of children who might be within the structure and at risk from a fire or similar emergency. The word "aggregate" is used in recognition of the fact that the platforms and tubes that make up the multilevel play structure run above each other at various levels. In calculating the area of the projections, it is important to account for all areas that might be expected to be occupied within, on top of, or beneath the components of the structure when the structure is used for its intended function.

A.12.4.9.1.2

An example of a Class A special amusement building would be a theme park attraction or dark ride where patrons are restrained inside a ride vehicle and guided through a building on a track.

An example of a Class B special amusement building would be an escape room or theme park attraction where a patron can exit the building once the amusement or effects are stopped. Temporary rides such as a merry-go-round or train located in a mall would not meet the definition of a Class B special amusement building unless there was an element to the ride where a patron would become confused or is otherwise confined to the ride vehicle and unable to self-evacuate. See A.3.3.37.9.

An example of a Class C special amusement building would be a temporary haunted house, maze, or carnival attraction.

A.12.4.9.2.1.3

Consideration should be given to the provision of directional exit marking on or adjacent to the floor.

A.12.4.9.2.2.1

Lighting levels within special amusement buildings might be reduced to levels that are lower than those required by Section 7.8 for show purposes. In addition, projections, special effects, haze, and other theatrical elements might be combined, which can disorient occupants who are unfamiliar with the egress route. The activation of the automatic sprinkler system or smoke detection system should immediately increase illumination to the required levels and stop all show elements that would continue to disorient or confuse occupants.

Because of the delay in verification or cross-zoning of smoke detectors, positive alarm sequence should not be utilized when alarm-verification or cross-zoned smoke detectors is selected.

In the context of a special amusement building, a conflicting or confusing sound or visual is any audio or visual device that is intended to quickly distract the attention the patron of a special amusement building for the purpose of frightening, confounding, disorienting, or otherwise capturing the attention of the patron. Examples of this include strobing and flashing lights, loud sound effects, scare or jump effects, loud music, animated figures, projected animation, and interactive games. These can all interfere with the fire alarm notification devices and live announcements from the attraction operator for the patron's attention. In addition, effects that simulate the sound, sight, and smell of flames or smoke will confuse the patron if they continue to operate when the fire alarm system has been activated.

Some examples of audio and visuals that might occur in a special amusement building, but that might not constitute a conflicting sound or visual, include static or very slow-moving video or projected images, background music, steady state lighting, and ride vehicle triggered effects.

A.12.4.9.2.2.2

Amusement rides and devices that contain or restrain their patrons such that they are unable to evacuate without the assistance of a ride operator present a unique challenge during an emergency. ASTM F2291, *Standard Practice for Design of Amusement Rides or and Devices*, provides for the design of evacuation paths in case the ride stops before completing its full cycle. The safest and fastest way to exit patrons during an emergency might be to "cycle out" by continuing ride operation until all patrons have exited the ride at the normal exit point (at the unload platform). If a patron were to attempt to exit the ride vehicle while the ride continues operation during an emergency, the patron may potentially be struck by the ride vehicle, or the ride's safety systems might stop all ride motion, potentially extending the evacuation period. Because increasing the illumination of the means of egress along the ride and terminating any conflicting or confusing sounds or visuals while the ride is cycling out might entice the patrons to attempt to self-evacuate while the ride is in motion, the authority having jurisdiction and the owner are encouraged to work closely to develop a plan that implements the safest and most efficient method to exit the patrons from the ride, which might include continuing normal show operation during cycle out. In addition, the plan should assure that all ride operators and emergency responders understand their roles during cycle out, or during an evacuation if the ride cycle out is interrupted.

The ride owner should work with the authority having jurisdiction from an early stage to develop a pre-incident plan in accordance with NFPA 1620 and any required or applicable provisions of 12.4.2.5.2.

A.12.4.9.4.2

Special amusement attractions might contain an operator console or "tower," which might also serve as a constantly attended location when the ride is operating.

A.12.4.9.4.4

Notification in special amusement buildings should be considered carefully depending on the operation of the special amusement. Voice announcements are the required method. However, automatically transmitted evacuation instructions might not be appropriate in some rides when occupants are confined to a ride vehicle and unable to self-evacuate. In order to avoid confusion, manual voice announcements from the ride operator might be preferable to pre-recorded evacuation instructions for some rides.

A.12.4.9.4.3

Special amusement buildings that contain rides tend to be occupied after operating hours by maintenance staff. After-hours maintenance work might take place along the ride track or in an attached maintenance bay where ride vehicles are moved on and off spur tracks. When no ride operator is located at the constantly attended location to receive alarm signals, a means of automatically sounding the general evacuation signal should be provided for after-hours occupants.

A.12.4.9.5.1

See A.12.4.9.1.1.

A.12.4.9.6.1

Special amusement buildings might simulate different structures, such as an outdoor scene where false walls and ceilings, commonly known as sets, are recreated indoors with various fabrics and materials used to simulate trees, leaves, or other items. Sets in special amusement buildings are often designed by entertainment companies familiar with Broadway-style stage productions. However, unlike stages and theaters, there are no requirements for smoke control or proscenium protection. The authority having jurisdiction should consider and evaluate the total quantity of material introduced into the space.

A.12.4.9.6.2

The evacuation plan for special amusement buildings should consider the safest and fastest way to remove occupants from the structure. When a ride stops within the special amusement building, removing occupants from the ride system might present an extended evacuation. Additionally, hazards associated with the ride and show system might present electrical and entanglement challenges to occupants unfamiliar with the building. Evacuation of special amusement buildings can also pose challenges to the local fire department if they are not familiar with the nature of the building or ride system. Specialized equipment for rescue, ride vehicle-specific tools for releasing doors, and high-energy ride vehicle hazard awareness might all be required when evacuating from a location other than a load/unload station.

The ride owner should work with the authority having jurisdiction from an early stage to develop a pre-incident plan in accordance with NFPA 1620 and any required or applicable provisions of 12.4.2.5.2.

A.12.4.12.2(2)

Delayed-egress locks on doors from the airport loading walkway into the airport terminal building might compromise life safety due to the limited period of time the airport loading walkway will provide protection for emergency egress. The requirement of 12.4.12.2(2) would not limit the use of access-controlled or delayed-egress hardware from the airport terminal building into the airport loading walkway.

A.12.7.3(3)(a)

Securely supported altar candles in churches that are well separated from any combustible material are permitted. On the other hand, lighted candles carried by children wearing cotton robes present a hazard too great to be permitted. There are many other situations of intermediate hazard where the authority having jurisdiction will have to exercise judgment.

A.12.7.4.1

Fabric applied over unused seating sections should meet the requirements of 12.7.4.

A.12.7.4.3

The phrase "unprotected materials containing foamed plastic" is meant to include foamed plastic items covered by "thermally thin" combustible fabrics or paint. (See A.10.2.3.3.)

A.12.7.5.3.7.1(3)

See A.12.4.2.1.

A.12.7.6.2

Crowd managers and crowd manager supervisors need to clearly understand the required duties and responsibilities specific to the venue's emergency plan. The crowd management training program should include a clear appreciation of crowd dynamics factors including space, energy, time, and information, as well as specific crowd management techniques, such as metering. Training should involve specific actions necessary during normal and emergency operations, and include an assessment of people-handling capabilities of a space prior to its use, the identification of hazards, an evaluation of projected levels of occupancy, the adequacy of means of ingress and egress and identification of ingress and egress barriers, the processing procedures such as ticket collection, and the expected types of human behavior. Training should also involve the different types of emergency evacuations and, where required by the emergency plan, relocation and shelter-in-place operations, and the challenges associated with each.

A.12.7.6.4

In large facilities, crowd managers typically have a specific area of responsibility. In such facilities, the requirements of 12.7.6.4 might apply only to the crowd managers' area of responsibility.

A.12.7.7

It is important that an adequate number of competent attendants is on duty at all times when the assembly occupancy is occupied.

A.12.7.7.3

It is not the intent of this provision to require an announcement in bowling alleys, cocktail lounges, restaurants, or places of worship.

A.13.1.2

Assembly occupancy requirements should be determined on a room-by-room basis, a floor-by-floor basis, and a total building basis. The requirements for each room should be based on the occupant load of that room, and the requirements for each floor should be based on the occupant load of that floor, but the requirements for the assembly building overall should be based on the total occupant load. Therefore, it is quite feasible to have several assembly occupancies with occupant loads of 300 or less grouped together in a single building. Such a building would be an assembly occupancy with an occupant load of over 1000.

A.13.1.3.3

For example, an assembly room for the residents of a detention occupancy will not normally be subject to simultaneous occupancy.

A.13.1.4.2

An understanding of the term *accessory room* might be useful to the enforcer of the *Code*, although the term is not used within the *Code*. An accessory room includes a dressing room, the property master's work and storage rooms, the carpenter's room, or similar rooms necessary for legitimate stage operations.

A.13.1.7.1

The increase in occupant load above that calculated using occupant load factors from Table 7.3.1.2 is permitted if the provisions of 13.1.7.1 are followed. The owner or operator has the right to submit plans and to be permitted an increase in occupant load if the plans comply with the *Code*. The authority having jurisdiction is permitted to reject the plan for increase in occupant load if the plan is unrealistic, inaccurate, or otherwise does not properly reflect compliance with other *Code* requirements. It is not the intent of the provisions of 13.1.7.1 to prohibit an increase in occupant load solely on the basis of exceeding the limits calculated using occupant load factors from Table 7.3.1.2.

Existing auditorium and arena structures might not be designed for the added occupant load beyond the fixed seating. The authority having jurisdiction should consider exit access and aisles before permitting additional occupant load in areas using seating such as festival seating or movable seating on the auditorium or arena floor area.

To assist in preventing serious overcrowding incidents in sports arenas, stadia, and similar occupancies, spectator standing room should not be permitted between the seating areas and the playing areas, except in horse race and dog track facilities.

Where a capacity or near-capacity audience is anticipated, all seating should be assigned with tickets showing the section, row, and seat number.

Where standing room is permitted, the capacity of the standing area should meet the following criteria:

- (1) The capacity should be determined on the basis of 5 ft² (0.46 m²) per person.
- (2) The capacity should be added to the seating capacity in determining egress requirements.
- (3) The capacity should be located to the rear of the seating area.
- (4) The capacity should be assigned standing-room-only tickets according to the area designated for the purpose.

The number of tickets sold, or otherwise distributed, should not exceed the aggregate number of seats plus the approved standing room numbers.

A.13.2.2.3.1(1)

The seating plan and the means of egress should be reviewed each time the seating is substantially rearranged.

A.13.2.3.2

The provisions of 13.2.3.2 should be applied within the audience seating chamber and to the room doors. The capacity of means of egress components encountered after leaving the audience seating chamber, such as concourses, lobbies, exit stair enclosures, and the exit discharge, should be calculated in accordance with Section 7.3.

A.13.2.3.6.6

The original *Code* wording exempted sports arenas and railway stations. If an assembly occupancy was not similar to a sports arena or railway station, it was often judged ineligible to use the provision of 13.2.3.6.6. A list of exempted assembly venues also raises the question of why other occupancies are not included and necessitates additions to the list. For example, an exhibit hall of very large size might have several main entrances/exits. A theater extending the width of a block cannot really have a main entrance/exit in one confined location. A restaurant might have a main entrance serving the parking lot and another main entrance for those entering from the street. The authority having jurisdiction needs to determine where such arrangements are acceptable.

A.13.2.4

It is not the intent to require four means of egress from each level of an assembly occupancy building having a total occupant load of more than 1000 where, individually, the floors have occupant loads of less than 1000.

A.13.2.5.6.2

This requirement and the associated requirement of 13.2.5.6.3 have the effect of prohibiting festival seating, unless it truly is a form of seating, such as lawn seating, where generous spaces are commonly maintained between individuals and small groups so that people can circulate freely at any time. Such lawn seating is characterized by densities of about one person per 15 ft² (1.4 m²). Both requirements prohibit uncontrolled crowd situations, such as in front of stages at rock music concerts where the number and density of people is uncontrolled by architectural or management features.

A.13.2.5.6.3

This requirement is intended to facilitate rapid emergency access to individuals who are experiencing a medical emergency, especially in the case of cardiopulmonary difficulties, where there is a need for rapid medical attention from trained personnel. The requirement also addresses the need for security and law enforcement personnel to reach individuals whose behavior is endangering themselves and others.

A.13.2.5.6.4

The catchment area served by an aisle accessway or aisle is the portion of the total space that is naturally served by the aisle accessway or aisle. Hence, the requirement for combining the required capacity where paths converge is, in effect, a restatement of the idea of a catchment area. The establishment of catchment areas should be based on a balanced use of all means of egress, with the number of persons in proportion to egress capacity.

A.13.2.5.7

For purposes of the means of egress requirements of this *Code*, tablet-arm chair seating is not considered seating at tables. Dinner theater–style configurations are required to comply with the aisle accessway provisions applying to seating at tables and the aisle requirements of 13.2.5.8, if the aisles contain steps or are ramps. (*See also 7.1.7 and A.7.1.7.2.*)

A.13.2.5.7.1

Seats having reclining backs are assumed to be in their most upright position when unoccupied.

A.13.2.5.7.5

The system known as *continental seating* has one pair of egress doors provided for every five rows that is located close to the ends of the rows. In previous editions of the *Code*, such egress doors were required to provide a clear width of not less than 66 in. (1675 mm) discharging into a foyer, into a lobby, or to the exterior of the building. This continental seating arrangement can result in egress flow times (i.e., with nominal flow times of approximately 100 seconds, rather than 200 seconds) that are approximately one-half as long as those resulting where side aisles lead to more remote doors. Such superior egress flow time performance is desirable in some situations; however, special attention should be given either to a comparably good egress capacity for other parts of the egress system or to sufficient space to accommodate queuing outside the seating space.

A.13.2.5.8.3

It is the intent to permit handrails to project not more than 3½ in. (90 mm) into the clear width of aisles required by 13.2.5.8.3.

A.13.2.5.8.4.1

Technical information about the convenience and safety of ramps and stairs having gradients in the region of 1 in 8 clearly suggests that the goal should be slopes for ramps that are less steep and combinations of stair risers and treads that are, for example, superior to 4 in. (100 mm) risers and 32 in. (865 mm) treads. This goal should be kept in mind by designers in establishing the gradient of seating areas to be served by aisles.

A.13.2.5.8.5(3)

Tread depth is more important to stair safety than is riser height. Therefore, in cases where the seating area gradient is less than 5 in 11, it is recommended that the tread dimension be increased beyond 11 in. (280 mm), rather than reducing the riser height. Where the seating area gradient exceeds 8 in 11, it is recommended that the riser height be increased while maintaining a tread depth of not less than 11 in. (280 mm).

A.13.2.5.8.5(5)

Completely uniform tread dimensions are preferred over aisle stair designs where tread depths alternate between relatively small intermediate treads between seating platforms and relatively large treads at seating platforms. A larger tread that is level with the seating platform is not needed to facilitate easy access to, and egress from, a row of seating. If this arrangement is used, it is important to provide a tread depth that is better than minimum for the intermediate tread; hence, 13 in. (330 mm) is specified. Where nonuniformities exist due to construction tolerance, they should not exceed ¼ in. (4.8 mm) between adjacent treads.

A.13.2.5.8.9

Failure to provide a handrail within a 30 in. (760 mm) horizontal distance of all required portions of the aisle stair width means that the egress capacity calculation is required to be modified as specified by 13.2.3.3(3). This modification might lead to an increase in the aisle width. Although this increase will compensate for reduced egress efficiency, it does not help individuals walking on such portions of stairs to recover from missteps, other than by possibly marginally reducing the crowding that might exacerbate the problem of falls. (See also 7.2.2.4.)

A.13.2.5.8.10

Certain tread cover materials such as plush carpets, which are often used in theaters, produce an inherently well-marked tread nosing under most lighting conditions. On the other hand, concrete treads have nosings with a sharp edge and, especially under outdoor lighting conditions, are difficult to discriminate. Therefore, concrete treads require an applied marking stripe. The slip resistance of such marking stripes should be similar to the rest of the treads, and no tripping hazard should be created; luminescent, self-luminous, and electroluminescent tread markings have the advantage of being apparent in reduced light or in the absence of light.

A.13.2.5.9

For purposes of the means of egress requirements of this *Code*, seating at counters or at other furnishings is considered to be the same as seating at tables.

A.13.2.5.9.2

Effectively, where the aisle accessway is bounded by movable seating, the 12 in. (305 mm) minimum width might be increased by about 15 in. to 30 in. (380 mm to 760 mm) as seating is pushed in toward tables. Moreover, it is such movement of chairs during normal and emergency egress situations that makes the zero-clearance exception workable. The exception also applies to booth seating where people sitting closest to the aisle normally move out ahead of people farthest from the aisle.

A.13.2.5.9.3

See A.13.2.5.10.3.

A.13.2.5.9.4

The minimum width requirement as a function of accessway length is as follows:

- (1) 0 in. (0 mm) for the first 6 ft (1830 mm) of length toward the exit
- (2) 12 in. (305 mm) for the next 6 ft (1830 mm); that is, up to 12 ft (3660 mm) of length
- (3) 12 in. to 24 in. (305 mm to 610 mm) for lengths from 12 ft to 36 ft (3.7 m to 11 m), the maximum length to the closest aisle or egress doorway permitted by 13.2.5.9.5

Any additional width needed for seating is to be added to these widths, as described in 13.2.5.10.3.

A.13.2.5.10.1

See 7.1.7 and A.7.1.7.2 for special circulation safety precautions applicable where small elevation differences occur.

A.13.2.5.10.2

It is important to make facilities accessible to people using wheelchairs. See ICC A117.1, *Accessible and Usable Buildings and Facilities*, which provides guidance on appropriate aisle widths.

A.13.2.5.10.3

Figure A.13.2.5.10.3 shows typical measurements involving seating and tables abutting an aisle. Note that, for purposes of the means of egress requirements of this *Code*, seating at counters or other furnishings is considered to be the same as seating at tables.

Figure A.13.2.5.10.3 Seating at Tables Abutting an Aisle.

**A.13.2.11.1(8)**

The written plan should identify the unguarded areas and should include precautions and provisions to mitigate the fall hazard. Such precautions and provisions might include the following:

- (1) Training
- (2) Choreography
- (3) Blocking
- (4) Rehearsal
- (5) Restricted access to the stage
- (6) Restricted access to unguarded edges
- (7) Warning lights
- (8) Audible warnings
- (9) Tactile edges
- (10) Warning barriers
- (11) Signage
- (12) Temporary barriers
- (13) Personal fall protection
- (14) Fall restraint
- (15) Spotters

A.13.3.1(1)

The allowance for unenclosed stairs or ramps presumes the balcony or mezzanine complies with the other provisions of the *Code*, such as travel distance to exits in accordance with 13.2.6 and number of exits in accordance with 13.2.4. For the purposes of this exception, a balcony with glazing that provides a visual awareness of the main assembly area is considered open.

A.13.3.4.2.3

The intent is to require detectors only in nonsprinklered hazardous areas that are unoccupied. Where the building is occupied, the detectors in the unoccupied, unsprinklered hazardous areas will initiate occupant notification. If the building is unoccupied, the fire in the nonsprinklered hazardous area is not a life safety issue, and the detectors, upon activation, are not required to notify anyone. The signal from a detector is permitted to be sent to a control panel in an area that is occupied when the building is occupied, but that is unoccupied when the building is unoccupied, without the need for central station monitoring or the equivalent.

A.13.4.2.1

Life safety evaluations are examples of performance-based approaches to life safety. In this respect, significant guidance in the form and process of life safety evaluations is provided by Chapter 5, keeping in mind the fire safety emphasis in Chapter 5. Performance criteria, scenarios, evaluation, safety factors, documentation, maintenance, and periodic assessment (including a warrant of fitness) all apply to the broader considerations in a life safety evaluation. A life safety evaluation deals not only with fire but also with storms, collapse, crowd behavior, and other related safety considerations for which a checklist is provided in A.13.4.2.3. Chapter 5 provides guidance, based on fire safety requirements, for establishing a documented case showing that products of combustion in all conceivable fire scenarios will not significantly endanger occupants using means of egress in the facility (e.g., due to fire detection, automatic suppression, smoke control, large-volume space, or management procedures). Moreover, means of egress facilities plus facility management capabilities should be adequate to cope with scenarios where certain egress routes are blocked for some reason.

In addition to making realistic assumptions about the capabilities of persons in the facility (e.g., an assembled crowd including many disabled persons or persons unfamiliar with the facility), the life safety evaluation should include a factor of safety of not less than 2.0 in all calculations relating to hazard development time and required egress time (the combination of flow time and other time needed to detect and assess an emergency condition, initiate egress, and move along the egress routes). The factor of safety takes into account the possibility that half of the egress routes might not be used (or usable) in certain situations.

Regarding crowd behavior, the potential hazards created by larger masses of people and greater crowd densities (which can be problematic during ingress, occupancy, and egress) demand that technology be used by designers, managers, and authorities responsible for buildings to compensate for the relaxed egress capacity provisions of Table 13.4.3.3. In very large buildings for assembly use, the hazard of crowd crushes can exceed that of fire or structural failure. Therefore, the building designers, managers, event planners, security personnel, police authorities, and fire authorities, as well as the building construction authorities, should understand the potential problems and solutions, including coordination of their activities. For crowd behavior, this understanding includes factors of design, information, management, and expectations during ingress, circulation, and egress. Published guidance on these factors and techniques is found in ANSI ES1.9, *Crowd Management*; the *SFPE Handbook of Fire Protection Engineering*, in Chapter 56, Egress Concepts and Design Approaches; Chapter 58, Human Behavior in Fire; and Chapter 59, Employing the Hydraulic Model in Assessing Emergency Movement; and the *SFPE Guide to Human Behavior in Fire* and the publications referenced therein.

Table 13.2.3.2 and Table 13.4.3.3 are based on a linear relationship between number of seats and nominal flow time, with not less than 200 seconds (3.3 minutes) for 2,000 seats plus 1 second for every additional 50 seats up to 25,000. Beyond 25,000 total seats, the nominal flow time is limited to 660 seconds (11 minutes). Nominal flow time refers to the flow time for the most able group of patrons; some groups less familiar with the premises or less able groups might take longer to pass a point in the egress system. Although three or more digits are noted in the tables, the resulting calculations should be assumed to provide only two significant figures of precision.

A.13.4.2.3

Factors to be considered in a life safety evaluation might include the following:

- (1) Nature of the events being accommodated, including the following:
 - (a) Ingress, intra-event movement, and egress patterns
 - (b) Ticketing and seating policies/practices
 - (c) Event purpose (e.g., sports contest, religious meeting)
 - (d) Emotional qualities (e.g., competitiveness) of event
 - (e) Time of day when event is held
 - (f) Time duration of single event
 - (g) Time duration of attendees' occupancy of the building
- (2) Occupant characteristics and behavior, including the following:
 - (a) Homogeneity
 - (b) Cohesiveness
 - (c) Familiarity with building
 - (d) Familiarity with similar events
 - (e) Capability (as influenced by factors such as age, physical abilities)
 - (f) Socioeconomic factors
 - (g) Small minority involved with recreational violence
 - (h) Emotional involvement with the event and other occupants
 - (i) Use of alcohol or drugs
 - (j) Food consumption
 - (k) Washroom utilization
- (3) Management, including the following:
 - (a) Clear, contractual arrangements for facility operation/use as follows:
 - i. Between facility owner and operator
 - ii. Between facility operator and event promoter
 - iii. Between event promoter and performer
 - iv. Between event promoter and attendee
 - v. With police forces
 - vi. With private security services
 - vii. With ushering services
 - (b) Experience with the building
 - (c) Experience with similar events and attendees
 - (d) Thorough, up-to-date operations manual
 - (e) Training of personnel
 - (f) Supervision of personnel
 - (g) Communications systems and utilization
 - (h) Ratios of management and other personnel to attendees
 - (i) Location/distribution of personnel
 - (j) Central command location
 - (k) Rapport between personnel and attendees
 - (l) Personnel support of attendee goals
 - (m) Respect of attendees for personnel due to the following:
 - i. Dress (uniform) standards
 - ii. Age and perceived experience
 - iii. Personnel behavior, including interaction
 - iv. Distinction between crowd management and control
 - v. Management concern for facility quality (e.g., cleanliness)
 - vi. entire event experience of attendees (i.e., not just during occupancy of the building)
- (4) Emergency management preparedness, including the following:
 - (a) Complete range of emergencies addressed in operations manual
 - (b) Power loss
 - (c) Fire
 - (d) Severe weather
 - (e) Earthquake
 - (f) Crowd incident
 - (g) Terrorism
 - (h) Hazardous materials
 - (i) Transportation accident (e.g., road, rail, air)
 - (j) Communications systems available
 - (k) Personnel and emergency forces ready to respond
 - (l) Attendees clearly informed of situation and proper behavior
- (5) Building systems, including the following:
 - (a) Structural soundness
 - (b) Normal static loads

- (c) Abnormal static loads (e.g., crowds, precipitation)
- (d) Dynamic loads (e.g., crowd sway, impact, explosion, wind, earthquake)
- (e) Stability of nonstructural components (e.g., lighting)
- (f) Stability of movable (e.g., telescoping) structures
- (g) Fire protection
- (h) Fire prevention (e.g., maintenance, contents, housekeeping)
- (i) Compartmentation
- (j) Automatic detection and suppression of fire
- (k) Smoke control
- (l) Alarm and communications systems
- (m) Fire department access routes and response capability
- (n) Structural integrity
- (o) Weather protection
- (p) Wind
- (q) Precipitation (attendees rush for shelter or hold up egress of others)
- (r) Lightning protection
- (s) Circulation systems
- (t) Flowline or network analysis
- (u) Waywinding and orientation
- (v) Merging of paths (e.g., precedence behavior)
- (w) Decision/branching points
- (x) Route redundancies
- (y) Counterflow, crossflow, and queuing situations
- (z) Control possibilities, including metering
- (aa) Flow capacity adequacy
- (ab) System balance
- (ac) Movement time performance
- (ad) Flow times
- (ae) Travel times
- (af) Queuing times
- (ag) Route quality
- (ah) Walking surfaces (e.g., traction, discontinuities)
- (ai) Appropriate widths and boundary conditions
- (aj) Handrails, guardrails, and other rails
- (ak) Ramp slopes
- (al) Step geometries
- (am) Perceptual aspects (e.g., orientation, signage, marking, lighting, glare, distractions)
- (an) Route choices, especially for vertical travel
- (ao) Resting/waiting areas
- (ap) Levels of service (overall crowd movement quality)
- (aq) Services
- (ar) Washroom provision and distribution
- (as) Concessions
- (at) First aid and EMS facilities
- (au) General attendee services

A scenario-based approach to performance-based fire safety is addressed in Chapter 5. In addition to utilizing such scenarios and, more generally, the attention to performance criteria, evaluation, safety factors, documentation, maintenance, and periodic assessment required when the Chapter 5 option is used, life safety evaluations should consider scenarios based on characteristics important in assembly occupancies. These characteristics include the following:

- (1) Whether there is a local or mass awareness of an incident, event, or condition that might provoke egress
- (2) Whether the incident, event, or condition stays localized or spreads
- (3) Whether or not egress is desired by facility occupants
- (4) Whether there is a localized start to any egress or mass start to egress
- (5) Whether exits are available or not available

Examples of scenarios and sets of characteristics that might occur in a facility follow.

Scenario 1. Characteristics: mass start, egress desired (by management and attendees), exits not available, local awareness.

Normal egress at the end of an event occurs just as a severe weather condition induces evacuees at the exterior doors to retard or stop their egress. The backup that occurs in the egress system is not known to most evacuees, who continue to press forward, potentially resulting in a crowd crush.

Scenario 2. Characteristics: mass start, egress not desired (by management), exits possibly not available, mass awareness.

An earthquake occurs during an event. The attendees are relatively safe in the seating area. The means of egress outside the seating area are relatively unsafe and vulnerable to aftershock damage. Facility management discourages mass egress until the means of egress can be checked and cleared for use.

Scenario 3. Characteristics: local start, incident stays local, egress desired (by attendees and management), exits available, mass awareness.

A localized civil disturbance (e.g., firearms violence) provokes localized egress, which is seen by attendees, generally, who then decide to leave also.

Scenario 4. Characteristics: mass start, egress desired (by attendees), incident spreads, exits not available, mass awareness.

In an open-air facility unprotected from wind, precipitation, and lightning, sudden severe weather prompts egress to shelter but not from the facility. The means of egress congest and block quickly as people in front stop once they are under shelter, while people behind them continue to press forward, potentially resulting in a crowd crush.

These scenarios illustrate some of the broader factors to be taken into account when assessing the capability of both building systems and management features on which reliance is placed in a range of situations, not just fire emergencies. Some scenarios also illustrate the conflicting motivations of management and attendees based on differing perceptions of danger and differing knowledge of hazards, countermeasures, and capabilities. Mass egress might not be the most appropriate life safety strategy in some scenarios, such as Scenario 2.

Table A.13.4.2.3 summarizes the characteristics in the scenarios and provides a framework for developing other characteristics and scenarios that might be important for a particular facility, hazard, occupant type, event, or management.

Table A.13.4.2.3 Life Safety Evaluation Scenario Characteristics Matrix

Scenario	Local Awareness	Mass Awareness	Incident Localized	Incident Spreads	Management		Occupants		Local Start	Mass Start	Exits Available	Exits Not Available	Other
					Egress Desired	Egress Not Desired	Egress Desired	Egress Not Desired					
1	X	—	—	—	X	—	X	—	—	X	—	X	—
2	—	X	—	—	—	X	—	—	—	X	—	X	—
3	—	X	X	—	X	—	X	—	X	—	X	—	—
4	—	X	—	X	—	—	X	—	—	X	—	X	—

A.13.4.3

Outdoor facilities are not accepted as inherently smoke-protected but must meet the requirements of smoke-protected assembly seating in order to use the special requirements for means of egress.

A.13.4.9

Special amusement buildings are unique structures that can present challenges not common in assembly or other occupancies. Hazards in special amusement buildings can include industrial, electrical, pneumatic, stored energy systems, or other systems and equipment associated with the ride and/or show systems. Occupants are typically not familiar with their surroundings, and the provided exit access might not be apparent while the building is operating in show conditions.

Additionally, special amusement buildings might present design challenges, which the authority having jurisdiction might need to consider. For example, a ride building containing a roller coaster might meet the height requirements for a high-rise structure but only contain one story of height and mezzanines or catwalks at upper levels for evacuation. Portions of a ride might exit and return into the building, traverse to an open structure, be surrounded by water, or contain an atrium. Each of these conditions presents challenges to the design of fire protection, fire alarm, and life safety systems, as well as the emergency action plan required in 13.7.13.

Where a special amusement building is installed inside another building on a temporary basis, such as within an exhibit hall, the special amusement building requirements apply only to the portions of the building used as a special amusement. For example, the smoke detectors required by 13.4.9.4.3 are not required to be connected to the building's fire alarm system. Where installed in an exhibit hall, such smoke detectors are also required to comply with the provisions applicable to an exhibit.

A.13.4.9.1.1

The aggregate horizontal projections of a multilevel play structure are indicative of the number of children who might be within the structure and at risk from a fire or similar emergency. The word “aggregate” is used in recognition of the fact that the platforms and tubes that make up the multilevel play structure run above each other at various levels. In calculating the area of the projections, it is important to account for all areas that might be expected to be occupied within, on top of, or beneath the components of the structure when the structure is used for its intended function.

A.13.4.9.1.2

An example of a Class A special amusement building would be a theme park attraction or dark ride where patrons are restrained inside a ride vehicle and guided through a building on a track.

An example of a Class B special amusement building would be an escape room or theme park attraction where a patron can exit the building once the amusement or effects are stopped. Temporary rides such as a merry-go-round or train located in a mall would not meet the definition of a Class B special amusement building unless there was an element to the ride where a patron would become confused or is otherwise confined to the ride vehicle and unable to self-evacuate. See A.3.3.37.9.

An example of a Class C special amusement building would be a temporary haunted house, maze, or carnival attraction.

A.13.4.9.2.1.3

Consideration should be given to the provision of directional exit marking on or adjacent to the floor.

A.13.4.9.2.2.1

Lighting levels within special amusement buildings might be reduced to levels that are lower than those required by Section 7.8 for show purposes. In addition, projections, special effects, haze, and other theatrical elements might be combined, which can disorient occupants who are unfamiliar with the egress route. The activation of the automatic sprinkler system or smoke detection system should immediately increase illumination to the required levels and stop all show elements that would continue to disorient or confuse occupants.

Because of the delay in verification or cross-zoning of smoke detectors, positive alarm sequence should not be utilized when alarm-verification or cross-zoned smoke detectors is selected.

In the context of a special amusement building, a conflicting or confusing sound or visual is any audio or visual device that is intended to quickly distract the attention the patron of a special amusement building for the purpose of frightening, confounding, disorienting, or otherwise capturing the attention of the patron. Examples of this include strobing and flashing lights, loud sound effects, scare or jump effects, loud music, animated figures, projected animation, and interactive games. These can all interfere with the fire alarm notification devices and live announcements from the attraction operator for the patron's attention. In addition, effects that simulate the sound, sight and smell of flames or smoke will confuse the patron if they continue to operate when the fire alarm system has been activated.

Some examples of audio and visuals that might occur in a special amusement building, but that might not constitute a conflicting sound or visual, include static or very slow-moving video or projected images, background music, steady state lighting, and ride vehicle triggered effects.

A.13.4.9.2.2.2

Amusement rides and devices that contain or restrain their patrons such that they are unable to evacuate without the assistance of a ride operator present a unique challenge during an emergency. While ASTM F2291, *Standard Practice for Design of Amusement Rides or and Devices*, provides for the design of evacuation paths in case the ride stops before completing its full cycle. The safest and fastest way to exit patrons during an emergency might be to “cycle out” by continuing ride operation until all patrons have exited the ride at the normal exit point (at the unload platform). If a patron were to attempt to exit the ride vehicle while the ride continues operation during an emergency, the patron may potentially be struck by the ride vehicle, or the ride's safety systems might stop all ride motion, potentially extending the evacuation period. Because increasing the illumination of the means of egress along the ride and terminating any conflicting or confusing sounds or visuals while the ride is cycling out might entice the patrons to attempt to self-evacuate while the ride is in motion, the authority having jurisdiction and the owner are encouraged to work closely to develop a plan that implements the safest and most efficient method to exit the patrons from the ride, which might include continuing normal show operation during cycle out. In addition, the plan should assure that all ride operators and emergency responders understand their roles during cycle out, or during an evacuation if the ride cycle out is interrupted.

The ride owner should work with the authority having jurisdiction from an early stage to develop a pre-incident plan in accordance with NFPA 1620 and any required or applicable provisions of 13.4.2.5.2.

A.13.4.9.4.2

Special amusement attractions might contain an operator console or “tower,” which might also serve as a constantly attended location when the ride is operating.

A.13.4.9.4.4

Notification in special amusement buildings should be considered carefully depending on the operation of the special amusement. Voice announcements are the required method. However, automatically transmitted evacuation instructions might not be appropriate in some rides when occupants are confined to a ride vehicle and unable to self-evacuate. In order to avoid confusion, manual voice announcements from the ride operator might be preferable to pre-recorded evacuation instructions for some rides.

A.13.4.9.4.3

Special amusement buildings that contain rides tend to be occupied after operating hours by maintenance staff. After-hours maintenance work might take place along the ride track or in an attached maintenance bay where ride vehicles are moved on and off spur tracks. When no ride operator is located at the constantly attended location to receive alarm signals, a means of automatically sounding the general evacuation signal should be provided for after-hours occupants.

A.13.4.9.5.1

See A.13.4.9.1.1.

A.13.4.9.6.1

Special amusement buildings might simulate different structures, such as an outdoor scene where false walls and ceilings, commonly known as sets, are recreated indoors with various fabrics and materials used to simulate trees, leaves, or other items. Sets in special amusement buildings are often designed by entertainment companies familiar with Broadway-style stage productions. However, unlike stages and theaters, there are no requirements for smoke control or proscenium protection. The authority having jurisdiction should consider and evaluate the total quantity of material introduced into the space.

A.13.4.9.6.2

The evacuation plan for special amusement buildings should consider the safest and fastest way to remove occupants from the structure. When a ride stops within the special amusement building, removing occupants from the ride system might present an extended evacuation. Additionally, hazards associated with the ride and show system might present electrical and entanglement challenges to occupants unfamiliar with the building. Evacuation of special amusement buildings can also pose challenges to the local fire department if they are not familiar with the nature of the building or ride system. Specialized equipment for rescue, ride vehicle-specific tools for releasing doors, and high-energy ride vehicle hazard awareness might all be required when evacuating from a location other than a load/unload station.

The ride owner should work with the authority having jurisdiction from an early stage to develop a pre-incident plan in accordance with NFPA 1620 and any required or applicable provisions of 13.4.2.5.2.

A.13.4.12.2(2)

Delayed-egress locks on doors from the airport loading walkway into the airport terminal building might compromise life safety due to the limited period of time the airport loading walkway will provide protection for emergency egress. The requirement of 13.4.12.2(2) would not limit the use of access-controlled or delayed-egress hardware from the airport terminal building into the airport loading walkway.

A.13.7.3(3)(a)

Securely supported altar candles in churches that are well separated from any combustible material are permitted. On the other hand, lighted candles carried by children wearing cotton robes present a hazard too great to be permitted. There are many other situations of intermediate hazard where the authority having jurisdiction will have to exercise judgment.

A.13.7.4.1

Fabric applied over unused seating sections should meet the requirements of 13.7.4.

A.13.7.4.3

The phrase "unprotected materials containing foamed plastic" is meant to include foamed plastic items covered by "thermally thin" combustible fabrics or paint. (See A.10.2.3.3.)

A.13.7.5.3.7.1(3)

See A.13.4.2.1.

A.13.7.6.2

Crowd managers and crowd manager supervisors need to clearly understand the required duties and responsibilities specific to the venue's emergency plan. The crowd management training program should include a clear appreciation of crowd dynamics factors including space, energy, time, and information, as well as specific crowd management techniques, such as metering. Training should involve specific actions necessary during normal and emergency operations, and include an assessment of people-handling capabilities of a space prior to its use, the identification of hazards, an evaluation of projected levels of occupancy, the adequacy of means of ingress and egress and identification of ingress and egress barriers, the processing procedures such as ticket collection, and the expected types of human behavior. Training should also involve the different types of emergency evacuations and, where required by the emergency plan, relocation and shelter-in-place operations, and the challenges associated with each.

A.13.7.6.4

In large facilities, crowd managers typically have a specific area of responsibility. In such facilities, the requirements of 13.7.6.4 might apply only to the crowd managers' area of responsibility.

A.13.7.7

It is important that an adequate number of competent attendants is on duty at all times when the assembly occupancy is occupied.

A.13.7.7.3

It is not the intent of this provision to require an announcement in bowling alleys, cocktail lounges, restaurants, or places of worship.

A.14.2.2.2.4

While 14.2.2.2.4 establishes locking criteria for classroom doors only, a school's emergency action plan could identify situations where other areas need to be secured. The provisions of this subsection should be considered when evaluating those areas as well. Examples of such areas are administrative offices, gymnasiums, teacher lounges, libraries, auditoriums, and cafeterias.

A.14.2.2.3

See A.7.2.2.4.5.4 regarding additional handrails on stairs that are used extensively by children 5 years of age or less.

A.14.2.5.9

A corridor roofed over and enclosed on its long side and open to the atmosphere at the end is permitted to be considered an exterior corridor if either of the following criteria are met:

- (1) Clear story openings for the corridor are provided on both sides of the corridor and above adjacent roofs or buildings, and such clear openings are not less than one-half the height of the corridor walls.
- (2) The corridor roof has unobstructed openings to the sky not less than 50 percent of the area of the roof.

The openings detailed in A.14.2.5.9(1) and A.14.2.5.9(2) are to be equally distributed, and, if louvers are installed, they are to be fixed open with a clear area based on the actual openings between louver vanes.

A.14.2.11.1

It is highly desirable that all windows be of a type that can be readily opened from inside and that they are large enough and low enough for use by students, teachers, and firefighters. Windows are permitted to serve as a supplementary means of emergency escape, particularly where ladders can be raised by firefighters or others.

A.14.3.2.1(2)(a)

It is not the intent to classify a room with a domestic-type clothes washer and a domestic-type clothes dryer as a laundry.

A.14.3.3.2

The definition of interior wall finish is meant to include washroom water closet partitions.

A.14.3.4.2.3.1

Occupied portions of the building should have access to a central point for manual activation of the evacuation signal.

A.14.3.4.2.3.2

Occupied portions of the building should have access to a central point for manual activation of the evacuation signal.

[See SR-66](#)

A.14.7.1.2

The built environment of schools often uses both passive and active security features. These features should be considered part of the approved emergency action plans for these facilities. Assessing how these systems perform under normal circumstances, in emergency situations, and when the power fails is recommended.

A.14.7.2.1

The requirements are, of necessity, general in scope, because it is recognized that they apply to all types of educational occupancies as well as conditions of occupancies, such as truant schools; schools for students with intellectual, vision, hearing, and speech disabilities; and public schools. It is fully recognized that no one code can meet all the conditions of the various buildings involved, and it will be necessary for site administrators to issue supplements to these requirements; however, all supplements should be consistent with these requirements.

A.14.7.2.4

Many jurisdictions are now conducting other drills in addition to emergency egress drills. Targeted violence events can include everything from active shooters to use of other weapons intended to cause harm. Natural hazard drills generally consist of tornado or earthquake drills.

A.14.7.3.1

Particular attention should be given to keeping all doors unlocked; keeping doors that serve to protect the safety of paths of egress closed and under no conditions blocked open, such as doors on stairway enclosures; keeping outside stairs and fire escape stairs free from all obstructions and clear of snow and ice; and allowing no accumulation of snow or ice or materials of any kind outside exit doors that might prevent the opening of the door or interfere with rapid escape from the building.

Any condition likely to interfere with safe egress should be corrected immediately, if possible, or otherwise should be reported at once to the appropriate authorities.

A.15.2.2.2.4

While 15.2.2.2.4 establishes locking criteria for classroom doors only, a school's emergency action plan could identify situations where other areas need to be secured. The provisions of this subsection should be considered when evaluating those areas as well. Examples of such areas are administrative offices, gymnasiums, teacher lounges, libraries, auditoriums, and cafeterias.

A.15.2.2.2.4.1(3)

The installation of new hardware that necessitates two nonsimultaneous releasing motions on existing doors in existing educational occupancies in accordance with 15.2.2.2.4.1(3) is permitted where such installation is necessary for compliance with the door locking criteria in 15.2.2.2.4.1. In accordance with 43.1.4.5, rehabilitation work performed for compliance with the Code's existing occupancy requirements is exempt from Chapter 43 and the installation of such new equipment is not subject to Section 43.5, which would require compliance with the new occupancy provisions. Where a new door is installed in an existing educational occupancy, the requirements of 14.2.2.2.4 apply.

A.15.2.2.3

See A.7.2.2.4.5.4 regarding additional handrails on stairs that are used extensively by children 5 years of age or less.

A.15.2.5.9

A corridor roofed over and enclosed on its long side and open to the atmosphere at the end is permitted to be considered an exterior corridor if either of the following criteria are met:

- (1) Clear story openings for the corridor are provided on both sides of the corridor and above adjacent roofs or buildings, and such clear openings are not less than one-half the height of the corridor walls.
- (2) The corridor roof has unobstructed openings to the sky not less than 50 percent of the area of the roof.

The openings detailed in A.15.2.5.9(1) are to be equally distributed, and, if louvers are installed, they are to be fixed open with a clear area based on the actual openings between louver vanes.

A.15.2.11.1

It is highly desirable that all windows be of a type that can be readily opened from inside and that they are large enough and low enough for use by students, teachers, and firefighters. Windows are permitted to serve as a supplementary means of emergency escape, particularly where ladders can be raised by firefighters or others.

[See SR-65](#)

A.15.2.11.1.2

Windows for rescue are a nonconventional application provided in educational and day-care occupancies as a result of the 1958 Our Lady of the Angels fire in Chicago. The Code intends for the fire department or others to assist students, especially over ladders, once students have moved through the window opening. Windows for rescue are not considered a component of the means of egress and therefore only comply with the criteria spelled out in 15.2.11.1.2 and not Chapter 7. Therefore landings, handrails, and guardrails are not required nor are the geometrical design requirements found in 7.2.2.2.1 for stairs or 7.2.5 for ramps, except as required in 15.2.11.1.2.

A.15.3.2.1(2)(a)

It is not the intent to classify a room with a domestic-type clothes washer and a domestic-type clothes dryer as a laundry.

A.15.3.4.2.3.1

Occupied portions of the building should have access to a central point for manual activation of the evacuation signal.

A.15.3.4.2.3.2

Occupied portions of the building should have access to a central point for manual activation of the evacuation signal.

A.15.3.4.3.1.1

The audible occupant notification signal for evacuation of an educational occupancy building should be the distinctive three-pulse temporal pattern fire alarm evacuation signal that is required of new systems by *NFPA 72*. The temporal pattern will help educate students to recognize the need to evacuate when they are in other occupancies. Existing fire alarm systems should be modified, as feasible, to sound the three-pulse temporal pattern.

A.15.3.4.3.1.2

For this provision, there are many factors to consider when determining what constitutes a replacement of the fire alarm system. In addition to a complete fire alarm system replacement, a system replacement might also be warranted when a main fire alarm control unit panel or secondary/subordinate control unit(s) is replaced, when the occupant notification system is replaced or added to, or where there is expansion, addition, or significant tenant finish of the building. The authority having jurisdiction is responsible for determining what meets the criteria for replacement in their jurisdiction. For replacement of a fire alarm system in an educational occupancy, it is key that an emergency voice/alarm communication system replace a nonvoice system whenever possible.

A.15.3.6(2)

This provision permits valve supervision in accordance with Section 9.7, rather than requiring that the entire automatic sprinkler system be electrically supervised. It is intended that the valve supervision be performed electrically, not by chaining and locking the valves in the open position.

[See SR-66f](#)**A.15.7.1.2**

The built environment of schools often uses both passive and active security features. These features should be considered part of the approved emergency action plans for these facilities. Assessing how these systems perform under normal circumstances, in emergency situations, and when the power fails is recommended.

A.15.7.2.1

The requirements are, of necessity, general in scope, because it is recognized that they apply to all types of educational occupancies as well as conditions of occupancies, such as truant schools; schools for students with intellectual, vision, hearing, and speech disabilities; and public schools. It is fully recognized that no one code can meet all the conditions of the various buildings involved, and it will be necessary for site administrators to issue supplements to these requirements; however, all supplements should be consistent with these requirements.

A.15.7.2.4

Many jurisdictions are now conducting other drills in addition to emergency egress drills. Targeted violence events can include everything from active shooters to use of other weapons intended to cause harm. Natural hazard drills generally consist of tornado or earthquake drills.

A.15.7.3.1

Particular attention should be given to keeping all doors unlocked; keeping doors that serve to protect the safety of paths of egress closed and under no conditions blocked open, such as doors on stairway enclosures; keeping outside stairs and fire escape stairs free from all obstructions and clear of snow and ice; and allowing no accumulation of snow or ice or materials of any kind outside exit doors that might prevent the opening of the door or interfere with rapid escape from the building.

Any condition likely to interfere with safe egress should be corrected immediately, if possible, or otherwise should be reported at once to the appropriate authorities.

A.16.1.1

Day-care occupancies do not provide for the full-time maintenance of a client. Occupancies that provide a primary place of residence are addressed in other occupancy chapters. (*See Chapters 24 through 33.*)

The requirements of Chapter 16 are based on the need to adequately protect the occupants in case of fire. The requirements assume that adequate staffing will be available and are based on staffing similar to that outlined in Table A.16.1.1.

Table A.16.1.1 Staffing

Staff-to-Client Ratio	Age (mo.)
1:3	0–24
1:4	25–36
1:7	37–60
1:10	61–96
1:12	≥97
1:3	Clients incapable of self-preservation

If staff-to-client ratios fall below those suggested by Table A.16.1.1, it is the responsibility of the authority having jurisdiction to determine the additional safeguards beyond the requirements of Chapter 16 that are necessary. Typical additional provisions might include restricting the day-care occupancy to the level of exit discharge, requiring additional smoke detection, requiring automatic sprinkler protection, requiring better or additional means of egress, and requiring similar types of provisions, depending on the situation.

A.16.1.1.7

The definition of day-care occupancy is intended to exclude day-care uses that are part of some other occupancy. In such cases, the requirements of the predominant occupancy apply. Examples of excluded facilities include the following:

- (1) Rooms located within places of worship used as nurseries or for supervision of children or religious education while services are being held in the building.
- (2) Rooms used for temporary child care during short-term recreational activities of the child's relative or guardian, such as within a health club or park district.
- (3) Rooms used for temporary child care during short-term activities such as court hearings, medical appointments, libraries, or other similar circumstances.

A.16.1.2.3

A conversion from a day-care occupancy with more than 12 clients to a day-care home is not considered a change of occupancy. The resulting day-care home should be permitted to meet the requirements of Chapter 17 for existing day-care homes.

A.16.2.2.2.4

The purpose of this requirement is to prevent arrangements whereby a client can be trapped in a space or area. It is intended that this provision be broadly interpreted by the authority having jurisdiction to include equipment such as refrigerators and freezers.

A.16.2.2.3

See A.7.2.2.4.5.4 regarding additional handrails on stairs that are used extensively by children 5 years of age or less.

A.16.3.2.1(2)(a)

It is not the intent to classify a room with a domestic-type clothes washer and a domestic-type clothes dryer as a laundry.

A.16.6.1.4.2

A conversion from a day-care occupancy with more than 12 clients to a day-care home is not considered a change of occupancy. The resulting day-care home should be permitted to meet the requirements of Chapter 17 for existing day-care homes.

A.16.7.1

The requirements are, of necessity, general in scope, because it is recognized that they apply to all types of day-care occupancies as well as conditions of occupancies, such as truant day-care occupancies; occupancies for persons with intellectual, vision, hearing, and speech disabilities; adult day-care; care of infants; and day-care occupancies. It is fully recognized that no one code can meet all the conditions of the various buildings involved, and it will be necessary for site administrators, through the written fire emergency response plan, to issue supplements to these requirements; however, all supplements should be consistent with these requirements. Additionally, it is recommended that fire safety be a part of the educational programs of the occupancy for clients.

Fire emergency response plans need to be written and made available to all employees, including temporary or substitute staff, so that all employees know what is expected of them during a fire emergency. The elements needed in the written plan should be identified in coordination with the authority having jurisdiction.

The facility fire emergency response plan might be a module of a facility disaster plan that covers other emergencies.

The proper safeguarding of clients during a fire emergency requires prompt and effective response by the facility employees in accordance with the fire emergency response plan. Duties covered under the plan should be assigned by position rather than by employee name. Such assignment ensures that, in the absence of an employee, the duties of the position will be performed by a substitute or temporary employee assigned to the position. Temporary or substitute employees should be instructed in advance regarding their duties under the plan for the position to which they are assigned.

Written fire emergency response plans should include, but should not be limited to, information for employees regarding methods and devices available for alerting occupants of a fire emergency. Employees should know how the fire department is to be alerted. Even where automatic systems are expected to alert the fire department, the written plan should provide for backup alerting procedures by staff. Other responses of employees to a fire emergency should include the following:

- (1) Removal of clients in immediate danger to areas of safety, as set forth in the plan
- (2) Methods of using building features to confine the fire and its by-products to the room or area of origin
- (3) Control of actions and behaviors of clients during removal or evacuation activities and at predetermined safe assembly areas

The written plan should state clearly the facility policy regarding the actions staff are to take or not take to extinguish a fire. It should also incorporate the emergency egress and relocation drill procedures set forth in 16.7.2.

For additional guidance on emergency action plans, see *NFPA 1600*. This standard establishes a common set of criteria for disaster management, emergency management, and business continuity programs.

[See SR-66](#)

A.16.7.1.2

The built environment of day-care occupancies often uses both passive and active security features. These features should be considered part of the approved emergency action plans for these facilities. Assessing how these systems perform under normal circumstances, in emergency situations, and when the power fails is recommended.

A.16.7.2.1

The requirements are, of necessity, general in scope, because it is recognized that they apply to all types of day-care occupancies as well as conditions of occupancies, such as truant day-care occupancies; and day-care occupancies for persons with intellectual, vision, hearing, and speech disabilities. It is fully recognized that no one code can meet all the conditions of the various buildings involved, and it will be necessary for site administrators to issue supplements to these requirements; however, all supplements should be consistent with these requirements.

A.16.7.3.2

Particular attention should be given to keeping all doors unlocked; keeping doors that serve to protect the safety of paths of egress closed and under no conditions blocked open, such as doors on stairway enclosures; keeping outside stairs and fire escape stairs free from all obstructions and clear of snow and ice; and allowing no accumulation of snow or ice or materials of any kind outside exit doors that might prevent the opening of the door or interfere with rapid escape from the building.

A.16.7.5

It is the intent that the requirement for adequate adult staff to be awake at all times when clients are present be applied to family day-care and group day-care homes that are operated at night, as well as day-care occupancies.

A.17.1.1

Day-care occupancies do not provide for the full-time maintenance of a client. Occupancies that provide a primary place of residence are addressed in other occupancies. (*See Chapters 24 through 33.*)

The requirements of Chapter 17 are based on the need to adequately protect the occupants in case of fire. The requirements assume that adequate staffing will be available and are based on staffing similar to that outlined in Table A.17.1.1.

Table A.17.1.1 Staffing

Staff-to-Client Ratio	Age (mo.)
1:3	0–24
1:4	25–36
1:7	37–60
1:10	61–96
1:12	≥97
1:3	Clients incapable of self-preservation

If staff-to-client ratios fall below those suggested by Table A.17.1.1, it is the responsibility of the authority having jurisdiction to determine the additional safeguards beyond the requirements of Chapter 17 that are necessary. Typical additional provisions might include restricting the day-care occupancy to the level of exit discharge, requiring additional smoke detection, requiring automatic sprinkler protection, requiring better or additional means of egress, and requiring similar types of items, depending on the situation.

A.17.1.1.7

The definition of day-care occupancy is intended to exclude day-care uses that are part of some other occupancy. In such cases, the requirements of the predominant occupancy apply. Examples of excluded facilities include the following:

- (1) Rooms located within places of worship used as nurseries or for supervision of children or religious education while services are being held in the building.
- (2) Rooms used for temporary child care during short-term recreational activities of the child's relative or guardian, such as within a health club or park district.
- (3) Rooms used for temporary child care during short-term activities such as court hearings, medical appointments, libraries, or other similar circumstances.

A.17.1.2.3

A conversion from a day-care occupancy with more than 12 clients to a day-care home is not considered a change of occupancy. The resulting day-care home should be permitted to meet the requirements of Chapter 17 for existing day-care homes.

A.17.2.2.2.4

The purpose of this requirement is to prevent arrangements where a client can be trapped in a space or area. It is intended that this provision be broadly interpreted by the authority having jurisdiction to include equipment such as refrigerators and freezers.

A.17.2.2.2.6.1(3)

The installation of new hardware that necessitates two nonsimultaneous releasing motions on existing doors in existing day care occupancies in accordance with 17.2.2.2.6.1(3) is permitted where such installation is necessary for compliance with the door locking criteria in 17.2.2.2.6.1. In accordance with 43.1.4.5, rehabilitation work performed for compliance with the *Code*'s existing occupancy requirements is exempt from Chapter 43 and the installation of such new equipment is not subject to Section 43.5, which would require compliance with the new occupancy provisions. Where a new door is installed in an existing day care occupancy, the requirements of 16.2.2.2.6 apply.

A.17.2.2.3

See 7.2.2.4.5.4 regarding additional handrails on stairs that are used extensively by children 5 years of age and under.

[See SR-66](#)

A.17.2.11.1.2

Windows for rescue are a nonconventional application provided in educational and day-care occupancies as a result of the 1958 Our Lady of the Angels fire in Chicago. The *Code* intends for the fire department or others to assist clients, especially over ladders, once clients have moved through the window opening. Windows for rescue are not considered a component of the means of egress and therefore only comply with the criteria spelled out in 17.2.11.1.2 and not Chapter 7. Therefore landings, handrails, and guardrails are not required nor are the geometrical design requirements found in 7.2.2.2.1 for stairs or 7.2.5 for ramps, except as required in 17.2.11.1.2.

A.17.3.2.1(2)(a)

It is not the intent to classify a room with a domestic-type clothes washer and a domestic-type clothes dryer as a laundry.

A.17.6.1.1.2

Day-care homes do not provide for the full-time maintenance of a client. Day-care occupancies that provide a primary place of residence are addressed in other occupancy chapters. (*See Chapters 24 through 33.*)

A.17.6.1.4.2

A conversion from a day-care occupancy with more than 12 clients to a day-care home is not considered a change of occupancy. The resulting day-care home should be permitted to meet the requirements of Chapter 17 for existing day-care homes.

A.17.7.1

The requirements are, of necessity, general in scope, because it is recognized that they apply to all types of day-care occupancies as well as conditions of occupancies, such as truant day-care occupancies; occupancies for persons with intellectual, vision, hearing, and speech disabilities; adult day-care; care of infants; and day-care occupancies. It is fully recognized that no one code can meet all the conditions of the various buildings involved, and it will be necessary for site administrators, through the written fire emergency response plan, to issue supplements to these requirements; however, all supplements should be consistent with these requirements. Additionally, it is recommended that fire safety be a part of the educational programs of the occupancy for clients.

Fire emergency response plans need to be written and made available to all employees, including temporary or substitute staff, so that all employees know what is expected of them during a fire emergency. The elements needed in the written plan should be identified in coordination with the authority having jurisdiction.

The facility fire emergency response plan might be a module of a facility disaster plan that covers other emergencies.

The proper safeguarding of clients during a fire emergency requires prompt and effective response by the facility employees in accordance with the fire emergency response plan. Duties covered under the plan should be assigned by position rather than by employee name. Such assignment ensures that, in the absence of an employee, the duties of the position will be performed by a substitute or temporary employee assigned to the position. Temporary or substitute employees should be instructed in advance regarding their duties under the plan for the position to which they are assigned.

Written fire emergency response plans should include, but should not be limited to, information for employees about methods and devices available for alerting occupants of a fire emergency. Employees should know how the fire department is to be alerted. Even where automatic systems are expected to alert the fire department, the written plan should provide for backup alerting procedures by staff. Other responses of employees to a fire emergency should include the following:

- (1) Removal of clients in immediate danger to areas of safety, as set forth in the plan
- (2) Methods of using building features to confine the fire and its by-products to the room or area of origin
- (3) Control of actions and behaviors of clients during removal or evacuation activities and at predetermined safe assembly areas

The written plan should state clearly the facility policy regarding the actions staff are to take or not take to extinguish a fire. It should also incorporate the emergency egress and relocation drill procedures set forth in 17.7.2.

For additional guidance on emergency action plans, see *NFPA 1600*. This standard establishes a common set of criteria for disaster management, emergency management, and business continuity programs.

[See SR-66](#)

A.17.7.1.2

The built environment of day-care occupancies often uses both passive and active security features. These features should be considered part of the approved emergency action plans for these facilities. Assessing how these systems perform under normal circumstances, in emergency situations, and when the power fails is recommended.

A.17.7.2.1

The requirements are, of necessity, general in scope, because it is recognized that they apply to all types of day-care occupancies as well as conditions of occupancies, such as truant day-care occupancies; and day-care occupancies for persons with intellectual, vision, hearing, and speech disabilities. It is fully recognized that no one code can meet all the conditions of the various buildings involved, and it will be necessary for site administrators to issue supplements to these requirements; however, all supplements should be consistent with these requirements.

A.17.7.3.2

Particular attention should be given to keeping all doors unlocked; keeping doors that serve to protect the safety of paths of egress closed and under no conditions blocked open, such as doors on stairway enclosures; keeping outside stairs and fire escape stairs free from all obstructions and clear of snow and ice; and allowing no accumulation of snow or ice or materials of any kind outside exit doors that might prevent the opening of the door or interfere with rapid escape from the building.

A.17.7.5

It is the intent that the requirement for adequate adult staff to be awake at all times when clients are present be applied to family day-care and group day-care homes that are operated at night, as well as day-care occupancies.

A.18.1.1.1.1

In determining equivalency for conversions, modernizations, renovations, or unusual design concepts of hospitals or nursing homes, the authority having jurisdiction is permitted to accept evaluations based on the health care occupancies fire safety evaluation system (FSSES) of NFPA 101A utilizing the parameters for new construction.

A.18.1.1.1.7

There are many reasons why doors in the means of egress in health care occupancies might need to be locked for the protection of the patients or the public. Examples of conditions that might justify door locking include dementia, mental health, infant care, pediatric care, or patients under court detention order requiring medical treatment in a health care facility. See 18.2.2.2.5 for details on door locking.

A.18.1.1.1.9

The *Code* recognizes that certain functions necessary for the life safety of building occupants — such as the detection of fire and associated products of combustion, the closing of corridor doors, the operation of manual fire alarm devices, and the removal of patients from the room of fire origin — require the intervention of facility staff. It is not the intent of 18.1.1.1.9 to specify the levels or locations of staff necessary to meet this requirement.

A.18.1.1.1.10

It should be recognized that under certain conditions, an ACS might need to be established to support emergent health care delivery and temporarily supplement existing health care systems. The establishment of an ACS should be coordinated with Annex D, government and private industry recommendations, and the local authority having jurisdiction. The required fire emergency plan should include provisions for a continual fire watch to facilitate the safe evacuation or relocation of occupants in the event of an emergency.

A.18.1.1.2

This objective is accomplished in the context of the physical facilities, the type of activities undertaken, the provisions for the capabilities of staff, and the needs of all occupants through requirements directed at the following:

- (1) Prevention of ignition
- (2) Detection of fire
- (3) Control of fire development
- (4) Confinement of the effects of fire
- (5) Extinguishment of fire
- (6) Provision of refuge or evacuation facilities, or both
- (7) Staff reaction

A.18.1.1.4.3.3

For the purpose of this requirement, a floor that is not divided by a smoke barrier is considered one smoke compartment. Where automatic sprinklers are retrofitted into existing nonsprinklered buildings, the construction alternatives for sprinklers provided in this *Code* are intended to apply to the renovated area.

A.18.1.1.4.3.4

In minor rehabilitation, only the rehabilitation itself — not the entire smoke compartment or building — is required to be brought up to the requirements for new nonsprinklered facilities.

A.18.1.3.4

Doctors' offices and treatment and diagnostic facilities that are intended solely for outpatient care and are physically separated from facilities for the treatment or care of inpatients, but that are otherwise associated with the management of an institution, might be classified as business occupancies rather than health care occupancies.

A.18.1.3.5.1

It is the intent that these requirements apply to mobile, transportable, and relocatable structures (in accordance with 1.3.2) where such structures are used to provide shared medical services on an extended or a temporary basis. Where properly separated from the health care occupancy and intended to provide services simultaneously for three or fewer health care patients who are litterborne, the level of protection for such structures should be based on the appropriate occupancy classification of other chapters of this *Code*. Mobile, transportable, or relocatable structures that are not separated from a contiguous health care occupancy, or that are intended to provide services simultaneously for four or more health care patients who are litterborne, should be classified and designed as health care occupancies.

A.18.2.2

In planning egress, arrangements should be made to transfer patients from one section of a floor to another section of the same floor that is separated by a fire barrier or smoke barrier in such a manner that patients confined to their beds can be transferred in their beds. Where the building design will allow, the section of the corridor containing an entrance or elevator lobby should be separated from corridors leading from it by fire or smoke barriers. Such arrangement, where the lobby is centrally located, will, in effect, produce a smoke lock, placing a double barrier between the area to which patients might be taken and the area from which they need to be evacuated because of threatening smoke and fire.

A.18.2.2.2.4(2)

Where delayed-egress electrical locking systems complying with 7.2.1.6.1 are used, the provisions of 18.2.2.2.5 are not required.

A.18.2.2.2.4(3)

Where sensor-release of electrical locking systems complying with 7.2.1.6.2 are used, the provisions of 18.2.2.2.5 are not required.

[Detail SR-66†](#)

A.18.2.2.2.5

The requirements for these permitted locking systems also apply to doors that are locked or that are typically unlocked and that lock upon approach of a patient.

A.18.2.2.2.5.1

Psychiatric units, Alzheimer units, and dementia units are examples of areas with patients who might have clinical needs that justify door locking. Forensic units and detention units are examples of areas with patients who might pose a security threat. Where Alzheimer or dementia patients in nursing homes are not housed in specialized units, the provisions of 18.2.2.2.5.1 should not apply. (See 18.2.2.2.5.3.)

[See SR-66†](#)

A.18.2.2.2.5.2

Pediatric units, maternity units, and emergency departments are examples of areas where patients might have special needs that justify door locking. Door-locking arrangements should be permitted to reduce the risk of abduction of infants and children who are patients.

[See SR-66†](#)

[PCs \[2\]](#)

A.18.2.2.2.5.3

Pediatric units, maternity units, and emergency departments are examples of areas where patients might have special needs that justify door locking. Door-locking arrangements should be permitted to reduce the risk of abduction of infants and children who are patients.

[See SR-66†](#)

A.18.2.2.2.5.3(3)

The intent of this section is to ensure that for a given smoke compartment containing door-locking arrangements, all adjacent smoke compartments on the same floor, as well as those smoke compartments containing the means of egress from the secured area to the exits from the smoke compartment containing the locked area required by 18.2.4.4, be protected throughout by an approved, supervised automatic sprinkler system.

	See SR-66†
A.18.2.2.2.5.3(7) UL 294, <i>Access Control System Units</i>, and UL 1034, <i>Burglary-Resistant Electric Locking Mechanisms</i>, are two standards that provide criteria for listed door-locking hardware. The electrical locking hardware might be a component of an electrical locking system, or the electrical locking hardware might be a device with an individual listing.	
	See SR-66†
A.18.2.2.2.5.4(1) A location such as a nurse station is considered normally attended if it is an area steadily used by staff throughout the period the area contains patients and where, at a given time within that period, staff will generally be present. Uninterrupted physical staff presence at the location for the entire period is not required for the location to be normally attended.	
	See SR-66†
A.18.2.2.2.5.4(3) The intent of this section is to ensure that for a given smoke compartment containing door-locking arrangements, all adjacent smoke compartments on the same floor, as well as those smoke compartments containing the means of egress from the secured area to the exits from the smoke compartment containing the locked area required by 18.2.4.4, be protected throughout by an approved, supervised automatic sprinkler system.	
	See SR-66†
A.18.2.2.2.5.4(6) UL 294, <i>Access Control System Units</i>, and UL 1034, <i>Burglary-Resistant Electric Locking Mechanisms</i>, are two standards that provide criteria for listed door-locking hardware. The electrical locking hardware might be a component of an electrical locking system, or the electrical locking hardware might be a device with an individual listing.	
A.18.2.2.2.7 In some health care occupancies, especially nursing homes, the use of murals to disguise doors has been found to be beneficial for certain patient populations. This provision is intended to apply to disguising of egress doors by painting the doors or the use of wall paper on the doors. The marking of the means of egress such as required exit signs should be clearly visible and not disguised by the mural. Where decorations are applied to the door, the requirements of Section 18.7 would still apply and painting a mural on the door would not be considered a decoration. Such murals should not obscure required vision panels or affect the required fire resistance rating of fire-rated door assemblies.	
A.18.2.2.2.7(2) It is intended that the door-releasing hardware includes levers, locks, knobs, and panic bars, that are directly operated or grasped by staff.	
A.18.2.2.2.7(3) It is intended that the door hardware that is permitted to be covered (i.e., disguised by the mural) includes items such as hinges, closers, and magnets, which would normally not be directly operated or grasped by staff.	
A.18.2.2.2.8 It is desirable to keep doors in exit passageways, stair enclosures, horizontal exits, smoke barriers, and required enclosures around hazardous areas closed at all times to impede the travel of smoke and fire gases. Functionally, however, this involves decreased efficiency and limits patient observation by the staff of a facility. To accommodate such needs, it is practical to presume that such doors will be kept open, even to the extent of employing wood chocks and other makeshift devices. Doors in exit passageways, horizontal exits, and smoke barriers should, therefore, be equipped with automatic hold-open devices activated by the methods described, regardless of whether the original installation of the doors was predicated on a policy of keeping them closed.	
A.18.2.3.4 It is not the intent that the required corridor width be maintained clear and unobstructed at all times. Projections into the required width are permitted by 7.3.2.2. It is not the intent that 18.2.3.4 supersede 7.3.2.2.	
A.18.2.3.4(1) Occupant characteristics are an important factor to be evaluated in setting egress criteria. Egress components in nonpatient use areas, such as administrative office spaces, should be evaluated based on actual use. A clear corridor width of not less than 44 in. (1120 mm) is specified, assuming occupants in nonpatient areas will be mobile and capable of evacuation without assistance.	
A.18.2.3.4(2) The intent of 18.2.3.4(2) is to permit limited noncontinuous projections along the corridor wall. These include hand-rub dispensing units complying with 18.3.2.6, nurse charting units, wall-mounted computers, telephones, artwork, bulletin boards, display case frames, cabinet frames, fire alarm boxes, and similar items. It is not the intent to permit the narrowing of the corridor by the walls themselves. The provision of 7.3.2.2 permits projections up to 4½ in. (114 mm) to be present at and below the 38 in. (965 mm) height specified in 18.2.3.4(2), and it is not the intent of 18.2.3.4(2) to prohibit such projections. Permitting projections above the 38 in. (965 mm) handrail height complies with the intent of the requirement, as such projections will not interfere with the movement of gurneys, beds, and wheelchairs. Projections below handrail height for limited items, such as fire extinguisher cabinets and recessed water coolers, also will not interfere with equipment movement. The purpose of the provision of 18.2.3.4(2)(b)ii, requiring a projection below the main projection, is to accommodate requirements from ADA that projections be not more than 4 in. (100 mm) so as to prevent persons with visual impairments from impacting projections that they are unable to detect. The lower projection within 27 in. (685 mm) of the floor is needed for cane detection.	
A.18.2.3.4(3) Exit access should be arranged to avoid any obstructions to the convenient removal of nonambulatory persons carried on stretchers or on mattresses serving as stretchers.	
A.18.2.3.4(4)(c) Wheeled equipment and carts in use include food service carts, housekeeping carts, medication carts, isolation carts, and similar items. Isolation carts should be permitted in the corridor only where patients require isolation precautions. Unattended wheeled crash carts and other similar wheeled emergency equipment are permitted to be located in the corridor when “not in use,” because they need to be immediately accessible during a clinical emergency. Note that “not in use” is not the same as “in storage.” Storage is not permitted to be open to the corridor, unless it meets one of the provisions permitted in 18.3.6.1 and is not a hazardous area. Wheeled portable patient lift or transport equipment needs to be readily available to clinical staff for moving, transferring, toileting, or relocating patients. These devices are used daily for safe handling of patients and to provide for worker safety. This equipment might not be defined as “in use” but needs to be convenient for the use of caregivers at all times.	
A.18.2.3.4(5) The means for affixing the furniture can be achieved with removable brackets to allow cleaning and maintenance. Affixing the furniture to the floor or wall prevents the furniture from moving, so as to maintain a minimum 6 ft (1830 mm) corridor clear width. Affixing the furniture to the floor or wall also provides a sturdiness that allows occupants to safely transfer in and out.	
A.18.2.3.4(5)(f) Examples of building service and fire protection equipment include fire extinguishers, manual fire alarm boxes, shutoff valves, and similar equipment.	
A.18.2.3.4(6) The 8 ft (2440 mm) corridor width does not need to be maintained at the door or the open door leaf. A reduction for the frame and leaf is acceptable as long as the minimum clear width is provided at the door opening in the direction of egress travel. In situations where egress occurs only in one direction, it is permissible to have a single door leaf.	

A.18.2.3.5(1)

See A.18.2.3.4(1).

A.18.2.3.5(2)

The intent of 18.2.3.5 is to permit limited noncontinuous projections along the corridor wall. These include hand-rub dispensing units complying with 18.3.2.6, nurse charting units, wall-mounted computers, telephones, artwork, bulletin boards, display case frames, cabinet frames, fire alarm boxes, and similar items. It is not the intent to permit the narrowing of the corridor by the walls themselves. The provision of 7.3.2.2 permits projections up to 4½ in. (114 mm) to be present at and below the 38 in. (965 mm) height specified in 18.2.3.5(3), and it is not the intent of 18.2.3.5(3) to prohibit such projections. Permitting projections above the 38 in. (965 mm) handrail height complies with the intent of the requirement, as such projections will not interfere with the movement of gurneys, beds, and wheelchairs. Projections below handrail height for limited items, such as fire extinguisher cabinets and recessed water coolers, also will not interfere with equipment movement.

The purpose of the provision of 18.2.3.4(2)(b)ii, requiring a projection below the main projection, is to accommodate requirements from ADA that projections be not more than 4 in. (100 mm) so as to prevent persons with visual impairments from impacting projections that they are unable to detect. The lower projection within 27 in. (685 mm) of the floor is needed for cane detection.

A.18.2.3.5(4)

See A.18.2.3.4(3).

A.18.2.3.5(5)(c)

Wheeled equipment and carts in use include food service carts, housekeeping carts, medication carts, isolation carts, and similar items. Isolation carts should be permitted in the corridor only where patients require isolation precautions.

Unattended wheeled crash carts and other similar wheeled emergency equipment are permitted to be located in the corridor when “not in use,” because they need to be immediately accessible during a clinical emergency. Note that “not in use,” is not the same as “in storage.” Storage is not permitted to be open to the corridor, unless it meets one of the provisions permitted in 18.3.6.1 and is not a hazardous area.

Wheeled portable patient lift or transport equipment needs to be readily available to clinical staff for moving, transferring, toileting, or relocating patients. These devices are used daily for safe handling of patients and to provide for worker safety. This equipment might not be defined as “in use” but needs to be convenient for the use of caregivers at all times.

A.18.2.3.5(6)

The 6 ft (1830 mm) corridor width does not need to be maintained at the door or the open door leaf. A reduction for the frame and leaf is acceptable as long as the minimum clear width is provided at the door opening in the direction of egress travel. In situations where egress occurs only in one direction, it is permissible to have a single door leaf.

A.18.2.4.4

An exit is not necessary for each individual smoke compartment if there is access to an exit through other smoke compartments without passing through the smoke compartment of fire origin.

A.18.2.5.4

The term *intervening rooms or spaces* means rooms or spaces serving as a part of the required means of egress from another room.

A.18.2.5.6.1

For the purposes of this paragraph, it is the intent that the term *habitable rooms* not include individual bathrooms, closets, and similar spaces, as well as briefly occupied work spaces, such as control rooms in radiology and small storage rooms in a pharmacy.

A.18.2.5.7.1.2

Two or more contiguous suites with an aggregate area not exceeding the suite size limitations of 18.2.5.7.2.3 and 18.2.5.7.3.3 are permitted to be considered a single suite, so as not to require separation from each other.

A.18.2.5.7.1.3(A)

The term *intervening room* means a room serving as a part of the required means of egress from another room.

A.18.2.5.7.1.3(C)

Examples of suites that might be hazardous areas are medical records and pharmaceutical suites.

[PCs \[1\]](#)

[SR-6663](#)

[Hide Legislati](#)

A.18.2.5.7.2.1(B)

Supervision of sleeping suites is accomplished by direct supervision by staff, smoke detection, or a combination of direct supervision and smoke detection. The following ~~three~~ two options are available for meeting the supervision requirements for patient sleeping suites having an area not exceeding 7500 ft² (700 m²):

- (1) Direct supervision of all sleeping rooms by staff from a normally attended location within the suite [in accordance with 18.2.5.7.2.1(B)(1)(a)]
- (2) Supervision of those sleeping rooms that can be directly supervised [in accordance with 18.2.5.7.2.1(B)(1)(a)] and smoke detection provided in the sleeping rooms that cannot be directly supervised [in accordance with 18.2.5.7.2.1(B)(1)(b)] as depicted in Figure A.18.2.5.7.2.1(B)

~~Total (complete) coverage smoke detection throughout the sleeping suite [in accordance with 18.2.5.7.2.1(B)(2)] as depicted in Figure A.18.2.5.7.2.1(B)(b)~~

~~Where the option for total (complete) coverage smoke detection is used, the provision of 9.6.2.9 requires detectors in all occupiable areas that are suitable for smoke detector operation. For example, an area subject to shower steam would not require a smoke detector.~~

~~For patient sleeping suites having an area greater than 7500 ft² (700 m²), both direct supervision by staff and total (complete) coverage smoke detection throughout the sleeping suite are required [in accordance with 18.2.5.7.2.3(C)] as depicted in Figure A.18.2.5.7.2.1(B)(c).~~

The interior partitions or walls might extend full height to the ceiling, provided that they do not obscure visual supervision of the suite. Where they do obscure visual supervision, see 18.2.5.7.2.1(B)(2).

Figure A.18.2.5.7.2.1(B) All Sleeping Rooms Provided with Either with Direct Supervision by Staff or Smoke Detection.

Figure A.18.2.5.7.2.1(B)(b) Supervision Provided by Total (Complete) Smoke Detection Throughout the Sleeping Suite.

Figure A.18.2.5.7.2.1(B)(c) For Suites >7500 ft² (>700 m²), All Sleeping Rooms Must Be Provided with Direct Supervision by Staff and Total (Complete) Smoke Detection Installed Throughout the Sleeping Suite.

A.18.2.5.7.2.2(A)

Where only one means of egress is required from the suite, it needs to be provided by a door opening directly to a corridor complying with 18.3.6 or to a horizontal exit.

A.18.2.5.7.2.2(C)

Where the second exit access for a sleeping suite is through an adjacent suite, it is the intent that the 100 ft (30 m) travel distance limitation in the suite be applied only to the suite under consideration.

[See SR-666](#)

A.18.2.5.7.2.3(C)

Direct supervision and total (complete) coverage smoke detection throughout the sleeping suite is depicted in Figure A.18.2.5.7.2.3(C).

Where a total (complete) coverage smoke detection is required by this Code, the provision of 9.6.2.9 requires detectors in all occupiable areas that are suitable for smoke detector operation. For example, an area subject to shower steam would not require a smoke detector, nor is smoke detection required in areas not subject to occupancy, such as closets, spaces above the ceiling, and the like.

Figure A.18.2.5.7.2.3(C) For Suites >7500 ft² (>700 m²). All Sleeping Rooms Must Be Provided with Direct Supervision by Staff and Total (Complete) Smoke Detection Installed Throughout the Sleeping Suite.

A.18.2.5.7.2.3(C)(1)

The alternative of 18.2.5.7.2.1(B)(4)(b) is not to be applied, since 18.2.5.7.2.3(C)(2) requires total coverage automatic smoke detection for the suite that exceeds 7500 ft² (700 m²) but does not exceed 10,000 ft² (930 m²).

A.18.2.5.7.3.1(C)

Where the second exit access for a non-sleeping suite is through an adjacent suite, it is the intent that the adjacent suite not be considered an intervening room.

A.18.2.5.7.3.2(B)

Where a total (complete) coverage smoke detection system is required by this Code, detection is only required in occupiable areas in accordance with 9.6.2.9. This means that smoke detection is not required in areas not subject to occupancy, such as closets, spaces above the ceiling, and the like.

[See SR-666](#)

A.18.3.2.1.3(3)

Sterile core rooms have a specific purpose in supporting OR functions. Equipment and items located in these rooms are intended to be staged for the daily activities of the OR. Positive latching should not be installed on doors that are intended to facilitate access into and out of the ORs by staff to limit the spread of infection.

A.18.3.2.5.2

This provision is intended to permit appliances used for reheating, limited cooking, and food preparation, such as microwave ovens, hot plates, electric skillets, toasters, and nourishment centers to be exempt from the requirements for commercial cooking equipment and hazardous area protection. Limited quantities of butter, cooking spray, or oil can be used.

A.18.3.2.5.3

The intent of 18.3.2.5.3 is to limit the number of persons for whom meals are routinely prepared to not more than 30. Staff and feeding assistants are not included in this number.

A.18.3.2.5.3(3)

The minimum airflow of 500 cfm (14,000 L/m) is intended to require the use of residential hood equipment at the higher end of equipment capacities. It is also intended to draw a sufficient amount of the cooking vapors into the grease baffle and filter system to reduce migration beyond the hood.

A.18.3.2.5.3(6)

The intent of this provision is to limit cooking fuel to gas or electricity. The prohibition of solid fuels for cooking is not intended to prohibit charcoal grilling on grills located outside the facility.

A.18.3.2.5.3(9)

The intent of this requirement is that the fuel source for the cooktop or range is to be turned on only when staff is present or aware that the kitchen is being used. The timer function is meant to provide an additional safeguard if the staff forgets to deactivate the cooktop or range. If a cooking activity lasts longer than 120 minutes, the timer would be required to be manually reset.

A.18.3.2.5.3(11)

Protection of the cooktop or range is accomplished by the sprinklers that are required in the space and the required cooktop hood fire suppression system. The smoke alarms are intended to notify staff who might not be in the immediate area. Smoke alarms should be maintained a minimum of 20 ft (6.1 m) away from the cooktop or range as studies have shown this distance to be the threshold for significantly reducing nuisance alarms caused by cooking. The intent of the interconnected smoke alarms, with silence feature, is that while the devices would alert staff members to a potential problem, if it is a nuisance alarm, the staff members can use the silence feature instead of disabling the alarm. The referenced study indicates that nuisance alarms are reduced with photoelectric smoke alarms. Providing two interconnected alarms provides a safety factor since they are not electrically supervised by the fire alarm system. (*Smoke Alarms – Pilot Study of Nuisance Alarms Associated with Cooking*)

A.18.3.2.5.3(12)

The provision of 18.3.2.5.3(12) recognizes that it is more important to maintain the 20 ft (6.1 m) minimum spacing criterion between the smoke alarm and the cooktop or range, to minimize nuisance alarms, than to assure that the smoke alarm is located within the kitchen area itself.

A.18.3.2.5.3(13)

The requirements of 18.3.2.5.3(13) are intended to allow the local staff to silence and reset the system smoke detector without the assistance of the engineering or maintenance personnel. This provision is not intended to require the system smoke detector to initiate a building-wide occupant alarm signal or to notify the emergency forces.

A.18.3.2.5.4

The provisions of 18.3.2.5.4 differ from those of 18.3.2.5.3, as they apply to cooking equipment that is separated from the corridor.

A.18.3.2.5.5

The provision of 18.3.2.5.5 clarifies that protected commercial cooking equipment does not require an enclosure (separation) as a hazardous area in accordance with Section 8.7, as is required by 18.3.2.1.

A.18.3.3.2

The reductions in class of interior finish prescribed by 10.2.8.1 are permitted to be used.

A.18.3.4.2

It is not the intent of this *Code* to require single-station smoke alarms that might be required by local codes to be connected to or to initiate the building fire alarm system.

A.18.3.4.3.1(2)

In health care occupancies, fire alarm system notification is often designed primarily to notify staff who are responsible for the occupants in their care. The staff can be used as an alternate means for notifying others who might need to relocate or evacuate.

PCs [1]

A.18.3.4.5.3

The requirement for smoke detectors in spaces open to the corridors eliminates the requirements of 18.3.6.1(1)(c), 18.3.6.1(2)(b), and 18.3.6.1(5)(b) for direct supervision by the facility staff of nursing homes.

[See SR-66](#)

A.18.3.4.6.1

The required location of carbon monoxide detectors is intended to be found in the scoping document, NFPA, 101, under 18.3.4.6.2. The locations indicated in NFPA 72 are intended to be superseded by the NFPA, 101 requirements.

A.18.3.5.1

In areas where the replenishment of water supplies is not immediately available from on-site sources, alternate provisions for the water-fill rate requirements of NFPA 13 and NFPA 22 that are acceptable to the authority having jurisdiction should be provided. Appropriate means for the replenishment of these supplies from other sources, such as fire department tankers, public safety organizations, or other independent contractors should be incorporated into the overall fire safety plan of the facility.

With automatic sprinkler protection required throughout new health care facilities and quick-response sprinklers required in smoke compartments containing patient sleeping rooms, a fire and its life-threatening byproducts can be reduced, thereby allowing the defend-in-place concept to continue. The difficulty in maintaining the proper integrity of life safety elements has been considered, and it has been judged that the probability of a sprinkler system operating as designed is equal to or greater than other life safety features.

A.18.3.5.6

The requirements for use of quick-response sprinklers intend that quick-response sprinklers be the predominant type of sprinkler installed in the smoke compartment. It is recognized, however, that quick-response sprinklers might not be approved for installation in all areas, such as those where NFPA 13 requires sprinklers of the intermediate- or high-temperature classification. It is not the intent of the 18.3.5.6 requirements to prohibit the use of standard sprinklers in limited areas of a smoke compartment where intermediate- or high-temperature sprinklers are required.

Residential sprinklers are considered acceptable in patient sleeping rooms of all health care facilities, even though not specifically listed for this purpose in all cases.

Where the installation of quick-response sprinklers is impracticable in patient sleeping room areas, appropriate equivalent protection features acceptable to the authority having jurisdiction should be provided. It is recognized that the use of quick-response sprinklers might be limited in facilities housing certain types of patients or by the installation limitations of quick-response sprinklers.

A.18.3.5.10

This exception is limited to hospitals, as nursing homes and many limited care facilities might have more combustibles within the closets. The limited amount of clothing found in the small clothes closets in hospital patient rooms is typically far less than the amount of combustibles in casework cabinets that do not require sprinkler protection, such as nurse servers. In many hospitals, especially new hospitals, it is difficult to make a distinction between clothes closets and cabinet work. The exception is far more restrictive than similar exceptions for hotels and apartment buildings. NFPA 13 already permits the omission of sprinklers in wardrobes. It is not the intent of 18.3.5.10 to affect the wardrobe provisions of NFPA 13. It is the intent that the sprinkler protection in the room covers the closet as if there were no door on the closet.

A.18.3.5.11

For the proper operation of sprinkler systems, cubicle curtains and sprinkler locations need to be coordinated. Improperly designed systems might obstruct the sprinkler spray from reaching the fire or might shield the heat from the sprinkler. Many options are available to the designer including, but not limited to, hanging the cubicle curtains 18 in. (455 mm) below the sprinkler deflector; using a ½ in. (13 mm) diagonal mesh or a 70 percent open weave top panel that extends 18 in. (455 mm) below the sprinkler deflector; or designing the system to have a horizontal and minimum vertical distance that meets the requirements of NFPA 13. The test data that form the basis of the NFPA 13 requirements are from fire tests with sprinkler discharge that penetrated a single privacy curtain.

A.18.3.6.1(1)

The intent is also to permit a space that is compliant with the provisions of 18.3.6.1(1) to be considered open to the corridor even though it is physically separated from the corridor by walls and doors. The walls and doors would not need to comply with 18.3.6.2 through 18.3.6.5. For example, doors would be permitted without a latch or with a louver.

A.18.3.6.1(1)(a)

The presence of stored combustible materials in a room or space open to the corridor does not necessarily result in the room or space being classified as a hazardous area. In some circumstances, the amount and type of combustibles might result in the room or space being classified as a hazardous area by the authority having jurisdiction.

A.18.3.6.1(1)(c)

The omission of smoke detection does not pertain to nurses' stations that are not continuously staffed as there would not be early detection by staff in such areas during "off" hours.

A.18.3.6.1(2)

A typical nurses' station would normally contain one or more of the following with associated furniture and furnishings:

- (1) Charting area
- (2) Clerical area
- (3) Nourishment station
- (4) Storage of small amounts of medications, medical equipment and supplies, clerical supplies, and linens
- (5) Patient monitoring and communications equipment

The omission of smoke detection does not pertain to nurses' stations that are not continuously staffed as there would not be early detection by staff in such areas during "off" hours.

A.18.3.6.1(4)(b)

The omission of smoke detection does not pertain to nurses' stations that are not continuously staffed as there would not be early detection by staff in such areas during "off" hours.

A.18.3.6.2

It is the intent of the *Code* that there be no required fire resistance or area limitations for vision panels in corridor walls and doors.

An architectural, exposed, suspended-grid acoustical tile ceiling with penetrating items, such as sprinkler piping and sprinklers; ducted HVAC supply and return-air diffusers; speakers; and recessed lighting fixtures, is capable of limiting the transfer of smoke.

A.18.3.6.2.1

The provision for terminating the corridor wall at the ceiling is not intended to prevent the wall from extending above the ceiling.

A.18.3.6.2.3

While a corridor wall is required to form a barrier to limit the transfer of smoke, such a barrier is not required to be either a smoke barrier or a smoke partition — two terms for which specific *Code* definitions and requirements apply.

A.18.3.6.3

While it is recognized that closed doors serve to maintain tenable conditions in a corridor and adjacent patient rooms, such doors, which, under normal or fire conditions, are self-closing, might create a special hazard for the personal safety of a room occupant. Such closed doors might present a problem of delay in discovery, confining fire products beyond tenable conditions.

Because it is critical for responding staff members to be able to immediately identify the specific room involved, it is recommended that approved automatic smoke detection that is interconnected with the building fire alarm be considered for rooms having doors equipped with closing devices. Such detection is permitted to be located at any approved point within the room. When activated, the detector is required to provide a warning that indicates the specific room of involvement by activation of a fire alarm annunciator, nurse call system, or any other device acceptable to the authority having jurisdiction.

Where a nurse server penetrates a corridor wall, the access opening on the corridor side of the nurse server must be protected as is done for a corridor door.

A.18.3.6.3.1

Gasketing of doors should not be necessary to achieve resistance to the passage of smoke if the door is relatively tight-fitting.

A.18.3.6.3.11

Doors should not be blocked open by furniture, door stops, chocks, tie-backs, drop-down or plunger-type devices, or other devices that necessitate manual unlatching or releasing action to close. Examples of hold-open devices that release when the door is pushed or pulled are friction catches or magnetic catches.

A.18.3.6.3.13

It is not the intent of 18.3.6.3.13 to prohibit the application of push plates, hardware, or other attachments on corridor doors in health care occupancies.

A.18.3.6.5.1

It is not the intent of 18.3.6.5.1 to permit mail slots or pass-through openings in doors or walls of rooms designated as a hazardous area.

A.18.3.7

See A.18.2.2.

Where two floors communicate via two-story openings with partial enclosure in accordance with 8.6.8 or convenience openings in accordance with 8.6.9, the total smoke compartment area is the combined areas of the compartments exposed to each other on both floors.

A.18.3.7.3(2)

Where the smoke control system design requires dampers so that the system will function effectively, it is not the intent of the provision to permit the damper to be omitted.

This provision is not intended to prevent the use of plenum returns where ducting is used to return air from a ceiling plenum through smoke barrier walls. Short stubs or jumper ducts are not acceptable. Ducting is required to connect at both sides of the opening and to extend into adjacent spaces away from the wall. The intent is to prohibit open-air transfers at or near the smoke barrier walls.

A.18.3.7.6

Smoke barrier doors are intended to provide access to adjacent zones. The pair of cross-corridor doors are required to be opposite swinging. Access to both zones is required.

It is not the intent of 18.3.7.6 to prohibit the application of push plates, hardware, or other attachments on some barrier doors in health care occupancies. The provision of 18.3.7.6 requires the door leaves to be of substantial construction that is sufficient to resist fire for 20 minutes. Non-labeled 1¼ in. (44 mm) thick, solid bonded wood-core doors that are used in place of labeled 20-minute fire doors are not subject to the requirements of NFPA 80 therefore, nonrated factory or field-applied protective plates unlimited in height are permitted.

A.18.3.7.8

Smoke barriers might include walls having door openings other than cross-corridor doors. There is no restriction in the *Code* regarding which doors or how many doors form part of a smoke barrier. For example, doors from the corridor to individual rooms are permitted to form part of a smoke barrier. Split astragals (i.e., astragals installed on both door leaves) are also considered astragals.

A.18.3.7.9

It is not the intent to require the frame to be a listed assembly.

A.18.4.4

Extensive research, including fire modeling, has indicated that alcohol-based hand-rub solutions can be safely installed in corridors of health care facilities, provided that certain other precautions are taken. The total quantities of flammable liquids in any area should comply with the provisions of other recognized codes, including NFPA 1 and NFPA 30. In addition, special consideration should be given to the following:

- (1) Obstructions created by the installation of hand-rub solution dispensers
- (2) Location of dispensers with regard to adjacent combustible materials and potential sources of ignition, especially where dispensers are mounted on walls of combustible construction
- (3) Requirements for other fire protection features, including complete automatic sprinkler protection, to be installed throughout the compartment
- (4) Amount and location of the flammable solutions, both in use and in storage, particularly with respect to potential for leakage or failure of the dispenser

A.18.4.5.1

For example, the provisions of 18.1.1.4.3.1(2) and 18.1.1.4.3.4 do not require the installation of sprinklers if the modification involves less than 50 percent of the area of the smoke compartment and less than 4500 ft² (420 m²) of the area of the smoke compartment.

A.18.5.2.2

For both new and existing buildings, it is the intent to permit the installation and use of fireplace stoves and room heaters utilizing solid fuel as defined in NFPA 211 provided that all such devices are installed, maintained, and used in accordance with the appropriate provisions of that standard and all manufacturers' specifications. These requirements are not intended to permit freestanding solid fuel-burning appliances such as freestanding wood-burning stoves.

A.18.5.2.3(2)(d)

The glass front of a direct-vent fireplace can become extremely hot. Barriers such as screens or mesh installed over the direct-vent glass help reduce the risk of burn from touching the glass.

A.18.5.2.3(2)(e)

The intent of locating controls in a restricted location is to ensure staff is aware of use of the fireplace and to prevent unauthorized use. Examples of locked controls are a keyed switch or locating the switch in a staff-controlled location such as a staff station.

A.18.7

Health care occupants have, in large part, varied degrees of physical disability, and their removal to the outside, or even their disturbance caused by moving, is inexpedient or impractical in many cases, except as a last resort. Similarly, recognizing that there might be an operating necessity for the restraint of the mentally ill, often by use of barred windows and locked doors, fire exit drills are usually extremely disturbing, detrimental, and frequently impracticable.

In most cases, fire exit drills, as ordinarily practiced in other occupancies, cannot be conducted in health care occupancies. Fundamentally, superior construction, early discovery and extinguishment of incipient fires, and prompt notification need to be relied on to reduce the occasion for evacuation of buildings of this class to a minimum.

A.18.7.1.4

Many health care occupancies conduct fire drills without disturbing patients by choosing the location of the simulated emergency in advance and by closing the doors to patients' rooms or wards in the vicinity prior to initiation of the drill. The purpose of a fire drill is to test and evaluate the efficiency, knowledge, and response of institutional personnel in implementing the facility fire emergency action plan. Its purpose is not to disturb or excite patients. Fire drills should be scheduled on a random basis to ensure that personnel in health care facilities are drilled not less than once in each 3-month period.

Drills should consider the ability to move patients to an adjacent smoke compartment. Relocation can be practiced using simulated patients or empty wheelchairs.

A.18.7.2.1

Each facility has specific characteristics that vary sufficiently from other facilities to prevent the specification of a universal emergency procedure. The recommendations that follow, however, contain many of the elements that should be considered and adapted, as appropriate, to the individual facility.

Upon discovery of fire, personnel should immediately take the following action:

- (1) If any person is involved in the fire, the discoverer should go to the aid of that person, calling aloud an established code phrase, which provides for both the immediate aid of any endangered person and the transmission of an alarm.
- (2) Any person in the area, upon hearing the code called aloud, should activate the building fire alarm using the nearest manual fire alarm box.
- (3) If a person is not involved in the fire, the discoverer should activate the building fire alarm using the nearest manual fire alarm box.
- (4) Personnel, upon hearing the alarm signal, should immediately execute their duties as outlined in the facility fire safety plan.
- (5) The telephone operator should determine the location of the fire as indicated by the audible signal.
- (6) In a building equipped with an uncoded alarm system, a person on the floor of fire origin should be responsible for promptly notifying the facility telephone operator of the fire location.
- (7) If the telephone operator receives a telephone alarm reporting a fire from a floor, the operator should regard that alarm in the same fashion as an alarm received over the fire alarm system and should immediately notify the fire department and alert all facility personnel of the place of fire and its origin.
- (8) If the building fire alarm system is out of order, any person discovering a fire should immediately notify the telephone operator by telephone, and the operator should then transmit this information to the fire department and alert the building occupants.

A.18.7.3.3

The purpose of this requirement is to provide a means for building designers, occupants, and operators to clearly designate approved egress corridors that can be identified even though physical or other obvious barriers might not be present to indicate their location. Floor plans used to satisfy this requirement might incorporate more than one function and more than one smoke compartment of the building, provided egress corridors are clearly identified where no fixed barriers are present. Such plans should be accessible to the authority having jurisdiction but should not be required to be posted.

A.18.7.4

The most rigid discipline with regard to prohibition of smoking might not be nearly as effective in reducing incipient fires from surreptitious smoking as the open recognition of smoking, with provision of suitable facilities for smoking. Proper education and training of the staff and attendants in the ordinary fire hazards and their abatement is unquestionably essential. The problem is a broad one, varying with different types and arrangements of buildings; the effectiveness of rules of procedure, which need to be flexible, depends in large part on the management.

A.18.7.5.1

In addition to the provisions of 10.3.1, which deal with ignition resistance, additional requirements with respect to the location of cubicle curtains relative to sprinkler placement are included in NFPA 13.

A.18.7.5.6(2)

The user should verify that the products meet the referenced test methods of NFPA 701 and not the small-scale test procedure that was previously eliminated from NFPA 701.

A.18.7.5.6(4)

The percentage of decorations should be measured against the area of any wall or ceiling, not the aggregate total of walls, ceilings, and doors. The door is considered part of the wall. The decorations must be located such that they do not interfere with the operation of any door, sprinkler, smoke detector, or any other life safety equipment. Other art might include hanging objects or three-dimensional items.

A.18.7.5.7.1

It is not the intent to permit collection receptacles with a capacity greater than 64 gal (242 L) to be positioned at or near a nurses' station based on the argument that such nurses' station is constantly attended. The large collection receptacle itself needs to be actively attended by staff. Staff might leave the large receptacle in the corridor outside a patient room while entering the room to collect soiled linen or trash, but staff is expected to return to the receptacle, move on to the next room, and repeat the collection function. Where staff is not actively collecting material for placement in the receptacle, the receptacle is to be moved to a room protected as a hazardous area.

A.18.7.5.7.2

It is the intent that this provision permits recycling of bottles, cans, paper, and similar clean items that do not contain grease, oil, flammable liquids, or significant plastic materials using larger containers or several adjacent containers and not require locating such containers in a room protected as a hazardous area. Containers for medical records awaiting shredding are often larger than 64 gal (242 L). These containers are not to be included in the calculations and limitations of 18.7.5.7.1. There is no limit on the number of these containers, as FM Approvals 6920/ 6921, *Approval Standard for Oily Waste Cans and Containers for Combustible Waste*, ensures that the fire will not spread outside of the container. FM approval standards are written for use with FM Approvals. The tests can be conducted by any approved laboratory. The portions of the standard referring to FM Approvals are not included in this reference.

A.18.7.8

Portable space heaters complying with 18.7.8 should be permitted to be located in office areas, nurses stations, and other similar nonpatient spaces within the same smoke compartment as patient sleeping rooms.

A.19.1.1.1.1

In determining equivalency for existing hospitals or nursing homes, the authority having jurisdiction is permitted to accept evaluations based on the health care occupancies fire safety evaluation system (FSES) of NFPA 101A utilizing the parameters for existing buildings.

A.19.1.1.1.7

There are many reasons why doors in the means of egress in health care occupancies might need to be locked for the protection of the patients or the public. Examples of conditions that might justify door locking include dementia, mental health, infant care, pediatric care, or patients under court detention order requiring medical treatment in a health care facility. See 19.2.2.2.5 for details on door locking.

A.19.1.1.1.9

The *Code* recognizes that certain functions necessary for the life safety of building occupants — such as the detection of fire and associated products of combustion, the closing of corridor doors, the operation of manual fire alarm devices, and the removal of patients from the room of fire origin — require the intervention of facility staff. It is not the intent of 19.1.1.1.9 to specify the levels or locations of staff necessary to meet this requirement.

A.19.1.1.1.10

It should be recognized that under certain conditions, an ACS might need to be established to support emergent health care delivery and temporarily supplement existing health care systems. The establishment of an ACS should be coordinated with Annex D, government and private industry recommendations, and the local authority having jurisdiction. The required fire emergency plan should include provisions for a continual fire watch to facilitate the safe evacuation or relocation of occupants in the event of an emergency.

A.19.1.1.2

This objective is accomplished in the context of the physical facilities, the type of activities undertaken, the provisions for the capabilities of staff, and the needs of all occupants through requirements directed at the following:

- (1) Prevention of ignition
- (2) Detection of fire
- (3) Control of fire development
- (4) Confinement of the effects of fire
- (5) Extinguishment of fire
- (6) Provision of refuge or evacuation facilities, or both
- (7) Staff reaction

A.19.1.1.4.3.3

For the purpose of this requirement, a floor that is not divided by a smoke barrier is considered one smoke compartment. Where automatic sprinklers are retrofitted into existing nonsprinklered buildings, the construction alternatives for sprinklers provided in this *Code* are intended to apply to the renovated area.

A.19.1.1.4.3.4

In minor rehabilitation, only the rehabilitation itself is required to be brought up to the requirements for new nonsprinklered facilities, not the entire smoke compartment or building.

A.19.1.3.4

Doctors' offices and treatment and diagnostic facilities that are intended solely for outpatient care and are physically separated from facilities for the treatment or care of inpatients, but that are otherwise associated with the management of an institution, might be classified as business occupancies rather than health care occupancies.

A.19.1.3.5.1

It is the intent of the *Code* that these requirements apply to mobile, transportable, and relocatable structures (in accordance with 1.3.2) when such structures are used to provide shared medical services on an extended or a temporary basis. Where properly separated from the health care occupancy and intended to provide services simultaneously for three or fewer health care patients who are litterborne, the level of protection for such structures should be based on the appropriate occupancy classification of other chapters of this *Code*. Mobile, transportable, or relocatable structures that are not separated from a contiguous health care occupancy, or that are intended to provide services simultaneously for four or more health care patients who are litterborne, should be classified and designed as health care occupancies.

A.19.1.6.1

Footnotes C and D to Table 19.1.6.1 relating to permitted construction types for existing nursing homes reflect nursing home characteristics that are compliant with a fire safety evaluation system (FSES) for health care occupancies analysis that was prepared in accordance with the 2001 edition of NFPA 101A. The features specify potential options to achieve a passing score on the FSES while having a noncompliant construction type. Other options complying with the 2001 edition of NFPA 101A should be considered. Construction type is specifically addressed since upgrading construction type is difficult if even possible.

A.19.1.6.2

Unoccupied space, for the purposes of 19.1.6.2(3), is space not normally occupied by persons, fuel-fired equipment, or hazardous contents.

A.19.1.6.7(3)

Number of attendants is covered in Section 4.5 of NFPA 101A. The number of attendants is based on attendant staff available to respond to an emergency at minimum staffing levels. Where nursing stations or other positions of attendants are located at the junction of two or more smoke compartments and the location of the station is such that each of the smoke compartments has immediate access and is in view of the nursing station, the total staffing assignment can be credited to each of the smoke compartments.

A.19.1.6.8(3)

See A.19.1.6.7(3).

A.19.1.6.9

The single most important factor controlling risk in a health care facility is the degree to which patients need assistance in taking the actions necessary for their safety. The level of capability in health care facilities varies from patients who, if informed or directed, are able to take positive, self-protecting actions to those patients who have no ability to move or even to take the simplest actions to safeguard themselves. In some cases, patients are directly connected to a fixed life-support system and are so dependent on it that, regardless of their physical condition or the availability of assistance, they cannot be moved without jeopardy of death or serious harm. In the measurement of occupancy risk factors, the least mobile category of patient expected in the zone determines the risk factor for that zone. The rationale for this approach is that, if a zone accepts any patient with a reduced mobility status, it might accept other such patients at any time. The impact of this approach is that most health care facilities should be rated in the "not mobile" risk category. Mobility status should be based on the minimum level of mobility in an average 24-hour period. [101A:4.5.1.1]

A.19.1.6.9.3

Examples of patients classified as not mobile include persons who are totally bedridden; who need assistance getting out of bed or moving; and who are restrained, locked in their rooms, or otherwise prevented from taking complete emergency self-protection evacuation actions without assistance.

A.19.2.2.2.4(2)

Where delayed-egress electrical locking systems complying with 7.2.1.6.1 are used, the provisions of 19.2.2.2.5 are not required.

A.19.2.2.2.4(3)

Where sensor-release of electrical locking systems complying with 7.2.1.6.2 are used, the provisions of 19.2.2.2.5 are not required.

[Detail SR-66f](#)

A.19.2.2.2.5

The requirements for these permitted locking systems also apply to doors that are locked or that are typically unlocked and that lock upon approach of a patient.

A.19.2.2.2.5.1

Psychiatric units, Alzheimer units, and dementia units are examples of areas with patients who might have clinical needs that justify door locking. Forensic units and detention units are examples of areas with patients who might pose a security threat. Where Alzheimer or dementia patients in nursing homes are not housed in specialized units, the provisions of 19.2.2.2.5.1 should not apply. (See 19.2.2.2.5.3.)

[See SR-66f](#)

A.19.2.2.2.5.2

Pediatric units, maternity units, and emergency departments are examples of areas where patients might have special needs that justify door locking. Door-locking arrangements should be permitted to reduce the risk of abduction of infants and children who are patients.

[See SR-66f](#)

PCs [2]

A.19.2.2.2.5.3

Pediatric units, maternity units, and emergency departments are examples of areas where patients might have special needs that justify door locking. Door-locking arrangements should be permitted to reduce the risk of abduction of infants and children who are patients.

[See SR-66f](#)

A.19.2.2.2.5.3(3)

The intent of this section is to ensure that for a given smoke compartment containing door-locking arrangements, all adjacent smoke compartments on the same floor, as well as those smoke compartments containing the means of egress from the secured area to the exits from the smoke compartment containing the locked area required by 19.2.4.4, be protected throughout by an approved, supervised automatic sprinkler system.

PCs [1]

A.19.2.2.2.5.3(7)

UL 294, *Access Control System Units*, and UL 1034, *Burglary-Resistant Electric Locking Mechanisms*, are two standards that provide criteria for listed door-locking hardware. The electrical locking hardware might be a component of an electrical locking system, or the electrical locking hardware might be a device with an individual listing.

[See SR-66f](#)

A.19.2.2.2.5.4(1)

A location such as a nurse station is considered normally attended if it is an area steadily used by staff throughout the period the area contains patients and where, at a given time within that period, staff will generally be present. Uninterrupted physical staff presence at the location for the entire period is not required for the location to be normally attended.

[See SR-66f](#)

A.19.2.2.2.5.4(3)

The intent of this section is to ensure that for a given smoke compartment containing door-locking arrangements, all adjacent smoke compartments on the same floor, as well as those smoke compartments containing the means of egress from the secured area to the exits from the smoke compartment containing the locked area required by 19.2.4.4, be protected throughout by an approved, supervised automatic sprinkler system.

[See SR-66f](#)

A.19.2.2.2.5.4(6)

UL 294, *Access Control System Units*, and UL 1034, *Burglary-Resistant Electric Locking Mechanisms*, are two standards that provide criteria for listed door-locking hardware. The electrical locking hardware might be a component of an electrical locking system, or the electrical locking hardware might be a device with an individual listing.

A.19.2.2.2.7

In some health care occupancies, especially nursing homes, the use of murals to disguise doors has been found to be beneficial for certain patient populations. This provision is intended to apply to disguising of egress doors by painting the doors or the use of wall paper on the doors. The marking of the means of egress such as required exit signs should be clearly visible and not disguised by the mural. Where decorations are applied to the door, the requirements of Section 19.7 would still apply and painting a mural on the door would not be considered a decoration. Such murals should not obscure required vision panels or affect the required fire resistance rating of fire-rated door assemblies.

A.19.2.2.2.7(2)

It is intended that the door releasing hardware includes levers, locks, knobs, and panic bars that are directly operated or grasped by staff.

A.19.2.2.2.7(3)

It is intended that the door hardware that is permitted to be covered (i.e., disguised by the mural) includes items such as hinges, closers, and magnets, which would normally not be directly operated or grasped by staff.

A.19.2.2.2.8

It is desirable to keep doors in exit passageways, stair enclosures, horizontal exits, smoke barriers, and required enclosures around hazardous areas closed at all times to impede the travel of smoke and fire gases. Functionally, however, this involves decreased efficiency and limits patient supervision by the staff of a facility. To accommodate such needs, it is practical to presume that such doors will be kept open, even to the extent of employing wood chocks and other makeshift devices. Doors in exit passageways, horizontal exits, and smoke barriers should, therefore, be equipped with automatic hold-open devices actuated by the methods described, regardless of whether the original installation of the doors was predicated on a policy of keeping them closed.

A.19.2.2.5.3

The waiver of the requirement for doors to swing in the direction of egress travel is based on the assumption that, in this occupancy, there is no possibility of a panic rush that might prevent the opening of doors that swing against egress travel.

A desirable arrangement, which is possible with corridors 8 ft (2440 mm) or more in width, is to have two 42 in. (1070 mm) doors, normally closed, each swinging with the egress travel (in opposite directions).

A.19.2.3.4

It is not the intent that the required corridor width be maintained clear and unobstructed at all times. Projections into the required width are permitted by 7.3.2.2. It is not the intent that 19.2.3.4 supersede 7.3.2.2. Existing corridors more than 48 in. (1220 mm) in width are not permitted to be reduced in width, unless they exceed the width requirements of 18.2.3.4 or 18.2.3.5. (*See 4.6.7.4, 4.6.7.5, and 4.6.12.2.*)

A.19.2.3.4(2)

The intent of 19.2.3.4(2) is to permit limited noncontinuous projections along the corridor wall. These include hand-rub dispensing units complying with 19.4.4, nurse charting units, wall-mounted computers, telephones, artwork, bulletin boards, display case frames, cabinet frames, fire alarm boxes, and similar items. It is not the intent to permit the narrowing of the corridor by the walls themselves. The provision of 7.3.2.2 permits projections up to 4½ in. (114 mm) to be present at and below the 38 in. (965 mm) handrail height, and it is not the intent of 19.2.3.4(2) to prohibit such projections.

The purpose of the provision of 19.2.3.4(3)(b)ii, requiring a projection below the main projection, is to accommodate ADA requirements that projections be not more than 4 in. (100 mm) so as to prevent persons with visual impairments from impacting projections that they are unable to detect. The lower projection within 27 in. (685 mm) of the floor is needed for cane detection.

A.19.2.3.4(4)(c)

Wheeled equipment and carts in use include food service carts, housekeeping carts, medication carts, isolation carts, and similar items. Isolation carts should be permitted in the corridor only where patients require isolation precautions.

Unattended wheeled crash carts and other similar wheeled emergency equipment are permitted to be located in the corridor when "not in use," because they need to be immediately accessible during a clinical emergency. Note that "not in use" is not the same as "in storage." Storage is not permitted to be open to the corridor, unless it meets one of the provisions permitted in 19.3.6.1 and is not a hazardous area.

Wheeled portable patient lift or transport equipment needs to be readily available to clinical staff for moving, transferring, toileting, or relocating patients. These devices are used daily for safe handling of patients and to provide for worker safety. This equipment might not be defined as "in use" but needs to be convenient for the use of caregivers at all times.

A.19.2.3.4(5)

The means for affixing the furniture can be achieved with removable brackets to allow cleaning and maintenance. Affixing the furniture to the floor or wall prevents the furniture from moving, so as to maintain a minimum 6 ft (1830 mm) corridor clear width. Affixing the furniture to the floor or wall also provides a sturdiness that allows occupants to safely transfer in and out.

A.19.2.3.4(5)(f)

Examples of building service and fire protection equipment include fire extinguishers, manual fire alarm boxes, shutoff valves, and similar equipment.

A.19.2.4.4

An exit is not necessary for each individual smoke compartment if there is access to an exit through other smoke compartments without passing through the smoke compartment of fire origin.

A.19.2.5.3

Every exit or exit access should be arranged, if practical and feasible, so that no corridor has a dead end exceeding 30 ft (9.1 m).

A.19.2.5.4

The term *intervening rooms or spaces* means rooms or spaces serving as a part of the required means of egress from another room.

A.19.2.5.6.1

For the purposes of this paragraph, it is the intent that the term *habitable rooms* not include individual bathrooms, closets, and similar spaces, as well as briefly occupied work spaces, such as control rooms in radiology and small storage rooms in a pharmacy.

A.19.2.5.7.1.2

Two or more contiguous suites with an aggregate area not exceeding the suite size limitation of 19.2.5.7.2.3 and 19.2.5.7.3.3 are permitted to be considered a single suite, so as not to require separation from each other. The intent of 19.2.5.7.1.2(2) is to continue to permit suites that have smoke-resisting walls separating them from the rest of the building, even though the walls might not have a fire resistance rating. This requirement includes walls that comply with 19.3.6.2.4, even though sprinkler protection is not provided.

A.19.2.5.7.1.3(A)

The term *intervening room* means a room serving as a part of the required means of egress from another room.

A.19.2.5.7.1.3(C)

Examples of suites that might be hazardous areas are medical records and pharmaceutical suites.

A.19.2.5.7.1.3(D)

It is the intent that the provision of 19.2.5.7.1.3(D) apply only where the quantities of combustibles occupy an area exceeding 50 ft² (4.6 m²) so as to be a hazardous contents area. Where quantities of combustibles occupy less than 50 ft² (4.6 m²), there is no restriction on quantity.

[PCs \[1\]](#)

[SR-0665](#)

[Hide Legislati](#)

A.19.2.5.7.2.1(B)

Supervision of existing sleeping suites is accomplished by direct supervision by staff, automatic smoke detection, or a combination of direct supervision and smoke detection. The following ~~three~~ two options are available for meeting the supervision requirements for patient sleeping suites having an area not exceeding 5000 ft² (460 m²):

- (1) Direct supervision of all sleeping rooms by staff from a normally attended location within the suite [in accordance with 19.2.5.7.2.1(B)(1)]
- (2) Supervision of those sleeping rooms that can be directly supervised [in accordance with 19.2.5.7.2.1(B)(1)] and automatic smoke detection provided in the sleeping rooms that cannot be directly supervised [in accordance with 19.2.5.7.2.1(B)(2)] as depicted in Figure A.19.2.5.7.2.1(B)

~~Total (complete) coverage automatic smoke detection throughout the sleeping suite [in accordance with 19.2.5.7.2.1(B)(2)] as depicted in Figure A.19.2.5.7.2.1(B)(b)~~

~~Where the option for total (complete) coverage automatic smoke detection is used, the provision of 9.6.2.9 requires detectors in all occupiable areas that are suitable for smoke detector operation. For example, an area subject to shower steam would not require a smoke detector.~~

~~For patient sleeping suites having an area greater than 5000 ft² (460 m²) but not greater than 7500 ft² (700 m²), sprinkler protection is required throughout the suite and the supervision requirements of 19.2.5.7.2.1 also apply. Such protection might take the form of standard-response sprinklers in accordance with 19.3.5.7 or quick-response sprinklers in accordance with 19.3.5.8. Where standard-response sprinklers are used in accordance with 19.3.5.7, the suite must be protected by total (complete) automatic smoke detection [in accordance with 19.2.5.7.2.3(B)(1)] as depicted in Figure A.19.2.5.7.2.1(B)(c).~~

~~For patient sleeping suites having an area greater than 7500 ft² (700 m²), the suite must be protected by quick-response sprinklers in accordance with 19.3.5.8, direct supervision of all sleeping rooms must be provided by staff, and total (complete) coverage automatic smoke detection must be provided throughout the sleeping suite [in accordance with 19.2.5.7.2.3(C)] as depicted in Figure A.19.2.5.7.2.1(B)(d).~~

The interior partitions or walls might extend full height to the ceiling, provided that they do not obscure visual supervision of the suite. Where they do obscure visual supervision, see 19.2.5.7.2.1(B)(4).

Figure A.19.2.5.7.2.1(B) All Sleeping Rooms Provided with Either with Direct Supervision by Staff or Smoke Detection.

Figure A.19.2.5.7.2.1(B)(b) Supervision Provided by Total (Complete) Smoke Detection Throughout the Sleeping Suite.

Figure A.19.2.5.7.2.1(B)(c) For Suites >5000 ft² (>460 m²) and ≤7500 ft² (≤700 m²) Protected by Standard Response Sprinklers, Total (Complete) Smoke Detection Required Throughout the Sleeping Suite.

Figure A.19.2.5.7.2.1(B)(d) For Suites $>7500 \text{ ft}^2$ ($>700 \text{ m}^2$), All Sleeping Rooms Must Be Provided with Direct Supervision by Staff and Total (Complete) Smoke Detection Installed Throughout the Sleeping Suite.

A.19.2.5.7.2.2(A)

Where only one means of egress is required from the suite, it needs to be provided by a door opening directly to a corridor complying with 19.3.6 or to a horizontal exit.

A.19.2.5.7.2.2(C)

Where the second exit access for a sleeping suite is through an adjacent suite, it is the intent that the 100 ft (30 m) travel distance limitation in the suite be applied only to the suite under consideration.

[See SR-666](#)

A.19.2.5.7.2.3(B)

For patient sleeping suites having an area greater than 5000 ft^2 (460 m^2) but not greater than 7500 ft^2 (700 m^2), sprinkler protection is required throughout the suite and the supervision requirements of 19.2.5.7.2.1 also apply. Such protection might take the form of standard-response sprinklers in accordance with 19.3.5.7 or quick-response sprinklers in accordance with 19.3.5.8. Where standard-response sprinklers are used in accordance with 19.3.5.7, the suite must be protected by total (complete) automatic smoke detection [in accordance with 19.2.5.7.2.3(B)(1)] as depicted in Figure A.19.2.5.7.2.3(B).

Figure A.19.2.5.7.2.3(B) For Suites $>5000 \text{ ft}^2$ ($>460 \text{ m}^2$) and $\leq 7500 \text{ ft}^2$ ($\leq 700 \text{ m}^2$) Protected by Standard Response Sprinklers, Total (Complete) Smoke Detection Required Throughout the Sleeping Suite.

[See SR-666](#)

A.19.2.5.7.2.3(C)

For patient sleeping suites having an area greater than 7500 ft² (700 m²), the suite must be protected by quick-response sprinklers in accordance with 19.3.5.8, direct supervision of all sleeping rooms must be provided by staff, and total (complete) coverage automatic smoke detection must be provided throughout the sleeping suite [in accordance with 19.2.5.7.2.3(C)] as depicted in Figure A.19.2.5.7.2.3(C).

Figure A.19.2.5.7.2.3(C) For Suites >7500 ft² (>700 m²). All Sleeping Rooms Must Be Provided with Direct Supervision by Staff and Total (Complete) Smoke Detection Installed Throughout the Sleeping Suite.

See SR-66:

A.19.2.5.7.2.3(C)(1)

The alternative of 19.2.5.7.2.1(B)(2)(4)(b) is not to be applied, since 19.2.5.7.2.3(C)(2) requires total coverage automatic smoke detection for the suite that exceeds 7500 ft² (700 m²) but does not exceed 10,000 ft² (930 m²).

A.19.2.5.7.3.1(C)

Where the second exit access for a nonsleeping suite is through an adjacent suite, it is the intent that the adjacent suite not be considered an intervening room.

A.19.2.5.7.3.2(B)

Where a total (complete) coverage smoke detection system is required by this Code, detection is only required in occupiable areas in accordance with 9.6.2.9. This means that smoke detection is not required in areas not subject to occupancy, such as closets, spaces above the ceiling, and the like.

A.19.3.2.1.2

Penetrations of hazardous area walls located above ceilings that comply with Section 8.4 are not required to be sealed to comply with 19.3.2.1.2.

See SR-66:

A.19.3.2.1.5(9)

Sterile core rooms have a specific purpose in supporting OR functions. Equipment and items located in these rooms are intended to be staged for the daily activities of the OR. Positive latching should not be installed on doors that are intended to facilitate access into and out of the ORs by staff to limit the spread of infection.

A.19.3.2.5.2

This provision is intended to permit appliances used for reheating, limited cooking, and food preparation, such as microwave ovens, hot plates, electric skillets, toasters, and nourishment centers, to be exempt from the requirements for commercial cooking equipment and hazardous area protection. Limited quantities of butter, cooking spray, or oil can be used.

A.19.3.2.5.3

The intent of 19.3.2.5.3 is to limit the number of persons for whom meals are routinely prepared to not more than 30. Staff and feeding assistants are not included in this number.

A.19.3.2.5.3(3)

The minimum airflow of 500 cfm (14,000 L/m) is intended to require the use of residential hood equipment at the higher end of equipment capacities. It is also intended to draw a sufficient amount of the cooking vapors into the grease baffle and filter system to reduce migration beyond the hood.

A.19.3.2.5.3(6)

The intent of this provision is to limit cooking fuel to gas or electricity. The prohibition of solid fuels for cooking is not intended to prohibit charcoal grilling on grills located outside the facility.

A.19.3.2.5.3(9)

The intent of this requirement is that the fuel source for the cooktop or range is to be turned on only when staff is present or aware that the kitchen is being used. The timer function is meant to provide an additional safeguard if the staff forgets to deactivate the cooktop or range. If a cooking activity lasts longer than 120 minutes, the timer would be required to be manually reset.

A.19.3.2.5.3(11)

Protection of the cooktop or range is accomplished by the sprinklers that are required in the space and the required cooktop hood fire suppression system. The smoke alarms are intended to notify staff who might not be in the immediate area. Smoke alarms should be maintained a minimum of 20 ft (6.1 m) away from the cooktop or range as studies have shown this distance to be the threshold for significantly reducing nuisance alarms caused by cooking. The intent of the interconnected smoke alarms, with silence feature, is that while the devices would alert staff members to a potential problem, if it is a nuisance alarm, the staff members can use the silence feature instead of disabling the alarm. The referenced study indicates that nuisance alarms are reduced with photoelectric smoke alarms. Providing two interconnected alarms provides a safety factor since they are not electrically supervised by the fire alarm system. (*Smoke Alarms – Pilot Study of Nuisance Alarms Associated with Cooking*)

A.19.3.2.5.3(12)

The provision of 19.3.2.5.3 recognizes that it is more important to maintain the 20 ft (6.1 m) minimum spacing criterion between the smoke alarm and the cooktop or range, to minimize nuisance alarms, than to assure that the smoke alarm is located within the kitchen area itself.

A.19.3.2.5.3(13)

The requirements of 19.3.2.5.3(13) are intended to allow the local staff to silence and reset the system smoke detector without the assistance of the engineering or maintenance personnel. This provision is not intended to require the system smoke detector to initiate a building-wide occupant alarm signal or to notify the emergency forces.

A.19.3.2.5.4

The provisions of 19.3.2.5.4 differ from those of 19.3.2.5.3, as they apply to cooking equipment that is separated from the corridor.

A.19.3.2.5.5

The provision of 19.3.2.5.5 clarifies that protected commercial cooking equipment does not require an enclosure (separation) as a hazardous area in accordance with Section 8.7, as is required by 19.3.2.1.

A.19.3.3.2

The reduction in class of interior finish prescribed by 10.2.8.1 is permitted to be used.

A.19.3.4.2

It is not the intent of this *Code* to require single-station smoke alarms, which might be required by local codes, to be connected to or to initiate the building fire alarm system.

A.19.3.4.3.1(1)

It is the intent of this provision to permit a visible fire alarm signal instead of an audible signal to reduce interference between the fire alarm and medical equipment monitoring alarms.

PCs [2]

A.19.3.4.3.1(4)

In health care occupancies, fire alarm system notification is often designed primarily to notify staff who are responsible for the occupants in their care. The staff can be used as an alternate means for notifying others who might need to relocate or evacuate.

A.19.3.5.4

It is not the intent to require existing standard sprinklers in existing sprinkler systems to be replaced with listed quick-response or listed residential sprinklers. It is the intent that new sprinkler systems installed in existing buildings comply with the requirements of Chapter 18, including 18.3.5.6.

A.19.3.5.7

It is intended that any valve that controls automatic sprinklers in the building or portions of the building, including sectional and floor control valves, be electrically supervised. Valves that control isolated sprinkler heads, such as in laundry and trash chutes, are not required to be electrically supervised. Appropriate means should be provided to ensure that valves that are not electrically supervised remain open.

A.19.3.5.8

The provisions of 19.3.5.8(6) and 19.3.5.8(7) are not intended to supplant NFPA 13 which requires that residential sprinklers with more than a 10°F (5.6°C) difference in temperature rating not be mixed within a room. Currently there are no additional prohibitions in NFPA 13 on the mixing of sprinklers having different thermal response characteristics. Conversely, there are no design parameters to make practical the mixing of residential and other types of sprinklers.

Residential sprinklers are considered acceptable in patient sleeping rooms of all health care facilities, even though not specifically listed for this purpose in all cases.

A.19.3.5.8(6)

It is not the intent of the *Code* to permit standard-response sprinklers to meet the criteria of 19.3.5.8 just because the sprinklers were installed before quick-response sprinklers were invented or listed. The intent of 19.3.5.8(6) is to permit older quick-response systems to be credited, even though there might be some standard-response sprinklers in existence due to the fact that quick-response sprinklers were unavailable for those specific locations at the time. For example, in the early days of quick-response sprinklers, there were no high-temperature quick-response sprinklers available.

A.19.3.5.10

This exception is limited to hospitals, as nursing homes and many limited care facilities might have more combustibles within the closets. The limited amount of clothing found in the small clothes closets in hospital patient rooms is typically far less than the amount of combustibles in casework cabinets that do not require sprinkler protection, such as nurse servers. In many hospitals, especially new hospitals, it is difficult to make a distinction between clothes closets and cabinet work. The exception is far more restrictive than similar exceptions for hotels and apartment buildings. NFPA 13 already permits the omission of sprinklers in wardrobes. It is not the intent of 19.3.5.10 to affect the wardrobe provisions of NFPA 13. It is the intent that the sprinkler protection in the room covers the closet as if there were no door on the closet.

A.19.3.5.11

For the proper operation of sprinkler systems, cubicle curtains and sprinkler locations need to be coordinated. Improperly designed systems might obstruct the sprinkler spray from reaching the fire or might shield the heat from the sprinkler. Many options are available to the designer including, but not limited to, hanging the cubicle curtains 18 in. (455 mm) below the sprinkler deflector; using ½ in. (13 mm) diagonal mesh or a 70 percent open weave top panel that extends 18 in. (455 mm) below the sprinkler deflector; or designing the system to have a horizontal and minimum vertical distance that meets the requirements of NFPA 13. The test data that forms the basis of the NFPA 13 requirements is from fire tests with sprinkler discharge that penetrated a single privacy curtain.

A.19.3.6.1(1)

The intent is also to permit a space that is compliant with the provisions of 19.3.6.1(1) to be considered open to the corridor even though it is physically separated from the corridor by walls and doors. The walls and doors would not need to comply with 19.3.6.2 through 19.3.6.5. For example, doors would be permitted without a latch or with a louver.

A.19.3.6.1(1)(a)

The presence of stored combustible materials in a room or space open to the corridor does not necessarily result in the room or space being classified as a hazardous area. In some circumstances, the amount and type of combustibles might result in the room or space being classified as a hazardous area by the authority having jurisdiction.

A.19.3.6.1(1)(c)

The omission of smoke detection does not pertain to nurses' stations that are not continuously staffed as there would not be early detection by staff in such areas during "off" hours.

A.19.3.6.1(2)(b)

The omission of smoke detection does not pertain to nurses' stations that are not continuously staffed as there would not be early detection by staff in such areas during "off" hours.

A.19.3.6.1(3)

A typical nurses' station would normally contain one or more of the following with associated furniture and furnishings:

- (1) Charting area
- (2) Clerical area
- (3) Nourishment station
- (4) Storage of small amounts of medications, medical equipment and supplies, clerical supplies, and linens
- (5) Patient monitoring and communications equipment

The omission of smoke detection does not pertain to nurses' stations that are not continuously staffed as there would not be early detection by staff in such areas during "off" hours.

A.19.3.6.1(5)(b)

The omission of smoke detection does not pertain to nurses' stations that are not continuously staffed as there would not be early detection by staff in such areas during "off" hours.

A.19.3.6.1(7)(b)

A fully developed fire (flashover) occurs if the rate of heat release of the burning materials exceeds the capability of the space to absorb or vent that heat. The ability of common lining (wall, ceiling, and floor) materials to absorb heat is approximately 0.75 Btu/ft² (0.07 kJ/m²) of lining. The venting capability of open doors or windows is in excess of 20 Btu/ft² (1.95 kJ/m²) of opening. In a fire that has not reached flashover conditions, fire will spread from one furniture item to another only if the burning item is close to another furniture item. For example, if individual furniture items have a heat release rate of 500 Btu/s (525 kW) and are separated by 12 in. (305 mm) or more, the fire is not expected to spread from item to item, and flashover is unlikely to occur. *(See also the NFPA Fire Protection Handbook.)*

A.19.3.6.1(8)

This provision permits waiting areas to be located across the corridor from each other, provided that neither area exceeds the 600 ft² (55.7 m²) limitation.

A.19.3.6.2.2

The intent of the minimum ½-hour fire resistance rating for corridor partitions is to require a nominal fire rating, particularly where the fire rating of existing partitions cannot be documented. Examples of acceptable partition assemblies would include, but are not limited to, ½ in. (13 mm) gypsum board, wood lath and plaster, gypsum lath, or metal lath and plaster.

A.19.3.6.2.3

The purpose of extending a corridor wall above a lay-in ceiling or through a concealed space is to provide a barrier to limit the passage of smoke. Such a barrier is not required to be either a smoke barrier or a smoke partition — two terms for which specific *Code* definitions and requirements apply. The intent of 19.3.6.2.3 is not to require light-tight barriers above lay-in ceilings or to require an absolute seal of the room from the corridor. Small holes, penetrations, or gaps around items such as ductwork, conduit, or telecommunication lines should not affect the ability of this barrier to limit the passage of smoke.

A.19.3.6.2.4

An architectural, exposed, suspended-grid acoustical tile ceiling with penetrating items, such as sprinkler piping and sprinklers; ducted HVAC supply and return-air diffusers; speakers; and recessed lighting fixtures, is capable of limiting the transfer of smoke.
The provision for terminating the corridor wall at the ceiling is not intended to prevent the wall from extending above the ceiling.

A.19.3.6.2.6

Monolithic ceilings are continuous horizontal membranes composed of noncombustible or limited-combustible materials, such as plaster or gypsum board, with seams or cracks permanently sealed.

A.19.3.6.3

The provision of 19.3.6.3 requires the door leaves to be of substantial construction that is sufficient to resist fire for 20 minutes. These doors, described as 1¼ in. (44 mm) thick, solid-bonded wood-core doors, are nonrated doors and are not subject to the requirements of NFPA 80.

A.19.3.6.3.1

Gasketing of doors should not be necessary to achieve resistance to the passage of smoke if the door is relatively tight-fitting.

A.19.3.6.3.5

While it is recognized that closed doors serve to maintain tenable conditions in a corridor and adjacent patient rooms, such doors, which, under normal or fire conditions, are self-closing, might create a special hazard for the personal safety of a room occupant. Such closed doors might present a problem of delay in discovery, confining fire products beyond tenable conditions.

Because it is critical for responding staff members to be able to immediately identify the specific room involved, it is recommended that approved automatic smoke detection that is interconnected with the building fire alarm be considered for rooms having doors equipped with closing devices. Such detection is permitted to be located at any approved point within the room. When activated, the detector is required to provide a warning that indicates the specific room of involvement by activation of a fire alarm annunciator, nurse call system, or any other device acceptable to the authority having jurisdiction.

In existing buildings, use of the following options reasonably ensures that patient room doors will be closed and remain closed during a fire:

- (1) Doors should have positive latches, ~~and a- or as an alternative, the doors in a fire emergency become positively latched upon activation of an automatic smoke detector, provided the doors are also self-closing or automatic-closing. (see 18.3.6.3.6) .~~
- (2) A suitable program that trains staff to close the doors in an emergency should be established.
- (3) It is the intent of the *Code* that no new installations of roller latches be permitted; however, repair or replacement of roller latches is not considered a new installation.
- (4) Doors protecting openings to patient sleeping or treatment rooms, or spaces having a similar combustible loading, might be held closed using a closer exerting a closing force of not less than 5 lbf (22 N) on the door latch stile.

A.19.3.6.3.10

Doors should not be blocked open by furniture, door stops, chocks, tie-backs, drop-down or plunger-type devices, or other devices that necessitate manual unlatching or releasing action to close. Examples of hold-open devices that release when the door is pushed or pulled are friction catches or magnetic catches.

A.19.3.6.3.12

It is not the intent of 19.3.6.3.12 to prohibit the application of push plates, hardware, or other attachments on corridor doors in health care occupancies.

A.19.3.6.5.1

It is not the intent of 19.3.6.5.1 to permit mail slots or pass-through openings in doors or walls of rooms designated as a hazardous area.

A.19.3.7

Where two floors communicate via two-story openings with partial enclosure in accordance with 8.6.8 or convenience openings in accordance with 8.6.9, the total smoke compartment area is the combined areas of the compartments exposed to each other on both floors.

A.19.3.7.1

The removal of existing smoke barriers is permitted only where the resulting condition meets or exceeds the requirements for new construction (see 4.6.7.4 and 4.6.12.2).

A.19.3.7.3(2)

Where the smoke control system design requires dampers in order that the system functions effectively, it is not the intent of the exception to permit the damper to be omitted.

This provision is not intended to prevent the use of plenum returns where ducting is used to return air from a ceiling plenum through smoke barrier walls. Short stubs or jumper ducts are not acceptable. Ducting is required to connect at both sides of the opening and to extend into adjacent spaces away from the wall. The intent is to prohibit open-air transfers at or near the smoke barrier walls.

A.19.3.7.6.1

It is not the intent of 19.3.7.6.1 to prohibit the application of push plates, hardware, or other attachments on smoke barrier doors in health care occupancies.

A.19.3.7.8

Smoke barriers might include walls having door openings other than cross-corridor doors. There is no restriction in the *Code* regarding which doors or how many doors form part of a smoke barrier. For example, doors from the corridor to individual rooms are permitted to form part of a smoke barrier.

A.19.4.3

The provision of 19.4.3 is intended to prevent the phase-in period for the installation of sprinklers from being reset to 12 years upon adoption of this edition of this *Code* in jurisdictions where the phase-in period had already begun via the adoption of an earlier edition.

A.19.4.4

Extensive research, including fire modeling, has indicated that alcohol-based hand-rub solutions can be safely installed in corridors of health care facilities, provided that certain other precautions are taken. The total quantities of flammable liquids in any area should comply with the provisions of other recognized codes, including NFPA 1 and NFPA 30. In addition, special consideration should be given to the following:

- (1) Obstructions created by the installation of hand-rub solution dispensers
- (2) Location of dispensers with regard to adjacent combustible materials and potential sources of ignition, especially where dispensers are mounted on walls of combustible construction
- (3) Requirements for other fire protection features, including complete automatic sprinkler protection, to be installed throughout the compartment
- (4) Amount and location of the flammable solutions, both in use and in storage, particularly with respect to potential for leakage or failure of the dispenser

A.19.5.2.2

For both new and existing buildings, it is the intent to permit the installation and use of fireplace stoves and room heaters using solid fuel as defined in NFPA 211 provided that all such devices are installed, maintained, and used in accordance with the appropriate provisions of that standard and all manufacturers' specifications. These requirements are not intended to permit freestanding solid-fuel-burning appliances such as freestanding wood-burning stoves.

A.19.5.2.3(2)(d)

The glass front of a direct-vent fireplace can become extremely hot. Barriers such as screens or mesh installed over the direct-vent glass help reduce the risk of burn from touching the glass.

A.19.5.2.3(2)(e)

The intent of locating controls in a restricted location is to ensure staff is aware of use of the fireplace and to prevent unauthorized use. Examples of locked controls are a keyed switch or locating the switch in a staff-controlled location such as a staff station.

A.19.7

Health care occupants have, in large part, varied degrees of physical disability, and their removal to the outside, or even their disturbance caused by moving, is inexpedient or impractical in many cases, except as a last resort. Similarly, recognizing that there might be an operating necessity for the restraint of the mentally ill, often by use of barred windows and locked doors, fire exit drills are usually extremely disturbing, detrimental, and frequently impracticable.

In most cases, fire exit drills, as ordinarily practiced in other occupancies, cannot be conducted in health care occupancies. Fundamentally, superior construction, early discovery and extinguishment of incipient fires, and prompt notification need to be relied on to reduce the occasion for evacuation of buildings of this class to a minimum.

A.19.7.1.4

Many health care occupancies conduct fire drills without disturbing patients by choosing the location of the simulated emergency in advance and by closing the doors to patients' rooms or wards in the vicinity prior to initiation of the drill. The purpose of a fire drill is to test and evaluate the efficiency, knowledge, and response of institutional personnel in implementing the facility fire emergency action plan. Its purpose is not to disturb or excite patients. Fire drills should be scheduled on a random basis to ensure that personnel in health care facilities are drilled not less than once in each 3-month period.

Drills should consider the ability to move patients to an adjacent smoke compartment. Relocation can be practiced using simulated patients or empty wheelchairs.

A.19.7.2.1

Each facility has specific characteristics that vary sufficiently from other facilities to prevent the specification of a universal emergency procedure. The recommendations that follow, however, contain many of the elements that should be considered and adapted, as appropriate, to the individual facility.

Upon discovery of fire, personnel should immediately take the following action:

- (1) If any person is involved in the fire, the discoverer should go to the aid of that person, calling aloud an established code phrase, which provides for both the immediate aid of any endangered person and the transmission of an alarm.
- (2) Any person in the area, upon hearing the code called aloud, should activate the building fire alarm using the nearest manual fire alarm box.
- (3) If a person is not involved in the fire, the discoverer should activate the building fire alarm using the nearest manual fire alarm box.
- (4) Personnel, upon hearing the alarm signal, should immediately execute their duties as outlined in the facility fire safety plan.
- (5) The telephone operator should determine the location of the fire as indicated by the audible signal.
- (6) In a building equipped with an uncoded alarm system, a person on the floor of fire origin should be responsible for promptly notifying the facility telephone operator of the fire location.
- (7) If the telephone operator receives a telephone alarm reporting a fire from a floor, the operator should regard that alarm in the same fashion as an alarm received over the fire alarm system and should immediately notify the fire department and alert all facility personnel of the place of fire and its origin.
- (8) If the building fire alarm system is out of order, any person discovering a fire should immediately notify the telephone operator by telephone, and the operator should then transmit this information to the fire department and alert the building occupants.

A.19.7.3.3

The purpose of this requirement is to provide a means for building designers, occupants, and operators to clearly designate approved egress corridors that can be identified even though physical or other obvious barriers might not be present to indicate their location. Floor plans used to satisfy this requirement might incorporate more than one function and more than one smoke compartment of the building, provided egress corridors are clearly identified where no fixed barriers are present. Such plans should be accessible to the authority having jurisdiction but should not be required to be posted.

A.19.7.4

The most rigid discipline with regard to prohibition of smoking might not be nearly as effective in reducing incipient fires from surreptitious smoking as the open recognition of smoking, with provision of suitable facilities for smoking. Proper education and training of the staff and attendants in the ordinary fire hazards and their abatement is unquestionably essential. The problem is a broad one, varying with different types and arrangements of buildings; the effectiveness of rules of procedure, which need to be flexible, depends in large part on the management.

A.19.7.5.1

In addition to the provisions of 10.3.1, which deal with ignition resistance, additional requirements with respect to the location of cubicle curtains relative to sprinkler placement are included in NFPA 13.

A.19.7.5.6(2)

The user should verify that the products meet the referenced test methods of NFPA 701 and not the small-scale test procedure that was previously eliminated from NFPA 701.

A.19.7.5.6(4)

The percentage of decorations should be measured against the area of any wall or ceiling, not the aggregate total of walls, ceilings, and doors. The door is considered part of the wall. The decorations must be located such that they do not interfere with the operation of any door, sprinkler, smoke detector, or any other life safety equipment. Other art might include hanging objects or three-dimensional items.

A.19.7.5.6(5)

When determining if the hazard for fire development or spread is present, consideration should be given to whether the building or area being evaluated is sprinklered.

A.19.7.5.7.1

It is not the intent to permit collection receptacles with a capacity greater than 64 gal (242 L) to be positioned at or near a nurses' station based on the argument that such nurses' station is constantly attended. The large collection receptacle itself needs to be actively attended by staff. Staff might leave the large receptacle in the corridor outside a patient room while entering the room to collect soiled linen or trash, but staff is expected to return to the receptacle, move on to the next room, and repeat the collection function. Where staff is not actively collecting material for placement in the receptacle, the receptacle is to be moved to a room protected as a hazardous area.

A.19.7.5.7.2

It is the intent that this provision permits recycling of bottles, cans, paper, and similar clean items that do not contain grease, oil, flammable liquids, or significant plastic materials, using larger containers or several adjacent containers, and not require locating such containers in a room protected as a hazardous area. Containers for medical records awaiting shredding are often larger than 64 gal (242 L). These containers are not to be included in the calculations and limitations of 19.7.5.7.1. There is no limit on the number of these containers, as FM Approvals 6920/ 6921, *Approval-Standard for Oily Waste Cans and Containers for Combustible Waste*, ensures that the fire will not spread outside of the container. FM approval standards are written for use with FM Approvals. The tests can be conducted by any approved laboratory. The portions of the standard referring to FM Approvals are not included in this reference.

A.19.7.7

A document that provides recognized engineering principles for the testing of smoke control systems is NFPA 92.

A.19.7.8

Portable space heaters complying with 19.7.8 should be permitted to be located in office areas, nurses stations, and other similar nonpatient spaces within the same smoke compartment as patient sleeping rooms.

A.20.1.1.1.6

The Code recognizes that certain functions necessary for the life safety of building occupants, such as the closing of corridor doors, the operation of manual fire alarm devices, and the removal of patients from the room of fire origin, require the intervention of facility staff. It is not the intent of 20.1.1.1.6 to specify the levels or locations of staff necessary to meet this requirement.

A.20.1.1.2

This objective is accomplished in the context of the physical facilities, the type of activities undertaken, the provisions for the capabilities of staff, and the needs of all occupants through requirements directed at the following:

- (1) Prevention of ignition
- (2) Detection of fire
- (3) Control of fire development
- (4) Confinement of the effects of fire
- (5) Extinguishment of fire
- (6) Provision of refuge or evacuation facilities, or both
- (7) Staff reaction

A.20.1.3.2

Doctors' offices and treatment and diagnostic facilities that are intended solely for outpatient care and are physically separated from facilities for the treatment or care of inpatients, but are otherwise associated with the management of an institution, might be classified as business occupancies rather than health care occupancies.

A.20.2.2.2.4

The words "principal entrance/exit doors" describe doors that the authority having jurisdiction can reasonably expect to be unlocked in order for the facility to do business.

A.20.2.3.3

Building codes and accessibility codes might require cane detection below projections that exceed 4 in. (102 mm).

A.20.3.2.1

It is not the intent of this provision that rooms inside individual tenant spaces that are used to store routine office supplies for that tenant be required to be either separated or sprinklered.

A.20.3.2.3

The requirement for separating high-hazard contents areas from other parts of the building is intended to isolate the hazard, and 8.2.3.3 is applicable.

PCs [1]

A.20.3.4.3.1.2

In ambulatory health care occupancies, fire alarm system notification is often designed primarily to notify staff who are responsible for the occupants in their care. The staff can be used as an alternate means for notifying others who might need to relocate or evacuate.

[See SR-66:](#)

A.20.3.4.5.1

The required location of carbon monoxide detectors is intended to be found in the scoping document, NFPA 101, under 20.3.4.5.2. The locations indicated in NFPA 72 are intended to be superseded by the NFPA 101 requirements.

A.20.3.6.1

The intent of 38.3.6.1(1) through 38.3.6.1(3) is to permit spaces to be open to the exit access corridor without separation.

A.20.3.6.1(1)

Where exits are available from an open floor area, such as open plan buildings, corridors are not required to be separated. An example of an open plan building is a building in which the work spaces and accesses to exits are delineated by the use of tables, desks, bookcases, or counters, or by partitions that are less than floor-to-ceiling height.

A.20.3.6.1(2)

It is the intent of this provision that a single tenant be limited to an area occupied under a single management and work the same hours. The concept is that people under the same employ working the same hours would likely be familiar with their entire tenant space. It is not the intent to apply this provision simply because tenants are owned by the same organization. For example, in a government-owned office building, the offices of different federal agencies would be considered multiple tenants, because an employee normally works for one agency. The agencies might work various hours. Another example of multiple tenancy would be a classroom building of a university, because some classrooms might be in use at times when other classrooms are not being used.

A.20.3.7

Where two floors communicate via two-story openings with partial enclosure in accordance with 8.6.8 or convenience openings in accordance with 8.6.9, the total smoke compartment area is the combined areas of the compartments exposed to each other on both floors.

A.20.3.7.12

Smoke barriers might include walls having door openings other than cross-corridor doors. There is no restriction in the *Code* regarding which doors or how many doors form part of a smoke barrier. For example, doors from the corridor to individual rooms are permitted to form part of a smoke barrier.

A.20.3.7.16

Split astragals (i.e., astragals installed on both door leaves) are also considered astragals.

A.20.4.4

Extensive research, including fire modeling, has indicated that alcohol-based hand-rub solutions can be safely installed in corridors of health care facilities, provided that certain other precautions are taken. The total quantities of flammable liquids in any area should comply with the provisions of other recognized codes, including NFPA 1 and NFPA 30. In addition, special consideration should be given to the following:

- (1) Obstructions created by the installation of hand-rub solution dispensers
- (2) Location of dispensers with regard to adjacent combustible materials and potential sources of ignition, especially where dispensers are mounted on walls of combustible construction
- (3) Requirements for other fire protection features, including complete automatic sprinkler protection, to be installed throughout the compartment
- (4) Amount and location of the flammable solutions, both in use and in storage, particularly with respect to potential for leakage or failure of the dispenser

A.20.7

Ambulatory health care occupants have, in large part, varied degrees of physical disability, and their removal to the outside, or even their disturbance caused by moving, is inexpedient or impractical in many cases, except as a last resort. Similarly, recognizing that there might be an operating necessity for the restraint of the mentally ill, often by use of barred windows and locked doors, fire exit drills are usually extremely disturbing, detrimental, and frequently impracticable.

In most cases, fire exit drills, as ordinarily practiced in other occupancies, cannot be conducted in ambulatory health care occupancies. Fundamentally, superior construction, early discovery and extinguishment of incipient fires, and prompt notification need to be relied on to reduce the occasion for evacuation of buildings of this class to a minimum.

A.20.7.1.4

Many ambulatory health care occupancies conduct fire drills without disturbing patients by choosing the location of the simulated emergency in advance and by closing the doors in the vicinity prior to the initiation of the drill. The purpose of a fire drill is to test and evaluate the efficiency, knowledge, and response of personnel in implementing the facility fire emergency plan. Its purpose is not to disturb or excite patients. Fire drills should be scheduled on a random basis to ensure that personnel in ambulatory health care facilities are drilled not less than once in each 3-month period.

Drills should consider the ability to move patients to an adjacent smoke compartment. Relocation can be practiced using simulated patients or empty wheelchairs.

A.20.7.2.1

Each facility has specific characteristics that vary sufficiently from other facilities to prevent the specification of a universal emergency procedure. The recommendations that follow, however, contain many of the elements that should be considered and adapted, as appropriate, to the individual facility.

Upon discovery of fire, personnel should immediately take the following action:

- (1) If any person is involved in the fire, the discoverer should go to the aid of that person, calling aloud an established code phrase, which provides for both the immediate aid of any endangered person and the transmission of an alarm.
- (2) Any person in the area, upon hearing the code called aloud, should activate the building fire alarm using the nearest manual fire alarm box.
- (3) If a person is not involved in the fire, the discoverer should activate the building fire alarm using the nearest manual fire alarm box.
- (4) Personnel, upon hearing the alarm signal, should immediately execute their duties as outlined in the facility fire safety plan.
- (5) The telephone operator should determine the location of the fire as indicated by the audible signal.
- (6) In a building equipped with an uncoded alarm system, a person on the floor of fire origin should be responsible for promptly notifying the facility telephone operator of the fire location.
- (7) If the telephone operator receives a telephone alarm reporting a fire from a floor, the operator should regard that alarm in the same fashion as an alarm received over the fire alarm system and should immediately notify the fire department and alert all facility personnel of the place of fire and its origin.
- (8) If the building fire alarm system is out of order, any person discovering a fire should immediately notify the telephone operator by telephone, and the operator should then transmit this information to the fire department and alert the building occupants.

A.20.7.4

The most rigid discipline with regard to prohibition of smoking might not be nearly as effective in reducing incipient fires from surreptitious smoking as the open recognition of smoking, with provision of suitable facilities for smoking. Proper education and training of the staff and attendants in the ordinary fire hazards and their abatement is unquestionably essential. The problem is a broad one, varying with different types and arrangements of buildings; the effectiveness of rules of procedure, which need to be flexible, depends in large part on the management.

A.20.7.5.1

In addition to the provisions of 10.3.1, which deal with ignition resistance, additional requirements with respect to the location of cubicle curtains relative to sprinkler placement are included in NFPA 13.

A.20.7.5.4(4)

The percentage of decorations should be measured against the area of any wall or ceiling, not the aggregate total of walls, ceilings, and doors. The door is considered part of the wall. The decorations must be located such that they do not interfere with the operation of any door, sprinkler, smoke detector, or any other life safety equipment. Other art might include hanging objects or three-dimensional items.

A.20.7.5.5.2

It is the intent that this provision permits recycling of bottles, cans, paper, and similar clean items that do not contain grease, oil, flammable liquids, or significant plastic materials using larger containers or several adjacent containers and not require locating such containers in a room protected as a hazardous area. Containers for medical records awaiting shredding are often larger than 64 gal (242 L). These containers are not to be included in the calculations and limitations of 20.7.5.5.1. There is no limit on the number of these containers, as FM Approvals 6920/ 6921, *Approval Standard for Oily Waste Cans and Containers for Combustible Waste*, ensures that the fire will not spread outside of the container. FM approval standards are written for use with FM Approvals. The tests can be conducted by any approved laboratory. The portions of the standard referring to FM Approvals are not included in this reference.

A.20.7.7

A document that provides recognized engineering principles for the testing of smoke control systems is NFPA 92.

A.21.1.1.1.6

The *Code* recognizes that certain functions necessary for the life safety of building occupants, such as the closing of corridor doors, the operation of manual fire alarm devices, and the removal of patients from the room of fire origin, require the intervention of facility staff. It is not the intent of 21.1.1.1.6 to specify the levels or locations of staff necessary to meet this requirement.

A.21.1.1.2

This objective is accomplished in the context of the physical facilities, the type of activities undertaken, the provisions for the capabilities of staff, and the needs of all occupants through requirements directed at the following:

- (1) Prevention of ignition
- (2) Detection of fire
- (3) Control of fire development
- (4) Confinement of the effects of fire
- (5) Extinguishment of fire
- (6) Provision of refuge or evacuation facilities, or both
- (7) Staff reaction

A.21.1.3.3

Doctors' offices and treatment and diagnostic facilities that are intended solely for outpatient care and are physically separated from facilities for the treatment or care of inpatients, but that are otherwise associated with the management of an institution, might be classified as business occupancies rather than health care occupancies.

A.21.2.2.2.4

The words "principal entrance/exit doors" describe doors that the authority having jurisdiction can reasonably expect to be unlocked in order for the facility to do business.

A.21.2.2.2.14

The waiver of the requirement for doors to swing in the direction of egress travel is based on the assumption that, in this occupancy, there is little possibility of a panic rush that might prevent the opening of doors that swing against egress travel.

A desirable arrangement, which is possible with corridors 6 ft (1830 mm) or more in width, is to have two 32 in. (810 mm) doors, normally closed, each swinging with the egress travel (in opposite directions).

A.21.2.3.3

Building codes and accessibility codes might require cane detection below projections that exceed 4 in. (102 mm).

A.21.3.2.1

It is not the intent of this provision that rooms inside individual tenant spaces that are used to store routine office supplies for that tenant be required to be either separated or sprinklered.

A.21.3.2.3

The requirement for separating high-hazard contents areas from other parts of the building is intended to isolate the hazard, and 8.2.3.3 is applicable.

[PCs \[2\]](#)

A.21.3.4.3.1.2

In ambulatory health care occupancies, fire alarm system notification is often designed primarily to notify staff who are responsible for the occupants in their care. The staff can be used as an alternate means for notifying others who might need to relocate or evacuate.

A.21.3.7

Where two floors communicate via two-story openings with partial enclosure in accordance with 8.6.8 or convenience openings in accordance with 8.6.9, the total smoke compartment area is the combined areas of the compartments exposed to each other on both floors.

A.21.3.7.10

Smoke barriers might include walls having door openings other than cross-corridor doors. There is no restriction in the *Code* regarding which doors or how many doors form part of a smoke barrier. For example, doors from the corridor to individual rooms are permitted to form part of a smoke barrier.

A.21.4.3.2

In some cases, appreciable cost might be involved in bringing an existing occupancy into compliance. Where this is true, it would be appropriate for the authority having jurisdiction to prescribe a schedule determined jointly with the facility, allowing suitable periods of time for the correction of the various deficiencies and giving due weight to the ability of the owner to secure the necessary funds.

A.21.4.4

Extensive research, including fire modeling, has indicated that alcohol-based hand-rub solutions can be safely installed in corridors of health care facilities, provided that certain other precautions are taken. The total quantities of flammable liquids in any area should comply with the provisions of other recognized codes, including NFPA 1 and NFPA 30. In addition, special consideration should be given to the following:

- (1) Obstructions created by the installation of hand-rub solution dispensers
- (2) Location of dispensers with regard to adjacent combustible materials and potential sources of ignition, especially where dispensers are mounted on walls of combustible construction
- (3) Requirements for other fire protection features, including complete automatic sprinkler protection, to be installed throughout the compartment
- (4) Amount and location of the flammable solutions, both in use and in storage, particularly with respect to potential for leakage or failure of the dispenser

A.21.7

Ambulatory health care occupants have, in large part, varied degrees of physical disability, and their removal to the outside, or even their disturbance caused by moving, is inexpedient or impractical in many cases, except as a last resort. Similarly, recognizing that there might be an operating necessity for the restraint of the mentally ill, often by use of barred windows and locked doors, fire exit drills are usually extremely disturbing, detrimental, and frequently impracticable.

In most cases, fire exit drills, as ordinarily practiced in other occupancies, cannot be conducted in ambulatory health care occupancies. Fundamentally, superior construction, early discovery and extinguishment of incipient fires, and prompt notification need to be relied on to reduce the occasion for evacuation of buildings of this class to a minimum.

A.21.7.1.4

Many ambulatory health care occupancies conduct fire drills without disturbing patients by choosing the location of the simulated emergency in advance and by closing the doors in the vicinity prior to initiation of the drill. The purpose of a fire drill is to test and evaluate the efficiency, knowledge, and response of personnel in implementing the facility fire emergency plan. Its purpose is not to disturb or excite patients. Fire drills should be scheduled on a random basis to ensure that personnel in ambulatory health care facilities are drilled not less than once in each 3-month period.

Drills should consider the ability to move patients to an adjacent smoke compartment. Relocation can be practiced using simulated patients or empty wheelchairs.

A.21.7.2.1

Each facility has specific characteristics that vary sufficiently from other facilities to prevent the specification of a universal emergency procedure. The recommendations that follow, however, contain many of the elements that should be considered and adapted, as appropriate, to the individual facility.

Upon discovery of fire, personnel should immediately take the following action:

- (1) If any person is involved in the fire, the discoverer should go to the aid of that person, calling aloud an established code phrase, which provides for both the immediate aid of any endangered person and the transmission of an alarm.
- (2) Any person in the area, upon hearing the code called aloud, should activate the building fire alarm using the nearest manual fire alarm box.
- (3) If a person is not involved in the fire, the discoverer should activate the building fire alarm using the nearest manual fire alarm box.
- (4) Personnel, upon hearing the alarm signal, should immediately execute their duties as outlined in the facility fire safety plan.
- (5) The telephone operator should determine the location of the fire as indicated by the audible signal.
- (6) In a building equipped with an uncoded alarm system, a person on the floor of fire origin should be responsible for promptly notifying the facility telephone operator of the fire location.
- (7) If the telephone operator receives a telephone alarm reporting a fire from a floor, the operator should regard that alarm in the same fashion as an alarm received over the fire alarm system and should immediately notify the fire department and alert all facility personnel of the place of fire and its origin.
- (8) If the building fire alarm system is out of order, any person discovering a fire should immediately notify the telephone operator by telephone, and the operator should then transmit this information to the fire department and alert the building occupants.

A.21.7.4

The most rigid discipline with regard to prohibition of smoking might not be nearly as effective in reducing incipient fires from surreptitious smoking as the open recognition of smoking, with provision of suitable facilities for smoking. Proper education and training of the staff and attendants in the ordinary fire hazards and their abatement is unquestionably essential. The problem is a broad one, varying with different types and arrangements of buildings; the effectiveness of rules of procedure, which need to be flexible, depends in large part on the management.

A.21.7.5.1

In addition to the provisions of 10.3.1, which deal with ignition resistance, additional requirements with respect to the location of cubicle curtains relative to sprinkler placement are included in NFPA 13.

A.21.7.5.4(4)

The percentage of decorations should be measured against the area of any wall or ceiling, not the aggregate total of walls, ceilings, and doors. The door is considered part of the wall. The decorations must be located such that they do not interfere with the operation of any door, sprinkler, smoke detector, or any other life safety equipment. Other art might include hanging objects or three-dimensional items.

A.21.7.5.5.2

It is the intent that this provision permits recycling of bottles, cans, paper, and similar clean items that do not contain grease, oil, flammable liquids, or significant plastic materials using larger containers or several adjacent containers and not require locating such containers in a room protected as a hazardous area. Containers for medical records awaiting shredding are often larger than 64 gal (242 L). These containers are not to be included in the calculations and limitations of 21.7.5.5.1. There is no limit on the number of these containers, as FM Approvals [6920/ 6921, *Approval-Standard for Oily Waste Cans and Containers for Combustible Waste*](#), ensures that the fire will not spread outside of the container. FM approval standards are written for use with FM Approvals. The tests can be conducted by any approved laboratory. The portions of the standard referring to FM Approvals are not included in this reference.

A.21.7.7

A document that provides recognized engineering principles for the testing of smoke control systems is NFPA 92.

A.22.1.1.1.4(2)

In determining equivalency for conversions, modernizations, renovations, or unusual design concepts of detention and correctional facilities, the authority having jurisdiction is permitted to accept evaluations based on the detention and correctional occupancies fire safety evaluation system (FSES) of NFPA 101A utilizing the parameters for new construction.

A.22.1.1.1.6

It is not the intent to classify as detention and correctional occupancies the areas of health care occupancies in which doors are locked against patient egress where needed for the clinical needs of the patients. For example, a dementia treatment center can be adequately protected by the health care occupancies requirements of Chapter 18. *[See 18.1.1.1.7, 18.2.2.2.2, 18.2.2.2.4(1), and 18.2.2.2.6.]*

The one-resident threshold requirement of 22.1.1.1.6 is not meant to force a residential occupancy, where security is imposed on one or more occupants, to be reclassified as a detention and correctional occupancy.

A.22.1.1.1.7

Lockups in which persons are detained with some degree of security imposed on them are common in many occupancies. Examples include the following:

- (1) Immigration and naturalization facilities at border crossings
- (2) Customs facilities at international airports
- (3) Prisoner holding facilities at courthouses
- (4) Local police department holding areas
- (5) Security offices at sports stadia
- (6) Security offices at shopping mall complexes

A.22.1.2.1

Users and occupants of detention and correctional facilities at various times can be expected to include staff, visitors, and residents. The extent and nature of facility utilization vary according to the type of facility, its function, and its programs.

Figure A.22.1.2.1 illustrates the five use conditions.

Figure A.22.1.2.1 Detention and Correctional Use Conditions.

**A.22.1.2.2**

Prompt operation is intended to be accomplished in the period of time between detection of fire, either by the smoke detector(s) required by 22.3.4.4 or by other means, whichever occurs first, and the advent of intolerable conditions forcing emergency evacuation. Fire tests have indicated that the time available is a function of the volume and height of the space involved and the rate of fire development. In traditional one-story corridor arrangements, the time between detection by smoke detectors and the advent of lethal conditions down to head height can be as short as approximately 3 minutes. In addition, it should be expected that approximately 1 minute will be required to evacuate all the occupants of a threatened smoke compartment once the locks are released. In such a case, a prompt release time would be 2 minutes.

A.22.1.2.3(2)

If the Use Condition I facility conforms to the requirements of residential occupancies under this *Code*, there are no staffing requirements. If the Use Condition I facility conforms to the requirements of Use Condition II facilities as permitted by this provision, staffing is required in accordance with 22.7.1.

A.22.1.3

Detention and correctional facilities are a complex of structures, each serving a definite and usually different purpose. In many institutions, all, or almost all, the occupancy-type classifications found in this *Code* are represented. Means of egress and other features are governed by the type of occupancy classification and the hazard of occupancy, unless specific exemptions are made.

All buildings and structures are to be classified using Chapter 22 and Section 6.1 as a guide, subject to the ruling of the authority having jurisdiction where a question arises concerning the proper classification of any individual building or structure.

Use condition classification of the institution, as well as of individual areas within the complex, is always to be considered by the authority having jurisdiction.

A.22.1.3.2.2

Key-operated locking hardware of a lesser grade than institutional grade hardware might not be suitable for the heavy use to which such locks are expected to be subjected.

A.22.2.2.5.2

An exit is not necessary from each individual fire compartment or smoke compartment if there is access to an exit through other fire compartments or smoke compartments without passing through the fire compartment or smoke compartment of fire origin.

A.22.2.11.1.4

It might be necessary to provide a certain number of resident sleeping rooms with doors providing a clear width of not less than 32 in. (810 mm) (see 7.2.1.2) to comply with the requirements for accessible units with mobility features. Such sleeping rooms should be located where there is a direct accessible route to the exterior or to an area of safe refuge. (See 22.3.7.)

A.22.2.11.1.8

A remote position is generally a control point where a number of doors can be unlocked simultaneously, either mechanically or electrically. In areas where there are a number of sleeping rooms, it is impractical for attendants to unlock doors individually. Doors in an exit should be unlocked prior to unlocking sleeping room doors. Sight and sound supervision of resident living areas can be by means of camera and communications systems.

This section of the *Code* does not intend to prohibit Use Condition V facilities, nor does it intend to limit Use Condition V facilities to 10 manually released locks.

A.22.3.1(2)

For purposes of providing control valves and waterflow devices, multilevel residential housing areas complying with this provision are considered to be one story.

A.22.4.5.13.2

Mattresses used in detention and correctional facilities should be evaluated with regard to the fire hazards of the environment. The potential for vandalism and excessive wear and tear also should be taken into account when evaluating the fire performance of the mattress. ASTM F1870, *Standard Guide for Selection of Fire Test Methods for the Assessment of Upholstered Furnishings in Detention and Correctional Facilities*, provides guidance for this purpose in Section 10, "Tests and Specifications Designed for Detention and Correction Facilities." One of the tests referenced in that section is similar to the test in Annex A3 of ASTM F1085, *Standard Specification for Mattress and Box Springs for Use in Berths in Marine Vessels*, referenced in 10.3.3.2.2 of this *Code*. ASTM F1870 also includes guidance on alternative fire test methods that can be used to assess whether a mattress or mattress cushioning meets the requirements of 10.3.3.2 by simply melting and flowing away from the flame.

A.22.4.6.1.4(1)

The term *other physical restraints* is meant to include the use of personal restraint devices, such as handcuffs or shackles, where occupants are secured to the structure or furnishings to restrict movement.

A.22.4.7

The health, security, and fire safety implications should be reviewed by the detention and correction facility prior to installation.

A.22.7.1.2

This requirement is permitted to be met by electronic or oral monitoring systems, visual monitoring, call signals, or other means.

A.22.7.1.3

Periodic, coordinated training should be conducted and should involve detention and correctional facility personnel and personnel of the fire department legally committed to serving the facility.

A.22.7.2

Personal property provides combustible contents for fire development. Therefore, adequate controls are needed to limit the quantity and combustibility of the fuels available to burn to reduce the probability of room flashover. The provisions of 22.7.4 will not, by themselves, prevent room flashover if personal property controls are not provided.

A.22.7.4

The type, quantity, and arrangement of furniture and other combustibles are important factors in determining how fast the fire will develop. Furnishings, including upholstered items and wood items, such as wardrobes, desks, and bookshelves, might provide sufficient fuel to result in room flashover, which is the full fire involvement of all combustibles within a room once sufficient heat has been built up within the room.

A.22.7.4.3

See A.22.4.5.13.2.

A.23.1.1.1.4(2)

In determining equivalency for existing detention and correctional facilities, the authority having jurisdiction is permitted to accept evaluations based on the detention and correctional occupancies fire safety evaluation system (FSSES) of NFPA 101A utilizing the parameters for existing buildings.

A.23.1.1.1.6

It is not the intent to classify as detention and correctional occupancies the areas of health care occupancies in which doors are locked against patient egress where needed for the clinical needs of the patients. For example, a dementia treatment center can be adequately protected by the health care occupancies requirements of Chapter 19. [See 19.1.1.1.7, 19.2.2.2.2, 19.2.2.2.4(1), and 19.2.2.2.6.]

The one-resident threshold requirement of 23.1.1.1.6 is not meant to force a residential occupancy, where security is imposed on one or more occupants, to be reclassified as a detention and correctional occupancy.

A.23.1.1.1.7

Lockups in which persons are detained with some degree of security imposed on them are common in many occupancies. Examples include the following:

- (1) Immigration and naturalization facilities at border crossings
- (2) Customs facilities at international airports
- (3) Prisoner holding facilities at courthouses
- (4) Local police department holding areas
- (5) Security offices at sports stadia
- (6) Security offices at shopping mall complexes

A.23.1.2.1

Users and occupants of detention and correctional facilities at various times can be expected to include staff, visitors, and residents. The extent and nature of facility utilization will vary according to the type of facility, its function, and its programs.

Figure A.23.1.2.1 illustrates the five use conditions.

Figure A.23.1.2.1 Detention and Correctional Use Conditions.

**A.23.1.2.2**

Prompt operation is intended to be accomplished in the period of time between detection of fire, either by the smoke detector(s) required by 23.3.4.4 or by other means, whichever occurs first, and the advent of intolerable conditions forcing emergency evacuation. Fire tests have indicated that the time available is a function of the volume and height of the space involved and the rate of fire development. In traditional one-story corridor arrangements, the time between detection by smoke detectors and the advent of lethal conditions down to head height can be as short as approximately 3 minutes. In addition, it should be expected that approximately 1 minute will be required to evacuate all the occupants of a threatened smoke compartment once the locks are released. In such a case, a prompt release time would be 2 minutes.

A.23.1.2.3(2)

If the Use Condition I facility conforms to the requirements of residential occupancies under this Code, there are no staffing requirements. If the Use Condition I facility conforms to the requirements of Use Condition II facilities as permitted by this exception, staffing is required in accordance with 23.7.1.

A.23.1.3

Detention and correctional facilities are a complex of structures, each serving a definite and usually different purpose. In many institutions, all, or almost all, of the occupancy-type classifications found in this Code are represented. Means of egress and other features are governed by the type of occupancy classification and the hazard of occupancy, unless specific exemptions are made.

All buildings and structures are to be classified using Chapter 23 and Section 6.1 as a guide, subject to the ruling of the authority having jurisdiction where there is a question as to the proper classification of any individual building or structure.

Use condition classification of the institution, as well as of individual areas within the complex, is always to be considered by the authority having jurisdiction.

A.23.1.3.2.1

Key-operated locking hardware should be of institutional grade. Lesser grade hardware might not be suitable for the heavy use to which such locks are expected to be subjected.

A.23.2.2.5.2

An exit is not necessary from each individual fire compartment if there is access to an exit through other fire compartments without passing through the fire compartment of fire origin.

See SR-66.

PCs [1]

A.23.2.2.5.3

This provision is intended to promote the use of horizontal exits in detention and correctional occupancies. Horizontal exits provide an especially effective egress system for an occupancy in which the occupants, due to security concerns, are not commonly released to the outside. This provision offers a Code-specified equivalent alternative to the requirement of 7.2.4.3.5 that horizontal exits are not to be penetrated by ducts. The intended continuity of the fire-resistance-rated and smoke-resisting barrier is maintained by requiring that duct penetrations of horizontal exits be protected by combination fire dampers/smoke-leakage-rated dampers fire-smoke dampers that close upon activation of a smoke detector and a heat-actuated mechanism before the barrier's ability to resist the passage of smoke and fire is compromised.

A.23.2.4.2

Multilevel and multitiered residential housing areas meeting the requirements of 23.3.1.2 and 23.3.1.3 are considered one story. Therefore, two exits are not required from each level; only access to two exits is required.

A.23.2.4.3

An exit is not necessary from each individual fire compartment and smoke compartment if there is access to an exit through other fire compartments or smoke compartments without passing through the fire compartment or smoke compartment of fire origin.

A.23.2.5.2(3)

In determining whether to approve the existing common path of travel that exceeds 50 ft (15 m), the authority having jurisdiction should ensure that the common path is not in excess of the travel distance permitted by 23.2.6.

A.23.2.5.3

Every exit or exit access should be arranged, if feasible, so that no corridor or aisle has a pocket or dead end exceeding 50 ft (15 m) for Use Conditions II, III, and IV and 20 ft (6100 mm) for Use Condition V.

A.23.2.11.1.4

It might be necessary to provide a certain number of resident sleeping rooms with doors providing a clear width of not less than 32 in. (810 mm) (see 7.2.1.2) to comply with the requirements for accessible units with mobility features. Such sleeping rooms should be located where there is a direct accessible route to the exterior or to an area of safe refuge. (See 23.3.7.)

A.23.2.11.1.8

A remote position is generally a control point where a number of doors can be unlocked simultaneously, either mechanically or electrically. In areas where there are a number of sleeping rooms, it is impractical for attendants to unlock doors individually. Doors in an exit should be unlocked prior to unlocking sleeping room doors. Sight and sound supervision of resident living areas can be by means of camera and communications systems.

This section of the *Code* does not intend to prohibit Use Condition V facilities, nor does it intend to limit Use Condition V facilities to 10 manually released locks.

A.23.3.1.2.1

It is not the intent of this requirement to restrict room face separations, which restrict visibility from the common space into individual sleeping rooms.

A.23.3.1.2.3

The vertical separation between the lowest floor level and the uppermost floor level is not to exceed 13 ft (3960 mm). Figure A.23.3.1.2.3 illustrates how the height is to be determined.

Figure A.23.3.1.2.3 Vertical Height Measurement.

A.23.3.1.3

A recommended method of calculating the expected level of smoke in a smoke removal–equipped cell block follows.

This method for calculating the expected level of smoke has been developed from data experimentally produced in full-scale burnouts of test cells. The test cells were sized, loaded with fuel, and constructed to represent severe conditions of heavily fuel-loaded [approximately 6 lb/ft² (29 kg/m²)] cells as found in prison locations. The filling rate and temperature of the effluent gas and smoke have been calculated using the data from these tests and established formulae from plume dynamics.

The application of the method described in A.23.3.1.3 should be limited to situations where there is not less than 10 ft (3050 mm) from the floor level to the lowest acceptable level of smoke accumulation (Z); the reservoir above the lowest acceptable level for Z is at least 20 percent of the Z dimension; the length of the cell block is not less than Z ; and the fan is not less than 10 ft (3050 mm) higher than the floor of the highest cell.

The determination of smoke removal requirements is based on the dimensions of the cell opening. Where more than one cell opening is involved, the larger size on the level being calculated should be used.

The fan size, temperature rating, and operations means can be determined by the procedure that follows.

Acceptable Smoke Level. Determine the lowest acceptable level of smoke accumulation in accordance with 23.3.1.3. The vertical distance between that level and the floor level of the lowest open cell is the value of Z to be used in connection with Figure A.23.3.1.3(a).

Characteristic Cell Opening. Determine the opening of the cell face. Where there is more than one size of cell opening, use the largest. Match the actual opening to those shown in Figure A.23.3.1.3(b), and use the corresponding curve from Figure A.23.3.1.3(a). If there is no match between the size and shape of the opening and Figure A.23.3.1.3(a), interpolate between the curves. If the opening exceeds 6 ft × 6 ft (1.8 m × 1.8 m), use the curve for a 6 ft × 6 ft (1.8 m × 1.8 m) opening. This curve represents the maximum burning situation, and increasing the size of the opening will not increase the actual burning rate.

Exhaust Fan Rate. Determine the exhaust fan capacity needed to extract smoke at a rate that will maintain the smoke level at a point higher than Z . This is the rate shown on the baseline of Figure A.23.3.1.3(a) corresponding to the level of Z on the vertical axis for the solid line (ventilation rate) curve appropriate to the cell door size. This exhaust capability needs to be provided at a point higher than Z .

Intake Air. Provide intake air openings that either exist or are automatically provided at times of emergency smoke removal. These openings are to be located at or near the baseline of the cell block to allow for intake air at the rate to be vented by the fan. The openings provided shall be sufficient to avoid a friction load that can reduce the exhaust efficiency. Standard air-handling design criteria are used in making this calculation.

Fan Temperature Rating. Determine the potential temperature of gases that the fan might be required to handle by measuring the distance from the floor of the highest cell to the centerline of the fan, or fan ports if the fan is in a duct or similar arrangement. Determine the intersection of the new Z value with the appropriate ventilation rate curve (solid line) from Figure A.23.3.1.3(a). Estimate the temperature rise by interpolating along the appropriate ventilation rate curve and between the constant temperature rise curves (dashed lines) from Figure A.23.3.1.3(a). Provide all elements of the exhaust system that are to be above the acceptable smoke level with the capability to effectively operate with the indicated increase in temperature.

Operation of Exhaust System. Arrange the emergency exhaust system to initiate automatically on detection of smoke, on operation of a manual fire alarm system, or by direct manual operation. The capability to manually start the automatic exhaust system should be provided in a guard post in the cell block, at another control location, or both. Where appropriate, the emergency exhaust fans are permitted to be used for comfort ventilation as well as for serving their emergency purposes.

Figure A.23.3.1.3(a) Cell Block Smoke Control Ventilation Curves.

Figure A.23.3.1.3(b) Typical Cell Openings.

A.23.3.2.1

It is strongly recommended that padded cells not be used due to their fire record. However, recognizing that they will be used in some cases, provisions for the protection of padded cells are provided. It is recognized that the minimum ¾-hour fire-protection-rated fire door will be violated with the "plant on" of the padding, but a minimum ¾-hour fire-protection-rated fire door should be the base of the assembly.

A.23.3.4.3.1(2)

The staff at the constantly attended location should have the capability to promptly initiate the general alarm function and contact the fire department or have direct communication with a control room or other location that can initiate the general alarm function and contact the fire department.

A.23.3.4.4.3

An open dormitory is a dormitory that is arranged to allow staff to observe the entire dormitory area at one time.

A.23.3.4.5.1(3)

The intent is to require carbon monoxide detectors in occupiable spaces immediately adjacent, vertically or horizontally, to attached garages, regardless of the presence of openings between the garage and the adjacent occupiable spaces. Other occupiable spaces that are not adjacent to the attached garage do not require carbon monoxide detectors.

A.23.3.5.2

Where the openings in ceilings or partitions are ¼ in. (6.3 mm) or larger in the smallest dimension, where the thickness or depth of the material does not exceed the smallest dimension of the openings, and where such openings constitute not less than 70 percent of the area of the ceiling or partition material, the disruption of sprinkler spray patterns is permitted to be disregarded.

A.23.3.5.4(1)

Where access to portable fire extinguishers is locked, staff should be present on a 24-hour basis and should have keys readily available to unlock access to the extinguishers. Where supervision of sleeping areas is from a 24-hour attended staff location, portable fire extinguishers are permitted to be provided at the staff location in lieu of the sleeping area.

A.23.3.5.4(2)

It is recognized that locating portable fire extinguishers only at staff locations might result in travel distances to extinguishers being in excess of those permitted by NFPA 10.

A.23.3.7.1

Consideration can be given for large open areas that might be permitted to function as smoke sinks as an alternative to the installation of more than one smoke barrier as required by 23.3.7.1. Vertical movement downward to an area of refuge might be permitted by the authority having jurisdiction in lieu of horizontal movement.

A.23.3.7.1(2)

A door to the outside, by itself, does not meet the intent of this provision if emergency operating procedures do not provide for the door to be unlocked when needed. In cases where use of the door is not ensured, a true smoke barrier per the base requirement of 23.3.7.1 would be needed.

A.23.3.7.3(2)

Consideration should be given to increasing the travel distance to a smoke barrier to coincide with existing range lengths and exits.

A.23.3.7.5

Structural fire resistance is defined as the ability of the assembly to stay in place and maintain structural integrity without consideration of heat transmission. Twelve-gauge steel plate suitably framed and stiffened meets this requirement.

A.23.3.7.6(1)

As an example, a smoke barrier is permitted to consist of fire-rated glazing panels mounted in a security grille arrangement.

A.23.3.8

The requirements in Table 23.3.8 for smoke-resistant and fire-rated separations include taking the necessary precautions to restrict the spread of smoke through the air-handling system. However, the intent is not that smoke dampers are required to be provided for each opening. Smoke dampers would be one acceptable method; however, other techniques, such as allowing the fans to continue to run with 100 percent supply and 100 percent exhaust, would be acceptable.

A.23.4.2.2(2)

The automatic smoke venting should be in accordance with NFPA 204 for light-hazard occupancies.

A.23.4.6.1.4(1)

The term *other physical restraints* is meant to include the use of personal restraint devices, such as handcuffs or shackles, where occupants are secured to the structure or furnishings to restrict movement.

A.23.4.7

The health, security, and fire safety implications should be reviewed by the detention and correction facility prior to installation.

A.23.7.1.2

This requirement is permitted to be met by electronic or oral monitoring systems, visual monitoring, call signals, or other means.

A.23.7.1.3

Periodic, coordinated training should be conducted and should involve detention and correctional facility personnel and personnel of the fire department legally committed to serving the facility.

A.23.7.2

Personal property provides combustible contents for fire development. Therefore, adequate controls are needed to limit the quantity and combustibility of the fuels available to burn to reduce the probability of room flashover. The provisions of 23.7.4 will not, by themselves, prevent room flashover if personal property controls are not provided.

A.23.7.4.3

Mattresses used in detention and correctional facilities should be evaluated with regard to the fire hazards of the environment. The potential for vandalism and excessive wear and tear also should be taken into account when evaluating the fire performance of the mattress. ASTM F1870, *Standard Guide for Selection of Fire Test Methods for the Assessment of Upholstered Furnishings in Detention and Correctional Facilities*, provides guidance for this purpose in Section 10, "Tests and Specifications Designed for Detention and Correction Facilities." One of the tests referenced in that section is similar to the test in Annex A3 of ASTM F1085, *Standard Specification for Mattress and Box Springs for Use in Berths in Marine Vessels*, referenced in 10.3.3.2.2 of this *Code*. ASTM F1870 also includes guidance on alternative fire test methods that can be used to assess whether a mattress or mattress cushioning meets the requirements of 10.3.3.2 by simply melting and flowing away from the flame.

A.24.1.1.2

The *Code* specifies that, wherever there are three or more living units in a building, the building is considered an apartment building and is required to comply with either Chapter 30 or Chapter 31, as appropriate. A townhouse unit is considered to be an apartment building if there are three or more units in the building. The type of wall required between units in order to consider them as separate buildings is normally established by the authority having jurisdiction. If the units are separated by a wall of sufficient fire resistance and structural integrity to be considered as separate buildings, the provisions of Chapter 24 apply to each townhouse. Condominium status is a form of ownership, not occupancy; for example, there are condominium warehouses, condominium apartments, and condominium offices.

The provisions of 24.1.1.2 state that, in one- and two-family dwellings, each dwelling unit can be "occupied by members of a single family with not more than three outsiders." The *Code* does not define the term *family*. The definition of *family* might be subject to federal, state, and local regulations and might not be restricted to a person or a couple (two people) and their children. The following examples aid in differentiating between a single-family dwelling and a lodging or rooming house:

- (1) An individual or a couple (two people) who rent a house from a landlord and then sublease space for up to three individuals should be considered a family renting to a maximum of three outsiders, and the house should be regulated as a single-family dwelling in accordance with Chapter 24.
- (2) A house rented from a landlord by an individual or a couple (two people) in which space is subleased to 4 or more individuals, but not more than 16, should be considered and regulated as a lodging or rooming house in accordance with Chapter 26.
- (3) A residential building that is occupied by 4 or more individuals, but not more than 16, each renting from a landlord, without separate cooking facilities, should be considered and regulated as a lodging or rooming house in accordance with Chapter 26.

It is not the intent of the *Code* to restrict occupancy to persons related by blood, marriage, or adoption as in the traditional opinion of a family. Regulations affecting occupant safety under the *Life Safety Code* differ greatly from zoning regulations that attempt to control who may, and who may not, live in a residential area designated a "single family" zone. Community zoning regulations address problems of noise, pollution, littering, overcrowding, and traffic. Restricting occupancy of single-family housing based on the biological or legal relationships between its inhabitants bears no reasonable relationship to the goals of life safety.

A group of nonrelatives living together in a nontraditional group can be the "functional equivalent" of a more traditional family unit. The factors that must be considered by the authority having jurisdiction are whether the group shares the entire house other than individual bedrooms, lives, cooks, and functions together as a single housekeeping unit and is primarily nontransient.

A.24.2

The phrase "means of escape" indicates a way out of a residential unit that does not conform to the strict definition of means of egress but does meet the intent of the definition by providing an alternative way out of a building. (*See the definition of means of escape in 3.3.186.*)

A.24.2.2.3.3

A window with dimensions of 20 in. × 24 in. (510 mm × 610 mm) has an opening of 3.3 ft² (0.31 m²), which is less than the required 5.7 ft² (0.53 m²). Therefore, either the height or width needs to exceed the minimum requirement to provide the required clear area (see Figure A.24.2.2.3.3). The current minimum width and height dimensions, as well as the minimum clear opening, became a requirement of this Code in the 1976 edition and were based on tests conducted to determine the minimum size of the wall opening required to allow a firefighter wearing complete turnout gear and a self-contained breathing apparatus entry to the room from the exterior to effect search and rescue. Prior editions of the Code limited the width or height, or both, to not less than 22 in. (560 mm) and a clear opening of 5 ft² (0.47 m²). For existing window frames and sash of steel construction, adherence to these dimensional criteria is essential to allow firefighter entry. For existing window frames and sash of wood construction that can easily be removed prior to entry by firefighters to achieve the 5 ft² (0.47 m²) hole in the wall, the clear opening created by the occupant upon opening the window from the interior room side is required only to provide an opening measuring not less than 20 in. × 24 in. (510 mm × 610 mm) or 3.3 ft² (0.31 m²).

Figure A.24.2.2.3.3 Escape Window Utilizing a Window Well.

**A.24.2.4.7**

It is the intent of this requirement that security measures, where installed, do not prevent egress.

A.24.2.8

The grab bars and stanchions required by 24.2.8 are designed to improve safety of showering and bathing by ambulatory users, typically entering and exiting a bath, bathtub-shower combination, or shower facility for showering while standing, or for other forms of bathing that can entail transition to/from a crouching or sitting position.

For grab bar requirements appropriate for other uses and users, especially users with disabilities, refer to the requirements in ICC A117.1, *Accessible and Usable Buildings and Facilities*. Generally, the grab bars specified for this Code will not interfere with other grab bars installed in accordance with the requirements of ICC A117.1, and they can contribute to meeting the requirements of ICC A117.1 and vice versa. For example, combination vertical and horizontal grab bars (e.g., in an L configuration), as addressed by ICC A117.1, can meet the requirements of this Code for a vertical grab bar. Similarly, requirements for a horizontal grab bar or horizontal stanchion on the nonaccess side or back wall are compatible.

Dimensions for grab bar and stanchion locations and other requirements are as compatible as possible with the widely used standard, ICC A117.1. This led to a change in the way the height of horizontal and diagonal grab bars is stipulated — for example, as the height above the bathroom's finished floor level rather than the bathtub rim, which is variable depending on the overall form of the tub. It also makes the Code's height requirements more consistent — not only is the height of the upper and lower ends of vertical grab bars stipulated relative to the finished floor level, but all other orientations of grab bars are now addressed in the same way.

A.24.2.8.1.2

The provision of 24.2.8.1.2 is intended to ensure that grab bars, if provided voluntarily (i.e., as nonrequired) for dedicated showers, meet the requirements of 24.2.8, so that something appearing to be a grab bar can effectively perform as one. However, such grab bars would only be considered nonrequired in the case of dedicated showers not involving misstep and fall dangers addressed by 7.1.6.2 and 7.1.6.4. This means that walking surfaces must be at least as safe, in terms of underfoot conditions, as any other portion of the means of egress (where, for example, handrails are not required) for users not having mobility disabilities. This would require exceptionally careful choice and maintenance of underfoot materials as well as very effective control of water within and adjacent to the dedicated shower facility.

A guide to adequate underfoot slip resistance was reported by Pauls and Johnson in "Applying Ergonomics to Bathing Safety: Including Adoption of Unorthodox Practices for Slip-Resistant Underfoot Surface of Bathtubs Plus Showers and Provision of Effective Points of Control." It was based on a paper by Siegmund et al. and referred to that study as follows:

... a study to "quantify the friction used by barefoot subjects entering and exiting a typical bathtub/shower enclosure under dry and wet conditions". ... involved 60 subjects, equally divided by gender, from three age ranges, younger, middle age and older adults. Force plates with slip-resistant surfaces (with SR [slip resistance coefficient] of 0.55 to 0.90) provided data to derive utilized friction which was lower, by about 0.06, in wet conditions than in dry conditions. Older subjects used less friction than young subjects ($p=0.01$ to $p=0.001$ depending on complexity of the required movement). The range of utilized friction was 0.102 to 0.442, with a median of 0.23.

As an approximate guide to assessing these slip resistance criteria, the slip resistance coefficient is the tangent of the angle between the force being exerted by the leg and a line perpendicular to the underfoot surface. Thus, if the leg is extended straight, with the force of the body exerted at an angle of about 24 degrees to vertical, the tangent of that angle would be 0.445, an acceptable coefficient of friction if the leading foot did not slip on the underfoot surface if it was level.

The Pauls and Johnson paper reported achievable friction coefficients, measured with a tribometer [the Variable Incident Tribometer (VIT)], of 0.27 to 0.31 with a wet test tile covered with a thin damp or wet terry cloth towel (and up to 0.4 wet polished granite covered with a wet terry cloth towel). Thus, the Siegmund et al. study suggests that the leg angle of all the test participants was less than the 24 degrees to vertical assumed in this example calculation (as their utilized friction, again, was in the range of 0.102 to 0.442). Therefore, if slip resistance had not been built into the tub bottom surface (or if the slip resistance treatment had deteriorated with time and use), it could be achieved with a wet terry cloth towel underfoot.

If there is doubt as to the adequacy of slip resistance of underfoot surfaces, it is clearly very prudent to install the grab bars or stanchions stipulated in the requirements of this *Code*.

PCs [1]	SR-664d	Hide Legislation
---------	---------	----------------------------------

A.24.2.8.1.3

The *Code* does not require water closet grab bars and stanchions to be installed to improve the usability and safety of water closets. "Where provided," water closet grab bars and stanchions might be in close proximity to bathtubs or showers and could be used to comply with the bathtub or shower grab bar requirements. Preferences for two vertical points of control for water closets include one installed on each side and one in the front of the water closet. ~~One and within the functional reach of water closet users. In addition to these criteria, one~~ of these could be installed in accordance with the vertical points of control requirements for a bathtub or shower. The requirements for grab bars in and stanchions for showers and bathtubs ~~was were~~ added to the scope of the *Code* in 2018 ~~and 2021~~. Insights on best practices can be found in the study by [Kenny Kennedy](#) et al., "Toilet Grab-Bar Preference and Center of Pressure Deviation During Toilet Transfers in Healthy Seniors, Seniors With Hip Replacements, and Seniors Having Suffered a Stroke." ICC-A117.1, *Accessible and Usable Buildings and Facilities*, is an additional reference for ambulatory accessible water closets.

A.24.2.8.2

The requirements within this section provide design options for points of control when entering and/or exiting a bathtub or shower. Points of control are critical to providing guidance and stability to an occupant much the same as a handrail provides on stairs. The different points of control specified by this section, wall-mounted grabs or vertical stanchions, provide options for compliance in a wide range of conditions. It is important to note that only one point of control is required for entry and egress transfers. The use of a vertical stanchion is not required and is offered as an option to wall-mounted grab bars.

A.24.2.8.2.3

Grab bars located where they interfere with sealing or with a shower curtain against escape of water — especially to the floor surface outside the shower facility — might introduce safety problems in the form of greatly reduced slip resistance of the walking surface, which could violate this *Code*. This can be avoided with a 6 in. (150 mm) horizontal separation between the shower curtain rod and the grab bar. It is assumed that other forms of water control, such as an installed enclosure, will not interfere with the use of grab bars and stanchions.

A.24.2.8.2.5

A top-and-bottom-fixed, vertical stanchion satisfying requirements for a grab bar can offer flexibility in placement, for example, within the close quarters of a small bathroom where there is a water closet adjacent to the bathing facility and a single grab bar or vertical stanchion can serve both facilities. Where the bathing facility is freestanding, without walls, especially with large soaking tubs, including those on pedestals, the vertical stanchion is especially useful. The stanchion also can solve attachment problems where walls are nonexistent or difficult to use for installing conventional, wall-mounted grab bars.

A.24.2.8.3.1

Using the midpoints of the distance ranges and the minimum distance from the control end wall results in a 45-degree angle for the diagonal grab bar. Such a diagonal grab bar (or alternatively, a horizontal grab bar fairly similar to the option provided by 24.2.8.3.1, which meets requirements of ICC A117.1, *Standard for Accessible and Usable Buildings and Facilities*) was found suitable in tests performed of several grab bar options with 103 independent-living seniors with an average age of 70 [Sveistrup et al., 2003].

A.24.2.8.4

The best-performing grab bars are in the middle third of the permitted range for circular diameter. For some grab bar designs, with undulations and other surface geometry features to improve slip resistance for users' hands, these dimensions will be nominal with small variations depending on where measurements are taken. Children and others with smaller hands will be able to use the diameters within the lower part of the permitted range. When using a vertical stanchion, structural considerations, especially for stiffness, might dictate using diameters in the upper part of the permitted range.

Note that a minimum clearance between the grab bar or stanchion and an adjacent surface is specified. With grab bars, especially horizontal ones, on which large, downward loads are imposed by the arms of users, there is some concern about people's hands slipping into the clear space; however, this can occur even with an absolute 1.5 in. (38 mm) clearance, as some standards specify and most grab bar designs provide. Thus the main difference in the end result is where, along its length, the arm gets wedged behind the grab bar, not the complete prevention of this happening at all.

A.24.3.4.1.1

Paragraph 11.5.1.3 of *NFPA 72* contains related requirements. They specify that, where the interior floor area for a given level of a dwelling unit, excluding garage areas, is greater than 1000 ft² (93 m²), smoke alarms are to be installed as follows:

- (1) All points on the ceiling are to have a smoke alarm within a distance of 30 ft (9.1 m), measured along a path of travel, or to have one smoke alarm per 500 ft² (46.5 m²) of floor area, which is calculated by dividing the total interior floor area per level by 500 ft² (46.5 m²).
- (2) Where dwelling units include great rooms or vaulted/cathedral ceilings extending over multiple floors, smoke alarms located on the upper floor that are intended to protect the aforementioned area are permitted to be considered as part of the lower floor(s) protection scheme used to meet the requirements of A.24.3.4.1.1(1).

A.24.3.4.1.1(2)

Paragraphs 11.5.1.1(2) and 11.5.1.2 of *NFPA 72* contain related requirements. The requirement of 11.5.1.1(2) specifies that an alarm is to be installed outside of each separate dwelling unit sleeping area, within 21 ft (6.4 m) of any door to a sleeping room, with the distance measured along a path of travel. The requirement in 11.5.1.2 specifies that, where the area addressed in 11.5.1.1(2) is separated from the adjacent living areas by a door, a smoke alarm is to be installed in the area between the door and the sleeping rooms, and additional alarms are to be installed on the living area side of the door.

A.24.3.4.2.2

The placement requirements of *NFPA 72* are modified specifically for one- and two-family dwellings as required by this *Code* and do not affect other regulations within a jurisdiction.

A.24.3.5

Automatic sprinklers are recognized as an excellent addition to homes to enhance life safety and property protection. Automatic sprinklers can be part of a comprehensive package of fire protection and can assist in the overall master planning of a community. Where all of the buildings within an area are sprinklered, including the single-family dwellings, the response times and personnel of local fire departments can be established at different levels than if the buildings were not sprinklered, saving considerable amounts of tax dollars. When whole developments are sprinklered, water mains, hydrant spacing, road widths, and building density can be altered to help alleviate the economic impact of the sprinklers.

A.24.3.5.1

Where an automatic sprinkler system is not provided based upon a jurisdictional amendment in new one- and two-family dwellings, a disclosure statement should be provided to home buyers stating an automatic sprinkler system was not installed according to the national model codes or standards.

A.26.1.1.1

Bed and breakfast occupancies with more than 3, but fewer than 17, occupants are considered lodging and rooming houses.

A.26.2.3.5.1

It is the intent of this requirement that security measures, where installed, do not prevent egress.

A.26.2.4

See A.24.2.8.

A.26.3.1.2

Such protection can be accomplished by separation by physical distance, arrangement of the stairs, protection of the openings exposing the stairs, or a combination thereof.

A.26.3.4.3.1

The proprietor is the owner or owner's agent with responsible charge.

A.26.3.4.6.2

The placement requirements of *NFPA 72* are modified to accommodate lodging or rooming house occupancies that are part of multiple occupancy buildings (e.g., an on-call physicians' sleeping room in a hospital). The placement requirements of *NFPA 72* are modified specifically for lodging or rooming houses as required by this *Code* and do not affect other regulations within a jurisdiction.

A.26.3.6.2.3

The decision to permit the use of the criteria from *NFPA 13D* in these occupancies is based on the following:

- (1) The desire to obtain a level of fire suppression and control that is approximately equivalent to that delivered by residential facilities protected by such systems (*see A.1.1 in NFPA 13D*)
- (2) The fact that potential fire exposure and challenge to the suppression system in a small lodging and rooming occupancy is of the same nature and no more severe than that found in residences

A.28.2.2.12.2

The provision of 28.2.2.12.2 permits the entire floor to serve as an area of refuge where it is protected in accordance with 28.3.5. The provision is acceptable because supervised automatic sprinkler systems have built-in signals for monitoring features of the system, such as the opening and closing of water control valves. Such systems also monitor pump power supplies, water tank levels, and conditions that will impair the satisfactory operation of the sprinkler system. Because of these monitoring features, supervised automatic sprinkler systems have a high level of satisfactory performance and response to fire conditions.

A.28.2.3.3

The exemption contained in 28.2.3.3 applies to corridors within an individual room or suite and does not apply where a suite can be subdivided and rented separately.

A.28.2.7.2

Where open stairways are permitted, they are considered as exit access to exits rather than as exits, and the requirements for travel distance to exits include the travel on such stairs. (*See 7.6.3.*)

A.28.3.4.3.1

Visible signaling appliances might be governed by provisions of federal regulations in 28 CFR 36, Appendix A, "Americans with Disabilities Act Accessibility Guidelines for Buildings and Facilities," Section 4.28, Alarms.

A.28.3.4.3.2

The standard audible alarm signal used in all fire alarm horns and integral sounders of smoke detectors for the past 30 years utilized a typical frequency of approximately 3 KHz. Peer-reviewed research has concluded the waking effectiveness of a 520 Hz low-frequency signal is superior to the standard 3 KHz audible alarm signal for waking high-risk segments of the population such as people over 65, people who are hard of hearing, school-age children, and people who are alcohol-impaired. Therefore, the 520 Hz low-frequency audible alarm signal is now required in areas intended for sleeping within hotels and dormitories that are required to have a fire alarm system. The following product solutions are currently available in the market to produce the 520 Hz low-frequency audible alarm signal in sleeping rooms:

- (1) Smoke detectors with integral sounder bases
- (2) Fire alarm system horns and horn/strobes
- (3) Speakers connected to an in-building fire alarm emergency voice alarm communication (EVAC) system

The peer-reviewed research project — *Optimizing Fire Alarm Notification for High Risk Groups: Waking Effectiveness of Alarms (Auditory, Visual and Tactile) for Adults Who Are Hard of Hearing and Waking Effectiveness of Alarms (Auditory, Visual and Tactile) for the Alcohol Impaired* — was conducted under the auspices of the Fire Protection Research Foundation.

A.28.3.4.3.4

A quantity of such rooms and suites might be required to be equipped with accessible communication features based on the total number of rooms in a transient lodging facility. (*See 28 CFR Parts 35 and 36, "2010 ADA Standards for Accessible Design."*)

A.28.3.4.6

Caution needs to be exercised in locating smoke alarms with regard to their proximity to bathrooms, cooking facilities, and HVAC outlets in order to prevent nuisance alarms.

A.28.3.4.6.1

The standard audible alarm signal used in all smoke alarms for the past 30 years utilized a typical frequency of approximately 3 KHz. Peer-reviewed research has concluded the waking effectiveness of the 520 Hz low-frequency signal is superior to the standard 3 KHz audible alarm signal for waking high-risk segments of the population such as people over 65, people who are hard of hearing, school-age children, and people who are alcohol impaired. Therefore, the 520 Hz low-frequency audible alarm signal is now required for smoke alarms in areas intended for sleeping within hotels and dormitories that are required to have a fire alarm system. If smoke alarms capable of producing the low-frequency audible alarm signal are not available, smoke detectors arranged to function in the same manner as smoke alarms in accordance with 9.6.2.10.8 would be required. The following product solutions are currently available in the market if the smoke alarm is unable to produce the 520 Hz low-frequency audible alarm signal in sleeping rooms:

- (1) Smoke detectors with integral sounder bases
- (2) Fire alarm system horns and horn/strobes
- (3) Speakers connected to an in-building fire alarm emergency voice alarm communication (EVAC) system

The peer-reviewed research project — *Optimizing Fire Alarm Notification for High Risk Groups: Waking Effectiveness of Alarms (Auditory, Visual and Tactile) for Adults Who Are Hard of Hearing and Waking Effectiveness of Alarms (Auditory, Visual and Tactile) for the Alcohol Impaired* — was conducted under the auspices of the Fire Protection Research Foundation.

A.28.5.3.2

“Protected power supply” means a source of electrical energy of sufficient capacity to allow proper operation of the elevator and its associated control and communications systems. The power supply’s point of origin, system of distribution, type and size of overcurrent protection, degree of isolation from other portions of the building electrical system, and degree of mechanical protection should be such that it is unlikely that the supply would be disrupted at any but the advanced stages of building fire involvement or by structural collapse.

A protected power supply might consist of, and should provide, not less than the level of reliability associated with an electrical distribution system with service equipment located and installed in accordance with 230.72(B) and 230.82(5) of *NFPA 70*. The distribution system is not to have any other connection to the building electrical distribution system. A protected power supply is not required to incorporate two sources of energy or automatic transfer capability from a normal to an emergency source; for example, an alternate set of service conductors.

The number and type of elevators to be connected to a protected power supply should be limited, or the characteristics of the protected power supply should be selected to ensure conformance to 230.95 of *NFPA 70*, without the provision of ground fault protection for the supply.

An elevator installation supplied by a protected power supply should comply with Article 620 of *NFPA 70* and ASME A17.1/CSA B44, *Safety Code for Elevators and Escalators*. The energy absorption means should always be connected on the load side of the disconnecting means. The energy absorption means should not consist of loads likely to become inoperative or disconnected under the conditions assumed to exist when the elevator is under the control of fire department personnel. Examples of such loads include light and power loads external to the elevator equipment room.

A.28.7.1.1

Employers are obligated to determine the degree to which employees are to participate in emergency activities. Regulations of the U.S. Department of Labor (OSHA) govern these activities and provide options for employers, from total evacuation to aggressive structural fire fighting by employee brigades. (*For additional information, see 29 CFR 1910, Subparts E and L, “OSHA Regulations for Emergency Procedures and Fire Brigades.”*)

A.28.7.1.2

Emergencies should be assumed to have arisen at various locations in the occupancy in order to train employees in logical procedures.

A.28.7.4.1

Floor diagrams should reflect the actual floor arrangement and should be oriented with the actual direction to the exits.

A.28.7.4.2

Factors for developing the fire safety information include such items as construction type, suppression systems, alarm and detection systems, building layout, and building HVAC systems.

A.29.2.2.8

Due to the nature of escalators, they are no longer acceptable as a component in a means of egress. However, because many escalators have been used for exit access and exit discharge in the past, they are permitted to continue to be considered in compliance. Very few escalators have ever been installed in a manner to qualify as an exit. For information on escalator protection and requirements, see previous editions of the *Code*.

A.29.2.2.12.2

The provision of 29.2.2.12.2 permits the entire floor to serve as an area of refuge where it is protected in accordance with 29.3.5. The provision is acceptable because supervised automatic sprinkler systems have built-in signals for monitoring features of the system, such as the opening and closing of water control valves. Such systems also monitor pump power supplies, water tank levels, and conditions that will impair the satisfactory operation of the sprinkler system. Because of these monitoring features, supervised automatic sprinkler systems have a high level of satisfactory performance and response to fire conditions.

A.29.2.7.2

Where open stairways or escalators are permitted, they are considered as exit access to exits rather than as exits, and the requirements for travel distance to exits include the travel on such stairs and escalators. (*See 7.6.3.*)

A.29.3.4.3.6

The provision for immediate notification of the public fire department is intended to include, but is not limited to, all of the arrangements in 9.6.4.2. Other arrangements that depend on a clerk or other member of the staff to notify the fire department might also be permitted. In such cases, however, it is essential that a trained staff member and an immediately available means of calling the fire department are continuously available. If a telephone is to be used, it should not be of any type or arrangement that requires a coin or the unlocking of a device to contact the fire department.

A.29.3.4.5

Caution needs to be exercised in locating smoke alarms with regard to their proximity to bathrooms, cooking facilities, and HVAC outlets in order to prevent nuisance alarms.

A.29.3.5.3

Although not required by the *Code*, the use of residential sprinklers or quick-response sprinklers is encouraged for new installations of sprinkler systems within dwelling units, apartments, and guest rooms. Caution should be exercised, as the system needs to be designed for the sprinkler being used.

A.29.4.1.2

See 4.8.2.1(4).

A.29.7.1.1

Employers are obligated to determine the degree to which employees are to participate in emergency activities. Regulations of the U.S. Department of Labor (OSHA) govern these activities and provide options for employers, from total evacuation to aggressive structural fire fighting by employee brigades. (*For additional information, see 29 CFR 1910, Subparts E and L, “OSHA Regulations for Emergency Procedures and Fire Brigades.”*)

A.29.7.1.2

Emergencies should be assumed to have arisen at various locations in the occupancy in order to train employees in logical procedures.

A.29.7.4.1

Floor diagrams should reflect the actual floor arrangement and should be oriented with the actual direction to the exits.

A.29.7.4.2

Factors for developing the fire safety information include such items as construction type, suppression systems, alarm and detection systems, building layout, and building HVAC systems.

A.30.2.2.2.2.1

It is the intent of this requirement that security measures, where installed, should not prevent egress.

A.30.2.2.12.2

The provision of 30.2.2.12.2 permits the entire floor to serve as an area of refuge where it is protected in accordance with 31.3.5. The provision is acceptable because supervised automatic sprinkler systems have built-in signals for monitoring features of the system, such as the opening and closing of water control valves. Such systems also monitor pump power supplies, water tank levels, and conditions that will impair the satisfactory operation of the sprinkler system. Because of these monitoring features, supervised automatic sprinkler systems have a high level of satisfactory performance and response to fire conditions.

A.30.3.4.3.2

The standard audible alarm signal used in all fire alarm horns and integral sounders of smoke detectors for the past 30 years utilized a typical frequency of approximately 3 KHz. Peer-reviewed research has concluded the waking effectiveness of a 520 Hz low-frequency signal is superior to the standard 3 KHz audible alarm signal for waking high-risk segments of the population such as people over 65, people who are hard of hearing, school-age children, and people who are alcohol impaired. Therefore, the 520 Hz low-frequency audible alarm signal is now required in areas intended for sleeping within apartment buildings that are required to have a fire alarm system. The following product solutions are currently available in the market to produce the 520 Hz low-frequency audible alarm signal in sleeping rooms:

- (1) Smoke detectors with integral sounder bases
- (2) Fire alarm system horns and horn/strobes
- (3) Speakers connected to an in-building fire alarm emergency voice alarm communication (EVAC) system

The peer-reviewed research project — *Optimizing Fire Alarm Notification for High Risk Groups: Waking Effectiveness of Alarms (Auditory, Visual and Tactile) for Adults Who Are Hard of Hearing and Waking Effectiveness of Alarms (Auditory, Visual and Tactile) for the Alcohol Impaired* — was conducted under the auspices of the Fire Protection Research Foundation.

A.30.3.4.5

Previous editions of the *Code* permitted the single-station smoke alarm required by 30.3.4.5 to be omitted from each apartment where a complete automatic smoke detection system was installed throughout the building. With such a system, when one detector is activated, an alarm is sounded throughout the building. Experience with complete smoke detection systems in apartment buildings has shown that numerous nuisance alarms are likely to occur. Where there is a problem with frequent nuisance alarms, occupants ignore the alarm, or the system is either disconnected or otherwise rendered inoperative.

A.30.3.4.5.1

The standard audible alarm signal used in all smoke alarms for the past 30 years utilized a typical frequency of approximately 3 KHz. Peer-reviewed research has concluded the waking effectiveness of the 520 Hz low-frequency signal is superior to the standard 3 KHz audible alarm signal for waking high-risk segments of the population such as people over 65, people who are hard of hearing, school-age children, and people who are alcohol impaired. Therefore, the 520 Hz low-frequency audible alarm signal is now required for smoke alarms in areas intended for sleeping within apartment buildings that are required to have a fire alarm system. If smoke alarms that are capable of producing the low-frequency audible alarm signal are not available, smoke detectors arranged to function in the same manner as smoke alarms in accordance with 9.6.2.10.8 would be required. The following product solutions are currently available in the market if the smoke alarm is unable to produce the 520 Hz low-frequency audible alarm signal in sleeping rooms:

- (1) Smoke detectors with integral sounder bases
- (2) Fire alarm system horns and horn/strobes
- (3) Speakers connected to an in-building fire alarm emergency voice alarm communication (EVAC) system

The peer-reviewed research project — *Optimizing Fire Alarm Notification for High Risk Groups: Waking Effectiveness of Alarms (Auditory, Visual and Tactile) for Adults Who Are Hard of Hearing and Waking Effectiveness of Alarms (Auditory, Visual and Tactile) for the Alcohol Impaired* — was conducted under the auspices of the Fire Protection Research Foundation.

A.30.3.4.6.4

Where fuel-burning appliances or fuel-burning fireplaces are located outside but attached to the dwelling unit, the area or room containing the fuel-burning appliance or fuel-burning fireplace could be considered part of the attached dwelling unit(s). In this application, either carbon monoxide alarms or carbon monoxide detectors are permitted to be installed in the attached dwelling unit(s) in accordance with 30.3.4.6.

A.30.3.5.3

The 12 ft² (1.1 m²) closet sprinkler exemption differs from requirements in NFPA 13 because fire loss data supports the long-standing position of the *Code*, since the 1976 edition, to omit sprinklers from such closets. The provision is further supported by the lack of losses in buildings protected in accordance with NFPA 13D and NFPA 13R which permit the omission of sprinklers from closets not exceeding 24 ft² (2.2 m²).

A.30.4.2.2

See 4.8.2.1(4).

A.31.1

See Table A.31.1.

Table A.31.1 Alternate Requirements for Existing Apartment Buildings According to Protection Provided

Feature	No Suppression or Detection System Option 1	Complete Automatic Fire Detection Option 2	Automatic Sprinkler Protection in Selected Areas Option 3	Automatic Sprinkler Protection Throughout per NFPA 13 (with exceptions) Option 4
Exit Access				
Travel distance from apartment door to exit	100 ft (30 m)	150 ft (46 m)	150 ft (46 m)	200 ft (61 m)
Travel distance within apartment	75 ft (23 m)	125 ft (38 m)	75 ft (23 m)	125 ft (38 m)
Smoke barrier required (See 31.3.7.)	R	R	R	NR
Maximum single path corridor distance	35 ft (10.7 m)	35 ft (10.7 m)	35 ft (10.7 m)	35 ft (10.7 m)
Maximum dead end	50 ft (15 m)	50 ft (15 m)	50 ft (15 m)	50 ft (15 m)
<i>Corridor fire resistance</i>				
Walls	½ hr	½ hr	½ hr	½ hr
Doors (fire protection rating)	20 min. or 1¾ in. (44 mm) thick	20 min. or 1¾ in. (44 mm) thick	Smoke resisting	Smoke resisting
Interior Finish				
Lobbies and corridors	A or B	A or B	A or B	A, B, or C
Other spaces	A, B, or C	A, B, or C	A, B, or C	A, B, or C
Floors in corridors	I or II	I or II	NR	NR
Exits				
<i>Wall fire resistance</i>				
1–3 stories*	1 hr	1 hr	1 hr	1 hr
>3 stories*	2 hr	2 hr	2 hr	1 hr
<i>Smokeproof enclosures</i>				
Not high-rise	NR	NR	NR	NR
High-rise	R	R	R	NR
<i>Door fire resistance</i>				
1–3 stories*	1 hr	1 hr	1 hr	1 hr
>3 stories*	1½ hr	1½ hr	1½ hr	1 hr
<i>Interior finish</i>				
Walls and ceilings	A or B	A or B	A or B	A, B, or C
Floors	I or II	I or II	I or II	NR
Within Living Unit (Apartment)				
Escape windows, per Section 24.2 (See 31.2.1.)	R	R	R	NR
Alarm System				
>3 stories or >11 units*	Manual initiation	Manual and auto initiation	Manual and auto initiation	Manual and auto initiation
>2 stories or >50 units*	Annunciator panel	Annunciator panel	Annunciator panel	Annunciator panel

R:Required (see Code for details and exemptions). NR: No requirements.

*Number of stories in height.

A.31.2.2.8

Due to the nature of escalators, they are no longer acceptable as a component in a means of egress. However, because many escalators have been used for exit access and exit discharge in the past, they are permitted to continue to be considered in compliance. Very few escalators have ever been installed in a manner to qualify as an exit. For information on escalator protection and requirements, see previous editions of the Code.

A.31.2.2.12.2

The provision of 31.2.2.12.2 permits the entire floor to serve as an area of refuge where it is protected in accordance with 31.3.5. The provision is acceptable because supervised automatic sprinkler systems have built-in signals for monitoring features of the system, such as the opening and closing of water control valves. Such systems also monitor pump power supplies, water tank levels, and conditions that will impair the satisfactory operation of the sprinkler system. Because of these monitoring features, supervised automatic sprinkler systems have a high level of satisfactory performance and response to fire conditions.

A.31.2.4.6

This single-exit exemption could be applied to an apartment building three stories in height with a basement.

A.31.2.11.1

The provision of 31.2.11 recognizes the need to provide smoke control in existing buildings. Smokeproof enclosures can be accomplished without the use of a vestibule in accordance with 7.2.3.

A.31.3.4.4.1

It is intended that a building compliant with Option 2 function as described in the paragraph that follows.

Occupants within a living unit become aware of a fire emergency, either through personal awareness or through being alerted by the smoke alarm(s) installed within the living unit. Other building occupants are alerted to the fire emergency by the building fire alarm system that is initiated by manual fire alarm boxes adjacent to the exits, heat detection within the living unit where the fire emergency exists, smoke detection in the common areas outside the living unit, or a combination thereof. The installation of system heat detectors versus smoke detectors within the living unit is intended to eliminate nuisance-type alarms and reduce occupant complacency from frequent false alarms. The installation of smoke detection within the living unit should only be contemplated after a careful analysis of the goals and with the approval of the authority having jurisdiction.

A.31.3.4.5.1

NFPA 101 provides adequate, balanced fire protection and takes into consideration the passive and active systems required in a given occupancy. The level of protection prescribed by NFPA 72 which includes smoke alarms in all sleeping rooms, without exception, does not necessarily take into consideration the complete protection package mandated by NFPA 101.

A.31.3.4.6.4

Where fuel-burning appliances or fuel-burning fireplaces are located outside but attached to the dwelling unit, the area or room containing the fuel-burning appliance or fuel-burning fireplace could be considered part of the attached dwelling unit(s). In this application, either carbon monoxide alarms or carbon monoxide detectors are permitted to be installed in the attached dwelling unit(s) in accordance with 31.3.4.6.

A.31.3.5.2

Although not required by the *Code*, the use of residential sprinklers or quick-response sprinklers is encouraged for new installations of sprinkler systems within dwelling units, apartments, and guest rooms. Caution should be exercised, because the system needs to be designed for the sprinkler being used.

A.31.3.5.4

NFPA 101 and NFPA 13 both allow sprinklers to be omitted in small bathrooms in dwelling units. Historically, NFPA 13 sometimes differed in this requirement. Maintaining this provision in NFPA 101 allows all previously approved sprinkler installations to remain compliant.

A.31.3.5.8

For example, if an Option 3 sprinkler system were being used to justify use of Class C wall finish in an exit enclosure, the sprinkler system would need to be extended into the exit enclosure, even if the rest of the requirements for Option 3 did not require the sprinklers in the exit enclosure.

A.31.3.5.9

In previous editions, an engineered life safety system was an alternative to providing a full sprinkler system. This concept was removed in the 2021 edition. This removal does not prohibit the use of the performance-based design option in Chapter 5. The analysis required by Chapter 5 is more rigorous than the engineered life safety system analysis.

A.31.3.5.9.1

A 12-year time frame has been developed to encourage building owners to plan for the design and installation of a fire sprinkler system. The time frame is not intended for building owners to wait 11 years and then try and get the work done in the last year. One method for getting a full sprinkler system installed over time is to get the water supply in place and put the sprinkler system in the common portions of the building first. Then, as building spaces are renovated and tenants turn over, the sprinkler system can be extended into those spaces.

In a building undergoing such sprinkler system installed over time, the sprinkler system will only cover portions of the building during the intervening years. While this is less than ideal, it is acceptable under this *Code* to have such a partial system as long as there is a plan to finish the full system design and installation within the time frame established under the adoption of this *Code*. During the time that the building is partially sprinklered, the portions of the sprinkler system that are finished need to be inspected, tested, and maintained in operational condition.

One method that has been used to plan for the eventual installation of a full sprinkler system has been to install sprinklers in the corridors with one additional sprinkler into each opening off of the corridor in accordance with Option 3 of 31.3.5.6. If the system in the corridor is sized to accommodate the extension of the system eventually into all of the dwelling units and the penetration into the dwelling unit for the single sprinkler into the unit is sized properly to support the eventual extension of the system into the unit, then such a partial system can serve to meet this *Code* as long as there is an approved plan for finishing the full sprinkler system within the time frame established by the adoption of this *Code*. It should be noted that during the time that the partial sprinkler system is in place, the building meets Option 3 of this *Code*, which basically treats the building as "unsprinklered" in terms of the sprinkler trade-offs for provisions such as arrangements of egress and interior floor finish. Full credit for a sprinklered building can only be obtained when the sprinkler system is extended throughout the building in accordance with Option 4.

A.31.3.6.1

The intent is to recognize that existing partitions of sound wood lath and plaster, wire lath and plaster, or gypsum lath and plaster construction have demonstrated the ability to contain most room fires. Recent data on archaic construction methods have established the fire resistance rating of such construction at about 20 minutes. Such construction meets the intent of 31.3.6.1.

A.31.4.1.2

See 4.8.2.1(4).

A.32.1.6

The provisions of 8.3.1.1(4) address a ½-hour fire resistance rating. The information in A.8.3.1.1(4) addresses common materials used in barriers having a minimum ½-hour fire resistance rating.

A.32.2.2.3.1(3)

A window with dimensions of 20 in. × 24 in. (510 mm × 610 mm) has an opening of 3.3 ft² (0.31 m²), which is less than the required 5.7 ft² (0.53 m²). Therefore, either the height or width needs to exceed the minimum requirement to provide the required clear area.

A.32.2.2.6.3

Exterior stair protection can be accomplished through separation by physical distance, arrangement of the stairs, protection of the openings exposing the stairs, or other means acceptable to the authority having jurisdiction.

A.32.2.3.2.1

Spaces containing approved, properly installed and maintained furnaces and heating equipment, furnace rooms, and cooking and laundry facilities should not be classified as hazardous areas solely on the basis of such equipment.

A.32.2.3.5

All sprinkler systems installed in accordance with NFPA 13 and NFPA 13R are required to be inspected, tested, and maintained in accordance with NFPA 25. However, systems installed in accordance with NFPA 13D are historically exempt from applying NFPA 25. While there is a great deal of information in NFPA 25 that is not appropriate for NFPA 13D sprinkler systems, there are some basic concepts of inspection, testing, and maintenance that are critical to system performance and must be performed when an NFPA 13D sprinkler system is installed in a board and care occupancy. The frequencies mandated by this *Code* are slightly different from those required by NFPA 25. It is the intent of this *Code* to utilize the frequencies stated in Chapter 32, but to reference the purpose and the procedures for the inspections, tests, and maintenance from NFPA 25.

A.32.2.3.5.1

Where any provision requires the use of an automatic sprinkler system in accordance with 32.2.3.5, the provision of 32.2.3.5.2 is not permitted to be used.

A.32.2.3.5.2

Where a facility utilizing the provision of 32.2.3.5.2 is occupied by residents who can no longer comply with the 3-minute evacuation response, 33.1.8 requires the facility to comply with the requirements for new construction, including automatic sprinkler protection. (*See also A.33.1.8.*)

PCs [1]

A.32.2.3.5.3.2

The decision to permit the use of the criteria from NFPA 13D in these occupancies is based on the following:

- (1) The desire to obtain a level of fire suppression and control approximately equivalent to that delivered by residential facilities protected by such systems (*see A.1.1 in NFPA 13D*)
- (2) The fact that potential fire exposure and challenge to the suppression system in a small board and care facility are of the same nature and are no more severe than those found in residences

Chapter 32 permits the use of NFPA 13D, and NFPA 13R outside of their scopes. This permission is based on a review of the occupancy and a recognition that the fires in board and care facilities are similar to those of other residential occupancies and that the level of protection is appropriate. The requirements of NFPA 13D and NFPA 13R have been supplemented with requirements for additional water supplies to compensate for the special needs of the board and care occupancy.

NFPA 13D contains additional requirements for a piping system serving both sprinkler and domestic needs.

A.32.3.3.3

The provisions in 10.2.8 to permit modifications to interior finish requirements where automatic sprinklers are provided are permitted.

A.32.3.3.4.6

Positive alarm sequence applies only to emergency forces notification. Occupant notification is required to occur immediately upon activation of the detection device or system.

A.32.3.3.6

It is not the intent to prohibit furniture in corridors and spaces open to corridors, provided that the minimum required width is maintained. Storage is not permitted in corridors or spaces open to corridors. It is also not the intent to require corridors to be defined by a change in flooring texture, material, or color to separate them from areas allowed to be open to corridors.

Cooking facilities complying with 32.3.3.8 are permitted to be open to corridors. Sleeping rooms are required to be separated from means of egress in accordance with 32.3.3.6.

A.32.3.3.6.2

The purpose of this requirement is to protect sleeping rooms from a fire that occurs in an area that is outside of the sleeping room or suite of sleeping rooms such as corridors, housekeeping closets, IT rooms, electrical/mechanical rooms, libraries, offices, conference rooms, quiet rooms and medication rooms, washer/dryer rooms, common work rooms, common lounges, and common bathrooms. Bathrooms that can only be accessed directly from the sleeping room or suite of sleeping rooms can be considered part of the sleeping room or suite enclosure and, therefore, those rooms only should meet the requirements of 32.3.3.6.3 through 32.3.3.6.6 where those room walls either abut a corridor or abut a room other than a sleeping room.

A.32.3.3.7.9(2)

Where the smoke control system design requires dampers in order that the system functions effectively, it is not the intent of 32.3.3.7.9(2) to permit the damper to be omitted.

The term *fully ducted* means the supply and return-air systems are provided with continuous ducts from all air registers to the air-handling unit.

A.32.3.3.7.12

Smoke barrier doors are intended to provide access to adjacent zones. The pair of cross-corridor doors are required to be opposite swinging. Access to both zones is required.

A.32.3.3.7.16

Smoke barriers might include walls having door openings other than cross-corridor doors. There is no restriction in the *Code* regarding which doors or how many doors form part of a smoke barrier. For example, doors from the corridor to individual rooms are permitted to form part of a smoke barrier.

A.32.3.3.7.17

It is not the intent to require the frame to be a listed assembly.

A.32.3.3.8.2

This provision is intended to permit small appliances used for reheating, such as microwave ovens, hot plates, toasters, and nourishment centers to be exempt from the requirements for commercial cooking equipment and hazardous area protection.

A.32.3.3.8.3

The intent of 32.3.3.8.3 is to limit the number of persons for whom meals are routinely prepared to not more than 30. Staff and feeding assistants are not included in this number.

A.32.3.3.8.3(4)

The minimum airflow of 500 cfm (14,000 L/m) is intended to require the use of residential hood equipment at the higher end of equipment capacities. It is also intended to draw a sufficient amount of the cooking vapors into the grease baffle and filter system to reduce migration beyond the hood.

A.32.3.3.8.3(7)

The intent of this provision is to limit cooking fuel to gas or electricity. The prohibition of solid fuels for cooking is not intended to prohibit charcoal grilling on grills located outside the facility.

A.32.3.3.8.3(8)

Deep-fat frying is defined as a cooking method that involves fully immersing food in hot oil.

A.32.3.3.8.3(10)

The intent of this requirement is that the fuel source for the cooktop or range is to be turned on only when staff is present or aware that the kitchen is being used. The timer function is meant to provide an additional safeguard if the staff forgets to deactivate the cooktop or range. If a cooking activity lasts longer than 120 minutes, the timer would be required to be manually reset.

A.32.3.3.8.3(12)

The intent of requiring smoke alarms instead of smoke detectors is to prevent false alarms from initiating the building fire alarm system and notifying the fire department. Smoke alarms should be maintained a minimum of 20 ft (6.1 m) away from the cooktop or range as studies have shown this distance to be the threshold for significantly reducing false alarms caused by cooking. The intent of the interconnected smoke alarms, with silence feature, is that while the devices would alert staff members to a potential problem, if it is a false alarm, the staff members can use the silence feature instead of disabling the alarm. The referenced study indicates that nuisance alarms are reduced with photoelectric smoke alarms. Providing two interconnected alarms provides a safety factor since they are not electrically supervised by the fire alarm system. (*Smoke Alarms – Pilot Study of Nuisance Alarms Associated with Cooking*)

A.32.3.3.8.4

The provisions of 32.3.3.8.4 differ from those of 32.3.3.8.3, as they apply to cooking equipment that is separated from the corridor.

A.32.3.3.8.5

The provision of 32.3.3.8.5 clarifies that protected commercial cooking equipment does not require an enclosure (separation) as a hazardous area in accordance with Section 8.7, as is required by 32.3.3.2.

A.32.3.5.3.2

“Protected power supply” means a source of electrical energy of sufficient capacity to allow proper operation of the elevator and its associated control and communications systems. The power supply’s point of origin, system of distribution, type and size of overcurrent protection, degree of isolation from other portions of the building electrical system, and degree of mechanical protection should be such that it is unlikely that the supply would be disrupted at any but the advanced stages of building fire involvement or by structural collapse.

A protected power supply might consist of, and should provide, not less than the level of reliability associated with an electrical distribution system with service equipment located and installed in accordance with 230.72(B) and 230.82(5) of *NFPA 70*. The distribution system is not to have any other connection to the building electrical distribution system. A protected power supply is not required to incorporate two sources of energy or automatic transfer capability from a normal to an emergency source; for example, an alternate set of service conductors.

The number and type of elevators to be connected to a protected power supply should be limited, or the characteristics of the protected power supply should be selected to ensure conformance with 230.95 of *NFPA 70*, without the provision of ground fault protection for the supply.

An elevator installation supplied by a protected power supply should comply with Article 620 of *NFPA 70*, except that the energy absorption means required by 620.91 of *NFPA 70* should always be connected on the load side of the disconnecting means. The energy absorption means should not consist of loads likely to become inoperative or disconnected under the conditions assumed to exist when the elevator is under the control of fire department personnel. Examples of such loads include light and power loads external to the elevator equipment room.

A.32.4

Board and care occupancies in apartment buildings will usually be small facilities housing 16 or fewer residents. It is intended that the board and care occupancy conform to the requirements of Section 32.2 for small board and care facilities. In the unusual case where an apartment houses a large board and care facility, it would be reasonable for the authority having jurisdiction, using the requirement of 4.6.1, to apply the provisions of Section 32.3 to the apartment. In addition, the apartment building in which the facility is housed needs to comply with the requirements for apartment buildings in Chapters 30 and 31 and the additional criteria presented in Section 32.4.

A.32.4.1.3

In determining equivalency for conversions, modernizations, renovations, or unusual design concepts, the authority having jurisdiction might permit evaluations based on the residential board and care occupancies fire safety evaluation system (FSSES) of *NFPA 101A*.

A.32.7.1.1

Where residents require evacuation or relocation assistance, the plan should address the specific needs for each resident, and adequate staffing should be provided as necessary to implement the plan.

A.32.7.3.3

An assembly point can be located outside the building, in a separate building, or in an adjacent smoke compartment in the same building.

A.32.7.4.1

Smoking regulations should include the following:

- (1) Smoking should be prohibited in any room, compartment, or area where flammable or combustible liquids, combustible gases, or oxygen is used or stored and in any other hazardous location, and the following also should apply:
 - (a) Such areas should be posted with signs that read NO SMOKING or the international symbol for no smoking.
 - (b) In residential board and care facilities where smoking is totally prohibited and signs so indicating are placed at all major entrances, secondary signs with language that prohibits smoking are not required.
- (2) Smoking by residents classified as not responsible with regard to their ability to safely use and dispose of smoking materials should be prohibited.
- (3) Where a resident, as specified in A.32.7.4.1(2), is under direct supervision by staff or by a person approved by the administration, smoking might be permitted.
- (4) Smoking materials should not be provided to residents or maintained by residents without the approval of the administration.
- (5) Areas where smoking is permitted should be clearly identified.
- (6) Ashtrays of noncombustible material and safe design should be provided and required to be used in all areas where smoking is permitted.
- (7) Self-closing cover devices into which ashtrays can be emptied should be made available to all areas where smoking is permitted and should be required to be used.

A.32.7.5

The requirements applicable to draperies/curtains, upholstered furniture, and mattresses apply only to new draperies/curtains, new upholstered furniture, and new mattresses. The term *new* means unused, normally via procurement from the marketplace, either by purchase or donation, of items not previously used. Many board and care facilities allow residents to bring into the board and care home upholstered furniture items from the resident’s previous residence. Such items are not new and, thus, are not regulated. On the other hand, some of the larger board and care homes purchase contract furniture, as is done in hotels. Such new, unused furniture, whether purchased or received as a donation, is regulated by the requirements of 32.7.5.2. By federal law, mattresses manufactured and sold within the United States must pass testing per 16 CFR 1632, “Standard for the Flammability of Mattresses and Mattress Pads” (FF4-72).

A.32.7.5.2

New upholstered furniture within board and care homes should be tested for rates of heat release in accordance with 10.3.2.2.

A.32.7.5.3

New mattresses within board and care homes should be tested for rates of heat release in accordance with 10.3.3.2.

A.33.1.1

The requirements of Chapter 33 are designed to accommodate typical changes in the capabilities of the resident, such as those due to accidents, temporary illness, cyclical variations in capabilities, and gradual aging. This approach is based on the assumption that the capabilities of the resident will be evaluated not less than annually, and for residents with geriatric problems or degenerative diseases, not less than every 6 months. Also, residents should be re-evaluated after each accident or illness that requires hospitalization.

The requirements of Chapter 33 were developed on the assumption that the occupants will normally evacuate the building in fire emergencies. During fire exit drills, all occupants should evacuate the building with staff assistance, as needed. Exceptions can be made in facilities with an evacuation capability rating of impractical. Managers of board and care homes with nursing home backgrounds sometimes are not aware of the differences between the requirements of 19.7.1 and 33.7.3.

A.33.1.1.4

The provision of 33.1.1.4 was added after Chapter 32 was revised in its entirety to avoid potential conflicts between the two chapters. Occupancies meeting Chapter 32 requirements are deemed to comply with Chapter 33.

A.33.1.6

The provisions of 8.3.1.1(4) address a ½-hour fire resistance rating. The information in A.8.3.1.1(4) addresses common materials used in barriers having a minimum ½-hour fire resistance rating.

A.33.1.8

When the group evacuation capability changes to a level of greater risk, the owner/operator of the facility needs to take such action as is necessary, within a reasonable time frame, to restore the evacuation capability of the facility to that for which it was approved. If subsequent evaluations indicate that the original evacuation capability of the facility cannot or is not being maintained at the original level of risk, the facility would be considered as having changed the occupancy subclassification to one of greater risk, and the safeguards required for the level of greater risk would apply. If a facility improves its original evacuation capability to one of less risk, a re-evaluation and upgrading to the requirements for new construction are not needed.

A.33.2.1.2.1.1

In determining equivalency for existing buildings, conversions, modernizations, renovations, or unusual design concepts, the authority having jurisdiction might permit evaluations based on the residential board and care occupancies fire safety evaluation system (FSSES) of NFPA 101A.

A.33.2.2.3.1(3)

A window with dimensions of 20 in. × 24 in. (510 mm × 610 mm) has an opening of 3.3 ft² (0.31 m²), which is less than the required 5.7 ft² (0.53 m²). Therefore, either the height or width needs to exceed the minimum requirement to provide the required clear area.

A.33.2.2.6.3

Exterior stair protection can be accomplished through separation by physical distance, arrangement of the stairs, protection of the openings exposing the stairs, or other means acceptable to the authority having jurisdiction.

A.33.2.3.4.4

Most often, smoke alarms sounding an alarm at 85 dBA or greater, installed outside the bedroom area, will meet the intent of this requirement. Smoke alarms remotely located from the bedroom might not be loud enough to awaken the average person. In such cases, it is recommended that smoke alarms be interconnected so that the activation of any smoke alarm will cause all smoke alarms to activate.

NFPA 101 provides adequate, balanced fire protection and takes into consideration the passive and active systems required in a given occupancy. The level of protection prescribed by NFPA 72 which includes smoke alarms in all sleeping rooms, without exception, does not necessarily take into consideration the complete protection package prescribed by NFPA 101.

A.33.2.3.5

All sprinkler systems installed in accordance with NFPA 13 and NFPA 13R are required to be inspected, tested, and maintained in accordance with NFPA 25. However, systems installed in accordance with NFPA 13D are historically exempt from applying NFPA 25. While there is a great deal of information in NFPA 25 that is not appropriate for NFPA 13D sprinkler systems, there are some basic concepts of inspection, testing, and maintenance that are critical to system performance and must be performed when an NFPA 13D sprinkler system is installed in a board and care occupancy. The frequencies mandated by this Code are slightly different from those required by NFPA 25. It is the intent of this Code to utilize the frequencies stated in Chapter 32, but to reference the purpose and the procedures for the inspections, tests, and maintenance from NFPA 25.

A.33.2.3.5.3.1

The decision to permit the use of the criteria from NFPA 13D in these occupancies is based on the following:

- (1) The desire to obtain a level of fire suppression and control approximately equivalent to that delivered by residential facilities protected by such systems (*see A.1.1 in NFPA 13D*)
- (2) The fact that potential fire exposure and challenge to the suppression system in a small board and care facility are of the same nature and are no more severe than those found in residences

Chapter 33 permits the use of NFPA 13D and NFPA 13R outside of their scopes. This permission is based on a review of the occupancy and a recognition that the fires in board and care facilities are similar to those of other residential occupancies and that the level of protection is appropriate. In some circumstances, such as those for impractical evacuation capabilities, the requirements of NFPA 13D and NFPA 13R have been supplemented with requirements for additional water supplies to compensate for the special needs of the board and care occupancy.

A.33.2.3.5.3.4

Some previously approved NFPA 13R sprinkler systems might have been installed in four-story buildings greater than 60 ft (18.3 m) above grade plane prior to the requirement in Chapter 32 that limits the height of the building to 60 ft (18.3 m) above grade plane.

A.33.2.3.5.3.5

Some previously approved NFPA 13R sprinkler systems might have been installed in four-story buildings greater than 60 ft (18.3 m) above grade plane prior to the requirement in Chapter 32 that limits the height of the building to 60 ft (18.3 m) above grade plane.

A.33.3.1.2.1.1

In determining equivalency for existing buildings, conversions, modernizations, renovations, or unusual design concepts, the authority having jurisdiction might permit evaluations based on the residential board and care occupancies fire safety evaluation system (FSSES) of NFPA 101A.

A.33.3.3.4.6.1

See A.29.3.4.3.6.

A.33.3.3.5.1

It is intended that this requirement apply to existing small facilities that are converted to large facilities.

Chapter 33 permits the use of NFPA 13D and NFPA 13R outside of their scopes. This permission is based on a review of the occupancy and a recognition that the fires in board and care facilities are similar to those of other residential occupancies and that the level of protection is appropriate. In some circumstances, such as those for impractical evacuation capabilities, the requirements of NFPA 13D and NFPA 13R have been supplemented with requirements for additional water supplies to compensate for the special needs of the board and care occupancy.

A.33.3.3.5.1.1

Some previously approved NFPA 13R sprinkler systems might have been installed in four-story buildings greater than 60 ft (18.3 m) above grade plane prior to the requirement in Chapter 32 that limits the height of the building to 60 ft (18.3 m) above grade plane.

A.33.3.3.8.2

This provision is intended to permit small appliances used for reheating, such as microwave ovens, hot plates, toasters, and nourishment centers to be exempt from the requirements for commercial cooking equipment and hazardous area protection.

A.33.3.3.8.3

The intent of 33.3.3.8.3 is to limit the number of persons for whom meals are routinely prepared to not more than 30. Staff and feeding assistants are not included in this number.

A.33.3.3.8.3(4)

The minimum airflow of 500 cfm (14,000 L/m) is intended to require the use of residential hood equipment at the higher end of equipment capacities. It is also intended to draw a sufficient amount of the cooking vapors into the grease baffle and filter system to reduce migration beyond the hood.

A.33.3.3.8.3(7)

The intent of this provision is to limit cooking fuel to gas or electricity. The prohibition of solid fuels for cooking is not intended to prohibit charcoal grilling on grills located outside the facility.

A.33.3.3.8.3(8)

Deep-fat frying is defined as a cooking method that involves fully immersing food in hot oil.

A.33.3.3.8.3(10)

The intent of this requirement is that the fuel source for the cooktop or range is to be turned on only when staff is present or aware that the kitchen is being used. The timer function is meant to provide an additional safeguard if the staff forgets to deactivate the cooktop or range. If a cooking activity lasts longer than 120 minutes, the timer would be required to be manually reset.

A.33.3.3.8.3(12)

The intent of requiring smoke alarms instead of smoke detectors is to prevent false alarms from initiating the building fire alarm system and notifying the fire department. Smoke alarms should be maintained a minimum of 20 ft (6.1 m) away from the cooktop or range as studies have shown this distance to be the threshold for significantly reducing false alarms caused by cooking. The intent of the interconnected smoke alarms, with silence feature, is that while the devices would alert staff members to a potential problem, if it is a false alarm, the staff members can use the silence feature instead of disabling the alarm. The referenced study indicates that nuisance alarms are reduced with photoelectric smoke alarms. Providing two interconnected alarms provides a safety factor since they are not electrically supervised by the fire alarm system. (*Smoke Alarms — Pilot Study of Nuisance Alarms Associated with Cooking*).

A.33.3.3.8.4

The provisions of 33.3.3.8.4 differ from those of 33.3.3.8.3, as they apply to cooking equipment that is separated from the corridor.

A.33.3.3.8.5

The provision of 33.3.3.8.5 clarifies that protected commercial cooking equipment does not require an enclosure (separation) as a hazardous area in accordance with Section 8.7, as is required by 33.3.3.2.

A.33.4

Board and care occupancies in apartment buildings will usually be small facilities housing 16 or fewer residents. It is intended that the board and care occupancy conform to the requirements of Section 33.2 for small board and care facilities. In the unusual case where an apartment houses a large board and care facility, it would be reasonable for the authority having jurisdiction, using the requirement of 4.6.1, to apply the provisions of Section 33.3 to the apartment. In addition, the apartment building in which the facility is housed needs to comply with the requirements for apartment buildings in Chapters 30 and 31 and the additional criteria presented in Section 33.4.

A.33.4.1.3.1

In determining equivalency for existing buildings, conversions, modernizations, renovations, or unusual design concepts, the authority having jurisdiction might permit evaluations based on the residential board and care occupancies fire safety evaluation system (FSSES) of NFPA 101A.

A.33.7.1.1

Where residents require evacuation or relocation assistance, the plan should address the specific needs for each resident and, adequate staffing should be provided as necessary to implement the plan.

A.33.7.3.3

An assembly point can be located outside the building, in a separate building, or in an adjacent smoke compartment in the same building.

A.33.7.4.1

Smoking regulations should include the following:

- (1) Smoking should be prohibited in any room, compartment, or area where flammable or combustible liquids, combustible gases, or oxygen is used or stored and in any other hazardous location, and the following also should apply:
 - (a) Such areas should be posted with signs that read NO SMOKING or the international symbol for no smoking.
 - (b) In residential board and care facilities where smoking is totally prohibited and signs so indicating are placed at all major entrances, secondary signs with language that prohibits smoking are not required.
- (2) Smoking by residents classified as not responsible with regard to their ability to safely use and dispose of smoking materials should be prohibited.
- (3) Where a resident, as specified in A.33.7.4.1(2), is under direct supervision by staff or by a person approved by the administration, smoking might be permitted.
- (4) Smoking materials should not be provided to residents or maintained by residents without the approval of the administration.
- (5) Areas where smoking is permitted should be clearly identified.
- (6) Ashtrays of noncombustible material and safe design should be provided and required to be used in all areas where smoking is permitted.
- (7) Self-closing cover devices into which ashtrays can be emptied should be made available to all areas where smoking is permitted and should be required to be used.

A.33.7.5

The requirements applicable to draperies/curtains, upholstered furniture, and mattresses apply only to new draperies/curtains, new upholstered furniture, and new mattresses. The term *new* means unused, normally via procurement from the marketplace, either by purchase or donation, of items not previously used. Many board and care facilities allow residents to bring into the board and care home upholstered furniture items from the resident's previous residence. Such items are not new and, thus, are not regulated. On the other hand, some of the larger board and care homes purchase contract furniture, as is done in hotels. Such new, unused furniture, whether purchased or received as a donation, is regulated by the requirements of 33.7.5.2. By federal law, mattresses manufactured and sold within the United States must pass testing per 16 CFR 1632, "Standard for the Flammability of Mattresses and Mattress Pads" (FF 4-72).

A.33.7.5.2

New upholstered furniture within board and care homes should be tested for rates of heat release in accordance with 10.3.2.2.

A.33.7.5.3

New mattresses within board and care homes should be tested for rates of heat release in accordance with 10.3.3.2.

A.36.1.3.2.2(4)

Means to prevent spilled fuel from accumulating and entering the mercantile occupancy building can be by curbs, scuppers, special drainage systems, sloping the floor away from the door openings, or floor elevation differences of not less than 4 in. (100 mm).

A.36.2.2.2.2

The words "principal entrance/exit doors" describe doors that the authority having jurisdiction can reasonably expect to be unlocked in order for the facility to do business.

A.36.2.2.7.2

Egress from a mall structure should be designed as follows:

- (1) The mall/pedestrian way has been assigned no occupant load, but it is required to be provided with means of egress sized to accommodate the total occupant load of the mall structure based on the gross leasable area.
- (2) The exits for the mall/pedestrian way are permitted to be provided by a combination of exterior exit doors and exit passageways.
- (3) After completion of A.36.2.2.7.2(1), each tenant space is to be judged individually for occupant load and egress capacity, and the following also apply:
 - (a) The step specified in A.36.2.2.7.2(3) normally sends a portion or all (per 36.4.4.2) of the tenant space's occupant load into the mall concourse.
 - (b) Any remaining occupants are sent through the back of the tenant space into an exit passageway that might serve multiple tenant spaces and the mall concourse.
- (4) The width of the exit passageway is required to be sized for the most restrictive of the following:
 - (a) Width of not less than 66 in. (1675 mm) per 36.4.4.2(3)
 - (b) Portion of the egress capacity from the largest single tenant space being served by the exit passageway
 - (c) Portion of the egress capacity from the mall concourse being provided by the exit passageway

The concepts used in A.36.2.2.7.2(4)(a) through A.36.2.2.7.2(4)(c) include the following:

- (1) After proper egress capacity is provided for the mall/pedestrian way, each tenant space is then required to independently provide egress capacity for its occupants.
- (2) The mall required exit passageway width and the tenant space required exit passageway width are not required to be added together.
- (3) The required exit passageway width for a tenant space is not required to be added to that of other tenant spaces using the same exit passageway.

A.36.2.5.10

To eliminate the obstruction to the means of egress of the interior exit access and the exterior exit discharge, it is the intent to provide adequate area for transit and parking of wheeled carts or buggies used by customers. This area includes corral areas adjacent to exits that are constructed to restrict the movement of wheeled carts or buggies therefrom.

A.36.2.7.2

The basis for the exemption to the general rule on complete enclosure of exits up to their point of discharge to the outside of the building is that, with the specified safeguards, reasonable safety is maintained.

A stairway is not considered to discharge through the street floor area if it leads to the street through a fire-resistance-rated enclosure (exit passageway) separating it from the main area, even though there are doors between the first-floor stairway landing and the main area.

The provisions of 36.2.7.2 should not be confused with those for open stairways, as permitted by 36.3.1(1).

A.36.2.11.3

It is the intent of this paragraph to apply to areas where hazardous materials are present in excess of the maximum allowable quantities. See also Annex C for additional information.

A.36.3.2.1

It is the intent to permit a suspended natural-gas-fired unit heater that complies with the requirements of 9.2.2 to be installed and used in a mercantile occupancy without classifying the area in which it is located as hazardous.

A.36.3.2.1.1

These areas can include, but are not limited to, areas used for general storage, boiler or furnace rooms, and maintenance shops that include woodworking and painting areas.

A.36.3.2.2

The requirement for separating high-hazard contents areas from other parts of the building is intended to isolate the hazard, and 8.2.3.3 is applicable.

A.36.3.2.3

It is the intent of this paragraph to apply to areas where hazardous materials are present in excess of the maximum allowable quantities. See also Annex C for additional information.

A.36.3.2.4

It is not the intent to prohibit the use of equipment that is used less frequently and does not produce significant grease-laden vapors such as that equipment used for cooking demonstrations.

A.36.3.6.1

The intent of 36.3.6.1(2) and 36.3.6.1(3) is to permit spaces within single tenant spaces, or within buildings protected throughout by an approved, supervised automatic sprinkler system, to be open to the exit access corridor without separation.

A.36.4.4

This section provides an optional, not mandatory, arrangement for the design and construction of mall structures. At the discretion of the designer, these structures can be designed as a single building as long as they comply with the applicable requirements of the intended occupancy and with the requirements of 6.1.14 for buildings housing more than one occupancy.

A.36.4.4.2(4)(a)

An open mall concourse is permitted to serve as the public way provided the open mall concourse meets the definition of public way in accordance with this *Code*.

It is intended that the open mall concourse be designed, constructed, and arranged to permit the natural venting of smoke and other products of combustion to the outside air through openings in the walls, roof, or combination thereof of the mall concourse.

The solid area of the mall concourse walls and the horizontal projection of the solid area of any roof structures, including shade structures, awnings, and canopies, that cover the mall concourse should be summed to determine the aggregate area of solid construction associated with the mall concourse. A mall concourse can be considered an open mall concourse where at least 50 percent of the aggregate area of solid construction is open to the atmosphere. Open areas can include entrances to the mall concourse (e.g., barred gates that allow air to pass through versus an entrance storefront), clearstory spaces between the mall building (structure that houses tenants) and the roof above, and openings in the roof assembly. For the openings to be effective, they must also be distributed uniformly over the length of the mall concourse. Caution must be exercised in the design and construction so as to not create areas of possible congestion for smoke and hot gases to accumulate, such as a pitched (steep slope) roof assembly within the mall concourse.

Roof assemblies are permitted to have holes or open areas that represent openings to the outside. The roof assembly is also permitted to consist of a structure or assembly that allows the venting of the mall concourse. Examples of these vented roof structures include a roof trellis or an exposed roof structural frame only with no roofing materials. Structures that would permit the omission of automatic sprinkler protection, in accordance with NFPA 13, could be included to serve as open space for the purposes of the calculation of areas open to the outside air. Caution should be taken not to allow vegetation to grow into and around these structures that could reduce or impede the venting capabilities.

A.36.4.4.2(5) Mall Structure.

A mall structure can include either an enclosed mall concourse or an open mall concourse. A mall structure might be enclosed by construction that could range from total enclosure to construction that is open, either partially or totally, to the outer air. For structures without complete walls and/or roof, the termination of the mall exit discharge would determine the extent of the structure.

A.36.4.4.3.2

Multiple fire scenarios might need to be considered to evaluate overall tenability of the mall concourse space. See Section 5.5.

A.36.4.4.4

Where a mall concourse meets the requirements for a public way, the means of egress from each tenant space or building is permitted to terminate at the mall concourse. For those arrangements, the mall concourse would not be considered to be a portion of the means of egress.

A.36.4.4.4.2(1)

See 36.2.5.10.

A.36.4.4.4.2(3)

The minimum requirement for terminating mall concourse exit access in not less than 66 in. (1675 mm) of egress width relates to the minimum requirement for not less than one aisle in Class A mercantile occupancies with 30,000 ft² (2800 m²) or greater sales area to be 60 in. (1525 mm) in width.

A.36.4.4.4.2(5)

Walls providing tenant separations are only required to extend to the underside of the ceiling assembly, regardless of the ceiling's fire-resistive rating. If a ceiling is not provided in either of the tenant spaces, then the wall should extend to the underside of the roof or floor above.

A.36.4.4.4.2(6)

Fire experience in mall shopping centers indicates that the most likely place of fire origin is in the tenant space, where the combustible fire load is far greater than in the mall concourse. Furthermore, any fires resulting from the comparatively low fire load in the mall concourse are more likely to be detected and extinguished in their incipient stages. Early detection is likely due to the nature of the mall concourse as a high-traffic pedestrian way. Such fires produce less smoke development in a greater volume of space than fires in the more confined adjacent tenant space. Smoke control systems that address fire experience in mall concourses are necessary to ensure the integrity of the mall concourse as a pedestrian way by maintaining it reasonably free of the products of combustion for a duration not less than that required to evacuate the area of the building that is affected by the fire. Secondary considerations should include the following:

- (1) Confinement of the products of combustion to the area of origin
- (2) Removal of the products of combustion, with a minimum of migration of such products of combustion from one tenant space to another
- (3) Achievement of evacuation without the need for smoke control in one- and two-level mall structures protected by automatic sprinklers

Systems, or combinations of systems, that can be engineered to address fires in mall concourses of three or more levels include the following:

- (1) Separate mechanical exhaust or control systems
- (2) Mechanical exhaust or control systems in conjunction with heating, ventilating, and air-conditioning systems
- (3) Automatically or manually released gravity roof vent devices, such as skylights, relief dampers, or smoke vents
- (4) Combinations of items (1), (2), and (3) in this list, or any other engineered system designed to accomplish the purpose of this section

A.36.4.4.6.5

It is not the intent of 36.4.4.6.5 to require that large tenant spaces be considered anchor stores. A tenant space not considered in determining the occupant load of the mall concourse is required to be arranged so that all of its means of egress will be independent of the mall concourse.

A.36.4.4.6.8

For the purposes of emergency lighting, the open mall concourse should be considered a component of the means of egress. See 7.9.1.2.

A.36.4.4.7.3.2

It is the intent to permit the omission of visible alarm notification appliances from the mall concourse or pedestrian way in mall structures. It is anticipated that occupants with hearing impairments will receive cues from other building occupants and respond accordingly. Visible signals should be provided in public restrooms and other adjunct spaces in the mall concourse subject to occupancy solely by persons with hearing impairments.

A.36.4.4.9.2

Rooms opening onto the exit passageway are intended to include building service elevators, elevator machine rooms, electrical rooms, telephone rooms, janitor closets, restrooms, and similar normally unoccupied spaces not requiring hazardous area protection in accordance with Section 8.7.

[See SR-651](#)

A.36.4.4.12.2

Extending the audible and visible signals into the interior does not necessarily mean additional devices need to be installed. If the occupant notification systems installed to serve the area where the modular room is to be located provide the required audible and visible signals within the modular room, additional devices are not necessary. If the occupant notification systems installed to serve the area where the modular room is to be located do not provide the required audible and visible signals, then additional devices would be required to be installed within the modular room.

A.36.4.4.13

Fire experience in mall concourse shopping centers indicates that the most likely place of fire origin is in the tenant space where the combustible fire load is far greater than in the mall concourse.

Furthermore, any fires resulting from the comparatively low fire load in the mall concourse are more likely to be detected and extinguished in their incipient stages. Early detection is likely due to the nature of the mall concourse as a high-traffic pedestrian way. Such fires produce less smoke development in a greater volume of space than fires in the more confined adjacent tenant space.

Smoke control systems that address fire experience in mall concourses are necessary in order to achieve the following:

- (1) Ensure the integrity of the mall concourse as a pedestrian way by maintaining it reasonably free of the products of combustion for a duration not less than that required to evacuate the building
- (2) Confine the products of combustion to the area of origin
- (3) Remove the products of combustion with a minimum of migration of such products of combustion from one tenant to another

Systems, or combinations of systems, that can be engineered to address fires in mall concourses include the following:

- (1) Separate mechanical exhaust or control systems
- (2) Mechanical exhaust or control systems in conjunction with heating, ventilating, and air-conditioning systems
- (3) Automatically or manually released gravity roof vent devices, such as skylights, relief dampers, or smoke vents
- (4) Combinations of items (1), (2), and (3) in this list, or any other engineered system designed to accomplish the purpose of this section

A.36.4.4.14.3

Examples of these roof structures include but are not limited to shade structures, canopies, awnings, or other similar structures located above the open mall concourse that serve as a screen or shelter from the sun, rain, or other atmospheric and climate effects. However, these structures are designed to only partially enclose the area above a mall concourse and allow the mall concourse to be open to the atmosphere. They do not serve as a roof that is designed to separate the conditioned space of the mall concourse from the exterior atmosphere. These structures are permitted to be supported by the mall building and mall concourse walls, or they can be self-supporting. It is intended that these structures be protected by a supervised automatic sprinkler system where required by NFPA 13, unless allowed to be omitted with approval of the authority having jurisdiction.

A.36.4.4.14.4

Sprinklers could be omitted in kiosks located in portions of open mall concourses where no roof exists. Where sprinklers are provided at the mall concourse ceiling, the obstruction provisions of NFPA 13 also apply.

A.37.1.3.2.2(4)

Means to prevent spilled fuel from accumulating and entering the mercantile occupancy building can be by curbs, scuppers, special drainage systems, sloping the floor away from the door openings, or elevation differences of not less than 4 in. (100 mm).

A.37.2.2.2.2

The words "principal entrance/exit doors" describe doors that the authority having jurisdiction can reasonably expect to be unlocked in order for the facility to do business.

A.37.2.2.7.2

Egress from a mall structure should be designed as follows:

- (1) The mall/pedestrian way has been assigned no occupant load, but it is required to be provided with means of egress sized to accommodate the total occupant load of the mall structure based on the gross leasable area.
- (2) The exits for the mall/pedestrian way are permitted to be provided by a combination of exterior exit doors and exit passageways.
- (3) After completion of A.37.2.2.7.2(1), each tenant space is to be judged individually for occupant load and egress capacity, and the following also apply:
 - (a) The step specified in 37.4.4.4.2 normally sends a portion or all (per 37.4.4.4.2) of the tenant space's occupant load into the mall concourse.
 - (b) Any remaining occupants are sent through the back of the tenant space into an exit passageway that might serve multiple tenant spaces and the mall concourse.
- (4) The width of the exit passageway is required to be sized for the most restrictive of the following:
 - (a) Width of not less than 66 in. (1675 mm) per 37.4.4.4.2(3)
 - (b) Portion of the egress capacity from the largest single tenant space being served by the exit passageway
 - (c) Portion of the egress capacity from the mall concourse being provided by the exit passageway

The concepts used in A.37.2.2.7.2(4)(a) through A.37.2.2.7.2(4)(c) include the following:

- (1) After proper egress capacity is provided for the mall/pedestrian way, each tenant space is then required to independently provide egress capacity for its occupants.
- (2) The mall concourse required exit passageway width and the tenant space required exit passageway width are not required to be added together.
- (3) The required exit passageway width for a tenant space is not required to be added to that of other tenant spaces using the same exit passageway.

A.37.2.5.2

It is recognized that common paths of travel exceeding the permitted limits exist and, in some cases, are impractical to eliminate. The authority having jurisdiction might permit such paths of travel to continue to exist, taking into consideration any or all of the following:

- (1) Tenant arrangement
- (2) Automatic sprinkler protection
- (3) Smoke detection
- (4) Exit remoteness

A.37.2.5.3

The purpose of 37.2.5.3 is to avoid pockets or dead ends of such size that they pose an undue danger of persons becoming trapped in case of fire.

It is recognized that dead ends exceeding the permitted limits exist and, in some cases, are impractical to eliminate. The authority having jurisdiction might permit such dead ends to continue to exist, taking into consideration any or all of the following:

- (1) Tenant arrangement
- (2) Automatic sprinkler protection
- (3) Smoke detection
- (4) Exit remoteness

A.37.2.5.10

To eliminate the obstruction to the means of egress of the interior exit access and the exterior exit discharge, it is the intent to provide adequate area for transit and parking of wheeled carts or buggies used by customers. This area includes corral areas adjacent to exits that are constructed to restrict the movement of wheeled carts or buggies therefrom.

A.37.2.7.2

The basis for the exemption to the general rule on complete enclosure of exits up to their point of discharge to the outside of the building is that, with the specified safeguards, reasonable safety is maintained.

A stairway is not considered to discharge through the street floor area if it leads to the street through a fire-resistance-rated enclosure (exit passageway) separating it from the main area, even though there are doors between the first floor stairway landing and the main area.

The provisions of 37.2.7.2 should not be confused with those for open stairways, as permitted by 37.3.1(1) and 37.3.1(2).

A.37.2.11.3

It is the intent of this paragraph to apply to areas where hazardous materials are present in excess of the maximum allowable quantities. See also Annex C for additional information.

A.37.3.2.1

It is the intent to permit a suspended natural-gas-fired unit heater that complies with the requirements of 9.2.2 to be installed and used in a mercantile occupancy without classifying the area in which it is located as hazardous.

A.37.3.2.1.1

These areas can include, but are not limited to, areas used for general storage, boiler or furnace rooms, and maintenance shops that include woodworking and painting areas.

A.37.3.2.2

The requirement for separating high hazard contents areas from other parts of the building is intended to isolate the hazard, and 8.2.3.3 is applicable.

A.37.3.2.3

It is the intent of this paragraph to apply to areas where hazardous materials are present in excess of the maximum allowable quantities. See also Annex C for additional information.

A.37.3.2.4

It is not the intent to prohibit the use of equipment that is used less frequently and does not produce significant grease-laden vapors such as that equipment used for cooking demonstrations.

A.37.4.4

This section provides an optional, not mandatory, arrangement for the design and construction of mall structures. At the discretion of the designer, these structures can be designed as a single building as long as they comply with the applicable requirements of the intended occupancy and with the requirements of 6.1.14 for buildings housing more than one occupancy.

A.37.4.4.2(4)(a)

An open mall concourse is permitted to serve as the public way provided the open mall concourse meets the definition of public way in accordance with this Code.

It is intended that the open mall concourse be designed, constructed, and arranged to permit the natural venting of smoke and other products of combustion to the outside air through openings in the walls, roof, or combination thereof of the mall concourse.

The solid area of the mall concourse walls and the horizontal projection of the solid area of any roof structures, including shade structures, awnings, and canopies, that cover the mall concourse should be summed to determine the aggregate area of solid construction associated with the mall concourse. A mall concourse can be considered an open mall concourse where at least 50 percent of the aggregate area of solid construction is open to the atmosphere. Open areas can include entrances to the mall concourse (e.g., barred gates that allow air to pass through versus an entrance storefront), clearstory spaces between the mall building (structure that houses tenants) and the roof above, and openings in the roof assembly. For the openings to be effective, they must also be distributed uniformly over the length of the mall concourse. Caution must be exercised in the design and construction so as not to create areas of possible congestion for smoke and hot gases to accumulate, such as a pitched (steep slope) roof assembly within the mall concourse.

Roof assemblies are permitted to have holes or open areas that represent openings to the outside. The roof assembly is also permitted to consist of a structure or assembly that allows the venting of the mall concourse. Examples of these vented roof structures include a roof trellis or an exposed roof structural frame only with no roofing materials. Structures that would permit the omission of automatic sprinkler protection, in accordance with NFPA 13, could be included to serve as open space for the purposes of the calculation of areas open to the outside air. Caution should be taken not to allow vegetation to grow into and around these structures that could reduce or impede the venting capabilities.

A.37.4.4.2(5) Mall Structure.

A mall structure can include either an enclosed mall concourse or an open mall concourse. A mall structure might be enclosed by construction that could range from total enclosure to construction that is open, either partially or totally, to the outer air. For structures without complete walls and/or roof, the termination of the mall exit discharge would determine the extent of the structure.

A mall structure might enclose one or more uses, such as retail and wholesale stores, drinking and dining establishments, entertainment and amusement facilities, transportation facilities, offices, and other similar uses.

A.37.4.4.3.2

Multiple fire scenarios might need to be considered to evaluate overall tenability of the mall concourse space. See Section 5.5.

A.37.4.4.4

Where a mall concourse meets the requirements for a public way, the means of egress from each tenant space or building is permitted to terminate at the mall concourse. For those arrangements, the mall concourse would not be considered to be a portion of the means of egress.

A.37.4.4.4.2(1)

See 36.2.5.10.

A.37.4.4.4.2(3)

The minimum requirement for terminating mall concourse exit access in not less than 66 in. (1675 mm) of egress width relates to the minimum requirement for not less than one aisle in Class A mercantile occupancies with 30,000 ft² (2800 m²) or greater sales area to be 60 in. (1525 mm) in width.

A.37.4.4.4.2(6)

Fire experience in mall concourse shopping centers indicates that the most likely place of fire origin is in the tenant space, where the combustible fire load is far greater than in the mall concourse. Furthermore, any fires resulting from the comparatively low fire load in the mall concourse are more likely to be detected and extinguished in their incipient stages. Early detection is likely due to the nature of the mall concourse as a high-traffic pedestrian way. Such fires produce less smoke development in a greater volume of space than fires in the more confined adjacent tenant space. Smoke control systems that address fire experience in mall concourses are necessary to ensure the integrity of the mall concourse as a pedestrian way by maintaining it reasonably free of the products of combustion for a duration not less than that required to evacuate the area of the building that is affected by the fire. Secondary considerations should include the following:

- (1) Confinement of the products of combustion to the area of origin
- (2) Removal of the products of combustion, with a minimum of migration of such products of combustion from one tenant space to another
- (3) Achievement of evacuation without the need for smoke control in one- and two-level mall concourse buildings protected by automatic sprinklers

Systems, or combinations of systems, that can be engineered to address fires in mall concourses of three or more levels include the following:

- (1) Separate mechanical exhaust or control systems
- (2) Mechanical exhaust or control systems in conjunction with heating, ventilating, and air-conditioning systems
- (3) Automatically or manually released gravity roof vent devices, such as skylights, relief dampers, or smoke vents
- (4) Combinations of items (1), (2), and (3) in this list, or any other engineered system designed to accomplish the purpose of this section

A.37.4.4.6.5

It is not the intent of 37.4.4.6.5 to require that large tenant spaces be considered anchor stores. A tenant space not considered in determining the occupant load of the mall concourse is required to be arranged so that all of its means of egress will be independent of the mall concourse.

A.37.4.4.6.8

For the purposes of emergency lighting, the open mall concourse should be considered a component of the means of egress. See 7.9.1.2.

A.37.4.4.9.2

Rooms opening onto the exit passageway are intended to include building service elevators, elevator machine rooms, electrical rooms, telephone rooms, janitor closets, restrooms, and similar normally unoccupied spaces not requiring hazardous area protection in accordance with Section 8.7.

[See SR-65](#)

A.37.4.4.12.2

Extending the audible and visible signals into the interior does not necessarily mean additional devices need to be installed. If the occupant notification systems installed to serve the area where the modular room is to be located provide the required audible and visible signals within the modular room, additional devices are not necessary. If the occupant notification systems installed to serve the area where the modular room is to be located do not provide the required audible and visible signals, then additional devices would be required to be installed within the modular room.

A.37.4.4.14

Sprinklers might be omitted in kiosks located in portions of open mall concourses where no roof exists. Where sprinklers are provided at the mall concourse ceiling, the obstruction provisions of NFPA 13 also apply.

A.38.1.3.2.2(4)

Means to prevent spilled fuel from accumulating and entering the business occupancy building can be by curbs, scuppers, special drainage systems, sloping the floor away from the door openings, or elevation differences not less than 4 in. (100 mm).

A.38.2.2.2.2

The intent of this section is to apply only where specialized security measures are needed to prevent unwanted entry. Examples of doors that might use these provisions include college and university classroom doors, areas of office spaces open to the public, laboratories, or instructional rooms or spaces.

A.38.2.2.2.3

The words "principal entrance/exit doors" describe doors that the authority having jurisdiction can reasonably expect to be unlocked in order for the facility to do business.

A.38.2.3.2

It is not the intent that this provision apply to noncorridor or nonpassageway areas of exit access, such as the spaces between rows of desks created by office layout or low-height partitions.

A.38.2.11.3

It is the intent of this paragraph to apply to areas where hazardous materials in excess of the maximum allowable quantities are present. See also Annex C for additional information.

A.38.3.2.1

It is not the intent of this provision that rooms inside individual tenant spaces that are used to store routine office supplies for that tenant be required to be either separated or sprinklered.

A.38.3.2.2

The requirement for separating high-hazard contents areas from other parts of the building is intended to isolate the hazard, and 8.2.3.3 is applicable.

A.38.3.2.3

It is the intent of this paragraph to apply to areas where hazardous materials are present in excess of the maximum allowable quantities. See also Annex C for additional information.

A.38.3.2.4

It is not the intent to prohibit the use of equipment that is used less frequently and does not produce significant grease-laden vapors such as that equipment used for cooking demonstrations.

A.38.3.4.5

It is not the intent of this section to require a new risk analysis where an existing risk analysis addresses the issues or arrangements associated with a new building.

A.38.3.6.1

The intent of 38.3.6.1(1) through 38.3.6.1(3) is to permit spaces to be open to the exit access corridor without separation.

A.38.3.6.1(1)

Where exits are available from an open floor area, such as open plan buildings, corridors are not required to be separated. An example of an open plan building is a building in which the work spaces and accesses to exits are delineated by the use of tables, desks, bookcases, or counters, or by partitions that are less than floor-to-ceiling height.

A.38.3.6.1(2)

It is the intent of this provision that a single tenant be limited to an area occupied under a single management and work the same hours. The concept is that people under the same employ working the same hours would likely be familiar with their entire tenant space. It is not the intent to apply this provision simply because tenants are owned by the same organization. For example, in a government-owned office building, the offices of different federal agencies would be considered multiple tenants, because an employee normally works for one agency. The agencies might work various hours. Another example of multiple tenancy would be a classroom building of a university, because some classrooms might be in use at times when other classrooms are not being used.

[See SR-655](#)

A.38.7.9.2

Extending the audible and visible signals into the interior does not necessarily mean additional devices need to be installed. If the occupant notification systems installed to serve the area where the modular room is to be located provide the required audible and visible signals within the modular room, additional devices are not necessary. If the occupant notification systems installed to serve the area where the modular room is to be located do not provide the required audible and visible signals, then additional devices would be required to be installed within the modular room.

A.39.1.3.2.2(4)

Means to prevent spilled fuel from accumulating and entering the business occupancy building can be by curbs, scuppers, special drainage systems, sloping the floor away from the door openings, or elevation differences not less than 4 in. (100 mm).

A.39.2.2.2.2

The intent of this section is to apply only where specialized security measures are needed to prevent unwanted entry. Examples of doors that might use these provisions include college and university classroom doors, areas of office spaces open to the public, laboratories, or instructional rooms or spaces.

A.39.2.2.2.3

The words "principal entrance/exit doors" describe doors that the authority having jurisdiction can reasonably expect to be unlocked in order for the facility to do business.

A.39.2.5.2

It is recognized that common paths of travel exceeding the permitted limits exist and, in some cases, are impractical to eliminate. The authority having jurisdiction might permit such common paths of travel to continue to exist, taking into consideration any or all of the following:

- (1) Tenant arrangement
- (2) Automatic sprinkler protection
- (3) Smoke detection
- (4) Exit remoteness

A.39.2.5.3

It is recognized that dead ends exceeding the permitted limits exist and, in some cases, are impractical to eliminate. The authority having jurisdiction might permit such dead ends to continue to exist, taking into consideration any or all of the following:

- (1) Tenant arrangement
- (2) Automatic sprinkler protection
- (3) Smoke detection
- (4) Exit remoteness

A.39.2.11.3

It is the intent of this paragraph to apply to areas where hazardous materials are present in excess of the maximum allowable quantities. See also Annex C for additional information.

A.39.3.2.1

It is not the intent of this provision that rooms inside individual tenant spaces that are used to store routine office supplies for that tenant be required to be separated or sprinklered.

A.39.3.2.2

The requirement for separating high-hazard contents areas from other parts of the building is intended to isolate the hazard, and 8.2.3.3 is applicable.

A.39.3.2.3

It is the intent of this paragraph to apply to areas where hazardous materials are present in excess of the maximum allowable quantities. See also Annex C for additional information.

A.39.3.2.4

It is not the intent to prohibit the use of equipment that is used less frequently and does not produce significant grease-laden vapors such as that equipment used for cooking demonstrations.

A.39.4.2.2

The intent of this requirement is to provide a reasonable degree of safety from fire for all occupants of high-rise business occupancy buildings. This reasonable degree of safety can be accomplished by the installation of an automatic sprinkler system or application of an engineered life safety system.

The engineered life safety system is similar to alternative protection concepts contained in most building and fire codes. Alternative systems, methods, or devices achieving a reasonable level of protection and meeting the intent of the specific code requirement can be used if the level of life safety provided by that engineered life safety system is proven to the satisfaction of the authority having jurisdiction.

The engineered life safety system should be documented and include a narrative discussion of the features of the building structure, function, operational support systems, and occupant activities that impact fire protection and life safety. The submission to the authority having jurisdiction for approval should describe potential reasonable worst-case fire scenarios and their impact on building occupants and the facility's structures. Specific issues that should be addressed include rate of fire growth, type and location of fuel items, space layout, building construction, openings and ventilation, suppression capability, detection time, occupant notification, occupant reaction time, occupant mobility, and means of egress. Elements of the engineered life safety system might include but are not limited to the following:

- (1) Partial automatic sprinkler protection
- (2) Smoke detection alarms
- (3) Elevators
- (4) Smoke control
- (5) Compartmentation

Analytical and empirical tools, including fire models and performance-based design methods, such as those outlined in the *SFPE Engineering Guide to Performance-Based Fire Protection* and Chapter 5 of this *Code* can be used to support the engineered life safety system. If fire modeling is used as part of an analysis, an assessment of the predictive capabilities of the fire models should be included.

[See SR-655](#)

A.39.7.9.2

Extending the audible and visible signals into the interior does not necessarily mean additional devices need to be installed. If the occupant notification systems installed to serve the area where the modular room is to be located provide the required audible and visible signals within the modular room, additional devices are not necessary. If the occupant notification systems installed to serve the area where the modular room is to be located do not provide the required audible and visible signals, then additional devices would be required to be installed within the modular room.

A.40.1.2.1.3

Additional information on the definition of high-hazard industrial occupancy can be found in 3.3.205.8.2.

A.40.1.7

In most cases, the requirements for maximum travel distance to exits will be the determining factor, rather than number of occupants, because exits provided to satisfy travel distance requirements will be sufficient to provide egress capacity for all occupants, except in cases of an unusual arrangement of buildings or the high occupant load of a general manufacturing occupancy.

A.40.2.1.2

Horizontal and vertical utility chases in large industrial buildings used for routing of piping, ducts, and wiring must provide a reasonable level of access for occasional maintenance workers but do not warrant compliance with the comprehensive egress requirements of Chapter 7. Minimum access in these cases is governed by electrical and mechanical codes; 40.2.5.2, Industrial Equipment Access; and the Occupational Safety and Health Administration (OSHA) for facilities in the United States. Utility chases governed by 40.2.1.2 might involve tunnels or large open spaces located above or below occupied floors; however, such spaces differ from mechanical equipment rooms, boiler rooms, and furnace rooms, based on the anticipated frequency of use by maintenance workers. Portions of utility chases where the anticipated presence of maintenance workers is routine are not intended to be included by this paragraph.

A.40.2.2.5.2

The customary building code requirement for fire doors on both sides of an opening in a fire wall is permitted to be met by having an automatic-sliding fire door on one side and a self-closing fire door swinging out from the other side of the wall. This arrangement qualifies only as a horizontal exit from the sliding door side. For further information, see A.7.2.4.3.10.

A.40.2.5.2.1

Ancillary facilities located within industrial occupancies might include administrative office, laboratory, control, and employee service facilities that are incidental to the predominant industrial function and are of such size that separate occupancy classification is not warranted.

A.40.2.5.2.2

Occupants of ancillary facilities located within special-purpose industrial occupancies might be required by administrative controls to remain in the facility when a fire occurs in the predominant industrial area, so that they can perform an orderly shutdown of process equipment to control the spread of the fire and minimize damage to important equipment or perform other safety or security functions.

A.40.2.6.2

See NFPA 850 for protection recommendations.

A.40.2.9

The authority having jurisdiction should review the facility and designate the stairs, aisles, corridors, ramps, and passageways that should be required to be provided with emergency lighting. In large locker rooms or laboratories using hazardous chemicals, for example, the authority having jurisdiction should determine that emergency lighting is needed in the major aisles leading through those spaces.

A.40.3.2

Emergency lighting should be considered where operations require lighting to perform orderly manual emergency operation or shutdown, maintain critical services, or provide safe start-up after a power failure.

A.40.4.2.2(2)

It is recognized that industrial occupancy buildings impose a wide range of risks and hazards. The purpose of the engineered life safety system is to allow the building owner and the authority having jurisdiction the leeway to develop a protection method appropriate to the risk.

A.40.6

For further information on aircraft hangars, see NFPA 409.

A.42.2.1.2

Horizontal and vertical utility chases in large industrial buildings used for routing of piping, ducts, and wiring must provide a reasonable level of access for occasional maintenance workers but do not warrant compliance with the comprehensive egress requirements of Chapter 7. Minimum access in these cases is governed by the electrical and mechanical code; 40.2.5.3, Industrial Equipment Access; and the Occupational Safety and Health Administration (OSHA) for facilities in the United States. Utility chases governed by 42.2.1.2 might involve tunnels or large open spaces located above or below occupied floors; however, such spaces differ from mechanical equipment rooms, boiler rooms, and furnace rooms, based on the anticipated frequency of use by maintenance workers. Portions of utility chases where the anticipated presence of maintenance workers is routine are not intended to be included by this paragraph.

A.42.2.5.2

The customary building code requirement for fire doors on both sides of an opening in a fire wall is permitted to be met by having an automatic-sliding fire door on one side and a self-closing fire door swinging out from the other side of the wall. This arrangement qualifies only as a horizontal exit from the sliding door side. For further information, see A.7.2.4.3.10.

A.42.2.6

The travel distance to exits specified recognizes a low population density. Consideration should be given to locating areas that have a relatively high population, such as lunchrooms, meeting rooms, packaging areas, and offices, near the outside wall of the building to keep the travel distance to a minimum.

A.42.6

For further information on aircraft hangars, see NFPA 409.

A.42.7

For further information, see NFPA 61. The egress requirements for storage elevators are based on the possibility of fire and are not based on the possibility of grain dust explosions.

A.42.8.1.1

For further information on garages, including a definition of the term *open garage*, see NFPA 88A.

A.43.2.2.1.4

It is not the intent that a corridor, aisle, or circulation space within a suite be considered as a corridor that is shared by more than one occupant space. The suite should be considered as only one occupant space. The following situations should be considered to involve more than one occupant space:

- (1) Work affecting a corridor that is common to multiple guest rooms on a floor of a hotel occupancy
- (2) Work affecting a corridor that is common to multiple living units on a floor of an apartment building occupancy
- (3) Work affecting a corridor that is common to multiple tenants on a floor of a business occupancy

A.43.2.2.2

Equipment or fixtures do not include manufacturing, production, or process equipment, but do include connections from building service to process equipment.

A.43.4.2(2)

Some building codes have permitted an increase in egress capacity in buildings protected throughout by an approved automatic sprinkler system. The intent of 43.4.2(2) is that, during a renovation project, egress capacity is permitted to continue to be evaluated using the previously approved method.

A.43.4.4

The installation of new hardware that necessitates two nonsimultaneous releasing motions on existing doors in existing educational occupancies in accordance with 15.2.2.2.4.1(3) and existing day care occupancies in accordance with 17.2.2.2.6.1(3) is permitted where such installation is necessary for compliance with the door locking criteria in 15.2.2.2.4.1 and 17.2.2.2.6.1, respectively. In accordance with 43.1.4.5, rehabilitation work performed for compliance with the *Code's* existing occupancy requirements is exempt from Chapter 43 and the installation of such new equipment is not subject to Section 43.5, which would require compliance with the new occupancy provisions. Where a new door is installed in an existing educational or day care occupancy, the requirements of 14.2.2.2.4 or 16.2.2.2.6 apply, respectively.

A.43.6.2.2

The provisions for marking of means of egress are those addressed in Section 7.10.

A.43.7.2.1(2)

It is not the intent of 43.7.2.1(2) to supersede the provision of 32.2.3.5.2 that exempts automatic sprinklers from small board and care facility conversions serving eight or fewer residents when all occupants have the ability as a group to move reliably to a point of safety within 3 minutes.

A.43.7.3

Table 43.7.3 groups all the residential occupancy classifications into the general category of residential. The category of residential includes one- and two-family dwellings, lodging or rooming houses, hotels and dormitories, and apartment buildings. A change from one residential occupancy, as defined in 6.1.8.1 through 6.1.8.1.5, to another residential occupancy is classified as the rehabilitation work category of *change of occupancy* and subject to the requirements of 43.7.2.

Annex B Supplemental Evacuation Equipment

[Save As Word](#) [Show Revisions/Notes](#) [Show PIPIC's](#) [Quick Print](#)

This annex is not a part of the requirements of this NFPA document but is included for informational purposes only. Information in this annex is intended to be adopted by the jurisdiction at the discretion of the adopting jurisdiction. Additionally, information in this annex is intended to be incorporated on a voluntary basis by building owners and developers who might have a desire to include supplemental evacuation equipment in their projects.

Although this annex is written in mandatory language, it is not intended to be enforced or applied unless specifically adopted by the jurisdiction or, if it is being applied on a voluntary basis, by the building owner or developer.

Note: Traditionally, supplemental evacuation equipment has not been regulated or recognized by the *Code*. Until recently, such equipment was considered to include only items such as chain ladders and rope fire escape ladders for use in single-family homes. The criteria specified in Annex B also provides no regulation or recognition for the private installation and use of such equipment by an owner and family, while providing a framework of regulations for the use of controlled descent devices and platform rescue systems in commercial and residential multistory buildings. The broader term *supplemental evacuation equipment* provides for subsets of equipment to be added as further technologies develop.

B.1 General.**B.1.1 Definitions.****B.1.1.1 Controlled Descent Device.**

A system operating on the exterior of a building or structure that lowers one or two people per descent, each wearing a rescue harness, at a controlled rate from an upper level to the ground or other safe location.

B.1.1.2 Platform Rescue System.

An enclosed platform, or set of enclosed platforms, moving vertically along guides or other means on the exterior of a building or structure, intended for the evacuation of multiple occupants from an upper level or levels to the ground or other safe location, that has the capability of transporting emergency responders to upper levels of a building.

B.1.1.3 Supplemental Escape Device or System.

Dedicated equipment that supplements the means of egress or means of escape for exiting a building or structure.

Note: Supplemental escape devices and systems are not a substitute for the required means of egress or means of escape. If properly installed, maintained, and used, controlled descent devices and platform rescue systems might provide an added means of escape for the occupants where the required means of egress or means of escape is not usable or accessible, and where the event that has caused failure of the required system has not also impaired the functionality of the device or system itself.

B.1.1.4 Supplemental Evacuation Equipment.

Devices or systems that are not a part of the required means of egress or escape, but that might enhance use of the means of egress or escape, or provide an alternate to the means of egress or escape.

B.1.2 Reserved.

B.2 Supplemental Escape Devices or Systems.

A supplemental escape device or system, other than that provided or installed for use by the owner and owner's family, and the installation of such device or system, shall comply with Section B.3 or Section B.4, as appropriate, and the following criteria:

Note: The provisions of Section B.2 are not intended to preclude the installation of supplemental escape devices or systems that do not meet these requirements where intended for personal use, such as by an owner and family.

It should be recognized that supplemental escape devices or systems addressed by these requirements are intended to be used only when all other means of egress are unusable and when remaining in place to await the restoration of the means of egress is considered untenable.

Generally, fire departments have the capability of providing external rescue of building occupants within reach of their portable ladders, aerial ladders, and aerial platform devices. Where a fire department responds to a building emergency and has the capability to provide timely assistance with external rescue, that assistance should be used instead of the supplemental escape devices or systems.

- (1) Each supplemental escape device or system shall be of an approved type and shall comply with an approved product safety standard.
- (2) The installation of escape devices or systems shall be approved. Note: Use of a supplemental escape device or system typically requires that a window or exterior door be opened. The window or door should be closed, except when it is in use for escape. Where the design of the building does not provide exterior doors or operable windows and a window must be broken to use the device or system, consideration should be given to the probable effect of that action, such as showering the emergency response personnel and equipment below with sharp pieces of glass. In such a situation, to obtain approval, it might be appropriate to require tempered safety glass on windows that must be broken to deploy the supplemental escape device and access the system.
- (3) The supplemental escape device or system shall be installed, inspected, tested, maintained, and used in accordance with the manufacturer's instructions.
- (4) The location of each supplemental escape system access point shall be identified with a readily visible sign complying with the following:
 - (a) The sign shall be in plainly legible letters that read SUPPLEMENTAL ESCAPE DEVICE.
 - (b) The minimum height of the lettering shall be $\frac{3}{4}$ in. (19 mm), with a stroke width of $\frac{1}{8}$ in. (3 mm).
- (5) Each sign required by Section B.2(4) shall comply with the following:
 - (a) The sign shall include the following in plainly legible letters: "Use only when exits are not accessible and building evacuation is imperative, as directed by authorized building personnel or emergency responders."
 - (b) The minimum height of the lettering shall be $\frac{1}{2}$ in. (13 mm).
- (6) A sign with instructions for use of the escape device or system shall be provided and shall comply with the following:
 - (a) The sign shall be posted at the equipment and the equipment's access location.
 - (b) The minimum height of lettering on the instructions shall be $\frac{1}{2}$ in. (13 mm).
 - (c) Pictographs demonstrating use of the escape device or system shall be provided. Note: Given the nature of the probable circumstances surrounding its deployment, the proper use of the supplemental escape device or system should be readily apparent to the user or trained operator.
- (7) The signs and instructions specified in Section B.2(4), B.2(5), and B.2(6) shall be illuminated as follows:
 - (a) The signs shall be continuously illuminated while the building is occupied.
 - (b) The level of illumination provided shall be in accordance with 7.10.6.3, 7.10.7.2, or an approved equivalent.
- (8) Where emergency lighting is required by Chapters 11 through 43, it shall be provided as follows:
 - (a) The illumination shall be in accordance with 7.9.1.
 - (b) The level of illumination required by 7.9.2.1 shall be provided to illuminate the supplemental escape device or system at its access location and the required signage.
- (9) The supplemental escape device or system and its installation shall accommodate persons with various disabilities and of all ages. Note: It is not the intent of Section B.2(9) that access ramps, doorways, controls, signage, and other features of the supplemental escape device or system meet all requirements for accessibility for persons with disabilities. The equipment is supplemental in nature and is not recognized as part of the required means of egress. A number of other occupants should be trained to assist persons with disabilities to access the equipment. In selecting the equipment and approving the installation, consideration should be given to how persons with mobility impairments will access the equipment. Even when exit stairs are usable, elevators might not be able to be used. Use of a supplemental escape device or system to evacuate persons with mobility impairments might be desirable. Such circumstances should be considered and incorporated into the facility's evacuation plan, which should also identify the trained operators authorized to deploy the equipment for such use.
- (10) The installation shall be approved such that use of the supplemental escape device or system shall not cause any harm or injury to the user, operator, or others who might be in the vicinity of the equipment when in use.
- (11) Where an evacuation plan is required by Chapters 11 through 43, or by other regulation, an approved, written evacuation plan shall be provided as follows:
 - (a) The plan shall be in accordance with 4.8.2.
 - (b) The plan shall not rely on the use of supplemental escape devices and systems but shall accommodate the use of such a system by specifying the following:
 - i. Role of the supplemental escape device or system in the overall plan
 - ii. Role and authority of emergency response personnel with respect to the supplemental escape device or system
 - iii. Person or persons authorized to direct the deployment of, and to operate, the escape device or system
 - iv. Special considerations, if any, that affect the usability of the supplemental escape device or system
 - v. Training required for operators and users
 - (c) Note: An evacuation plan can be a highly effective tool in determining who should be evacuated under various scenarios and how that evacuation will be accomplished. Even where none is required, an evacuation plan is recommended to identify, among other things, those persons who are authorized to deploy supplemental escape devices and systems. The more sophisticated the equipment and the greater the number of potential evacuees, the greater is the need to have a trained and authorized person decide which equipment to deploy and when it should be deployed, based on the circumstances at the time. Such a person would be the incident commander, typically the emergency response officer in charge, whether from a private brigade or public service. Even where a building or facility is not required to have an approved evacuation plan by the Code, the supplemental escape device or system operating procedures should be integrated into the building evacuation and emergency procedures to the extent provided.
- (12) User and operator training shall be provided in conjunction with the installation of the supplemental escape device or system, and periodically thereafter.
- (13) Where an approved evacuation plan is required, training shall be provided in accordance with the approved plan.
- (14) The supplemental escape device or system shall be inspected and tested in accordance with the manufacturer's instructions but not less frequently than annually, and the following also shall apply:
 - (a) Notification of testing shall be provided to building occupants or the authority having jurisdiction, as appropriate.
 - (b) Written records of the inspection and testing shall be maintained by the owner for a minimum of 1 year after the next scheduled inspection and testing. Note: It is important that the supplemental escape device or system does not remain idle for many years in order to help ensure that it will be functional if it does need to be used. The manufacturer's instructions for the particular model of equipment involved should be followed.

- (15) Supplemental escape devices and systems shall be listed, certified, or approved to operate as intended over the prevalent climatic conditions for the location in which they are installed.

B.3 Platform Rescue Systems.

Where platform rescue systems are installed or provided, they shall comply with the following:

- (1) The platform rescue system shall comply with ASTM E2513, *Standard Specification for Multi-Story Building External Evacuation Platform Rescue Systems*, or an approved, equivalent product safety standard.
- (2) The platform rescue system shall be deployed with trained operators to assist with evacuation of occupants.
- (3) Where a fixed installation of electrical or other type power is required to operate the platform rescue system, a redundant source of power shall be provided.
- (4) The installation shall be designed such that the vertical distance to be traversed by the platform rescue system shall not exceed the limit specified in the product's listing, certification, or approved installation.
- (5) The platform access from within buildings shall be by ramps or stairs, and the following also shall apply:
 - (a) Portable ramps and stairs shall be permitted.
 - (b) The maximum slope of a ramp shall be as low as practical, but shall not be required to be less than 1 in 8.
 - (c) The maximum riser height of stairs shall be 9 in. (230 mm).
 - (d) The minimum tread depth of stairs shall be 9 in. (230 mm).
- (6) The platform access opening shall be sized in accordance with the following:
 - (a) For installations in new construction, the platform access opening shall be a minimum 32 in. (810 mm) in width and a minimum 48 in. (1220 mm) in height.
 - (b) For installations in existing construction, the platform access opening shall be as large as practical but shall not be required to exceed 32 in. (810 mm) in width and 48 in. (1220 mm) in height.
- (7) The platform access and egress shall not be by ladders.
- (8) Rooftop operating equipment and systems shall be protected from accumulations of climatic ice or snow and fire suppression ice.

B.4 Controlled Descent Devices.

Where controlled descent devices are installed or provided, they shall comply with the following:

- (1) The controlled descent device shall comply with ASTM E2484, *Standard Specification for Multi-Story Building External Evacuation Controlled Descent Devices*, or an approved, equivalent product safety standard.
- (2) The installation shall be designed such that the vertical distance to be traversed by the controlled descent device shall not exceed the limit specified in the product's listing, certification, or approved installation.
- (3) Where a fixed installation of electrical or other type power is required to operate the controlled descent device, a redundant source of power shall be provided.
- (4) Rooftop operating equipment and systems shall be protected from accumulations of climatic ice or snow and fire suppression ice.
- (5) Controlled descent device building access openings in new building installations shall be a minimum of 32 in. (810 mm) wide and 42 in. (1065 mm) high.
- (6) Controlled descent device building access openings in existing buildings shall be a minimum of 20 in. (510 mm) wide and 24 in. (610 mm) high and shall provide a clear opening of not less than 5.7 ft² (0.53 m²).
- (7) The approved occupant load and weight limits shall be posted adjacent to the controlled descent device installation or building access opening in minimum ½ in. (13 mm) letters, with a minimum ⅙ in. (1.6 mm) stroke.
- (8) The occupant load and weight limits shall not be exceeded in use.

Annex C NFPA Documents on Hazardous Materials

[Save As Word](#) [Show Revisions/Notes](#) [Show P/IPC's](#) [Quick Print](#)

This annex is not a part of the requirements of this NFPA document but is included for informational purposes only.

C.1 General.

C.1.1

NFPA 30, NFPA 45, NFPA 54, NFPA 55, NFPA 58, NFPA 400, and NFPA 495 represent a comprehensive set of requirements for protection against hazardous material emergencies appropriate to the level of safety afforded by the *Life Safety Code*.

C.1.2

Where a conflict exists between applicable requirements, an analysis should be made and the proper applicable requirement should be implemented or conformed to subject to the approval of the AHJ. [400:A.4.4]

C.1.3

The safe handling, collection, and disposal of hazardous waste can be accomplished only if the physical, chemical, and hazardous properties of its components are known and that information is properly applied. [400:A.4.5]

C.1.4

NFPA 30, NFPA 45, NFPA 55, and NFPA 400 include maximum allowable quantities (MAQs) and the control area concept and limit the MAQs within each control area. An established set of requirements apply to control areas with less than the MAQs. Control areas with hazardous materials quantities above the MAQs require additional controls or commensurate safeguards and features. NFPA 45 uses the term *laboratory unit*, which correlates to and is similar to control areas. From A.5.1 of NFPA 400, "The purpose is to permit limited amounts of hazardous contents in occupancies having minimum controls without triggering the more restrictive Protection Level 1 through Protection Level 4 building requirements."

C.2 Scope and Exclusions of Other Documents Addressing Hazardous Areas.

The following scope and exclusions are provided from NFPA 30, NFPA 45, NFPA 54, NFPA 55, NFPA 58, NFPA 400, and NFPA 495 to clarify the applicability of each code. Refer to individual documents for additional definitions and requirements.

C.2.1 NFPA 30.

C.2.1.1

Subsection 1.1.1 of NFPA 30 states: "This code shall apply to the storage, handling, and use of flammable and combustible liquids, including waste liquids."

C.2.1.2

Subsection 1.1.2 of NFPA 30 states: "This code shall not apply to the following:

- (1) Any liquid that has a melting point of 100°F (37.8°C) or greater
- (2) Any liquid that does not meet the criteria for fluidity given in the definition of liquid in [NFPA 30] Chapter 3 and in the provisions of [NFPA 30] Chapter 4
- (3) Any cryogenic fluid or liquefied gas, as defined in Chapter 3
- (4) Any liquid that does not have a flash point, but which is capable of burning under certain conditions
- (5) Any aerosol product
- (6) Any mist, spray, or foam
- (7) Transportation of flammable and combustible liquids as governed by the U.S. Department of Transportation
- (8) Storage, handling, and use of fuel oil tanks and containers connected with oil-burning equipment
- (9) Use and installation of alcohol-based hand rub (ABHR) dispensers"

C.2.2 NFPA 45.**C.2.2.1**

Subsection 1.1.1 of NFPA 45 states: "This code shall apply to laboratory buildings, laboratory units, and laboratory work areas whether located above or below grade in which chemicals, as defined, are handled or stored."

C.2.2.2

Subsection 1.1.2 of NFPA 45 states: "This code shall not apply to the following:

- (1) Laboratories for which the following conditions apply:
 - (a) Laboratory units that contain less than or equal to 4 L (1 gal) of flammable or combustible liquid
 - (b) Laboratory units that contain less than 2.2 standard m³ (75 scf) of flammable gas, not including piped-in low-pressure utility gas installed in accordance with NFPA 54
- (2) Laboratories that are pilot plants
- (3) Laboratories that handle only chemicals with a hazard rating of 0 or 1, as defined by NFPA 704, for all of the following: health, flammability, and instability
- (4) Laboratories that are primarily manufacturing plants
- (5) Incidental testing facilities
- (6) Physical, electronic, instrument, laser, or similar laboratories that use chemicals only for incidental purposes, such as cleaning
- (7) Hazards associated with radioactive materials, as covered by NFPA 801
- (8) Laboratories that work only with explosive material, as covered by NFPA 495"

C.2.3 NFPA 54.

Paragraph 1.1.1.1 of NFPA 54 states: "This code is a safety code that shall apply to the installation of fuel gas piping systems, appliances, equipment, and related accessories as shown in [NFPA 54] 1.1.1.1(A) through 1.1.1.1(D).

C.2.3.1

Coverage of piping systems shall extend from the point of delivery to the appliance connections. For other than undiluted liquefied petroleum gas (LP-Gas) systems, the point of delivery shall be the outlet of the service meter assembly or the outlet of the service regulator or service shutoff valve where no meter is provided. For undiluted LP-Gas systems, the point of delivery shall be considered to be the outlet of the final pressure regulator, exclusive of line gas regulators where no meter is installed. Where a meter is installed, the point of delivery shall be the outlet of the meter.

C.2.3.2

The maximum operating pressure shall be 125 psi (862 kPa).

Exception No. 1: Piping systems for gas-air mixtures within the flammable range are limited to a maximum pressure of 10 psi (69 kPa).

Exception No. 2: LP-Gas piping systems are limited to 20 psi (140 kPa), except as provided in 5.5.1(6).

C.2.3.3

Requirements for piping systems shall include design, materials, components, fabrication, assembly, installation, testing, inspection, operation, and maintenance.

C.2.3.4

Requirements for appliances, equipment, and related accessories shall include installation, combustion, and ventilation air and venting."

C.2.4 NFPA 55.

Subsection 4.4.2 1.3.2 of NFPA 55 states: "This code shall not apply to the following items ~~(reference standards for some of which appear in Annex-L)~~ :

~~Portable LP-Gas appliances and equipment of all types that are not connected to a fixed fuel piping system~~

~~Installation of appliances such as brooders, dehydrators, dryers, and irrigation equipment used for agricultural purposes~~

~~Raw material (feedstock) applications except for piping to special atmosphere generators~~

~~Oxygen-fuel gas cutting and welding systems~~

~~Industrial gas applications using such gases as acetylene and acetylenic compounds, hydrogen, ammonia, carbon monoxide, oxygen, and nitrogen~~

~~Petroleum refineries, pipeline compressor or pumping stations, loading terminals, compounding plants, refinery tank farms, and natural gas processing plants~~

~~Large integrated chemical plants or portions of such plants where flammable or combustible liquids or gases are produced by chemical reactions or used in chemical reactions~~

~~LP-Gas installations at utility gas plants~~

- (1) [Off-site transportation of materials covered by this code](#)
- (2) [Storage, use, and handling of radioactive gases in accordance with NFPA 801](#)
- (3) [Use and handling of medical compressed gases at health care facilities in accordance with NFPA 99, except as specified in Chapter 17](#)
- (4) [Systems consisting of cylinders of oxygen and cylinders of fuel gas used for welding and cutting in accordance with NFPA 51](#)
- (5) [Flammable gases used as a vehicle fuel when stored on a vehicle](#)
- (6) [Storage, use, and handling of liquefied and nonliquefied compressed gases in laboratory work areas in accordance with NFPA 45](#)
- (7) [Storage, use, and handling of liquefied petroleum gases in accordance with NFPA 58](#)
- (8) [Storage, use, and handling of compressed gases within closed-cycle refrigeration systems complying with the mechanical code](#)
- (9) [Liquefied natural gas \(LNG\) installations storage at utility plants under NFPA 59A](#)

~~Fuel gas piping in electric utility power plants~~

~~Proprietary items of equipment, apparatus, or instruments such as gas generating sets, compressors, and calorimeters~~

~~LP-Gas equipment for vaporization, gas mixing, and gas manufacturing~~

~~LP-Gas piping for buildings under construction or renovations that is not to become part of the permanent building piping system—that is, temporary fixed piping for building heat~~

~~Installation of LP-Gas systems for railroad switch heating~~

- (10) [Installation of LP-Gas and compressed Compressed natural gas \(CNG\) systems on vehicles and LNG utilized as a vehicle fuel in accordance with NFPA 52](#)
- (11) [Compressed hydrogen gas \(GH₂\) or liquefied hydrogen gas \(LH₂\) generated, installed, stored, piped, used, or handled in accordance with NFPA 2 when there are no specific or applicable requirements in NFPA 55](#)
- (12) [Nonflammable mixtures of ethylene oxide with other chemicals](#)
- (13) [Ethylene oxide in chambers 10 scf \(0.283 Nm³\) or less in volume or for containers holding 7.05 oz \(200 g\) of ethylene oxide or less"](#)

~~Gas piping, meters, gas pressure regulators, and other appurtenances used by the serving gas supplier in distribution of gas, other than undiluted LP-Gas~~

~~Building design and construction, except as specified herein~~

~~Fuel gas systems on recreational vehicles manufactured in accordance with NFPA 1192~~

~~Fuel gas systems using hydrogen as a fuel~~

~~Construction of appliances"~~

C.2.5 NFPA 58.**C.2.5.1**

Section 1.1 of NFPA 58 states: "This code shall apply to the storage, handling, transportation, and use of liquefied petroleum gas (LP-Gas)."

C.2.5.2

Subsection 1.3.2 of NFPA 58 states: "This code shall not apply to the following:

- (1) Frozen ground containers and underground storage in caverns, including associated piping and appurtenances used for the storage of LP-Gas
- (2) Natural gas processing plants, refineries, and petrochemical plants
- (3) LP-Gas at utility gas plants (including refrigerated storage) (*see NFPA 59*)
- (4) Chemical plants where specific approval of construction and installation plans is obtained from the authority having jurisdiction
- (5) LP-Gas used with oxygen
- (6) The portions of LP-Gas systems covered by NFPA 54 (ANSI Z223.1), where NFPA 54 (ANSI Z223.1) is adopted, used, or enforced
- (7) Transportation by air (including use in hot air balloons), rail, or water under the jurisdiction of the DOT
- (8) Marine fire protection
- (9) Refrigeration cycle equipment and LP-Gas used as a refrigerant in a closed cycle
- (10) The manufacturing requirements for recreational vehicle LP-Gas systems that are addressed by NFPA 1192
- (11) Propane vehicle fuel dispensers located at multiple fuel refueling stations (*see NFPA 30A*)"

C.2.6 NFPA 400.

C.2.6.1

Subsection 1.1.2 of NFPA 400 states: "This code shall apply to the storage, use, and handling of the following hazardous materials in all occupancies and facilities:

- (1) Ammonium nitrate solids and liquids
- (2) Corrosive solids and liquids
- (3) Flammable solids
- (4) Organic peroxide formulations
- (5) Oxidizer — solids and liquids
- (6) Pyrophoric solids and liquids
- (7) Toxic and highly toxic solids and liquids
- (8) Unstable (reactive) solids and liquids
- (9) Water-reactive solids and liquids
- (10) Compressed gases and cryogenic fluids as included within the context of NFPA 55"

C.2.6.2

Paragraph 1.1.2.1 of NFPA 400 states: "The quantity and arrangement limits in this code shall not apply to facilities that use ammonium perchlorate in the commercial manufacture of large-scale rocket motors."

C.2.6.3

Paragraph 1.1.2.2 of NFPA 400 states: "This code shall not apply to the following:

- (1) Storage or use of hazardous materials for individual use on the premises of one- and two-family dwellings
- (2) Explosives or blasting agents, which are regulated by NFPA 495, and display fireworks, 1.3 G, which are regulated by NFPA 1124
- (3) Refrigerants and refrigerant oil contained within closed cycle refrigeration systems complying with the fire code and the mechanical code adopted by the jurisdiction
- (4) High hazard contents stored or used in farm buildings or similar occupancies and in remote locations for on-premises agricultural use
- (5) Corrosive materials in stationary batteries utilized for facility emergency power or uninterrupted power supply, or similar purposes, in accordance with NFPA 1
- (6) Aerosols complying with NFPA 30B
- (7) Consumer fireworks, 1.4G, complying with NFPA 1124
- (8) Corrosive materials displayed in original packaging in mercantile occupancies and intended for personal or household use or as building materials
- (9) Flammable and combustible liquids having no other physical or health hazard properties covered by this code
- (10) Organic peroxide formulations that are capable of detonation as manufactured or when unpackaged or in authorized shipping containers under conditions of fire exposure, when stored, manufactured, or used in accordance with NFPA 495
- (11) Combustible metals, as defined in NFPA 484
- (12) LP-Gas complying with NFPA 58 or NFPA 59
- (13) When approved, materials that have been satisfactorily demonstrated not to present a potential danger to public health, safety, or welfare, based upon the quantity or condition of storage
- (14) The off-site transportation of hazardous materials when in accordance with Department of Transportation (DOT) regulations"

C.2.7 NFPA 495.**C.2.7.1**

Section 1.1 of NFPA 495 states: "This code shall apply to the manufacture, transportation, storage, sale, and use of explosive materials."

C.2.7.2

Subsections 1.3.1 through 1.3.6 of NFPA 495 provide the following exemptions:

1.3.1: This code shall not apply to the transportation of explosive materials where under the jurisdiction of the U.S. Department of Transportation (DOT). It shall apply, however, to state and municipal supervision of compliance with U.S. DOT 49 CFR 100–199.

1.3.2: This code shall not apply to the transportation and use of military explosives by federal or state military agencies, nor shall it apply to the transportation and use of explosive materials by federal, state, or municipal agencies while engaged in normal or emergency performance of duties.

1.3.3: This code shall not apply to the manufacture of explosive materials under the jurisdiction of the U.S. Department of Defense (DOD). This code also shall not apply to the distribution or storage of explosive materials by military agencies of the United States, nor shall it apply to arsenals, navy yards, depots, or other establishments owned or operated by, or on behalf of, the United States.

1.3.4: This code shall not apply to pyrotechnics such as flares, fuses, and railway torpedoes. It also shall not apply to fireworks and pyrotechnic special effects as defined in NFPA 1123, NFPA 1124, and NFPA 1126.

1.3.5: This code shall not apply to model and high-power rocketry as defined in NFPA 1122, NFPA 1125, and NFPA 1127.

1.3.6: This code shall not apply to the use of explosive materials in medicines and medicinal agents in the forms prescribed by the United States Pharmacopeia or the National Formulary.

Annex D Alternate Care Sites

[Save As Word](#) [Show Revisions/Notes](#) [Show P/IPC's](#) [Quick Print](#)

This annex is not a part of the requirements of this NFPA document but is included for informational purposes only.

D.1 General.

The establishment of an alternate care site (ACS) is an integrated planning effort led by state and local municipalities and federal agencies. Additional reference material to assist with ACSs has been developed by state and local municipalities, federal agencies, and health care organizations.

D.1.1

An ACS is any building, structure, or portion thereof not currently being used for health care that is temporarily converted, constructed, or relocated for health care use during an urgent need in capacity to provide additional capability for an affected community. An ACS includes spaces such as, but not limited to, hotels, arenas, barracks and dorms, tents, closed hospitals, and modular units.

D.1.2

It is not the intent of the *Code* to require an ACS to comply with the change of occupancy provisions of Section 43.7.

D.2 Planning and Design.**D.2.1**

In the event of a public health emergency, the rapid establishment of ACSs is critical to reduce the burden on established hospitals and other medical facilities.

D.2.2

Site assessments are critical to identify potential facility opportunities and to evaluate their effectiveness to support health care delivery. Some considerations include the number and type of patients the ACS would support, the proximity to nearby hospitals, personnel staffing requirements, utility requirements, air filtration and handling capacities, safety features for emergency response and egress, staging of ambulances, and parking availability.

D.2.3

Potential ACSs that are freestanding buildings or portions thereof must be evaluated for compliance with Chapter 4 prior to any rehabilitation.

D.2.4

For those facilities requiring rehabilitation, modifications should be designed where practical in accordance with Chapter 18 and in coordination with the local authority having jurisdiction.

D.3 Construction.**D.3.1**

Any construction to support the establishment of an ACS must be coordinated with the end user, authorities having jurisdiction, and other federal, state, and municipal officials.

D.3.2

Design deliverables to support expedited construction should include, but are not limited to, the following for immediate review and approval: schedule, site plan, life safety drawings, emergency power diagrams, isolation exhaust system schematic design, utility chase configurations, plumbing drawings to include those supporting modular facilities, equipment details, and headwall details for patient beds.

D.3.3

Product submittals to support expedited construction should include, but are not limited to, the following for immediate review and approval: generators, automatic transfer switches, medical gas distribution equipment, and isolation exhaust systems.

D.3.4

Consideration should be given to alternate means for occupant safety and protection where strict compliance with code provisions for health care facilities cannot be met. Examples of these alternate means of protection could include the modification of automatic fire sprinkler system designs to provide protection for temporary interior spaces and other considerations for alternate water supply and delivery, areas of coverage, and design densities, which can be used to provide an acceptable level of safety.

D.3.5

Any construction adjacent to occupied areas must have interim life safety measures in place throughout the duration of construction and equipment outfitting of the facility prior to patient occupancy.

D.3.6

The local authority having jurisdiction must approve occupancy of the ACS prior to use.

D.4 Operations and Maintenance.**D.4.1**

Life safety systems should be maintained in compliance with applicable criteria. The user of the ACS, or their designated representative, should ensure compliance with all recognized codes, standards, and recognized practices to the extent possible.

D.4.2

Because the facility is considered temporary, a fire watch must be initiated at the first day of occupancy and be maintained through such occupancy as an ACS.

D.4.3

Inspection, testing, and maintenance of fire protection systems should comply with the applicable provisions of 4.16.2 of this *Code*. Where such compliance is impracticable due to accessibility restrictions as a result of clinical operations, an ACS is permitted to document noncompliance with such requirement for inspection or testing and reschedule accordingly when the ACS is accessible for servicing.

D.4.4

Building services should comply with Section 18.5 or 19.5.

D.4.5

Operating features should comply with Section 18.7 or 19.7.

D.5 Facilities Decommissioning.**D.5.1**

Upon completion as an ACS, the facility or portion thereof should be returned to its original existing occupancy classification as appropriate.

D.5.2

Utilities required to support ACS operations should be removed in accordance with 4.6.12 upon permanent deactivation of the ACS.

Annex E Informational References

Public Comment No. 47-NFPA 101-2022 [New Section after 12.1.7.1.2]

New section 12.1.7.1.3*

For assembly occupancies with fixed seating, the Occupant Load shall be calculated by taking the number of fixed seats and increasing it by 10%.

Add new annex note:

A.12.1.7.1.3 The additional 10% is intended to accommodate attendees in wheelchairs that do not take any of the fixed seats, people that stand in front of the room to address the assembly, and people that stand along walls during popular events. The egress system needs to address all of these common occurrences.

Statement of Problem and Substantiation for Public Comment

I submitted this proposal as a Public Input last cycle to Table 7.3.1.2 and it was rejected by the Means of Egress Committee. I re-submitted the proposal this cycle (see PI 323) and the Means of Egress Committee determined that it was not within their jurisdiction and sent it to you for deliberation. Unfortunately, it never got to you. Staff has suggested that I submit this Public Comment in order to make sure that you address this serious situation.

In the Means of Egress Committee's reason for rejection last cycle, they stated that, "No data has been provided to substantiate the proposed revision." That Committee Statement was incorrect. I supported the proposed change as a means to account for people in wheelchairs and people who stand up in front of the room that do not have a seat. The egress system needs to account for these people as well as the people in seats. The occupant load needs to include these people so that the egress capacity is actually adequate to handle them. In this cycle, I am adding the very common situation of people standing that don't have a seat at popular events. The Occupant Load needs to address all of these critical situations.

I find it hard to believe that the Means of Egress Committee does not believe that people in wheelchairs roll into assembly occupancies with fixed seats and do not move into one of the fixed seats, leaving it open for another person. It would seem to me that the Americans with Disabilities Act (ADA) specifically requires the Occupant Load to account for people in wheelchairs. Does the NFPA really need me to remind them that if people in wheelchairs are not counted in the occupant load that is used to determine egress capacity, these people can sue the NFPA?

I also find it hard to believe that the Means of Egress Committee doubts that people stand in front of lecture halls, theaters, and other assembly spaces without using a seat and that people stand along the walls in popular activities when all of the seats are taken. I have witnessed this occurring at NFPA conferences. Since the Occupant Load in the past has not been required to account for these people, should we have shut down the program and kicked people out? Or should we make sure that the Occupant Load is sufficient to handle the situations we know are going to occur? Do I really need to build a case that by only counting the fixed seats for the Occupant Load in a fixed seating assembly occupancy, you are ignoring the people that are not in seats?

Asking specifically about the 10% number is appropriate. The Means of Egress Committee never actually questioned this number, but I can share how it was obtained. The ADA Standards for Accessible Design require a certain number of spaces to be added to fixed seat assembly spaces based on the number of fixed seats. The requirements vary between 1% and 8% for spaces with more than 50 seats (meeting the definition of Assembly). Since the justification for this proposed change is more than just ADA acceptance (such as a professor standing up in front of a class), the 8% number was rounded up to 10% so that there would be one simple rule that would help everyone comply with the ADA and account for everyone who was reasonably going to be in the room.

Alternatively, the committee could refer to the ADA Standards For Accessible Design to figure out how many additional people they should add to the occupant load, but that would be more cumbersome for the user. The 10% number is reasonable, easy to calculate, and provides a number that helps everyone meet the ADA Standards for Accessible Design regardless of the number of seats.

Note that this has not been proposed for existing buildings because it might cause serious problems with door widths and stairwells, which are difficult to retrofit. It is hoped that by incorporating these changes in new situations that egress capacity will improve over time as new buildings replace old ones and renovations force compliance with newer versions of the Code.

Submitter Information Verification

Submitter Full Name: Kenneth Isman

Organization: University of Maryland

Street Address:

City:

State:

Zip:

Submittal Date: Tue Mar 22 12:34:09 EDT 2022

Committee: SAF-AXM

Committee Statement

Committee Action: Rejected but held

Resolution: The PC is rejected and held for the next revision cycle in accordance with 4.4.8.3.1(b) and (c) of the Regulations. Additional study is warranted. 12.1.7.1 states that occupant load is the greater of the value determined in accordance with Table 7.3.1.2 or the actual number of occupants. The recommended value of a 10% increase could be onerous for large assembly occupancies.

Public Comment No. 12-NFPA 101-2022 [Section No. 12.3.5]

12.3.5 Extinguishment Requirements.

12.3.5.1

The following assembly occupancies shall be protected throughout by an approved, automatic sprinkler system in accordance with 9.7.1.1(1) and electrically supervised in accordance with 9.7.2:

- (1) Dance halls
- (2) Discotheques
- (3) Nightclubs
- (4) Bars
- (5) Restaurants
- (6) Assembly occupancies with festival seating

12.3.5.2

Any building containing one or more assembly occupancies where the aggregate occupant load of the assembly occupancies exceeds 300 shall be protected by an approved, supervised automatic sprinkler system in accordance with Section 9.7 as follows (*see also 12.1.6, 12.2.6, 12.3.2, and 12.3.6*):

- (1) Throughout the story containing the assembly occupancy
- (2) Throughout all stories below the story containing the assembly occupancy
- (3) In the case of an assembly occupancy located below the level of exit discharge, throughout all stories intervening between that story and the level of exit discharge, including the level of exit discharge

12.3.5.3

The requirements of 12.3.5.2 shall not apply to the following:

- (1)* Assembly occupancies consisting of a single multipurpose room of less than 12,000 ft² (1115 m²) that are not used for exhibition or display and are not part of a mixed occupancy
- (2) Gymnasiums, skating rinks, and swimming pools used exclusively for participant sports with no audience facilities for more than 300 persons
- (3)* Locations in stadia and arenas as follows:
 - (a) Over the floor areas used for contest, performance, or entertainment, provided that the roof construction is more than 50 ft (15 m) above the floor level, and use is restricted to low fire hazard uses
 - (b) Over the seating areas, provided that use is restricted to low fire hazard uses
 - (c) Over open-air concourses where an approved engineering analysis substantiates the ineffectiveness of the sprinkler protection due to building height and combustible loading
- (4) Locations in unenclosed stadia and arenas as follows:
 - (a) Press boxes of less than 1000 ft² (93 m²)
 - (b) Storage facilities of less than 1000 ft² (93 m²) if enclosed with not less than 1-hour-fire-resistance-rated construction
 - (c) Enclosed areas underneath grandstands that comply with 12.4.10.5

12.3.5.4

Where another provision of this chapter requires an automatic sprinkler system, the sprinkler system shall be installed in accordance with 9.7.1.1(1) and electrically supervised in accordance with 9.7.2.

12.3.5.5

High-rise buildings shall comply with 12.4.5.

12.3.5.6

Where required by 12.1.6, buildings containing assembly occupancies shall be protected by an approved, supervised automatic sprinkler system in accordance with Section 9.7 throughout the stories specified by Table 12.1.6.

12.3.5.7 Portable Fire Extinguishers.

Portable fire extinguishers shall be installed in assembly occupancies in accordance with Section 9.9, unless otherwise permitted by one of the following:

- (1) The requirement of 12.3.5.7 shall not apply to seating areas.
- (2) The requirement of 12.3.5.7 shall not apply to floor areas used for contests, performances, or entertainment.
- (3) The requirement of 12.3.5.7 shall not apply to outside assembly occupancy areas.
- (4) Portable extinguishers shall be permitted to be located in secure locations accessible to staff.

Additional Proposed Changes

Public Comment No. 162-NFPA 101-2022 [Section No. 12.3.5.1]

12.3.5.1

The following assembly occupancies shall be protected throughout by an approved, automatic sprinkler system in accordance with 9.7.1.1(1) and electrically supervised in accordance with 9.7.2:

- (1) Dance halls
- (2) Discotheques
- (3) Nightclubs
- (4) Bars
- (5) Restaurants
- (6) Assembly occupancies with festival ~~seating~~ or unsecured seating

Statement of Problem and Substantiation for Public Comment

Unsecured seating, while undefined in NFPA 101, is often coupled with assembly venues with festival seating. Per Section 12.7.9.2, unsecured seating is allowed with festival seating, but the sprinkler threshold is only tied to festival seating. Having unsecured seats adds to the means of egress delay and occupant safety.

Submittal Date: Fri May 27 10:00:30 EDT 2022

Committee: SAF-AXM

Committee Statement

Committee Action: Rejected

Resolution: The proposed revision would apply to small spaces (fewer than 200 seats), which should continue to be exempt from sprinkler requirements. It is also noted that the identified related public inputs do not address the concept proposed in the public comment.

Public Comment No. 144-NFPA 101-2022 [Section No. 12.4.6]

12.4.6 Alcohol-Based-Hand-Rub Dispensers.

The installation and maintenance of Alcohol-based-hand-rub dispensers and the storage of alcohol-based hand rub solutions in accordance with 8.7.3.3 shall be permitted.

Statement of Problem and Substantiation for Public Comment

This is a necessary change because, our current health situation with the latest viral outbreak has led to an increased need to install alcohol based hand sanitizer within many different types of occupancies. Adding this pointer is consistent with the actions taken in First Draft by other NFPA 101 TC's to provide uniformity throughout the standard by including a pointer to the requirements related to ABHR dispensers and storage of ABHR replacement solutions that are found in Section 8.7.3.3 of this code.

Public Comment No. 221-NFPA 101-2022 [New Section after 12.4.12]

[12.4.13 Modular Rooms.](#)

[12.4.13.1](#)

[Modular rooms installed in indoor locations shall comply with Section 10.7.](#)

[12.4.13.2*](#)

[Where provided in areas covered by an occupant notification system, the audible and visible signals shall extend into the interior of the modular room.](#)

[A.12.4.13.2](#)

[Extending the audible and visible signals into the interior of a modular room is likely to require the addition of audible and visible notification appliances within the space. However if the attenuation of the alarm signal is negligible within the space, additional notification appliances may not be necessary to provide the required alarm notification.](#)

Statement of Problem and Substantiation for Public Comment

The committee statement for resolving Public Input No. 301 stated that it was unclear why the proposed language was under the exposition facility requirements. This public comment will locate the proposed requirements in a new Section 12.4.13 under 12.4 for special provisions for clarity. Additionally, this public comment simplifies the intent of Public Input No. 301 that where modular rooms are installed in areas covered by an occupant notification system the audible and visible signals must extend into the interior of the modular room. This public comment uses similar language that was approved with FR-6632 that created a new Section 36.4.4.12, 36.4.4.12.1 and 36.4.4.12.2. A new Annex section was added to clarify that extending the audible and visible signals into the interior of the modular does not necessarily require the installation of a notification appliances in the interior of the modular room.

Submittal Date: Wed Mar 09 13:54:09 EST 2022

Committee: SAF-AXM

Committee Statement

Committee Action: Rejected

Resolution: There is concern about the proposed allowance to permit electric vehicles to remain in service due to the potential fire hazard associated with batteries.

Public Comment No. 169-NFPA 101-2022 [New Section after 13.3.4.3.7]

13.3.4.4 Carbon Monoxide Detection

13.3.4.4.1 Existing assembly occupancies shall be provided with carbon monoxide detection and warning equipment in accordance with Section 9.12 in the locations specified as follows:

- (1) On the ceiling of rooms containing permanently installed fuel-burning appliances or fuel-burning fireplaces
- (2) Centrally located within occupiable spaces served by the first supply air register from permanently installed fuel-burning HVAC systems
- (3)* Centrally located within occupiable spaces adjacent to an attached garage

A.13.3.4.4.1(3) The intent is to require CO detectors in occupiable spaces immediately adjacent, vertically or horizontally, to attached garages, regardless of the presence of openings between the garage and the adjacent occupiable spaces. Other occupiable spaces that are not adjacent to the attached garage do not require CO detectors.

13.3.4.4.2 Carbon monoxide detectors as specified in 13.3.4.4.1 shall not be required in the following locations:

- (1) Garages
- (2) Occupiable spaces with attached garages that are open parking structures as defined in 3.3.282.8.4
- (3) Occupiable spaces with attached garages that are mechanically ventilated in accordance with the mechanical code

Statement of Problem and Substantiation for Public Comment

Existing assembly occupancies currently lack requirements for CO detection in buildings with known CO hazards, including fuel-burning appliances. A CO source in any building that is not monitored by installed CO detection devices is a life safety hazard to occupants. High level CO exposure carries the immediate risk of permanent brain injury and death. The addition of a requirement for CO detection for existing assembly occupancies will prevent further deaths and injuries.

To clarify, the proposed revision being resubmitted is identical to the requirement that is currently in place for new assembly occupancies. If this proposed revision is considered “too onerous to be required retroactively,” the committee is urged to develop what it considers to be an adequate requirement. Similar action was taken by other 101 committees who created first revisions, committee input, or formed task groups to create CO detection requirements within their respective chapters (see page 7 of the Correlating Committee First Draft Meeting Minutes https://www.nfpa.org/assets/files/AboutTheCodes/101/101_A2023_SAF_AAC_FD_Minutes_1_22.pdf)

With regard to installation cost, primary consideration must be given to the unique nature of CO exposure and the inability of occupants to sense when they are being exposed. To avoid injury and death, there is no safe alternative to installed CO detection devices.

Existing buildings arguably carry the highest risk of exposure due to aging gas appliances and exhaust systems.

Please act to prevent further delay in getting this critical baseline requirement for life safety in place to protect occupants of existing assembly occupancies.

Additional Substantiating Data

According to the recent NFPA Fire Protection Research Foundation report “CO Detection and Alarm Requirements: Literature Review,” NFIRS data documents thousands of nonfire CO-related incident calls to assembly occupancies in the U.S. (Figure 9, page 24)

Case examples, including the death of a restaurant manager in NY in 2014, detailed in this same report (Table 5, page 44) demonstrate how quickly these incidents can escalate and cause harm. This particular CO leak also resulted in injuries to 27 people including first responders.

Examples of CO incidents in assembly occupancies appear regularly in news accounts:
<https://thejenkinsfoundation.com/category/co-incidents/public-buildings/>

“The lack of an operating alarm can be seen in several of these case studies. Carbon monoxide is colorless and odorless. Its early onset symptoms are not unique or severe, which leads to mistaking them for something else or thinking there is not a serious problem. These symptoms can quickly escalate to severe symptoms, which usually revolves around the victim becoming unconscious. People do not self-rescue when they are able, because they do not realize that they should. If someone does realize there is problem, it is most likely too late. This common sequence combined with CO’s toxicity, and a general negligence, makes CO a very dangerous problem that can happen almost anywhere. Detection is the only safeguard against this problem.”

Resolution: The subject warrants further study and there is insufficient time during the meeting to fully address all of the committee's concerns. A task group is being appointed to further address the subject.

Public Comment No. 161-NFPA 101-2022 [Section No. 13.3.5.1]

13.3.5.1

Where the occupant load exceeds 100, the following assembly occupancies shall be protected throughout by an approved ~~-,supervised-~~ automatic sprinkler system in accordance with 9.7.1.1(1) and electrically supervised in accordance with 9.7.2 :

- (1) Dance halls
- (2) Discotheques
- (3) Nightclubs
- (4) Bars
- (5) Restaurants
- (6) Assembly occupancies with festival or unsecured seating

Statement of Problem and Substantiation for Public Comment

This public comment makes three changes, it adds:

- 1) The correlating language for automatic sprinkler installation and electric supervision as is done in other TCs.
- 2) Bars and restaurants to correlate with new assembly sprinkler requirements in 12.3.5.1. Without the same language in the existing chapter, could the newly sprinklered bar or restaurant be permitted to remove the system? This change also correlates to the retrofit requirement located in other fire codes.
- 3) Unsecured seating is added to the festival seating threshold. Unsecured seating is permitted with festival seating and adds in a factor that delays egress.

Statement: This is a necessary change because, our current health situation with the latest viral outbreak has led to an increased need to install alcohol based hand sanitizer within many different types of occupancies. Adding this pointer is consistent with the actions

taken in First Draft by other NFPA 101 TC's to provide uniformity throughout the standard by including a pointer to the requirements related to ABHR dispensers and storage of ABHR replacement solutions that are found in Section 8.7.3.3 of this code.

Public Comment No. 222-NFPA 101-2022 [New Section after 13.4.12]

13.4.13 Modular Rooms.

13.4.13.1

Modular rooms installed in indoor locations shall comply with Section 10.7.

13.4.13.2*

Where provided in areas covered by an occupant notification system, the audible and visible signals shall extend into the interior of the modular room.

A.13.4.13.2

Extending the audible and visible signals into the interior does not necessarily mean additional devices need to be installed. Where occupant notification systems installed to serve the area where the modular booth is to be located provide the required audible and visible signals within the modular booth additional devices are not necessary. If the occupant notification systems installed to serve the area where the modular booth is to be located do not provide the required audible and visible signals, then additional devices would be required to be installed within the modular booth.

Statement of Problem and Substantiation for Public Comment

The committee statement for resolving Public Input No. 302 stated that it was unclear why the proposed language was under the exposition facility requirements. This public comment will locate the proposed requirements in a new Section 13.4.13 under 13.4 for special provisions for clarity. Additionally, this public comment simplifies the intent of Public Input No. 302 that where modular rooms are installed in areas covered by an occupant notification system the audible and visible signals must extend into the interior of the modular room. This public comment uses similar language that was approved with FR-6632 that created a new Section 36.4.4.12, 36.4.4.12.1 and 36.4.4.12.2. A new Annex section was added to clarify that extending the audible and visible signals into the interior of the modular does not necessary require the installation of a device in the interior of the modular room.

Submittal Date: Wed Mar 09 13:58:29 EST 2022

Committee: SAF-AXM

Committee Statement

Committee Action: Rejected

Resolution: There is concern about the proposed allowance to permit electric vehicles to remain in service due to the potential fire hazard associated with batteries.

Public Comment No. 44-NFPA 101-2022 [Section No. A.3.3.203.2]

A.3.3.203.2 Assembly Occupancy.

Assembly occupancies might include the following:

- (1) Armories
- (2) Assembly halls
- (3) Auditoriums
- (4) Bowling lanes
- (5) Club rooms
- (6) College and university classrooms, 50 persons and over
- (7) Conference rooms
- (8) Courtrooms
- (9) Dance halls
- (10) Drinking establishments
- (11) Exhibition halls
- (12) Gymnasiums
- (13) Libraries
- (14) Mortuary chapels
- (15) Motion picture theaters
- (16) Museums
- (17) Passenger stations and terminals of air, surface, underground, and marine public transportation facilities
- (18) Places of religious worship
- (19) Pool rooms
- (20) Recreation piers
- (21) Restaurants
- (22) Skating rinks
- (23) Special amusement buildings, regardless of occupant load
- (24) Theaters

Assembly occupancies are characterized by the presence or potential presence of crowds with attendant panic hazard in case of fire or other emergency. They are generally open or occasionally open to the public, and the occupants, who are present voluntarily, are not ordinarily subject to discipline or control. Such buildings are ordinarily not used for sleeping purposes. Special conference rooms, snack areas, and other areas incidental to, and under the control of, the management of other occupancies, such as offices, fall under the 50-person limitation.

Restaurants and drinking establishments with an occupant load of fewer than 50 persons should be classified as mercantile occupancies.

For special amusement buildings, see 12.4.9 and 13.4.9.

Additional Proposed Changes

101_A2023_SAF_AAC_CCN_44.pdf	101_Correlating Committee Note No. 44	

Statement of Problem and Substantiation for Public Comment

NOTE: The following CC Note No. 44 appeared in the First Draft Report on First Revision No. 6600. Consider adding new paragraph before last paragraph for consistency with corresponding language in A.6.1.2.1: "Occupancy of any room or space for assembly purposes by fewer than 50 persons in another occupancy, and incidental to such other occupancy, should be classified as part of the other occupancy and should be subject to the provisions applicable thereto."

Committee Statement

Committee Action: Rejected but see related SR

Resolution: [SR-6598-NFPA 101-2022](#)

Statement: The revision incorporates the language suggested by the correlating committee. It also deletes 'motion picture theaters' since 'theaters' are already listed, and also adds 'nightclubs', which are also assembly occupancies. The committee requests that the correlating committee make the same changes to the corresponding language in A.6.1.2.1, for which the Technical Committee on Fundamentals of Safety to Life is responsible.

Public Comment No. 80-NFPA 101-2022 [Section No. A.3.3.255.1]

A.3.3.255.1 Festival Seating.

Festival seating describes situations in assembly occupancies where ~~live entertainment events are held that are expected to result in overcrowding and~~ high audience density that can compromise public safety. ~~It is not the intent to apply the term *festival seating* to exhibitions; sports events; conventions; and bona fide political, religious, and educational events. Assembly occupancies with 15 ft² (1.4 m²) or more per person should not be considered festival seating.~~ is reasonably foreseeable. Festival seating might require greater attention to crowd management than reserved seating.

Statement of Problem and Substantiation for Public Comment

The Task Group assigned to this change met 4/29/2022 and discussed the purpose and originally proposed change. The intent of the originally proposed change was to eliminate wording and language that was prejudicial against festival seating and potentially inflammatory. The revised language focuses on festival seating potential for higher crowd density situations and need for effective crowd management techniques to be applied. It also removes language suggesting other types of events were not applicable to high crowd density situations as might occur with festival seating.

The definition now focuses on potential high crowd density situation and the need for effective crowd management.

TO: Technical Committee on Assembly Occupancies

FROM: Jenny Depew, *Committee Administrator*

DATE: November 8, 2022

SUBJECT: NFPA 101® Second Draft TC FINAL Ballot Results (A2023)

According to the final ballot results, all ballot items received the necessary affirmative votes to pass ballot.

31 **Members Eligible to Vote**

4 **Members Not Returned** (*Alhajri, Patterson, Ramseur, Tubbs*)

The attached report shows the number of affirmative, negative, and abstaining votes as well as the explanation of the vote for **each** revision.

To pass ballot, **each** revision requires: (1) a simple majority of those eligible to vote and (2) an affirmative vote of $\frac{2}{3}$ of ballots returned. See Sections 3.3.4.3.(c) and 4.3.10.1 of the ***Regulations Governing the Development of NFPA Standards***.

Second Revision No. 6593-NFPA 101-2022 [Section No. 12.3.5.1]

12.3.5.1

The following assembly occupancies shall be protected throughout by an approved, electrically supervised automatic sprinkler system in accordance with 9.7.1.1(1) and ~~electrically supervised in accordance with 9.7.2~~ :

- (1) Dance halls
- (2) Discotheques
- (3) Nightclubs
- (4) Bars
- (5) Restaurants
- (6) Assembly occupancies with festival seating

Submitter Information Verification

Committee: SAF-AXM

Submittal Date: Mon Aug 08 13:15:08 EDT 2022

Committee Statement

Committee Statement: The revision responds to CCN-10 and should meet the intent of the correlating committee. It clarifies that the sprinkler system must be electrically supervised and not the assembly occupancy.

Also being on the Fire Protection Features Committee, just feel this should be referencing NFPA 1 or at least NFPA 30. I will yield to the decision of the Technical Correlating Committee.

Second Revision No. 6596-NFPA 101-2022 [Section No. 13.3.5.1]

13.3.5.1

Where the occupant load exceeds 100, the following assembly occupancies shall be protected throughout by an approved, electrically supervised automatic sprinkler system in accordance with 9.7.1.1(1) and 9.7.2 :

- (1) Dance halls
- (2) Discotheques
- (3) Nightclubs
- (4) Assembly occupancies with festival seating

Submitter Information Verification

Committee: SAF-AXM

Submittal Date: Mon Aug 08 14:50:05 EDT 2022

Committee Statement

Committee Statement: The revision revises the supervision language for consistency with 12.3.5. The proposed addition of bars, restaurants, and unsecured seating are not incorporated because such retroactive requirements were not technically justified. Ch. 4 does not allow the removal of existing life safety features that are required for new occupancies.

Second Revision No. 6598-NFPA 101-2022 [Section No. A.3.3.203.2]

A.3.3.205.2 Assembly Occupancy.

Assembly occupancies might include the following:

- (1) Armories
- (2) Assembly halls
- (3) Auditoriums
- (4) Bowling lanes
- (5) Club rooms
- (6) College and university classrooms, 50 persons and over
- (7) Conference rooms
- (8) Courtrooms
- (9) Dance halls
- (10) Drinking establishments
- (11) Exhibition halls
- (12) Gymnasiums
- (13) Libraries
- (14) Mortuary chapels
- ~~Motion picture theaters~~
- (15) Museums
- (16) Nightclubs
- (17) Passenger stations and terminals of air, surface, underground, and marine public transportation facilities
- (18) Places of religious worship
- (19) Pool rooms
- (20) Recreation piers
- (21) Restaurants
- (22) Skating rinks
- (23) Special amusement buildings, regardless of occupant load
- (24) Theaters

Assembly occupancies are characterized by the presence or potential presence of crowds with attendant panic hazard in case of fire or other emergency. They are generally open or occasionally open to the public, and the occupants, who are present voluntarily, are not ordinarily subject to discipline or control. Such buildings are ordinarily not used for sleeping purposes. Special conference rooms, snack areas, and other areas incidental to, and under the control of, the management of other occupancies, such as offices, fall under the 50-person limitation.

Restaurants and drinking establishments with an occupant load of fewer than 50 persons should be classified as mercantile occupancies.

Occupancy of any room or space for assembly purposes by fewer than 50 persons in another occupancy, and incidental to such other occupancy, should be classified as part of the other occupancy and should be subject to the provisions applicable thereto.

For special amusement buildings, see 12.4.9 and 13.4.9.

Committee Comment No. 6619-NFPA 101-2022 [Section No. 32.2.3.5.3.2]

This was a Second Revision that has been modified or deleted as the result of Second Correlating Revision:

32.2.3.5.3.2*

An automatic sprinkler system with a 30-minute water supply, and complying with all of the following requirements and with NFPA 13D 9.7.1.1(2) shall be permitted:

- (1) All habitable areas ~~, closets, roofed porches, roofed decks, and roofed balconies shall be sprinklered, and closets shall be sprinklered.~~
- (2) Where a roof, deck, or balcony greater than 4 ft (1.2 m) wide is provided above, sprinklers shall be installed to protect attached exterior balconies, attached exterior decks, and ground floor patios directly serving dwelling units in buildings of Type V construction. [13R: 6.6.5.1]
- (3) Facilities with more than eight residents shall be treated as two-family dwellings with regard to water supply.

Submitter Information Verification

Committee: SAF-BCF

Submittal Date: Tue Aug 16 16:42:18 EDT 2022

Committee Statement

Committee Statement: The committee felt it was more appropriate to use language from NFPA 13R regarding exterior projections. This revision ensures the requirement when using an NFPA 13D system is no more stringent than when using a 13R system.

The pointer to NFPA 13D was replaced with 9.7.1.1(2) to align with the Correlating Committee direction on NFPA 13 references.

Negative with Comment

Knippa, Kevin

The proposed language does not clarify the requirement. A residential board and care occupancy does not contain dwelling units and is not a residential occupancy. Even if the proposed language can be interpreted to apply to a board and care occupancy, the proposed language does not protect outdoor covered areas that do not directly serve dwelling units (whatever that means in a non-residential occupancy).

Public Comment No. 153-NFPA 101-2022 [Section No. 32.2.3.5.2]

32.2.3.5.2*

In conversions, sprinklers shall not be required in small board and care homes serving eight or fewer residents when all occupants have the ability as a group to move reliably to a point of safety within 3 minutes.

In conversions, an automatic sprinkler system installed in accordance with NFPA 13D shall be provided

Statement of Problem and Substantiation for Public Comment

In Florida a "Certificate of Occupancy" is required before occupants can occupy the structure, therefore the 3 minute threshold is not reasonable, nor the ability to move 8 people having little to no self-preservation due in part to Florida's elderly population and combustible construction type used mostly in single family home conversions

Committee Statement

Committee Action: Rejected but held

Resolution: The proposed requirement is considered new material. It's unclear to the committee if the existing text is being removed.

Public Comment No. 212-NFPA 101-2022 [Section No. 32.2.3.5.3.1]

32.2.3.5.3.1*

In buildings four or fewer stories in height and not exceeding 60 ft (18.3 m) in height above grade plane, systems in accordance with NFPA 13R shall be permitted. All habitable areas, closets, ~~roofed porches, roofed decks, and roofed balconies shall be sprinklered.~~ and exterior projections exceeding 4 ft (1.2 m) in width shall be sprinklered.

A.32.2.3.5.3.1

Exterior projections are defined by NFPA 13 as follows: an extension beyond an exterior wall capable of collecting heat below. The reference to NFPA 13 applies to location of sprinklers only.

32.2.3.5.3.1.1*

Sprinklers shall be permitted to be omitted from below exterior projections in accordance with NFPA 13.

A.32.2.3.5.3.1.1

NFPA 13, in sections 9.2.3.1, 9.2.3.2 and 9.2.3.3 outlines situations where sprinklers can be omitted from below exterior projections. The reference to NFPA 13 applies to location of sprinklers only.

Statement of Problem and Substantiation for Public Comment

During the First Draft meeting, several public inputs were submitted with the intent further defining the width of the roof above porches, decks, and balconies. These areas are required to be provided with sprinklers (beyond the requirements of NFPA 13R) by this section. In the 2022 edition of NFPA 13 and NFPA 13R, a minimum roof depth of 4 ft was adopted to requires sprinklers below. Additionally, a new definition of exterior projections was added to the installation standards.

A task group was formed to address these public inputs (PI-196 and PI-197). The task group agreed with the concept of applying the terminology “exterior projection” and the minimum roof width of 4 ft. Additionally the task group felt that as the requirement of this section goes beyond those of NFPA 13 and NFPA 13D and as NFPA 13 outlines situations where sprinkler protection is not required under these projection, NFPA 101 should also allow the same omission as does NFPA 13.

Committee Statement

Committee Action: Rejected but see related SR**Resolution:** [SR-6618-NFPA 101-2022](#)**Statement:** NFPA 13R already sufficiently addresses exterior projections.

The pointer to NFPA 13R was replaced with 9.7.1.1(3) to align with the Correlating Committee direction on NFPA 13 references.

Public Comment No. 216-NFPA 101-2022 [Section No. 32.2.3.5.3.2]

32.2.3.5.3.2*

An automatic sprinkler system with a 30-minute water supply, and complying with all of the following requirements and with NFPA 13D shall be permitted:

- (1) All habitable areas, closets, ~~roofed porches, roofed decks, and roofed balconies~~ and exterior projections exceeding 4 ft (1.2 m) in width shall be sprinklered.
- (2) Facilities with more than eight residents shall be treated as two-family dwellings with regard to water supply.

32.2.3.5.3.2.1*

Sprinklers shall be permitted to be omitted from below exterior projections in accordance with NFPA 13.

A.32.2.3.5.3.2.1

NFPA 13, in sections 9.2.3.1, 9.2.3.2 and 9.2.3.3 outlines situations where sprinklers can be omitted from below exterior projections. The reference to NFPA 13 applies to location of sprinklers only.

Statement of Problem and Substantiation for Public Comment

During the First Draft meeting, several public inputs were submitted with the intent further defining the width of the roof above porches, decks, and balconies. These areas are required to be provided with sprinklers (beyond the requirements of NFPA 13R) by this section. In the 2022 edition of NFPA 13 and NFPA 13R, a minimum roof depth of 4 ft was adopted to requires sprinklers below. Additionally, a new definition of exterior projections was added to the installation standards.

A task group was formed to address these public inputs (PI-196 and PI-197 in NFPA 101 and PI-92 and PI-93 in NFPA 5000). The task group agreed with the concept of applying the terminology “exterior projection” and the minimum roof width of 4 ft. Additionally the task group felt that as the requirement of this section goes beyond those of NFPA 13R and NFPA 13D and as NFPA 13 outlines situations where sprinkler protection is not required under these projection, NFPA 101 should also allow the same omission as does NFPA 13.

Note an additional PI was submitted to annex section A32.2.3.5.3.2.

Committee Statement

Committee Action: Rejected but see related SR**Resolution:** SR-6619-NFPA 101-2022**Statement:** The committee felt it was more appropriate to use language from NFPA 13R regarding exterior projections. This revision ensures the requirement when using an NFPA 13D system is no more stringent than when using a 13R system.

The pointer to NFPA 13D was replaced with 9.7.1.1(2) to align with the Correlating Committee direction on NFPA 13 references.

Public Comment No. 209-NFPA 101-2022 [New Section after 32.2.3.5.7.2]

32.2.3.5.7.3

The provisions of 32.2.3.5.7.1 and 32.2.3.5.7.2 shall be permitted to be applied separately to portions of the attic separated by partitions having a minimum 1/2-hour fire resistance rating and extend from the ceiling to the underside of the floor or roof deck above.

Statement of Problem and Substantiation for Public Comment

During the First draft meeting, several public inputs were submitted with the intent of separating the portion of an attic that contains fuel-fired equipment or storage and allow the portion not used for living purpose, storage or fuel-fired equipment to follow the provisions of 32.2.3.5.7.2 and allow the separated portion that is used for storage or contains fuel fired storage to be equipped with sprinklers in accordance with 32.2.3.5.7.1.

A task group was formed to address these public inputs (PI-104, PI-106, PI 198, PI-205, PI-94). The task group agreed with the concept of applying the protection requirements separately when the attic is property separated and determined that a partition (wall to ceiling) with ½ hour fire resistance rating would be adequate.

Public Comment No. 190-NFPA 101-2022 [New Section after 32.2.3.5.8.15]

32.2.3.5.9 Portable Fire Extinguishers.

Portable fire extinguishers shall be provided in accordance with Section 9.9.

Statement of Problem and Substantiation for Public Comment

A 2013 NFPA Report: "U.S. Experience with Sprinklers" reports that there were 48,460 reported structure fires annually in buildings equipped with sprinkler systems between 2007-2011, and 40,440 (83 percent) never grew large enough to activate the system. Based on this report alone, it's clear that people are reacting to small fires and extinguishing them prior to sprinkler activation. Limiting a fire to the smallest area within a building is a sensible aspiration.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Under the Scope of the Life Safety Code, Subsection 1.1.2 entitled, "Danger to Life from Fire," the Code states the following: "The Code addresses those construction, protection, and occupancy features necessary to minimize danger to life from the effects of fire, including smoke, heat, and toxic gases created during a fire." Further, it states in Subsection 1.1.4 entitled, "Other Fire-Related Considerations," the following: "The Code addresses other considerations that are essential to life safety in recognition of the fact that life safety is more than a matter of egress. The Code also addresses protective features and systems, building services, operating features, maintenance activities, and other provisions in recognition of the fact that achieving an acceptable degree of life safety depends on additional safeguards to provide adequate egress time or protection for people exposed to fire."

Studies of building fires indicate that occupants typically exhibit altruistic behavior toward others. Human response to a threatening situation might follow one of a variety of behaviors. Individuals might choose to investigate, sound an alarm, assist with rescue, seek help, or flee. Such actions constitute normal behavior, even when taken collectively. Most people avoid direct contact with a fire while undertaking another action.

There is a fundamental discrepancy between official/policy assumptions and the public in relation to priorities in the event of a fire. Government and professionals focus on avoiding injuries and see that as the sole aspiration, in the pursuit of which everything else is secondary. In contrast, the public have a wide and largely unrecognized range of priorities when encountering a fire, based on their individual circumstances. These include: the avoidance of embarrassment/inconvenience; mitigating the impact of damage to the property, e.g. avoiding the risk of being unable to remain in their place of business; and their concern for the wellbeing of other people. Each are invested by different aspirations in the fire safety ecosystem.

A desire to achieve their self-appointed tasks is a strong motivation for the public's behavior when encountering a fire. For most, this will involve an active response of on average five actions, although for some it will be as many as 11. This includes investigating the initial cues and tackling the fire, often using improvised means. They are usually successful in doing so, with 70% to 80% of fires dealt with by the public without requiring professional assistance. It is important to note that in doing so, they are willingly acting against official advice and are not being coerced into this. The evidence shows the public to be effective and capable in tackling fires, even in the absence of any professional support, or often without specialized equipment. This is supported by the pioneering studies of the public experience of dwelling fires undertaken by Bryan (1977) and Wood (1972) in the USA and UK, respectively. Their studies supported by their findings that the public did undertake a range of self-appointed tasks including investigating and tackling fires. Recent studies have confirmed similar findings and these behaviors appear consistent over time.

The evidence further identifies that the public is willing and will accept minor consequences in their pursuit of achieving personal humanistic priorities and instinct. Concern for people, pets and possessions are strong and established drivers of behavior in the event of a fire. Therefore, this should be no surprise to see it as an influential feature of most individual's response to a fire.

A 2003 UK survey found that across all categories of location, extinguishers were successful in extinguishing 79.9% of fires. Note: Private houses accounted for only 3.3% of extinguisher use. It reported that 58.6% were operated by trained staff, 36.4% were operated by untrained staff and in 5% of incidents, this was unknown.

Data from the National Association of Fire Equipment Distributors (NAFED) provides even more robust validation of the influence of fire extinguishers as used by 'ordinary civilians. Their research and data indicate, "Of 13,221 fire incidents reported, portable fire extinguishers successfully extinguished 12,505 fires (95%)." (NAFED 2010: 2) The combined results of the 34 years of data are based on the performance of 32,756 fire extinguishers used on 13,453 incidents.

Fortunately, most people encountering a fire will avoid any injury or will be exposed to a low, and often considered risk of a minor injury at worst. This is not a matter of luck but due to a combination of their own abilities and to the low level of risk presented by most fires individuals would choose to fight at the incipient stage. A 2015 study identified that there was a disconnect between the fire service/government and the public in terms of what they referred to as 'risk tolerance'. This was most evident in attitude to injuries. Official policy seems to place avoidance of any injury as its highest priority and assumes this to also be the public's main motivation and enough to dictate any response to the discovery of a fire. However, the same study found that almost all those who incurred a minor injury accepted it as a reasonable cost in relation to pursuing or achieving their personal priorities. Further, they stated, in hindsight, they would do the same again.

It should be noted that numerous every day and discretionary activities carry similar or higher levels of risk to those resulting from using an extinguisher. Do-It-Yourself and sport for example are frequently responsible for injuries or even fatalities. In response, the government and industry seek to help make products safer or provide advice. This is preferred to denying people the option to participate in either activity by withdrawing public access to tools or sports equipment. The benefits achieved by the public using extinguishers are significant, given the potential for a fire to otherwise lead to detrimental and life-changing outcomes. A low and calculated level of personal risk willingly accepted by an individual tackling a fire can avoid, or reduce, a much higher risk to others should they ignore the fire and allow it to develop. Where current guidance discourages the provision of extinguishers in public spaces, this policy is neither supported by the evidence or justifiable through a consensus from the public. Rather it is imposed on them and is inconsistent with other approaches to public health.

The fire service's response time to structure fires has increased significantly over the past 25 years for several reasons like traffic, infrastructures, and lately staffing. Hence, the ability for the early interventions of the public are likely to be the most significant determinant of the outcome of a fire event. Most people do respond appropriately, and the literature confirms that they do not panic. Typically, most people are at risk of a minor injury at worst, due to the low risk from the fire and their own ability to assess and act in accordance with the situation.

A significant amount of data has been collected to support the requirement for portable extinguishers,

including: WPI/EKU Study: "Ordinary People and the Effective Operation of Fire Extinguishers", which clearly showed that the vast majority of people who have never used an extinguisher can operate one safely and effectively. This willingness of the public to accept minor injuries to protect individuals, the facility or their personal property is supported by literature and data and shows these to be well established behaviors which policy makers need to work with, rather than against. Reflecting official policy, national and local fire safety messaging has, for some time, urged the public, on discovering a fire in the home, to "Get out, stay out", "Don't put yourself at risk" and 'Leave it to the professionals.' This paternalistic messaging confirms the government policy makers and fire services' belief that a professional response is the only intervention capable of safely tackling fires. Again, this starkly contrasts with the reality that between 70% and 80% of dwelling fires are tackled effectively and at low risk, by the public. The policy also fails to accord with the public who have been shown to be tolerant, or accepting, of the incurrence of minor injuries in pursuit of their personal priorities.

Surveys from the National Association of Fire Equipment Distributors (NAFED) in America reveals the same trend of public firefighting, with even higher percentages not needing the fire service. "In both the 1979 and 1985 surveys, the fire department was only called for 13% of the reported fires. In the 1996 survey, the fire department was called in 24% of the reported fires. However, in the 2010 survey the number dropped to 17% of the time'. And 'These results are not unique to NAFED surveys. A 1978 publication by the U.S. Department of Commerce stated that about 90% of fires in households are not reported, based on their survey of 33,000 fires." (NAFED, 2010: 9)

The public are likely to encounter a fire that is relatively small and often contained to the item first ignited. They are often the ones present when fire starts. In summary, there is a significant difference between official assumptions/guidance and actual public behavior. However, the government and FRS seek to deter this behavior, and, in singularly promoting there, "Get out' message," and remove the simple yet potential life saving devices in sprinklered buildings.

A recent study also showed that the public do not just get out, with 49% never leaving the property during the fire. While this may surprise or concern many professionals, it is likely to be explained by a difference between the fire as perceived by professionals and the lived experience of the public. There is nothing to suggest that the public routinely take unnecessary risks. A more likely explanation is that the fire was small and not sufficiently well-developed to pose an imminent injury or life threat. As such, they were able to remain in the premises safely and relatively comfortably, which is supported by the evidence in relation to the majority of fires not spreading beyond the item first ignited or the room of origin. Inclement weather or other factors may also make remaining in the premises a safer or more comfortable option. Fires, like other emergencies, must also be understood in human terms.

The concept of trading off portable extinguishers in sprinklered buildings has been largely abandoned by fire protection principles. NFPA 10 states in subsection 5.1.2, "The selection of extinguishers shall be independent of whether the building is equipped with automatic sprinklers, standpipe and hose, or other fixed protection equipment." Other codes, and other occupancy chapters have abandoned this concept in recognition of the fact that portable extinguishers are a valuable, cost-effective layer of fire protection, and are intended for a different purpose than sprinklers. Recognition of the valuable role of extinguishers came from a 2003 report which concluded, 'Fire extinguishers are designed to prevent relatively minor incidents becoming major conflagrations.' It is, of course, difficult to prove how many and which fires would have developed to pose a serious risk if not tackled and contained early on. Events such as the Grenfell fire are a reminder of the consequences when this happens.

The National Fire Codes of both NFPA and the ICC require portable fire extinguishers in all occupancy classes including storage which addresses property protection and property loss as well as, the safety of the building occupants. Fire safety is grounded in the engineering discipline which brings many strengths to codes requirements, but it is insufficient, and fire safety effectiveness is limited by ignoring the social sciences of human behavior. It is important to appreciate that while different to official assumptions and desire for evacuation, research shows the public's priorities to be rational and appropriate. The public's experience of fire is vastly different to that of the professionals involved in the planning for and responding to fire.

Official policy and attitudes of the Technical Committee are most singularly directed at avoiding the risk when the public encounters a fire. This is well meaning but the research has shown that this DOES NOT I REPEAT DOES NOT align with the public's attitude or the ability of the general public. The belief that 'undesirable' behavior can be changed by advice, campaigns or other measures has been

shown to be inaccurate. The paternalistic approach by which government and the building safety regulatory sector seek to change human behavior by removing proven and effective appliances such as portable fire extinguishers is WRONG. However, the building safety regulatory sector continue this approach despite the evidence that public behaviors are safe, effective, and largely unaltered by current guidance and campaigns rather than providing appropriate safety devices for use by the public. A portable fire extinguisher is an effective item of fire protection which allows for small fires to be tackled by the occupants of a building and saves 100s of thousands of dollars in property loss.

Concerns have been indicted regarding the requirement for training. Training in the use of extinguishers is an important issue and one in which opinion appears more influential than the evidence. Whether purchased for a private dwelling or provided through regulatory processes, there is no mandatory requirement for training to use an extinguisher, and studies do not reveal training to be a requirement for their safe or effective use. In fact, the available data and studies demonstrate the opposite to be the case.

The Technical Committee should also note that portable fire extinguishers are designed for the novice user. Although, training is recommended for proper use and technique and is wide available through a variety of resources including at online training; there are no specified training requirements even under OSHA unless that is an assigned duty employee by the employer. The proposed requirement is intended as a provision for layered fire protection for the general public and employees for general safety.

Although there is limited data available related to extinguisher use since the removal of portable fire extinguishers in the NIFRS data field, there is little to no data supporting the removal of portable fire extinguishers and sole reliance on building fire sprinkler systems. Limiting a fire to the smallest area within a building is a sensible aspiration.

Cost has been another point of contention. A study by Richard Bukowski in 2014, the life cycle cost of portable fire extinguishers was determined to be between one and a half and four cents per foot annually; if coverage could be maximized to that allowable by code, the cost drops to between a half cent and one cent per foot annually. It's unlikely that any other layer of fire protection is so cost-effective.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Action:** Rejected

Resolution: The focus of the Life Safety Code should be on evacuation and should not encourage occupants, especially staff, to use extinguishers in lieu of assisting residents with evacuation.

Public Comment No. 191-NFPA 101-2022 [New Section after 32.2.3.5.8.15]

32.2.3.5.9 Portable Fire Extinguishers.

Portable fire extinguishers shall be provided in accordance with Section 9.9, unless permitted by the following:

- (1) Access to portable fire extinguishers shall be permitted to be locked.
- (2) Portable fire extinguishers shall be permitted to be located at staff locations only.

Statement of Problem and Substantiation for Public Comment

A 2013 NFPA Report: "U.S. Experience with Sprinklers" reports that there were 48,460 reported structure fires annually in buildings equipped with sprinkler systems between 2007-2011, and 40,440 (83 percent) never grew large enough to activate the system. Based on this report alone, it's clear that people are reacting to small fires and extinguishing them prior to sprinkler activation. Limiting a fire to the smallest area within a building is a sensible aspiration.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. The policy also fails to accord with the public who have been shown to be tolerant, or accepting, of the incurrence of minor injuries in pursuit of their personal priorities.

Surveys from the National Association of Fire Equipment Distributors (NAFED) in America reveals the same trend of public firefighting, with even higher percentages not needing the fire service. "In both the 1979 and 1985 surveys, the fire department was only called for 13% of the reported fires. In the 1996 survey, the fire department was called in 24% of the reported fires. However, in the 2010 survey the number dropped to 17% of the time'. And 'These results are not unique to NAFED surveys. A 1978 publication by the U.S. Department of Commerce stated that about 90% of fires in households are not reported, based on their survey of 33,000 fires." (NAFED, 2010: 9)

The public are likely to encounter a fire that is relatively small and often contained to the item first ignited. They are often the ones present when fire starts. In summary, there is a significant difference between official assumptions/guidance and actual public behavior. However, the government and FRS seek to deter this behavior, and, in singularly promoting there, "Get out' message," and remove the simple yet potential life saving devices in sprinklered buildings.

A recent study also showed that the public do not just get out, with 49% never leaving the property during the fire. While this may surprise or concern many professionals, it is likely to be explained by a difference between the fire as perceived by professionals and the lived experience of the public. There is nothing to suggest that the public routinely take unnecessary risks. A more likely explanation is that the fire was small and not sufficiently well-developed to pose an imminent injury or life threat. As such, they were able to remain in the premises safely and relatively comfortably, which is supported by the evidence in relation to the majority of fires not spreading beyond the item first ignited or the room of origin. Inclement weather or other factors may also make remaining in the premises a safer or more comfortable option. Fires, like other emergencies, must also be understood in human terms.

The concept of trading off portable extinguishers in sprinklered buildings has been largely abandoned by fire protection principles. NFPA 10 states in subsection 5.1.2, "The selection of extinguishers shall be independent of whether the building is equipped with automatic sprinklers, standpipe and hose, or other fixed protection equipment." Other codes, and other occupancy chapters have abandoned this concept in recognition of the fact that portable extinguishers are a valuable, cost-effective layer of fire protection, and are intended for a different purpose than sprinklers. Recognition of the valuable role of extinguishers came from a 2003 report which concluded, 'Fire extinguishers are designed to prevent relatively minor incidents becoming major conflagrations.' It is, of course, difficult to prove how many and which fires would have developed to pose a serious risk if not tackled and contained early on. Events such as the Grenfell fire are a reminder of the consequences when this happens.

The National Fire Codes of both NFPA and the ICC require portable fire extinguishers in all occupancy classes including storage which addresses property protection and property loss as well as, the safety of the building occupants. Fire safety is grounded in the engineering discipline which brings many strengths to codes requirements, but it is insufficient, and fire safety effectiveness is limited by ignoring the social sciences of human behavior. It is important to appreciate that while different to official assumptions and desire for evacuation, research shows the public's priorities to be rational and appropriate. The public's experience of fire is vastly different to that of the professionals involved in the planning for and responding to fire.

Official policy and attitudes of the Technical Committee are most singularly directed at avoiding the risk when the public encounters a fire. This is well meaning but the research has shown that this DOES NOT I REPEAT DOES NOT align with the public's attitude or the ability of the general public. The belief that 'undesirable' behavior can be changed by advice, campaigns or other measures has been shown to be inaccurate. The paternalistic approach by which government and the building safety regulatory sector seek to change human behavior by removing proven and effective appliances such as portable fire extinguishers is WRONG. However, the building safety regulatory sector continue this approach despite the evidence that public behaviors are safe, effective, and largely unaltered by current guidance and campaigns rather than providing appropriate safety devices for use by the public. A portable fire extinguisher is an effective item of fire protection which allows for small fires to be tackled by the occupants of a building and saves 100s of thousands of dollars in property loss.

Concerns have been indicted regarding the requirement for training. Training in the use of extinguishers is an important issue and one in which opinion appears more influential than the evidence. Whether purchased for a private dwelling or provided through regulatory processes, there is no mandatory requirement for training to use an extinguisher, and studies do not reveal training to be a requirement for their safe or effective use. In fact, the available data and studies demonstrate the opposite to be the case.

The Technical Committee should also note that portable fire extinguishers are designed for the novice user. Although, training is recommended for proper use and technique and is wide available through a variety of resources including at online training; there are no specified training requirements even under OSHA unless that is an assigned duty employee by the employer. The proposed requirement is intended as a provision for layered fire protection for the general public and employees for general safety.

Although there is limited data available related to extinguisher use since the removal of portable fire extinguishers in the NIFRS data field, there is little to no data supporting the removal of portable fire extinguishers and sole reliance on building fire sprinkler systems. Limiting a fire to the smallest area within a building is a sensible aspiration.

Cost has been another point of contention. A study by Richard Bukowski in 2014, the life cycle cost of portable fire extinguishers was determined to be between one and a half and four cents per foot annually; if coverage could be maximized to that allowable by code, the cost drops to between a half cent and one cent per foot annually. It's unlikely that any other layer of fire protection is so cost-effective.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

This proposal is to provide for the Technical Committee the ability to at a minimum place the requirement for portable fire extinguishers into hazardous areas only or to be placed in locked cabinets.

Committee Statement

Committee Action: Rejected

Resolution: The focus of the Life Safety Code should be on evacuation and should not encourage occupants, especially staff, to use extinguishers in lieu of assisting residents with evacuation.

Public Comment No. 210-NFPA 101-2022 [New Section after 33.2.3.5.7.2]

33.2.3.5.7.3

The provisions of 33.2.3.5.7.1 and 33.2.3.5.7.2 shall be permitted to be applied separately to portions of the attic separated by partitions having a minimum 1/2-hour fire resistance rating and extend from the ceiling to the underside of the floor or roof deck above.

Statement of Problem and Substantiation for Public Comment

During the First Draft meeting, several public inputs were submitted with the intent of separating the portion of an attic that contains fuel-fired equipment or storage and allow the portion not used for living purpose, storage or fuel-fired equipment to follow the provisions of 33.2.3.5.7.2 and allow the separated portion that is used for storage or contains fuel fired storage to be equipped with sprinklers in accordance with 33.2.3.5.7.1.

A task group was formed to address these public inputs (PI-104, PI-106, PI 198, PI-205, PI-94). The task group agreed with the concept of applying the protection requirements separately when the attic is property separated and determined that a partition (wall to ceiling) with ½ hour fire resistance rating would be adequate.

33.2.3.5.9 Portable Fire Extinguishers.

Portable fire extinguishers shall be provided in accordance with Section 9.9.

Statement of Problem and Substantiation for Public Comment

A 2013 NFPA Report: "U.S. Experience with Sprinklers" reports that there were 48,460 reported structure fires annually in buildings equipped with sprinkler systems between 2007-2011, and 40,440 (83 percent) never grew large enough to activate the system. Based on this report alone, it's clear that people are reacting to small fires and extinguishing them prior to sprinkler activation. Limiting a fire to the smallest area within a building is a sensible aspiration.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Under the Scope of the Life Safety Code, Subsection 1.1.2 entitled, "Danger to Life from Fire," the Code states the following: "The Code addresses those construction, protection, and occupancy features necessary to minimize danger to life from the effects of fire, including smoke, heat, and toxic gases created during a fire." Further, it states in Subsection 1.1.4 entitled, "Other Fire-Related Considerations," the following: "The Code addresses other considerations that are essential to life safety in recognition of the fact that life safety is more than a matter of egress. The Code also addresses protective features and systems, building services, operating features, maintenance activities, and other provisions in recognition of the fact that achieving an acceptable degree of life safety depends on additional safeguards to provide adequate egress time or protection for people exposed to fire."

Studies of building fires indicate that occupants typically exhibit altruistic behavior toward others. Human response to a threatening situation might follow one of a variety of behaviors. Individuals might choose to investigate, sound an alarm, assist with rescue, seek help, or flee. Such actions constitute normal behavior, even when taken collectively. Most people avoid direct contact with a fire while undertaking another action.

There is a fundamental discrepancy between official/policy assumptions and the public in relation to priorities in the event of a fire. Government and professionals focus on avoiding injuries and see that as the sole aspiration, in the pursuit of which everything else is secondary. In contrast, the public have a wide and largely unrecognized range of priorities when encountering a fire, based on their individual circumstances. These include: the avoidance of embarrassment/inconvenience; mitigating the impact of damage to the property, e.g. avoiding the risk of being unable to remain in their place of business; and their concern for the wellbeing of other people. Each are invested by different aspirations in the fire safety ecosystem.

A desire to achieve their self-appointed tasks is a strong motivation for the public's behavior when encountering a fire. For most, this will involve an active response of on average five actions, although for some it will be as many as 11. This includes investigating the initial cues and tackling the fire, often using improvised means. They are usually successful in doing so, with 70% to 80% of fires dealt with by the public without requiring professional assistance. It is important to note that in doing so, they are willingly acting against official advice and are not being coerced into this. The evidence shows the public to be effective and capable in tackling fires, even in the absence of any professional support, or often without specialized equipment. This is supported by the pioneering studies of the public experience of dwelling fires undertaken by Bryan (1977) and Wood (1972) in the USA and UK, respectively. Their studies supported by their findings that the public did undertake a range of self-appointed tasks including investigating and tackling fires. Recent studies have confirmed similar findings and these behaviors appear consistent over time.

The evidence further identifies that the public is willing and will accept minor consequences in their pursuit of achieving personal humanistic priorities and instinct. Concern for people, pets and possessions are strong and established drivers of behavior in the event of a fire. Therefore, this should be no surprise to see it as an influential feature of most individual's response to a fire.

A 2003 UK survey found that across all categories of location, extinguishers were successful in extinguishing 79.9% of fires. Note: Private houses accounted for only 3.3% of extinguisher use. It reported that 58.6% were operated by trained staff, 36.4% were operated by untrained staff and in 5% of incidents, this was unknown.

Data from the National Association of Fire Equipment Distributors (NAFED) provides even more robust validation of the influence of fire extinguishers as used by 'ordinary civilians. Their research and data indicate, "Of 13,221 fire incidents reported, portable fire extinguishers successfully extinguished 12,505 fires (95%)."

(NAFED 2010: 2) The combined results of the 34 years of data are based on the performance of 32,756 fire extinguishers used on 13,453 incidents.

Fortunately, most people encountering a fire will avoid any injury or will be exposed to a low, and often considered risk of a minor injury at worst. This is not a matter of luck but due to a combination of their own abilities and to the low level of risk presented by most fires individuals would choose to fight at the incipient stage. A 2015 study identified that there was a disconnect between the fire service/government and the public in terms of what they referred to as 'risk tolerance'. This was most evident in attitude to injuries. Official policy seems to place avoidance of any injury as its highest priority and assumes this to also be the public's main motivation and enough to dictate any response to the discovery of a fire. However, the same study found that almost all those who incurred a minor injury accepted it as a reasonable cost in relation to pursuing or achieving their personal priorities. Further, they stated, in hindsight, they would do the same again.

It should be noted that numerous every day and discretionary activities carry similar or higher levels of risk to those resulting from using an extinguisher. Do-It-Yourself and sport for example are frequently responsible for injuries or even fatalities. In response, the government and industry seek to help make products safer or provide advice. This is preferred to denying people the option to participate in either activity by withdrawing public access to tools or sports equipment. The benefits achieved by the public using extinguishers are significant, given the potential for a fire to otherwise lead to detrimental and life-changing outcomes. A low and calculated level of personal risk willingly accepted by an individual tackling a fire can avoid, or reduce, a much higher risk to others should they ignore the fire and allow it to develop. Where current guidance discourages the provision of extinguishers in public spaces, this policy is neither supported by the evidence or justifiable through a consensus from the public. Rather it is imposed on them and is inconsistent with other approaches to public health.

The fire service's response time to structure fires has increased significantly over the past 25 years for several reasons like traffic, infrastructures, and lately staffing. Hence, the ability for the early interventions of the public are likely to be the most significant determinant of the outcome of a fire event. Most people do respond appropriately, and the literature confirms that they do not panic. Typically, most people are at risk of a minor injury at worst, due to the low risk from the fire and their own ability to assess and act in accordance with the situation.

A significant amount of data has been collected to support the requirement for portable extinguishers,

including: WPI/EKU Study: "Ordinary People and the Effective Operation of Fire Extinguishers", which clearly showed that the vast majority of people who have never used an extinguisher can operate one safely and effectively. This willingness of the public to accept minor injuries to protect individuals, the facility or their personal property is supported by literature and data and shows these to be well established behaviors which policy makers need to work with, rather than against. Reflecting official policy, national and local fire safety messaging has, for some time, urged the public, on discovering a fire in the home, to "Get out, stay out", "Don't put yourself at risk" and 'Leave it to the professionals.' This paternalistic messaging confirms the government policy makers and fire services' belief that a professional response is the only intervention capable of safely tackling fires. Again, this starkly contrasts with the reality that between 70% and 80% of dwelling fires are tackled effectively and at low risk, by the public. The policy also fails to accord with the public who have been shown to be tolerant, or accepting, of the incurrence of minor injuries in pursuit of their personal priorities.

Surveys from the National Association of Fire Equipment Distributors (NAFED) in America reveals the same trend of public firefighting, with even higher percentages not needing the fire service. "In both the 1979 and 1985 surveys, the fire department was only called for 13% of the reported fires. In the 1996 survey, the fire department was called in 24% of the reported fires. However, in the 2010 survey the number dropped to 17% of the time'. And 'These results are not unique to NAFED surveys. A 1978 publication by the U.S. Department of Commerce stated that about 90% of fires in households are not reported, based on their survey of 33,000 fires." (NAFED, 2010: 9)

The public are likely to encounter a fire that is relatively small and often contained to the item first ignited. They are often the ones present when fire starts. In summary, there is a significant difference between official assumptions/guidance and actual public behavior. However, the government and FRS seek to deter this behavior, and, in singularly promoting there, "Get out' message," and remove the simple yet potential life saving devices in sprinklered buildings.

A recent study also showed that the public do not just get out, with 49% never leaving the property during the fire. While this may surprise or concern many professionals, it is likely to be explained by a difference between the fire as perceived by professionals and the lived experience of the public. There is nothing to suggest that the public routinely take unnecessary risks. A more likely explanation is that the fire was small and not sufficiently well-developed to pose an imminent injury or life threat. As such, they were able to remain in the premises safely and relatively comfortably, which is supported by the evidence in relation to the majority of fires not spreading beyond the item first ignited or the room of origin. Inclement weather or other factors may also make remaining in the premises a safer or more comfortable option. Fires, like other emergencies, must also be understood in human terms.

The concept of trading off portable extinguishers in sprinklered buildings has been largely abandoned by fire protection principles. NFPA 10 states in subsection 5.1.2, "The selection of extinguishers shall be independent of whether the building is equipped with automatic sprinklers, standpipe and hose, or other fixed protection equipment." Other codes, and other occupancy chapters have abandoned this concept in recognition of the fact that portable extinguishers are a valuable, cost-effective layer of fire protection, and are intended for a different purpose than sprinklers. Recognition of the valuable role of extinguishers came from a 2003 report which concluded, 'Fire extinguishers are designed to prevent relatively minor incidents becoming major conflagrations.' It is, of course, difficult to prove how many and which fires would have developed to pose a serious risk if not tackled and contained early on. Events such as the Grenfell fire are a reminder of the consequences when this happens.

The National Fire Codes of both NFPA and the ICC require portable fire extinguishers in all occupancy classes including storage which addresses property protection and property loss as well as, the safety of the building occupants. Fire safety is grounded in the engineering discipline which brings many strengths to codes requirements, but it is insufficient, and fire safety effectiveness is limited by ignoring the social sciences of human behavior. It is important to appreciate that while different to official assumptions and desire for evacuation, research shows the public's priorities to be rational and appropriate. The public's experience of fire is vastly different to that of the professionals involved in the planning for and responding to fire.

Official policy and attitudes of the Technical Committee are most singularly directed at avoiding the risk when the public encounters a fire. This is well meaning but the research has shown that this DOES NOT I REPEAT DOES NOT align with the public's attitude or the ability of the general public. The belief that 'undesirable' behavior can be changed by advice, campaigns or other measures has been

shown to be inaccurate. The paternalistic approach by which government and the building safety regulatory sector seek to change human behavior by removing proven and effective appliances such as portable fire extinguishers is WRONG. However, the building safety regulatory sector continue this approach despite the evidence that public behaviors are safe, effective, and largely unaltered by current guidance and campaigns rather than providing appropriate safety devices for use by the public. A portable fire extinguisher is an effective item of fire protection which allows for small fires to be tackled by the occupants of a building and saves 100s of thousands of dollars in property loss.

Concerns have been indicted regarding the requirement for training. Training in the use of extinguishers is an important issue and one in which opinion appears more influential than the evidence. Whether purchased for a private dwelling or provided through regulatory processes, there is no mandatory requirement for training to use an extinguisher, and studies do not reveal training to be a requirement for their safe or effective use. In fact, the available data and studies demonstrate the opposite to be the case.

The Technical Committee should also note that portable fire extinguishers are designed for the novice user. Although, training is recommended for proper use and technique and is wide available through a variety of resources including at online training; there are no specified training requirements even under OSHA unless that is an assigned duty employee by the employer. The proposed requirement is intended as a provision for layered fire protection for the general public and employees for general safety.

Although there is limited data available related to extinguisher use since the removal of portable fire extinguishers in the NIFRS data field, there is little to no data supporting the removal of portable fire extinguishers and sole reliance on building fire sprinkler systems. Limiting a fire to the smallest area within a building is a sensible aspiration.

Cost has been another point of contention. A study by Richard Bukowski in 2014, the life cycle cost of portable fire extinguishers was determined to be between one and a half and four cents per foot annually; if coverage could be maximized to that allowable by code, the cost drops to between a half cent and one cent per foot annually. It's unlikely that any other layer of fire protection is so cost-effective.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

(NAFED 2010: 2) The combined results of the 34 years of data are based on the performance of 32,756 fire extinguishers used on 13,453 incidents.

Fortunately, most people encountering a fire will avoid any injury or will be exposed to a low, and often considered risk of a minor injury at worst. This is not a matter of luck but due to a combination of their own abilities and to the low level of risk presented by most fires individuals would choose to fight at the incipient stage. A 2015 study identified that there was a disconnect between the fire service/government and the public in terms of what they referred to as 'risk tolerance'. This was most evident in attitude to injuries. Official policy seems to place avoidance of any injury as its highest priority and assumes this to also be the public's main motivation and enough to dictate any response to the discovery of a fire. However, the same study found that almost all those who incurred a minor injury accepted it as a reasonable cost in relation to pursuing or achieving their personal priorities. Further, they stated, in hindsight, they would do the same again.

It should be noted that numerous every day and discretionary activities carry similar or higher levels of risk to those resulting from using an extinguisher. Do-It-Yourself and sport for example are frequently responsible for injuries or even fatalities. In response, the government and industry seek to help make products safer or provide advice. This is preferred to denying people the option to participate in either activity by withdrawing public access to tools or sports equipment. The benefits achieved by the public using extinguishers are significant, given the potential for a fire to otherwise lead to detrimental and life-changing outcomes. A low and calculated level of personal risk willingly accepted by an individual tackling a fire can avoid, or reduce, a much higher risk to others should they ignore the fire and allow it to develop. Where current guidance discourages the provision of extinguishers in public spaces, this policy is neither supported by the evidence or justifiable through a consensus from the public. Rather it is imposed on them and is inconsistent with other approaches to public health.

The fire service's response time to structure fires has increased significantly over the past 25 years for several reasons like traffic, infrastructures, and lately staffing. Hence, the ability for the early interventions of the public are likely to be the most significant determinant of the outcome of a fire

event. Most people do respond appropriately, and the literature confirms that they do not panic. Typically, most people are at risk of a minor injury at worst, due to the low risk from the fire and their own ability to assess and act in accordance with the situation.

A significant amount of data has been collected to support the requirement for portable extinguishers, including: WPI/EKU Study: "Ordinary People and the Effective Operation of Fire Extinguishers", which clearly showed that the vast majority of people who have never used an extinguisher can operate one safely and effectively. This willingness of the public to accept minor injuries to protect individuals, the facility or their personal property is supported by literature and data and shows these to be well established behaviors which policy makers need to work with, rather than against. Reflecting official policy, national and local fire safety messaging has, for some time, urged the public, on discovering a fire in the home, to "Get out, stay out", "Don't put yourself at risk" and 'Leave it to the professionals.' This paternalistic messaging confirms the government policy makers and fire services' belief that a professional response is the only intervention capable of safely tackling fires. Again, this starkly contrasts with the reality that between 70% and 80% of dwelling fires are tackled effectively and at low risk, by the public. The policy also fails to accord with the public who have been shown to be tolerant, or accepting, of the incurrence of minor injuries in pursuit of their personal priorities.

Surveys from the National Association of Fire Equipment Distributors (NAFED) in America reveals the same trend of public firefighting, with even higher percentages not needing the fire service. "In both the 1979 and 1985 surveys, the fire department was only called for 13% of the reported fires. In the 1996 survey, the fire department was called in 24% of the reported fires. However, in the 2010 survey the number dropped to 17% of the time'. And 'These results are not unique to NAFED surveys. A 1978 publication by the U.S. Department of Commerce stated that about 90% of fires in households are not reported, based on their survey of 33,000 fires." (NAFED, 2010: 9)

The public are likely to encounter a fire that is relatively small and often contained to the item first ignited. They are often the ones present when fire starts. In summary, there is a significant difference between official assumptions/guidance and actual public behavior. However, the government and FRS seek to deter this behavior, and, in singularly promoting there, "Get out' message," and remove the simple yet potential life saving devices in sprinklered buildings.

A recent study also showed that the public do not just get out, with 49% never leaving the property during the fire. While this may surprise or concern many professionals, it is likely to be explained by a difference between the fire as perceived by professionals and the lived experience of the public. There is nothing to suggest that the public routinely take unnecessary risks. A more likely explanation is that the fire was small and not sufficiently well-developed to pose an imminent injury or life threat. As such, they were able to remain in the premises safely and relatively comfortably, which is supported by the evidence in relation to the majority of fires not spreading beyond the item first ignited or the room of origin. Inclement weather or other factors may also make remaining in the premises a safer or more comfortable option. Fires, like other emergencies, must also be understood in human terms.

The concept of trading off portable extinguishers in sprinklered buildings has been largely abandoned by fire protection principles. NFPA 10 states in subsection 5.1.2, "The selection of extinguishers shall be independent of whether the building is equipped with automatic sprinklers, standpipe and hose, or other fixed protection equipment." Other codes, and other occupancy chapters have abandoned this concept in recognition of the fact that portable extinguishers are a valuable, cost-effective layer of fire protection, and are intended for a different purpose than sprinklers. Recognition of the valuable role of extinguishers came from a 2003 report which concluded, 'Fire extinguishers are designed to prevent relatively minor incidents becoming major conflagrations.' It is, of course, difficult to prove how many and which fires would have developed to pose a serious risk if not tackled and contained early on. Events such as the Grenfell fire are a reminder of the consequences when this happens.

The National Fire Codes of both NFPA and the ICC require portable fire extinguishers in all occupancy classes including storage which addresses property protection and property loss as well as, the safety of the building occupants. Fire safety is grounded in the engineering discipline which brings many strengths to codes requirements, but it is insufficient, and fire safety effectiveness is limited by ignoring the social sciences of human behavior. It is important to appreciate that while different to official assumptions and desire for evacuation, research shows the public's priorities to be rational and appropriate. The public's experience of fire is vastly different to that of the professionals involved in the planning for and responding to fire.

Official policy and attitudes of the Technical Committee are most singularly directed at avoiding the risk when the public encounters a fire. This is well meaning but the research has shown that this DOES NOT I REPEAT DOES NOT align with the public's attitude or the ability of the general public. The belief that 'undesirable' behavior can be changed by advice, campaigns or other measures has been shown to be inaccurate. The paternalistic approach by which government and the building safety regulatory sector seek to change human behavior by removing proven and effective appliances such as portable fire extinguishers is WRONG. However, the building safety regulatory sector continue this approach despite the evidence that public behaviors are safe, effective, and largely unaltered by current guidance and campaigns rather than providing appropriate safety devices for use by the public. A portable fire extinguisher is an effective item of fire protection which allows for small fires to be tackled by the occupants of a building and saves 100s of thousands of dollars in property loss.

Concerns have been indicted regarding the requirement for training. Training in the use of extinguishers is an important issue and one in which opinion appears more influential than the evidence. Whether purchased for a private dwelling or provided through regulatory processes, there is no mandatory requirement for training to use an extinguisher, and studies do not reveal training to be a requirement for their safe or effective use. In fact, the available data and studies demonstrate the opposite to be the case.

The Technical Committee should also note that portable fire extinguishers are designed for the novice user. Although, training is recommended for proper use and technique and is wide available through a variety of resources including at online training; there are no specified training requirements even under OSHA unless that is an assigned duty employee by the employer. The proposed requirement is intended as a provision for layered fire protection for the general public and employees for general safety.

Although there is limited data available related to extinguisher use since the removal of portable fire extinguishers in the NIFRS data field, there is little to no data supporting the removal of portable fire extinguishers and sole reliance on building fire sprinkler systems. Limiting a fire to the smallest area within a building is a sensible aspiration.

Cost has been another point of contention. A study by Richard Bukowski in 2014, the life cycle cost of portable fire extinguishers was determined to be between one and a half and four cents per foot annually; if coverage could be maximized to that allowable by code, the cost drops to between a half cent and one cent per foot annually. It's unlikely that any other layer of fire protection is so cost-effective.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

This proposal is to provide for the Technical Committee the ability to at a minimum place the requirement for portable fire extinguishers into hazardous areas only or to be placed in locked cabinets.

Committee Action: Rejected

Resolution: The focus of the Life Safety Code should be on evacuation and should not encourage occupants, especially staff, to use extinguishers in lieu of assisting residents with evacuation.

Public Comment No. 175-NFPA 101-2022 [New Section after 33.3.3.4.8.3]

33.3.3.4.9 Carbon Monoxide Detection

33.3.3.4.9.1 Carbon monoxide detectors in accordance with Section 9.12 and 33.3.3.4.9 shall be provided where any of the following conditions exist:

(1) Where facilities have communicating attached garages, unless otherwise exempted by 33.3.3.4.9.3

(2) Where fuel-burning appliances or fuel-burning fireplaces are in the facility

33.3.3.4.9.2 Where required by 33.3.3.4.9.1, carbon monoxide detectors shall be installed in all of the following locations:

(1) Within rooms containing fuel-burning appliances or fuel-burning fireplaces, unless otherwise exempted by 33.3.3.4.9.4

(2) Centrally located within occupiable spaces served by the first supply air register from a fuel-burning HVAC system

(3) On every occupiable level

(4) Within adjacent communicating occupiable spaces to an attached garage, unless otherwise exempted by 33.3.3.4.9.3

33.3.3.4.9.3 Carbon monoxide detectors as specified in 33.3.3.4.9.1(1) shall not be required in the following locations:

(1) In garages

(2) Within facilities with communicating attached garages that are open parking structures as defined by the building code

(3) Within facilities with communicating attached garages that are mechanically ventilated in accordance with the mechanical code

33.3.3.4.9.4 Within resident units containing fuel-burning appliances or fuel-burning fireplaces, carbon monoxide alarms shall be permitted to be used.

Statement of Problem and Substantiation for Public Comment

Existing board and care occupancies currently lack requirements for CO detection in buildings with known CO hazards, including fuel-burning appliances. A CO source in any building that is not monitored by installed CO detection devices is a life safety hazard to occupants. The addition of these requirements will prevent deaths and injuries to occupants in the event of high level CO release within the building.

This public comment is submitted in support of committee action taken in the first revision phase to develop CO detection requirements for existing facilities. The proposed revision being resubmitted is identical to the requirement that is currently in place for new board and care occupancies. If this proposed revision has been "deemed to be excessive," the committee is urged to develop what it considers to be an adequate requirement for existing buildings.

With regard to installation cost, primary consideration must be given to the unique nature of CO exposure and the inability of occupants to sense when they are being exposed. To avoid injury and death, there is no safe alternative to installed CO detection devices.

Existing buildings arguably carry the highest risk of exposure due to aging gas appliances and exhaust systems.

“The lack of an operating alarm can be seen in several of these case studies. Carbon monoxide is colorless and odorless. Its early onset symptoms are not unique or severe, which leads to mistaking them for something else or thinking there is not a serious problem. These symptoms can quickly escalate to severe symptoms, which usually revolves around the victim becoming unconscious. People do not self-rescue when they are able, because they do not realize that they should. If someone does realize there is problem, it is most likely too late. This common sequence combined with CO’s toxicity, and a general negligence, makes CO a very dangerous problem that can happen almost anywhere. Detection is the only safeguard against this problem.”

Committee: SAF-BCF

Committee Statement

Committee Action: Rejected

Resolution: The language presented by the submitter is equal to that for new residential board and care occupancies and is deemed to be excessive. The TC recommends that the submitter revise the language to be more feasible for existing large residential board and care occupancies . The requirement for detection on every floor might not be justified in all cases. CO alarms might be a reasonable alternative to detectors in large facilities. The TC formed a task group that submitted PC-168 in Chapter 43 to add CO detectors and alarms when rehabilitation work is undertaken.

Public Comment No. 217-NFPA 101-2022 [Section No. A.32.2.3.5.3.2]

A.32.2.3.5.3.2

The decision to permit the use of the criteria from NFPA 13D in these occupancies is based on the following:

- (1) The desire to obtain a level of fire suppression and control approximately equivalent to that delivered by residential facilities protected by such systems (*see A.1.1 in NFPA 13D*)
- (2) The fact that potential fire exposure and challenge to the suppression system in a small board and care facility are of the same nature and are no more severe than those found in residences

Chapter 32 permits the use of NFPA 13D, and NFPA 13R outside of their scopes. This permission is based on a review of the occupancy and a recognition that the fires in board and care facilities are similar to those of other residential occupancies and that the level of protection is appropriate. The requirements of NFPA 13D and NFPA 13R have been supplemented with requirements for additional water supplies to compensate for the special needs of the board and care occupancy.

NFPA 13D contains additional requirements for a piping system serving both sprinkler and domestic needs.

Exterior projections are defined by NFPA 13 as follows: an extension beyond an exterior wall capable of collecting heat below. The reference to NFPA 13 applies to location of sprinklers only.

Substituting a variable for the installation standard that points to the installation standard back in Chapter 9 makes the document less user friendly. Users should not have to go back to Chapter 9 to recognize that 9.7.1.1 (1) means NFPA 13, 9.7.1.1(2) means NFPA 13D, and 9.7.1.1 (3) means NFPA 13R.

6624

SAF-BCF NFPA 101 References to NFPA 13/13D/13R

32.2.3.5.3

Where an automatic sprinkler system is installed, for either total or partial building coverage, all of the following requirements shall be met:

- (1) The system shall be in accordance with 9.7.1.1(1) and shall initiate the fire alarm system in accordance with 32.2.3.4.1.
- (2) The adequacy of the water supply shall be documented to the authority having jurisdiction.

32.2.3.5.4

Automatic sprinkler systems installed in accordance with 9.7.1.1(1) and 9.7.1.1(3) shall be provided with electrical supervision in accordance with 9.7.2.

32.2.3.5.5

Automatic sprinkler systems installed in accordance with 9.7.1.1(2) shall be provided with valve supervision by one of the following methods:

Single listed control valve that shuts off both domestic and sprinkler systems and separate shutoff for the domestic system only

- (2) Electrical supervision in accordance with 9.7.2
- (3) Valve closure that causes the sounding of an audible signal in the facility

32.2.3.5.8

Systems installed in accordance with 9.7.1.1(2) shall be inspected, tested, and maintained in accordance with 32.2.3.5.8.1 through 32.2.3.5.8.15, which reference specific sections of NFPA 25. The frequency of the inspection, test, or maintenance shall be in accordance with this Code, whereas the purpose and procedure shall be from NFPA 25.

33.2.3.5.3.1*

In prompt evacuation capability facilities, all of the following shall apply:

- (1) An automatic sprinkler system in accordance with 9.7.1.1(2) shall be permitted.

(2) Automatic sprinklers shall not be required in closets not exceeding 24 ft² (2.2 m²) and in bathrooms not exceeding 55 ft² (5.1 m²), provided that such spaces are finished with lath and plaster or materials providing a 15-minute thermal barrier.

33.2.3.5.3.2

In slow and impractical evacuation capability facilities, all of the following shall apply:

(1) An automatic sprinkler system in accordance with 9.7.1.1(2) with a 30-minute water supply, shall be permitted.

(2) All habitable areas and closets shall be sprinklered.

(3) Automatic sprinklers shall not be required in bathrooms not exceeding 55 ft² (5.1 m²), provided that such spaces are finished with lath and plaster or materials providing a 15-minute thermal barrier.

33.2.3.5.3.3

In prompt and slow evacuation capability facilities, where an automatic sprinkler system is in accordance with 9.7.1.1(1) sprinklers shall not be required in closets not exceeding 24 ft² (2.2 m²) and in bathrooms not exceeding 55 ft² (5.1 m²), provided that such spaces are finished with lath and plaster or materials providing a 15-minute thermal barrier.

33.2.3.5.3.4*

In prompt and slow evacuation capability facilities in buildings four or fewer stories above grade plane, systems in accordance with 9.7.1.1(3) shall be permitted.

33.2.3.5.3.5*

In impractical evacuation capability facilities in buildings four or fewer stories above grade plane, systems in accordance with 9.7.1.1(3) shall be permitted. All habitable areas and closets shall be sprinklered. Automatic sprinklers shall not be required in bathrooms not exceeding 55 ft² (5.1 m²), provided that such spaces are finished with lath and plaster or materials providing a 15-minute thermal barrier.

33.2.3.5.8

Systems installed in accordance with 9.7.1.1(2) shall be inspected, tested, and maintained in accordance with 33.2.3.5.8.1 through 33.2.3.5.8.15, which reference specific sections of NFPA

25. The frequency of the inspection, test, or maintenance shall be in accordance with this Code, whereas the purpose and procedure shall be from NFPA 25.

33.3.3.5.1.1*

In buildings four or fewer stories above grade plane, systems in accordance with 9.7.1.1(3) shall be permitted.

Second Revision No. 6618-NFPA 101-2022 [Section No. 32.2.3.5.3.1]

32.2.3.5.3.1

In buildings four or fewer stories in height and not exceeding 60 ft (18.3 m) in height above grade plane, systems in accordance with ~~NFPA 13R 9.7.1.1(3)~~ shall be permitted. All habitable areas, ~~closets, roofed porches, roofed decks, and roofed balconies~~ and closets shall be sprinklered.

Second Revision No. 6619-NFPA 101-2022 [Section No. 32.2.3.5.3.2]

32.2.3.5.3.2*

An automatic sprinkler system with a 30-minute water supply, and complying with all of the following requirements and with ~~NFPA 13D~~ 9.7.1.1(2), shall be permitted:

- (1) All habitable areas; and closets, ~~roofed porches, roofed decks, and roofed balconies~~ shall be sprinklered.
- (2) Where a roof, deck, or balcony greater than 4 ft (1.2 m) wide is provided above, sprinklers shall be installed to protect attached exterior balconies, attached exterior decks, and ground floor patios directly serving dwelling units in buildings of Type V construction. [13R: 6.6.5.1]
- (3) Facilities with more than eight residents shall be treated as two-family dwellings with regard to water supply.

Knippa, Kevin

The proposed language does not clarify the requirement. A residential board and care occupancy does not contain dwelling units and is not a residential occupancy. Even if the proposed language can be interpreted to apply to a board and care occupancy, the proposed language does not protect outdoor covered areas that do not directly serve dwelling units (whatever that means in a non-residential occupancy).

Second Revision No. 6616-NFPA 101-2022 [New Section after 32.2.3.5.7.2]

32.2.3.5.7.3

The provisions of 32.2.3.5.7.1 and 32.2.3.5.7.2 shall be permitted to be applied separately to portions of the attic separated by partitions that have a minimum 1/2-hour fire resistance rating and that extend to the underside of the floor or roof deck above.

Submitter Information Verification

Committee: SAF-BCF

Submittal Date: Tue Aug 16 14:46:37 EDT 2022

Committee Statement

Committee Statement: During the First draft meeting, several public inputs were submitted with the intent of separating the portion of an attic that contains fuel-fired equipment or storage and allow the portion not used for living purpose, storage or fuel-fired equipment to follow the provisions of 32.2.3.5.7.2 and allow the separated portion that is used for storage or contains fuel fired storage to be equipped with sprinklers in accordance with 32.2.3.5.7.1.

A task group was formed to address these public inputs (PI-104, PI-106, PI 198, PI-205, PI-94). The task group agreed with the concept of applying the protection requirements separately when the attic is properly separated and determined that a partition (wall to ceiling) with ½ hour fire resistance rating would be adequate.

Negative with Comment

Knippa, Kevin

There are few tested assemblies that provide a 1/2 hour fire resistance. The minimum protection should be a 1-hour fire resistance because there are numerous accepted assemblies to provide that fire resistance rating. Are opening protectives required? If so, what is the duration of the opening protective?

Rickard, John A.

I agree with Kevin Knippa's comment in the negative. The language in NFPA 13R is specific to dwelling units and needs to be revised to be adapted to residential board and care.

Second Revision No. 6617-NFPA 101-2022 [New Section after 33.2.3.5.7.2]

33.2.3.5.7.3

The provisions of 33.2.3.5.7.1 and 33.2.3.5.7.2 shall be permitted to be applied separately to portions of the attic separated by partitions that have a minimum 1/2-hour fire resistance rating and that extend to the underside of the floor or roof deck above.

Submitter Information Verification

Committee: SAF-BCF

Submittal Date: Tue Aug 16 14:56:40 EDT 2022

Committee Statement

Committee Statement: During the First Draft meeting, several public inputs were submitted with the intent of separating the portion of an attic that contains fuel-fired equipment or storage and allow the portion not used for living purpose, storage or fuel-fired equipment to follow the provisions of 33.2.3.5.7.2 and allow the separated portion that is used for storage or contains fuel fired storage to be equipped with sprinklers in accordance with 33.2.3.5.7.1.

A task group was formed to address these public inputs (PI-104, PI-106, PI 198, PI-205, PI-94). The task group agreed with the concept of applying the protection requirements separately when the attic is properly separated and determined that a partition (wall to ceiling) with ½ hour fire resistance rating would be adequate.

Committee Comment No. 6575-NFPA 101-2022 [Section No. 3.3.281]

This was a Second Revision that has been modified or deleted as the result of Second Correlating Revision:

3.3.281 Sprinkler System.

3.3.281.1 Automatic Sprinkler.

A fire suppression or control device that operates automatically when its heat-activated element is heated to its thermal rating or above, allowing to discharge over a specified area.
[13, 2022]

3.3.28.1 Sprinkler System (NFPA 13/13R)

A system, commonly activated by heat from a fire and discharges water over the fire area, that consists of an integrated network of piping designed in accordance with fire protection engineering standards that includes a water supply source, a control valve, a waterflow alarm, and a drain. The portion of the sprinkler system above ground is a network of specifically sized or hydraulically designed piping installed in a building, structure, or area, generally overhead, and to which sprinklers are attached in a systematic pattern. [13, 2022]

Committee Statement

Committee The sprinkler system definition is different from NFPA 13/13R to NFPA 13D. The NFPA

Statement: 13D definition does not have the waterflow alarm. This public comment correlates the previous first draft definition extracted from NFPA 13 with the extracted definition from NFPA 13D.

NFPA 1, FCC-OCP, SR 48 made the same changes suggested in this public comment for the following reason: This addresses the concerns raised by the FCC-AAC in CN-11. The two new extracted definitions address both definitions used by NFPA 13, 13R and 13D. NFPA 13R extracts the definition from 13.

**Committee Comment No. 6563-NFPA 101-2022 [Section No. 9.6.2.10]**

This was a Second Revision that has been modified or deleted as the result of Second Correlating Revision:

9.6.2.10 Smoke Alarms.**9.6.2.10.1**

Where required by another section of this *Code*, single-station and multiple-station smoke alarms shall be in accordance with *NFPA 72* unless otherwise provided in [9.6.2.10.4](#), [9.6.2.10.5](#), [2 through 9.6.2.10.7](#), or [9.6.2.10.8](#).

9.6.2.10.2

Where automatic smoke detection is required by Chapters 11 through 43, smoke alarms shall not be used as a substitute.

9.6.2.10.3 Smoke Alarms in Sleeping Rooms.**9.6.2.10.3.1 –**

In new construction, where required by Chapters 11 through 43, the alarm notification signal in sleeping rooms resulting from activation of smoke alarms shall be a 520 Hz low-frequency signal complying with *NFPA 72*.

9.6.2.10.4* –

~~The interconnection installation of smoke alarms shall apply only to new construction as provided in 9.6.2.10.10.~~

A.9.6.2.10.4 –

~~*NFPA 72* mandates smoke alarms in all sleeping rooms,~~

~~and~~

~~interconnection of~~

~~smoke~~

~~alarms is required for both new and existing installations. Per 9.6.2.10.1, the residential occupancy chapters determine whether smoke alarms are needed within sleeping rooms. Paragraph 9.6.2.10.4 limits the requirement for interconnection of smoke alarms to those in new construction. This *Code* does not intend to require compliant, existing smoke alarm installations to be interconnected. This *Code* is periodically revised to add retrospective requirements only where the need is clearly substantiated.~~

9.6.2.10.5* –

~~Unless otherwise provided in 9.6.2.10.7, smoke alarms and smoke detectors shall not be installed within an area of exclusion determined by a 10 ft (3.0 m) radial distance along a horizontal flow path from a stationary or fixed cooking appliance, unless listed for installation in close proximity to cooking appliances. Smoke alarms and smoke detectors installed between 10 ft (3.0 m) and 20 ft (6.1 m) along a horizontal flow path from a stationary or fixed cooking appliance shall be equipped with an alarm-silencing means or use photoelectric detection. [72 : 29.11.3.4(4)]~~

~~A.~~

~~detectors near stationary or fixed cooking appliances shall be in accordance with *NFPA 72*.~~

9.6.2.10.5

—

As per annex material located in A.29.5.1 of *NFPA 72*, it is not normally recommended that smoke alarms or smoke detectors be placed in kitchen spaces. This section of the code provides guidelines for safe installation if a need exists to install a smoke alarm or smoke detector in a residential kitchen space or cooking area.

Within this *Code* section, a fixed cooking appliance is any appliance that is intended to be permanently connected electrically to the wiring system or the fuel source. A stationary cooking appliance is any appliance that is intended to be fastened in place or located in a dedicated space and is connected to the supply circuit or fuel source.

Smoke alarms and smoke detectors that are currently available to consumers are susceptible to particles released into the air during normal cooking procedures. If smoke alarms and smoke detectors are placed too close to the area where the cooking source originates, a high level of nuisance alarms can occur. Frequent nuisance alarms can result in an occupant disabling the smoke alarm or smoke detector.

Nuisance alarm studies show that commercially available residential smoke alarms and smoke detectors are susceptible to nuisance alarms when installed too close to cooking appliances. As the horizontal distance between the smoke alarm or smoke detectors and the cooking appliance increases, the frequency of nuisance alarms decreases. Smoke alarms or smoke detectors that use ionization smoke detection have been shown to be more susceptible to cooking nuisance alarms than those that use photoelectric smoke detection when the alarms or detectors are installed within 10 ft (3.0 m) along a horizontal smoke travel path from a cooking appliance. Smoke alarms or smoke detectors that use photoelectric smoke detection produce nuisance alarms when installed less than 10 ft (3.0 m) from a cooking appliance, though to a lesser degree.

The occurrence of the higher frequency of nuisance alarms observed in smoke alarms or smoke detectors that use ionization detection have been documented in the fire research data. Due to the differences in technology between ionization detection and photoelectric detection, the sensitivity typically used for ionization detection is much higher than that used for photoelectric detection. This sensitivity difference is a result of each type of the detection being required to satisfy UL 217, *Single and Multiple Station Smoke Alarms*, performance tests. Removing detection technology from consideration, the frequency of nuisance alarms is solely due to the sensitivity of the detection method used. Thus, both ionization and photoelectric detector technologies will produce nuisance alarms due to cooking, but currently available smoke alarms and smoke detectors that use ionization detection typically produce more cooking-related nuisance alarms.

The higher sensitivities of currently available smoke alarms and smoke detectors that use ionization detection do provide a benefit at the expense of a potentially higher rate of cooking-related nuisance alarms. Research has demonstrated that ionization detection will typically respond faster than photoelectric detection to flaming fires, providing earlier warning to occupants that might allow for quicker intervention or faster egress. In general, the installation of smoke alarms or smoke detectors that use ionization detection will result in increased fire safety at the risk of a higher frequency of nuisance alarms. The installation of smoke alarms or smoke detectors that use photoelectric detection will result in reduced fire safety for flaming fires and a reduced risk of nuisance alarms. Based on the trade-off between faster response to fires and the frequency of nuisance alarms, detectors that utilize both technologies (i.e., ionization, photoelectric, and a combination) are allowed to be installed between 10 ft (3.0 m) and 20 ft (6.1 m) along a horizontal flow path from a standard or fixed cooking appliance if the specific detector is equipped with an alarm silencing means or is of the photoelectric type. Nuisance alarm studies provide data on cooking nuisances that emanate from both fixed cooking appliances and stationary cooking appliances (e.g., stove, oven) as well as portable cooking appliances (e.g., toaster). Based on these studies, which demonstrate the potential of all cooking appliances to generate nuisance sources, a zone of exclusion has been specified surrounding each stationary or fixed cooking appliance. The purpose of this zone is to limit the installation of smoke alarms and detectors in areas where stationary, fixed, or portable cooking appliances will be located within the residential kitchen space such that potential nuisance alarms are minimized. The size of the zone of exclusion is specified to attempt to take into account the unknown and transitory locations of portable cooking appliances. This zone of exclusion is determined by measuring a 10 ft (3.0 m) radial

distance from the closest edge of a stationary or fixed cooking appliance. The zone of exclusion is not intended to pass through walls or doorways. Figure A.9.6.2.10.5(a) provides an example of the zone of exclusion in a generalized residential kitchen. If other areas of this Code require that a smoke alarm or smoke detector be placed within a horizontal flow path distance between 10 ft (3.0 m) and 20 ft (6.1 m) from a stationary or fixed cooking appliance, the following method should be used to determine the distance, and only photoelectric detection or smoke alarms/detectors with alarm silencing means can be installed in this area.

To install a smoke alarm or detector between 10 ft (3.0 m) and 20 ft (6.1 m) from the cooking appliance, an installer must first determine the 10 ft (3.0 m) area of exclusion. Once the area of exclusion is determined, an installer must then determine the horizontal flow distance. This is the horizontal distance along the ceiling from the closest edge of the cooking appliance to the smoke alarm or detector. The horizontal distance can consist of line segments due to impediments, such as interior partitions. Once an impediment is met, the measurement of the distance will then continue along the new horizontal path segment until the distance requirement is met or another impediment is encountered. Figure A.9.6.2.10.5(b) provides an example for placement outside a kitchen in a nearby hallway. Figure A.9.6.2.10.5(c) provides another example of appropriate placement outside of a kitchen in an adjacent room. At a horizontal flow path distance of greater than 20 ft (6.1 m), any type of smoke alarm or smoke detector can be installed. In rare cases, a residential dwelling can be of such size and configuration that an area of exclusion of 10 ft (3.0 m) from a stationary or fixed cooking appliance excludes the placement of a smoke alarm or smoke detector required by other areas of this Code. In these cases, a smoke alarm or smoke detector using photoelectric detection can be installed at least 72 in. (1.83 m) from the fixed or stationary cooking appliance. Figure A.9.6.2.10.5(d) provides an example of this situation in practice where a smoke alarm or smoke detector is required outside of the sleeping area but the space is in close proximity to the kitchen space. [72: A.29.8.3.4(4)]

Figure A.9.6.2.10.5(a) Example of Zone of Exclusion (gray area) Within Typical Residential Kitchen. [72: Figure A.29.8.3.4(4)(a)]

Figure A.9.6.2.10.5(b) Example of Smoke Alarm or Smoke Detector Placement Between 10 ft (3.0 m) and 20 ft (6.1 m) Away in Hallway from Center of Stationary or Fixed Cooking Appliance. [72: Figure A.29.8.3.4(4)(b)]

Figure A.9.6.2.10.5(c) Example of Smoke Alarm or Smoke Detector Placement Between 10 ft (3.0 m) and 20 ft (6.1 m) Away in Hallway from Center of Stationary or Fixed Cooking Appliance. [72: Figure A.29.8.3.4(4)(c)]

Figure A.9.6.2.10.5(d) Example of Exception Placement of Photoelectric Smoke Alarm or Smoke Detector at 72 in. (1.83 m) from Stationary or Fixed Cooking Appliance. [72: Figure A.29.8.3.4(4)(d)]

9.6.2.10.6 –

Smoke alarms or smoke detectors that use photoelectric detection shall be permitted for installation at a radial distance greater than 6 ft (1.8 m) from any stationary or fixed cooking appliance when the following conditions are met:

- (1) The kitchen or cooking area and adjacent spaces have no clear interior partitions or headers.
- (2) The 10 ft (3.0 m) area of exclusion would prohibit the placement of a smoke alarm or smoke detector required by other sections of *NFPA 72*. [72 : 29.11.3.4(5)]

9.6.2.10.7 * –

Smoke alarms and smoke detectors shall not be installed within a 36 in. (910 mm) horizontal path from a door to a bathroom containing a shower or tub unless listed for installation in close proximity to such locations. [72 : 29.11.3.4(7)]

A.9.6.2.10.7 –

Studies indicate that smoke alarms and smoke detectors that use ionization detection, photoelectric detection, or a combination of ionization and photoelectric detection are susceptible to nuisance alarms caused by steam. Little research has been done on the comparative response of these types of detection to steam. Steam particles, in general, are visible, reflect light easily, and are typically produced in a size range that would be more likely to activate a photoelectric sensor. Thus, it is required that smoke alarms and smoke detectors be installed greater than 36 in. (910 mm) from the bathroom door where possible. Increasing the distance between the smoke alarm or smoke detector and the bathroom door can reduce the frequency of nuisance alarms from bathroom steam. Frequent nuisance alarms can result in the occupant disabling the smoke alarm. Each incremental increase in separation, up to 10 ft (3.0 m), between the bathroom door and the smoke alarm or smoke detector is expected to reduce the frequency of nuisance alarms. [72: A.29.8.3.4(5)]

9.6.2.10.8 –

~~System smoke detectors in accordance with NFPA 72 and arranged to function in the same manner as single-station or multiple-station smoke alarms shall be permitted in lieu of smoke alarms~~

-

[The installation of s](#) moke alarms and smoke detectors [near](#) a door to a bathroom containing a shower or tub [shall be in accordance with NFPA 72](#) .

9.6.2.10.6 –

9.6.2.10.7 – [Interconnection.](#)

9.6.2.10.7.1*

The interconnection of smoke alarms shall apply only to new construction.

A.9.6.2.10.7.1

Per 9.6.2.10.1, the residential occupancy chapters determine whether smoke alarms are needed within sleeping rooms. Paragraph 9.6.2.10.7.1 limits the requirement for interconnection of smoke alarms to those in new construction. This Code does not intend to require compliant, existing smoke alarm installations to be interconnected. This Code is periodically revised to add retrospective requirements only where the need is clearly substantiated.

9.6.2.10.

9—

~~Smoke alarms, other than battery-operated smoke alarms as permitted by other sections of this Code, shall be powered in accordance with the requirements of NFPA 72.~~

~~9.6.2.10.10* —~~

7.2*

In new construction, where two or more smoke alarms are required within a dwelling unit, suite of rooms, or similar area, they shall be arranged so that operation of any smoke alarm shall cause the alarm in all smoke alarms within the dwelling unit, suite of rooms, or similar area to sound, unless otherwise permitted by one of the following:

- (1) The requirement of 9.6.2.10.

10

- (1) 7 shall not apply where permitted by another section of

this

- (1) this Code.

- (2) The requirement of 9.6.2.10.

10

- (1) 7 shall not apply to configurations that provide equivalent distribution of the alarm signal.

A.9.6.2.10.

10—

7.2

A dwelling unit is that structure, area, room, or combination of rooms, including hotel rooms/suites, in which a family or individual lives. A dwelling unit includes living areas only and not common usage areas in multifamily buildings, such as corridors, lobbies, and basements.

9.6.2.10.

11—

8

System smoke detectors in accordance with NFPA 72 and arranged to function in the same manner as single-station or multiple-station smoke alarms shall be permitted in lieu of smoke alarms.

9.6.2.10.9

The alarms described in 9.6.2.10.10 shall sound only within an individual dwelling unit, suite of rooms, or similar area and shall not actuate the building fire alarm system, unless otherwise permitted by the authority having jurisdiction.

9.6.2.10.

12—

10

Smoke alarms shall be permitted to be connected to the building fire alarm system for the purpose of annunciation in accordance with NFPA 72.

Submitter Information Verification

Committee: SAF-BSF

Submittal Date: Tue Jul 19 13:06:14 EDT 2022

Committee Statement

Committee Statement: This is being submitted on behalf of the NFPA 101 Building Service and Fire Protection Equipment working group (WG) that was formed during the first draft meeting and is in response to public input (PI) 199.

The reason for PI-199 was due to new cooking resistance tests being added to the UL smoke alarm/detector listing standards (UL 217 and UL 268) and because UL is continually changing the compliance date for the new requirements. Therefore, the goal of the Second Revision is to:

- Remove the technology references in section 9.6.2.10.5 and 9.6.2.10.6 relating to the placement of smoke alarms/detectors installed near fixed cooking appliances.
- Modify the smoke detection requirements in section 9.6.2.10.5 and 9.6.2.10.6 to ensure they align (and most importantly don't conflict) with the requirements in Chapter 29 of the 2022 edition of NFPA 72.
- Reduce unwanted alarm activations from smoke alarms and smoke detectors being installed near stationary or fixed cooking appliances.

2021 Edition of NFPA 101, *Life Safety Code*

Proposed Text of Public Comment:

9.6.2.10 Smoke Alarms.

9.6.2.10.1 Where required by another section of this *Code*, single-station and multiple-station smoke alarms shall be in accordance with *NFPA 72* unless otherwise provided in ~~9.6.2.10, 9.6.2.10.5, 9.6.2.10.7 or 9.6.2.10.8~~ 9.6.2.10.2 through 9.6.2.10.10.

9.6.2.10.2 Where automatic smoke detection is required by Chapters 11 through 43, smoke alarms shall not be used as a substitute.

~~9.6.2.10.2.2 Smoke detectors in accordance with *NFPA 72* and arranged to function in the same manner as single station or multiple station smoke alarms shall be permitted in lieu of smoke alarms.~~

9.6.2.10.3 ~~Smoke Alarms in Sleeping Rooms.~~ In new construction, where required by chapters 11 through 43, the alarm notification signal in sleeping rooms resulting from activation of smoke alarms shall be a 520 Hz low-frequency signal complying with *NFPA 72*.

~~9.6.2.10.4* The interconnection of smoke alarms shall apply only to new construction as provided in 9.6.2.10.10.~~

~~A.9.6.2.10.4 *NFPA 72* mandates smoke alarms in all sleeping rooms, and interconnection of smoke alarms is required for both new and existing installations. Per 9.6.2.10.1, the residential occupancy chapters determine whether smoke alarms are needed within sleeping rooms. Paragraph 9.6.2.10.4 limits the requirement for interconnection of smoke alarms to those in new construction. This Code does not intend to require compliant, existing smoke alarm installations to be interconnected. ~~A.9.6.2.10.5~~

~~9.6.2.10.6 Smoke alarms or smoke detectors that use photoelectric detection shall be permitted for installation at a radial distance greater than 6 ft (1.8 m) from any stationary or fixed cooking appliance when the following conditions are met:~~

- ~~1) The kitchen or cooking area and adjacent spaces have no clear interior partitions or headers.~~
- ~~2) The 10 ft (3.0 m) area of exclusion would prohibit the placement of a smoke alarm or smoke detector required by other sections of NFPA 72. [72:29.11.3.4(5)]~~

9.6.2.10.7.5* The installation of smoke alarms and smoke detectors shall not be installed within a 36 in. (910 mm) horizontal path from near a door to a bathroom containing a shower or tub unless listed for installation in close proximity to such locations. [72:29.11.3.4(7)] shall be in accordance with NFPA 72.

~~**A.9.6.2.10.7** Studies indicate that smoke alarms and smoke detectors that use ionization detection, photoelectric detection, or a combination of ionization and photoelectric detection are susceptible to nuisance alarms caused by steam. Little research has been done on the comparative response of these types of detection to steam. Steam particles, in general, are visible, reflect light easily, and are typically produced in a size range that would be more likely to activate a photoelectric sensor. Thus, it is required that smoke alarms and smoke detectors be installed greater than 36 in. (910 mm) from the bathroom door where possible. Increasing the distance between the smoke alarm or smoke detector and the bathroom door can reduce the frequency of nuisance alarms from bathroom steam. Frequent nuisance alarms can result in the occupant disabling the smoke alarm. Each incremental increase in separation, up to 10 ft (3.0 m), between the bathroom door and the smoke alarm or smoke detector is expected to reduce the frequency of nuisance alarms. [72: A.29.8.3.4(5)]~~

9.6.2.10.96 Smoke alarms, other than battery-operated smoke alarms as permitted by other sections of this Code, shall be powered in accordance with the requirements of NFPA 72.

~~**9.6.2.10.6.1** In new construction, smoke alarms shall receive their primary power from a commercial source along with a secondary power source complying with NFPA 72.~~

~~**9.6.2.10.6.2** In existing construction, where permitted by Chapters 11 through 43, smoke alarms are allowed to receive their primary power from batteries.~~

9.6.2.10.107 Interconnection.

9.6.2.10.7.1* The interconnection of smoke alarms shall apply only to new construction.

~~**A.9.6.2.10.4** **A.9.6.2.10.7.1** NFPA 72 mandates smoke alarms in all sleeping rooms, and interconnection of smoke alarms is required for both new and existing installations.~~

Per 9.6.2.10.1, the residential occupancy chapters determine whether smoke alarms are needed within sleeping rooms. Paragraph ~~9.6.2.10.4~~ 9.6.2.10.7.1 limits the requirement for interconnection of smoke alarms to those in new construction. This Code does not intend to require compliant, existing smoke alarm installations to be interconnected. This Code is periodically revised to add retrospective requirements only where the need is clearly substantiated.

9.6.2.10.7.2 * In new construction, where two or more smoke alarms are required within a dwelling unit, suite of rooms, or similar area, they shall be arranged so that operation of any smoke alarm shall cause the alarm in all smoke alarms within the dwelling unit, suite of rooms, or similar area to sound, unless otherwise permitted by one of the following:

- 1) The requirement of ~~9.6.2.10.10~~ [9.6.2.10.7](#) shall not apply where permitted by another section of this *Code*.
- 2) The requirement of ~~9.6.2.10.10~~ [9.6.2.10.7](#) shall not apply to configurations that provide equivalent distribution of the alarm signal.

~~A.9.6.2.10.10~~ [A.9.6.2.10.7.2](#) A dwelling unit is that structure, area, room, or combination of rooms, including hotel rooms/suites, in which a family or individual lives. A dwelling unit includes living areas only and not common usage areas in multifamily buildings, such as corridors, lobbies, and basements.

9.6.2.10.8 System smoke detectors in accordance with NFPA 72 and arranged to function in the same manner as single-station or multiple-station smoke alarms shall be permitted in lieu of smoke alarms.

9.6.2.10.11 ~~9~~ The alarms described in ~~9.6.2.10.10~~ [9.6.2.10.7.2](#) shall sound only within an individual dwelling unit, suite of rooms, or similar area and shall not actuate the building fire alarm system, unless otherwise permitted by the authority having jurisdiction.

9.6.2.10.12 ~~10~~ Smoke alarms shall be permitted to be connected to the building fire alarm system for the purpose of annunciation in accordance with *NFPA 72*.

Reason Statement:

This is the first of two public comment (PC) being submitted on behalf of the NFPA 101 Building Service and Fire Protection Equipment working group (WG) that was formed during the first draft meeting and is in response to public input (PI) 199. It should be noted that two of eight WG members do not agree with portions of this PC and may submit their own PC.

The reason for PI-199 was due to new cooking resistance tests being added to the UL smoke alarm/detector listing standards (UL 217 and UL 268) and because UL is continually changing the compliance date for the new requirements. Therefore, the goal of the WG to is to:

- Remove the technology references in section 9.6.2.10.5 and 9.6.2.10.6 relating to the placement of smoke alarms/detectors installed near fixed cooking appliances.
- Modify the smoke detection requirements in section 9.6.2.10.5 and 9.6.2.10.6 to ensure they align (and most importantly don't conflict) with the requirements in Chapter 29 of the 2022 edition of NFPA 72.
- Reduce unwanted alarm activations from smoke alarms and smoke detectors being installed near stationary or fixed cooking appliances.
- Simply the smoke detection requirements in section 9.6.2.10.
- ~~Ensure the reliability of smoke alarms in new section 9.6.2.10.6.1 by requiring them to receive their primary power source wen from a commercial source along with a secondary power source.~~

The second PC is renumbering the annex paragraphs associated with 9.6.2.10.7.1 and 9.6.2.10.7.2.

- Simplify the smoke detection requirements in section 9.6.2.10.

Statement of Problem and Substantiation for Public Comment

NOTE: The following CC Note No. 5 appeared in the First Draft Report on First Revision No. 6571 and is also related to Public Input No. 335.

Consider the negative vote of P. Larrimer: "Some installations of automatic sprinklers do not meet the NFPA 13 definition for an automatic sprinkler system that has now been added to Chapter 3 of this document. The original PI suggested that automatic sprinklers are part of an automatic sprinkler system, but that is not always the case as identified by the text in 9.7.1.2. The existing title "Automatic Sprinklers" was more accurate since automatic sprinklers can be used without being installed in a system that meets the definition of an "automatic sprinkler system" as this section is now titled."

Hugo, Jeffrey M.

This is a subchapter title change that is similar to other fire protection systems in Chapter 9, i.e standpipe systems, fire alarm systems. Automatic sprinklers as a title is not appropriate for the systems based references in this chapter. Perhaps, to Mr. Larrimers' negative, the TC needs to subtitle or move sections 9.7.1.2 and 9.7.1.3 to address the partial systems covering hazardous areas.

Some installations of automatic sprinklers do not meet the NFPA 13 definition for an automatic sprinkler system that has now been added to Chapter 3 of this document. The original PI suggested that automatic sprinklers are part of an automatic sprinkler system, but that is not always the case as identified by the text in 9.7.1.2. The existing title “Automatic Sprinklers” was more accurate since automatic sprinklers can be used without being installed in a system that meets the definition of an “automatic sprinkler system” as this section is now titled.

Public Comment No. 4-NFPA 101-2022 [Section No. 3.3.281]

3.3.281 Sprinkler System.

A system, commonly activated by heat from a fire and discharges water over the fire area, that consists of an integrated network of piping designed in accordance with fire protection engineering standards that includes a water supply source, a control valve, a waterflow alarm, and a drain. The portion of the sprinkler system above ground is a network of specifically sized or hydraulically designed piping installed in a building, structure, or area, generally overhead, and to which sprinklers are attached in a systematic pattern. [13, 2022]

3.3.281.1 Automatic Sprinkler.

A fire suppression or control device that operates automatically when its heat-activated element is heated to its thermal rating or above, allowing to discharge over a specified area. [13, 2022]

The extracted definition from NFPA 13 includes a waterflow switch. NFPA 13D systems have a similar definition without a waterflow switch. Keeping this definition would change how NFPA 13D systems are handled by this code.

Public Comment No. 57-NFPA 101-2022 [Section No. 3.3.281 [Excluding any Sub-Sections]]

3.3.x Sprinkler System

3.3.x.1 Sprinkler System (NFPA 13/13R)

A system, commonly activated by heat from a fire and discharges water over the fire area, that consists of an integrated network of piping designed in accordance with fire protection engineering standards that includes a water supply source, a control valve, a waterflow alarm, and a drain. The portion of the sprinkler system above ground is a network of specifically sized or hydraulically designed piping installed in a building, structure, or area, generally overhead, and to which sprinklers are attached in a systematic pattern. [13, 2022]

3.3.x.2 Sprinkler System (NFPA 13D)

A system that consists of an integrated network of piping designed in accordance with fire protection engineering standards that includes a water supply source, a water control valve, and a drain. The portion of the sprinkler system above ground is a network of specifically sized or hydraulically designed piping installed in a building, structure, or area, generally overhead, and to which sprinklers are attached in a systematic pattern. The system is commonly activated by heat from a fire and discharges water over the fire area. [13D, 2022]

Statement of Problem and Substantiation for Public Comment

The sprinkler system definition is different from NFPA 13/13R to NFPA 13D. The NFPA 13D definition does not have the waterflow alarm. This public comment correlates the previous first draft definition extracted from NFPA 13 with the extracted definition from NFPA 13D.

NFPA 1, FCC-OCP, SR 48 made the same changes suggested in this public comment for the following reason: This addresses the concerns raised by the FCC-AAC in CN-11. The two new extracted definitions address both definitions used by NFPA 13, 13R and 13D. NFPA 13R extracts the definition from 13.

Public Comment No. 111-NFPA 101-2022 [Section No. 9.6.2.10]

9.6.2.10 Smoke Alarms.

9.6.2.10.1

Where required by another section of this *Code*, single-station and multiple-station smoke alarms shall be in accordance with *NFPA 72* unless otherwise provided in 9.6.2.10.4, 2 through 9.6.2.10.5, 9.6.2.10.7, or

9.6.2.10.

8.

2 Smoke Detection Systems Utilizing Smoke Detectors.

9.6.2.10.2

—

.1 Where automatic smoke detection is required by Chapters 11 through 43, smoke alarms shall not be used as a substitute.

9.6.2.10.2.2 Smoke detectors in accordance with *NFPA 72* and arranged to function in the same manner as single-station or multiple-station smoke alarms shall be permitted in lieu of smoke alarms.

9.6.2.10.3 Smoke Alarms in Sleeping Rooms.

9.6.2.10.3.1

In new construction, where required by Chapters 11 through 43, the alarm notification signal in sleeping rooms resulting from activation of smoke alarms shall be a 520 Hz low-frequency signal complying with *NFPA 72*.

9.6.2.10.4 * —

The interconnection

4 The installation of smoke alarms

shall apply only to new construction as provided in 9.6.2.10.10.

and smoke detectors near stationary or fixed cooking appliances shall be in accordance with *NFPA 72*.

9.6.2.10.5 * —

Unless otherwise provided in 9.6.2.10.7, smoke alarms and smoke detectors shall not be installed within an area of exclusion determined by a 10 ft (3.0 m) radial distance along a horizontal flow path from a stationary or fixed cooking appliance, unless listed for installation in close proximity to cooking appliances.

The installation of Smoke alarms and smoke detectors

installed between 10 ft (3.0 m) and 20 ft (6.1 m) along a horizontal flow path from a stationary or fixed cooking appliance shall be equipped with an alarm-silencing means or use photoelectric detection. [*72* : 29.11.3.4(4)]

near a door to a bathroom containing a shower or tub shall be in accordance with *NFPA 72*.

- The kitchen or cooking area and adjacent spaces have no clear interior partitions or headers. The 10 ft (3.0 m) area of exclusion would prohibit the placement of a smoke alarm or smoke detector required by other sections of *NFPA 72* - [72 : 29.11.3.4(5)]

9.6.2.10.6 -

Smoke alarms or smoke detectors that use photoelectric detection shall be permitted for installation at a radial distance greater than 6 ft (1.8 m) from any stationary or fixed cooking appliance when the following conditions are met:

Power Source. -

9.6.2.10.6.1 In new construction, smoke alarms shall receive their primary power from a commercial source along with a secondary power source complying with *NFPA 72* .

9.6.2.10.

7 * -

Smoke alarms and smoke detectors shall not be installed within a 36 in. (910 mm) horizontal path from a door to a bathroom containing a shower or tub unless listed for installation in close proximity to such locations. - [72 : 29.11.3.4(7)] **6.2** In existing construction, where permitted by Chapters 11 through 43, smoke alarms are allowed to receive their primary power from batteries.

9.6.2.10.

8-

System smoke detectors in accordance with *NFPA 72* and arranged to function in the same manner as single-station or multiple-station smoke alarms shall be permitted in lieu of smoke alarms **7 Interconnection** .

9.6.2.10.

9-

Smoke alarms, other than battery-operated smoke alarms as permitted by other sections of this Code , shall be powered in accordance with the requirements of *NFPA 72*

7.1* The interconnection of smoke alarms shall apply only to new construction .

9.6.2.10.

10 * -

7.2 In new construction, where two or more smoke alarms are required within a dwelling unit, suite of rooms, or similar area, they shall be arranged so that operation of any smoke alarm shall cause the alarm in all smoke alarms within the dwelling unit, suite of rooms, or similar area to sound, unless otherwise permitted by one of the following:

- (1) The requirement of 9.6.2.10.10 shall 7 shall not apply where permitted by another section of this Code.
- (2) The requirement of 9.6.2.10.10 7 shall not apply to configurations that provide equivalent distribution of the alarm signal.

9.6.2.10. 11- 8

The alarms described in 9.6.2.10.10 shall sound only within an individual dwelling unit, suite of rooms, or similar area and shall not actuate the building fire alarm system, unless otherwise permitted by the authority having jurisdiction.

9.6.2.10. 12 9

Smoke alarms shall be permitted to be connected to the building fire alarm system for the purpose of annunciation in accordance with *NFPA 72*.

Additional Proposed Changes

<u>File Name</u>	<u>Description</u>	<u>Approved</u>
NFPA_101_Chapt_9_Smoke_Alarm_DRAFT_PC_v3.docx	Word document summarizing the proposed changes	

Statement of Problem and Substantiation for Public Comment

This is the first of two public comment (PC) being submitted on behalf of the NFPA 101 Building Service and Fire Protection Equipment working group (WG) that was formed during the first draft meeting and is in response to public input (PI) 199. It should be noted that two of eight WG members do not agree with portions of this PC and may submit their own PC.

The reason for PI-199 was due to new cooking resistance tests being added to the UL smoke alarm/detector listing standards (UL 217 and UL 268) and because UL is continually changing the compliance date for the new requirements. Therefore, the goal of the WG is to:

- Remove the technology references in section 9.6.2.10.5 and 9.6.2.10.6 relating to the placement of smoke alarms/detectors installed near fixed cooking appliances.
- Modify the smoke detection requirements in section 9.6.2.10.5 and 9.6.2.10.6 to ensure they align (and most importantly don't conflict) with the requirements in Chapter 29 of the 2022 edition of NFPA 72.
- Reduce unwanted alarm activations from smoke alarms and smoke detectors being installed near stationary or fixed cooking appliances.
- Simply the smoke detection requirements in section 9.6.2.10.
- Ensure the reliability of smoke alarms in new section 9.6.2.10.6.1 by requiring them to receive their primary power source wen from a commercial source along with a secondary power source.

The second PC is renumbering the annex paragraphs associated with 9.6.2.10.7.1 and 9.6.2.10.7.2.

To avoid confusion, what follows is how section 9.6.2.10 would appear if this PC is approved.

9.6.2.10 Smoke Alarms.

9.6.2.10.1 Where required by another section of this Code, single-station and multiple-station smoke alarms shall be in accordance with NFPA 72 unless otherwise provided in 9.6.2.10.2 through 9.6.2.10.9.

9.6.2.10.2 Smoke Detection Systems Utilizing Smoke Detectors

9.6.2.10.2.1 Where automatic smoke detection is required by Chapters 11 through 43, smoke alarms shall not be used as a substitute.

9.6.2.10.2.2 Smoke detectors in accordance with NFPA 72 and arranged to function in the same manner as single-station or multiple-station smoke alarms shall be permitted in lieu of smoke alarms.

9.6.2.10.3 In new construction, where required by Chapters 11 through 43, the alarm notification signal in sleeping rooms resulting from activation of smoke alarms shall be a 520 Hz low-frequency signal complying with NFPA 72.

9.6.2.10.4 The installation of smoke alarms and smoke detectors near stationary or fixed cooking appliances shall be in accordance with NFPA 72.

9.6.2.10.5* The installation of smoke alarms and smoke detectors near a door to a bathroom containing a shower or tub shall be in accordance with NFPA 72.

9.6.2.10.6 Smoke alarms, other than battery-operated smoke alarms as permitted by other sections of this Code, shall be powered in accordance with the requirements of NFPA 72.

9.6.2.10.7* In new construction, where two or more smoke alarms are required within a dwelling unit, suite of rooms, or similar area, they shall be arranged so that operation of any smoke alarm shall cause the alarm in all smoke alarms within the dwelling unit, suite of rooms, or similar area to sound, unless otherwise permitted by one of the following:

- 1) The requirement of 9.6.2.10.7 shall not apply where permitted by another section of this Code.

2) The requirement of 9.6.2.10.7 shall not apply to configurations that provide equivalent distribution of the alarm signal.

9.6.2.10.8 The alarms described in 9.6.2.10.7.2 shall sound only within an individual dwelling unit, suite of rooms, or similar area and shall not actuate the building fire alarm system, unless otherwise permitted by the authority having jurisdiction.

9.6.2.10.9 Smoke alarms shall be permitted to be connected to the building fire alarm system for the purpose of annunciation in accordance with NFPA 72.

9.6.2.10.1 Where required by another section of this *Code*, single-station and multiple-station smoke alarms shall be in accordance with *NFPA 72* unless otherwise provided in ~~9.6.2.10, 9.6.2.10.5, 9.6.2.10.7 or 9.6.2.10.8~~ 9.6.2.10.2 through 9.6.2.10.9.

9.6.2.10.2 Smoke Detection Systems Utilizing Smoke Detectors

9.6.2.10.2.1 Where automatic smoke detection is required by Chapters 11 through 43, smoke alarms shall not be used as a substitute.

9.6.2.10.2.2 Smoke detectors in accordance with *NFPA 72* and arranged to function in the same manner as single-station or multiple-station smoke alarms shall be permitted in lieu of smoke alarms.

9.6.2.10.3 ~~Smoke Alarms in Sleeping Rooms.~~ In new construction, where required by Chapters 11 through 43, the alarm notification signal in sleeping rooms resulting from activation of smoke alarms shall be a 520 Hz low-frequency signal complying with *NFPA 72*.

~~9.6.2.10.4* The interconnection of smoke alarms shall apply only to new construction as provided in 9.6.2.10.10.~~

~~A.9.6.2.10.4 NFPA 72 mandates smoke alarms in all sleeping rooms, and interconnection of smoke alarms is required for both new and existing installations. Per 9.6.2.10.1, the residential occupancy chapters determine whether smoke alarms are needed within sleeping rooms. Paragraph 9.6.2.10.4 limits the requirement for interconnection of smoke alarms to those in new construction. This Code does not intend to require compliant, existing smoke alarm installations to be interconnected. This Code is periodically revised to add retrospective requirements only where the need is clearly substantiated.~~

9.6.2.10.4 The installation of smoke alarms and smoke detectors near stationary or fixed cooking appliances shall be in accordance with *NFPA 72*.

~~9.6.2.10.5* Unless otherwise provided in 9.6.2.10.7, smoke alarms and smoke detectors shall not be installed within an area of exclusion determined by a 10 ft (3.0 m) radial distance along a horizontal flow path from a stationary or fixed cooking appliance, unless listed for installation in close proximity to cooking appliances. Smoke alarms and smoke detectors installed between 10 ft (3.0 m) and 20 ft (6.1 m) along a horizontal flow path from a stationary or fixed cooking appliance shall be equipped with an alarm silencing means or use photoelectric detection. [72:29.11.3.4(4)]~~

~~A.9.6.2.10.5-~~

~~9.6.2.10.6 Smoke alarms or smoke detectors that use photoelectric detection shall be permitted for installation at a radial distance greater than 6 ft (1.8 m) from any stationary or fixed cooking appliance when the following conditions are met:~~

- ~~1) The kitchen or cooking area and adjacent spaces have no clear interior partitions or headers.~~
- ~~2) The 10 ft (3.0 m) area of exclusion would prohibit the placement of a smoke alarm or smoke detector required by other sections of NFPA 72. [72:29.11.3.4(5)]~~

9.6.2.10.75* The installation of smoke alarms and smoke detectors shall not be installed within a 36 in. (910 mm) horizontal path from near a door to a bathroom containing a shower or tub unless listed for installation in close proximity to such locations. [72:29.11.3.4(7)] shall be in accordance with NFPA 72.

~~A.9.6.2.10.7 Studies indicate that smoke alarms and smoke detectors that use ionization detection, photoelectric detection, or a combination of ionization and photoelectric detection are susceptible to nuisance alarms caused by steam. Little research has been done on the comparative response of these types of detection to steam. Steam particles, in general, are visible, reflect light easily, and are typically produced in a size range that would be more likely to activate a photoelectric sensor. Thus, it is required that smoke alarms and smoke detectors be installed greater than 36 in. (910 mm) from the bathroom door where possible. Increasing the distance between the smoke alarm or smoke detector and the bathroom door can reduce the frequency of nuisance alarms from bathroom steam. Frequent nuisance alarms can result in the occupant disabling the smoke alarm. Each incremental increase in separation, up to 10 ft (3.0 m), between the bathroom door and the smoke alarm or smoke detector is expected to reduce the frequency of nuisance alarms. [72: A.29.8.3.4(5)]~~

~~9.6.2.10.8 System smoke detectors in accordance with NFPA 72 and arranged to function in the same manner as single station or multiple station smoke alarms shall be permitted in lieu of smoke alarms.~~

9.6.2.10.96 Power Source. ~~Smoke alarms, other than battery-operated smoke alarms as permitted by other sections of this Code, shall be powered in accordance with the requirements of NFPA 72.~~

9.6.2.10.6.1 In new construction, smoke alarms shall receive their primary power from a commercial source along with a secondary power source complying with NFPA 72.

9.6.2.10.6.2 In existing construction, where permitted by Chapters 11 through 43, smoke alarms are allowed to receive their primary power from batteries.

9.6.2.10.107 Interconnection.

9.6.2.10.7.1* The interconnection of smoke alarms shall apply only to new construction.

~~A.9.6.2.10.4~~ **A.9.6.2.10.7.1** NFPA 72 mandates smoke alarms in all sleeping rooms, and interconnection of smoke alarms is required for both new and existing installations. Per 9.6.2.10.1, the residential occupancy chapters determine whether smoke alarms are needed within sleeping rooms. Paragraph ~~9.6.2.10.4~~ 9.6.2.10.7.1 limits the requirement for interconnection of smoke alarms to those in new construction. This Code does not intend to require compliant, existing smoke alarm installations to be interconnected. This Code is periodically revised to add retrospective requirements only where the need is clearly substantiated.

9.6.2.10.7.2 * In new construction, where two or more smoke alarms are required within a dwelling unit, suite of rooms, or similar area, they shall be arranged so that operation of any smoke alarm shall

cause the alarm in all smoke alarms within the dwelling unit, suite of rooms, or similar area to sound, unless otherwise permitted by one of the following:

- 1) The requirement of ~~9.6.2.10.10~~ [9.6.2.10.7](#) shall not apply where permitted by another section of this *Code*.
- 2) The requirement of ~~9.6.2.10.10~~ [9.6.2.10.7](#) shall not apply to configurations that provide equivalent distribution of the alarm signal.

~~A.9.6.2.10.10~~ [A.9.6.2.10.7.2](#) A dwelling unit is that structure, area, room, or combination of rooms, including hotel rooms/suites, in which a family or individual lives. A dwelling unit includes living areas only and not common usage areas in multifamily buildings, such as corridors, lobbies, and basements.

9.6.2.10.118 The alarms described in ~~9.6.2.10.10~~ [9.6.2.10.7.2](#) shall sound only within an individual dwelling unit, suite of rooms, or similar area and shall not actuate the building fire alarm system, unless otherwise permitted by the authority having jurisdiction.

9.6.2.10.129 Smoke alarms shall be permitted to be connected to the building fire alarm system for the purpose of annunciation in accordance with *NFPA 72*.

Reason Statement:

This is the first of two public comment (PC) being submitted on behalf of the NFPA 101 Building Service and Fire Protection Equipment working group (WG) that was formed during the first draft meeting and is in response to public input (PI) 199. It should be noted that two of eight WG members do not agree with portions of this PC and may submit their own PC.

The reason for PI-199 was due to new cooking resistance tests being added to the UL smoke alarm/detector listing standards (UL 217 and UL 268) and because UL is continually changing the compliance date for the new requirements. Therefore, the goal of the WG to is to:

- Remove the technology references in section 9.6.2.10.5 and 9.6.2.10.6 relating to the placement of smoke alarms/detectors installed near fixed cooking appliances.
- Modify the smoke detection requirements in section 9.6.2.10.5 and 9.6.2.10.6 to ensure they align (and most importantly don't conflict) with the requirements in Chapter 29 of the 2022 edition of NFPA 72.
- Reduce unwanted alarm activations from smoke alarms and smoke detectors being installed near stationary or fixed cooking appliances.
- Simply the smoke detection requirements in section 9.6.2.10.
- Ensure the reliability of smoke alarms in new section 9.6.2.10.6.1 by requiring them to receive their primary power source from a commercial source along with a secondary power source.

The second PC is renumbering the annex paragraphs associated with 9.6.2.10.7.1 and 9.6.2.10.7.2.

To avoid confusion, what follows is how section 9.6.2.10 would appear if this PC is approved.

9.6.2.10 Smoke Alarms.

9.6.2.10.1 Where required by another section of this *Code*, single-station and multiple-station smoke alarms shall be in accordance with *NFPA 72* unless otherwise provided in 9.6.2.10.2 through 9.6.2.10.9.

9.6.2.10.2 Smoke Detection Systems Utilizing Smoke Detectors

9.6.2.10.2.1 Where automatic smoke detection is required by Chapters 11 through 43, smoke alarms shall not be used as a substitute.

9.6.2.10.2.2 Smoke detectors in accordance with *NFPA 72* and arranged to function in the same manner as single-station or multiple-station smoke alarms shall be permitted in lieu of smoke alarms.

9.6.2.10.3 In new construction, where required by Chapters 11 through 43, the alarm notification signal in sleeping rooms resulting from activation of smoke alarms shall be a 520 Hz low-frequency signal complying with *NFPA 72*.

9.6.2.10.4 The installation of smoke alarms and smoke detectors near stationary or fixed cooking appliances shall be in accordance with *NFPA 72*.

9.6.2.10.5* The installation of smoke alarms and smoke detectors near a door to a bathroom containing a shower or tub shall be in accordance with *NFPA 72*.

9.6.2.10.6 Smoke alarms, other than battery-operated smoke alarms as permitted by other sections of this *Code*, shall be powered in accordance with the requirements of *NFPA 72*.

9.6.2.10.7* In new construction, where two or more smoke alarms are required within a dwelling unit, suite of rooms, or similar area, they shall be arranged so that operation of any smoke alarm shall cause the alarm in all smoke alarms within the dwelling unit, suite of rooms, or similar area to sound, unless otherwise permitted by one of the following:

- 1) The requirement of 9.6.2.10.7 shall not apply where permitted by another section of this *Code*.
- 2) The requirement of 9.6.2.10.7 shall not apply to configurations that provide equivalent distribution of the alarm signal.

9.6.2.10.8 The alarms described in 9.6.2.10.7.2 shall sound only within an individual dwelling unit, suite of rooms, or similar area and shall not actuate the building fire alarm system, unless otherwise permitted by the authority having jurisdiction.

9.6.2.10.9 Smoke alarms shall be permitted to be connected to the building fire alarm system for the purpose of annunciation in accordance with *NFPA 72*.

Public Comment No. 163-NFPA 101-2022 [Section No. 9.6.2.10]

9.6.2.10 Smoke Alarms.

9.6.2.10.1

Where required by another section of this *Code*, single-station and multiple-station smoke alarms shall be in accordance with *NFPA 72* unless otherwise provided in 9.6.2.10.4 , or 9.6.2.10.5, 9.6.2.10.7, or 9.6.2.10.8 .

9.6.2.10.2

Where automatic smoke detection is required by Chapters 11 through 43, smoke alarms shall not be used as a substitute.

9.6.2.10.3 Smoke Alarms in Sleeping Rooms.

9.6.2.10.3.1 –

In new construction, where

Where required by Chapters 11 through 43, the alarm notification signal in sleeping rooms resulting from activation of smoke alarms shall be a 520 Hz low-frequency signal complying with *NFPA 72*.

9.6.2.10.4*

The interconnection of smoke alarms shall apply only to new construction as provided in 9.6.2.10.10.

9.6.2.10.5*

Unless otherwise provided in 9.6.2.10.7 , smoke alarms and smoke detectors shall not be installed within an area of exclusion determined by a 10 ft (3.0 m) radial distance along a horizontal flow path from a stationary or fixed cooking appliance, unless listed for installation in close proximity to cooking appliances. Smoke alarms and smoke detectors installed between 10 ft (3.0 m) and 20 ft (6.1 m) along a horizontal flow path from a stationary or fixed cooking appliance shall be equipped with an alarm-silencing means or use photoelectric detection. [72 : 29.11.3.4(4)]

9.6.2.10.6 –

Smoke alarms or smoke detectors that use photoelectric detection shall be permitted for installation at a radial distance greater than 6 ft (1.8 m) from any stationary or fixed cooking appliance when the following conditions are met:

- (1) The kitchen or cooking area and adjacent spaces have no clear interior partitions or headers.
- (2) The 10 ft (3.0 m) area of exclusion would prohibit the placement of a smoke alarm or smoke detector required by other sections of *NFPA 72* . [72 : 29.11.3.4(5)]

9.6.2.10.7 * –

Smoke alarms and smoke detectors shall not be installed within a 36 in. (910 mm) horizontal path from a door to a bathroom containing a shower or tub unless listed for installation in close proximity to such locations. [72 : 29.11.3.4(7)]

9.6.2.10.8 –

System smoke detectors in accordance with *NFPA 72* and arranged to function in the same manner as single-station or multiple-station smoke alarms shall be permitted in lieu of smoke alarms.

9.6.2.10.9 6

Smoke alarms, other than battery-operated smoke alarms as permitted by other sections of this *Code*, shall be powered in accordance with the requirements of *NFPA 72*.

9.6.2.10.10 7 *

In new construction, where two or more smoke alarms are required within a dwelling unit, suite of rooms, or similar area, they shall be arranged so that operation of any smoke alarm shall cause the alarm in all smoke alarms within the dwelling unit, suite of rooms, or similar area to sound, unless otherwise permitted by one of the following:

- (1) The requirement of 9.6.2.10.10 ~~shall 7~~ shall not apply where permitted by another section of this *Code*.
- (2) The requirement of 9.6.2.10.10 ~~shall 7 shall~~ not apply to configurations that provide equivalent distribution of the alarm signal.

9.6.2.10.11 8

The alarms described in 9.6.2.10.10 ~~shall 7~~ shall sound only within an individual dwelling unit, suite of rooms, or similar area and shall not actuate the building fire alarm system, unless otherwise permitted by the authority having jurisdiction.

9.6.2.10.12 9

Smoke alarms shall be permitted to be connected to the building fire alarm system for the purpose of annunciation in accordance with *NFPA 72*.

Additional Proposed Changes

<u>File Name</u>	<u>Description</u>	<u>Approved</u>
NFPA_101_Chapt_9_Smoke_Alarm_DRAFT_Larrimer_Draft_5-27-22.docx	Word Document with Track Changes for 9.6.2.10.	

Statement of Problem and Substantiation for Public Comment

For 9.6.2.10.1: Everything for new construction should comply with *NFPA 72*. Exceptions should cover only those items that are not covered by *NFPA 72* (which only covers new installations). Deleted two paragraphs that were not exceptions to *NFPA 72*.

9.6.2.10.3 Title was not needed.

For 9.6.2.10.3.1 Changed numbering and, even though this only happens in new construction currently, (Ch 28 and Ch 30) it is not necessary to say that. If an existing chapter wanted to make low frequency alarms a requirement, they can do so. Note that using this would effectively require system notification appliances to provide the 520 Hz signal.

For 5, 6 and 6: 9.6.2.10.4, 5, and 6 (and the annex material) were deleted since these were extracts from *NFPA 72* and the base paragraph requires compliance with *NFPA 72*. In addition, these actually didn't extract the material as written in *NFPA 72*. Compare the text. These should also **ONLY** apply to new construction and when they are extracted, they also apply to existing systems in *NFPA 101*.

For 9.6.2.10.8 - renumbered to 5 and this is an exception (existing) to using single or multiple station smoke alarms as referenced in 9.6.2.10.

****For 9.6.2.10.9 I am not making any change to this (except numbering) since there was no public input addressing this issue. However, this text should be deleted as NFPA 72 addresses power supplies and NFPA 72 allows 10 year battery smoke alarms for new construction and doesn't require a connect to an A/C source. NFPA 72 also addresses 1 year batteries. The NFPA 101 Occupancy chapters address when battery powered alarms are allowed for existing systems but they are based on the old NFPA 72 when only 1 year batteries were available. I believe that the occupancy chapters should be informed that AC smoke alarms are not required for new construction based on the requirements of Chapter 9 and NFPA 72 and that 10 year batter smoke alarms are permitted by NFPA 72.

Summary of Occupancy Chapters:

Chapter 24, 24.3.4.1.3 implies that new dwellings required other than battery operated smoke alarms, but nothing in Chapter 9 or NFPA 72 would actually require AC smoke alarms.

In existing day care occupancies (see below), the implication is that Chapter 9 requires smoke alarms to be connected to the building electrical system. Section 17.6.3.4.5 is an exception to the "house electrical service-powered smoke alarms required by 17.6.3.4.4", but 17.6.3.4.4 only references 9.6.2.10 and 9.6.2.10 doesn't require connection to the building electrical system. 9.6.2.10 references NFPA 72 and that allows 10 year batteries for new installations.

17.6.3.4.4

Single-station or multiple-station smoke alarms or smoke detectors shall be provided in all rooms used for sleeping in accordance with 9.6.2.10, other than as permitted by 17.6.3.4.5.

17.6.3.4.5

Approved existing battery-powered smoke alarms, rather than house electrical service-powered smoke alarms required by 17.6.3.4.4, shall be permitted where the facility has testing, maintenance, and battery replacement programs that ensure reliability of power to the smoke alarms.

The same implication from Chapter 17 is in Chapter 26 (see below.)

26.3.4.5.3

Existing battery-powered smoke alarms, rather than house electric-powered smoke alarms, shall be permitted where the facility has demonstrated to the authority having jurisdiction that the testing, maintenance, and battery replacement programs will ensure reliability of power to the smoke alarms. Chapter 29 and Chapter 31 also have issues with power supplies. There is no required secondary (standby) power source required.

29.3.4.5.2

Single-station smoke alarms without a secondary (standby) power source shall be permitted.

31.3.4.5.2

Smoke alarms required by 31.3.4.5.1 shall not be required to be provided with a secondary (standby) power source.

31.3.4.5.4

Smoke alarms required by 31.3.4.5.3 shall be permitted to be battery powered.

It appears that Chapter 33 is the only chapter that actually requires AC smoke alarms as follows:

33.2.3.4.4.5

Smoke alarms shall be powered from the building electrical system and, when activated, shall initiate an alarm that is audible in all sleeping areas.

33.2.3.4.4.6

Smoke alarms in accordance with 33.2.3.4.4.1, 33.2.3.4.4.2, and 33.2.3.4.4.3 shall not be required where buildings are protected throughout by an approved automatic sprinkler system, in accordance with 33.2.3.5, that uses quick-response or residential sprinklers, and are protected with approved smoke alarms installed in each sleeping room, in accordance with 9.6.2.10, that are powered by the building electrical system.

33.2.3.4.4.7

Smoke alarms in accordance with 33.2.3.4.4.1, 33.2.3.4.4.2, and 33.2.3.4.4.3 shall not be required where buildings are protected throughout by an approved automatic sprinkler system, in accordance with 33.2.3.5, that uses quick-response or residential sprinklers, with existing battery-powered smoke alarms in each sleeping room, and where, in the opinion of the authority having jurisdiction, the facility has demonstrated that testing, maintenance, and a battery replacement program ensure the reliability of power to the smoke alarms.

33.3.3.4.7.1

Each sleeping room shall be provided with an approved smoke alarm in accordance with 9.6.2.10 that is powered from the building electrical system.

33.3.3.4.7.2

Existing battery-powered smoke alarms, rather than building electrical-service-powered smoke alarms,

shall be accepted where, in the opinion of the authority having jurisdiction, the facility has demonstrated that testing, maintenance, and battery replacement programs ensure the reliability of power to the smoke alarms.

33.3.3.4.7.3

Sleeping room smoke alarms shall not be required in facilities having an existing corridor smoke detection system that complies with Section 9.6 and is connected to the building fire alarm system. Chapter 43 requires smoke alarms connected to the electrical system even though it is not required by Chapter 9 or by NFPA 72.

43.8.4 Smoke Alarms.

Where an addition is made to a one- or two-family dwelling or a small residential board and care occupancy, interconnected smoke alarms, powered by the electrical system, meeting the requirements of the other sections of this Code shall be installed and maintained in the addition.

Committee Statement

Committee Action: Rejected but see related SR

Resolution: SR-6563-NFPA 101-2022

Statement: This is being submitted on behalf of the NFPA 101 Building Service and Fire Protection Equipment working group (WG) that was formed during the first draft meeting and is in response to public input (PI) 199.

The reason for PI-199 was due to new cooking resistance tests being added to the UL smoke alarm/detector listing standards (UL 217 and UL 268) and because UL is continually changing the compliance date for the new requirements. Therefore, the goal of the Second Revision is to:

- Remove the technology references in section 9.6.2.10.5 and 9.6.2.10.6 relating to the placement of smoke alarms/detectors installed near fixed cooking appliances.
- Modify the smoke detection requirements in section 9.6.2.10.5 and 9.6.2.10.6 to ensure they align (and most importantly don't conflict) with the requirements in Chapter 29 of the 2022 edition of NFPA 72.
- Reduce unwanted alarm activations from smoke alarms and smoke detectors being installed near stationary or fixed cooking appliances.
- Simplify the smoke detection requirements in section 9.6.2.10.

9.6.2.10 Smoke Alarms.

9.6.2.10.1 Where required by another section of this Code, single-station and multiple-station smoke alarms shall be in accordance with NFPA 72 unless otherwise provided in 9.6.2.10.4, 9.6.2.10.5, 9.6.2.10.7, or 9.6.2.10.8.5.

9.6.2.10.2 Where automatic smoke detection is required by Chapters 11 through 43, smoke alarms shall not be used as a substitute.

9.6.2.10.3 Smoke Alarms in Sleeping Rooms.

9.6.2.10.3.1 ~~In new construction,~~ Where required by Chapters 11 through 43, the alarm notification signal in sleeping rooms resulting from activation of smoke alarms shall be a 520 Hz low-frequency signal complying with NFPA 72.

9.6.2.10.4 * The interconnection of smoke alarms shall apply only to new construction as provided in 9.6.2.10.497.

9.6.2.10.5 * Unless otherwise provided in 9.6.2.10.7, smoke alarms and smoke detectors shall not be installed within an area of exclusion determined by a 10 ft (3.0 m) radial distance along a horizontal flow path from a stationary or fixed cooking appliance, unless listed for installation in close proximity to cooking appliances. Smoke alarms and smoke detectors installed between 10 ft (3.0 m) and 20 ft (6.1 m) along a horizontal flow path from a stationary or fixed cooking appliance shall be equipped with an alarm silencing means or use photoelectric detection. [72:29.11.3.4(4)]

9.6.2.10.6

Smoke alarms or smoke detectors that use photoelectric detection shall be permitted for installation at a radial distance greater than 6 ft (1.8 m) from any stationary or fixed cooking appliance when the following conditions are met:

(1) The kitchen or cooking area and adjacent spaces have no clear interior partitions or headers.

(2) The 10 ft (3.0 m) area of exclusion would prohibit the placement of a smoke alarm or smoke detector required by other sections of NFPA 72. [72:29.11.3.4(5)]

9.6.2.10.7 * Smoke alarms and smoke detectors shall not be installed within a 36 in. (910 mm) horizontal path from a door to a bathroom containing a shower or tub unless listed for installation in close proximity to such locations. [72:29.11.3.4(7)]

9.6.2.10.85 System smoke detectors in accordance with NFPA 72 and arranged to function in the same manner as single-station or multiple-station smoke alarms shall be permitted in lieu of smoke alarms.

9.6.2.10.96 Smoke alarms, other than battery-operated smoke alarms as permitted by other sections of this Code, shall be powered in accordance with the requirements of NFPA 72.

9.6.2.10.497 * In new construction, where two or more smoke alarms are required within a dwelling unit, suite of rooms, or similar area, they shall be arranged so that operation of any smoke alarm shall cause the alarm in all smoke alarms within the dwelling unit, suite of rooms, or similar area to sound, unless otherwise permitted by one of the following:

Commented [LPA(1): Everything for new construction should comply with NFPA 72. Exceptions should cover only those items that are not covered by NFPA 72 (which only covers new installations).

Commented [LPA(2): Even though this only happens in new construction, (Ch 28 and Ch 30) it is not necessary to say that. If an existing chapter wanted to make low frequency alarms a requirement, they can do so. Note that using this would effectively require system notification appliances to provide the 520 Hz signal.

Rev 1-26-22

(1) The requirement of 9.6.2.10.~~407~~ shall not apply where permitted by another section of this *Code*.

(2) The requirement of 9.6.2.10.~~407~~ shall not apply to configurations that provide equivalent distribution of the alarm signal.

9.6.2.10.418 The alarms described in 9.6.2.10.407- shall sound only within an individual dwelling unit, suite of rooms, or similar area and shall not actuate the building fire alarm system, unless otherwise permitted by the authority having jurisdiction.

9.6.2.10.429 Smoke alarms shall be permitted to be connected to the building fire alarm system for the purpose of annunciation in accordance with NFPA 72.

Commented [LPA(7)]: No change to these except the numbering. These are not exceptions to NFPA 72 nor 9.6.2.10.

Public Comment No. 234-NFPA 101-2022 [New Section after 9.6.3.5]

TITLE OF NEW CONTENT

9.6.3.6.*

Where modular rooms and sleep pods complying with Section 10.7 are provided in indoor areas provided with occupant notification systems, the required audible and visible signal shall be extended into the interior of these units.

A.9.6.3.6

Modular rooms and sleep pods are products that often include sound dampening and opaque walls and ceilings. This construction can prevent occupants from sensing alarms provided by the occupant notification system. Extending the audible and visible signals into the interior of a modular room is likely to require the addition of audible and visible notification appliances within the space. However if the attenuation of the alarm signal is negligible within the space, additional notification appliances may not be necessary to provide the required alarm notification.

Statement of Problem and Substantiation for Public Comment

In response to the committee's resolution statement for this public input, consider the following:

1. Regarding "the referenced section does not exist" see the new section 10.7 in the first draft report.
2. Regarding the question about "life safety risks", modular rooms and sleep pods are products (not building construction) that are introduced into an occupancy and plugged into a power source. They are advertised as privacy spaces and frequently include sound deadening insulation and opaque walls and ceilings. Thus occupants within these units may not see or hear the occupant notification system. This proposal addresses that hazard.
3. Regarding "there is no technical merit to the proposal", evidently other NFPA 101 technical committees saw the value in addressing these installations and made first revisions in several other NFPA 101 chapters.

The wording of the public input has been revised to match public comments submitted to other chapters. It is also being proposed for 9.6.3.6, rather than 9.6.3.6.1, and assumes the existing 9.6.3.6 and its subsections will be renumbered.

Action:

Resolution: The language can be confusing. Different configurations of sleeping pods or modular rooms may or may not need protection. The requirements for protection are addressed in section 10.7.1 of the first revision.

Public Comment No. 142-NFPA 101-2022 [Section No. 9.6.3.6.1]

9.6.3.6.1—

Areas not subject to occupancy by persons who are deaf or hard of hearing shall not be required to comply with the provisions for visible signals.

*
—

Where modular rooms and sleep pods complying with Section 10.6 are provided in indoor areas with occupant notification systems, the required minimum visible and audible notification signal levels shall be provided within the interior of these units and sleep pods must meet the sound level requirements for sleeping areas. . .

A.9.6.3.6.1

Modular rooms and other small privacy enclosures, including lactation stations, privacy booths, and sleep pods, are showing up in an increasing number of indoor locations.. Because these portable products include sound deadening construction and privacy walls, it may not be possible for occupants to hear or see alarm notification signals in the area in which they are located. The AHJ should measure the required sound and visual levels to ensure the alarm can be properly seen and heard within the space. For sleep pods this would require a sound level of at least 15 dB above the average ambient sound level or 5 dB above the maximum sound level having a duration of at least 60 seconds or a sound level of at least 75 dBA, whichever is greater, measured at the pillow level in the area required to be served by the system using the A-weighted scale (dBA).

-
-

Statement of Problem and Substantiation for Public Comment

With the increase in the use of modular rooms and sleep pods, which are showing up in a variety of different occupancies, there is a need to provide a basis for AHJs to review these installations in order to ensure that their installation complies with the applicable code requirements.

This proposal treats modular rooms and sleep pods, as products that can be installed in a building, not as building construction, and would provide guidance to allow the use of these prefabricated structures within other occupancies.

This also provides details related to the installation of these modular rooms and sleep pods within buildings that are equipped with alarm notification. By pointing to the requirements for alarm system notification, within the modular room or sleep pod ensures that proper audible and visible notification levels are met.

The proposal does not provide specific pointers to items such as egress requirements or sprinkler protection as these requirements are already addressed within the code elsewhere and would apply to the modular rooms and sleep pods when installed within an occupancy.

Committee Statement

Committee Action: Rejected

Resolution: Deletion of the current requirement of 9.6.3.6.1 is not appropriate and no technical reasoning is given. The requirements for protection are addressed in section 10.7.1 of the first revision.

Public Comment No. 107-NFPA 101-2022 [New Section after 9.7.2.1.1]

A.9.7.2.1.1

Supervisory (tamper) switches on valves controlling water supply to the automatic sprinkler system, including floor control assemblies, sectional and isolation valves, pressure switches, and waterflow switches, are examples of electrical supervisory attachments, or more appropriately defined by NFPA 72 as supervisory signal initiating devices. Other system components and parameters that are required to be supervised include, but not limited to, levels and temperatures of water in tanks, tank pressure, and air pressure on dry-pipe and preaction valves.

Some installation standards, such as NFPA 13, permit chains and locks on valves. While this method is acceptable when electrical supervision is not required, new installations of automatic sprinkler systems are required by building, life safety, and fire codes to be electrically supervised.

Statement of Problem and Substantiation for Public Comment

This comment addresses the TC's concern of reaching beyond fire sprinkler systems by removing the second paragraph of PI 230. The task group reviewed the last two sentences, and it is intended to be more restrictive than NFPA 13. Electrical supervision of valves and waterflow is noted in NFPA 13 to reduce water supply duration because of the instant supervisory or alarm notifications. Model building, life safety, and fire codes, in kind, attribute many tradeoffs to fully sprinklered buildings. These tradeoffs, in the past, such as in the 1980 NFPA 101, were often justified because of the electrical supervision initiating devices were connected to fire alarm panels.

101_A2023_SAF_AAC_CCN_6.pdf	101_Correlating Note No. 6	

Statement of Problem and Substantiation for Public Comment

NOTE: The following CC Note No. 6 appeared in the First Draft Report on First Revision No. 6570, and is also related to Public Input Nos. 448, 427, 429, and 450.

Consider the negative vote of P. Larrimer: "This section is not clear with respect to new and existing systems. It speaks to "new buildings" and "existing buildings". Does the committee want a new system in an existing building to comply with NFPA 1225? Does the committee expect all systems including existing systems to be designed, installed, inspected, and maintained in accordance with NFPA 1225? It is difficult to understand what is intended by the text. Recommend that the text read something like "For other than existing systems...." so that this is not interpreted to be a retroactive requirement for those systems that are already installed. This section should be deleted from Chapter 9 of NFPA 101 since there is no requirement for in-building emergency responder communications enhancement systems anywhere in NFPA 101."

First Revision No. 6570-NFPA 101-2021 [Section No. 9.15]

9.15* ~~Two-Way Radio Communication~~ In-Building Emergency Responder Communications Enhancement Systems.

A.9.15

~~Two-way radio communication~~ In-building emergency responder communications enhancement systems provide for greater flexibility and safety for emergency responders during in-building operations relating to fire and non-fire emergencies.

9.15.1

~~Where provided, two-way radio~~ In-building emergency responder communications enhancement systems shall be in accordance with ~~NFPA 1224~~ comply with the design, installation, testing, inspection, and maintenance requirements of NFPA 1225.

9.15.2

In new buildings, ~~minimum radio~~ the minimum in-building emergency responder communications enhancement system signal strength ~~for fire department communications~~ shall be in accordance with ~~NFPA 1224~~ 1225.

9.15.3*

In existing buildings, ~~radio~~ the minimum in-building emergency responder communications enhancement signal strength ~~for fire department communications~~ shall be as required by the authority having jurisdiction.

A.9.15.3

In existing buildings, it might be difficult to meet the minimum ~~radio~~ signal strength required by ~~NFPA 1224~~ 1225. The authority having jurisdiction might determine that certain areas of a building do not need to meet the ~~radio~~ signal strength coverage required by ~~NFPA 1224~~ 1225. The authority having jurisdiction might also determine that compliance with the minimum ~~radio signal strength in-building emergency responder communications enhancement system~~ outlined in ~~NFPA 1224~~ 1225 is appropriate.

Committee Statement and Meeting Notes

Committee Statement: The section is updated to correct the referenced NFPA installation standard for in-building emergency responder communication enhancement systems. The terminology for in building emergency communication system is changed to be consistent with NFPA installation standard and removes the reference to radio communication systems as there is a shift towards other technology platforms. Installation per NFPA 1225 is applicable when a system is provided or required by another code therefore the term “where required” is unnecessary.

Larrimer, Peter A.

This section is not clear with respect to new and existing systems. It speaks to “new buildings” and “existing buildings”. Does the committee want a new system in an existing building to comply with NFPA 1225? Does the committee expect all systems including existing systems to be designed, installed, inspected, and maintained in accordance with NFPA 1225? It is difficult to understand what is intended by the text. Recommend that the text read something like "For other than existing systems...."so that this is not interpreted to be a retroactive requirement for those systems that are already installed. This section should be deleted from Chapter 9 of NFPA 101 since there is no requirement for in-building emergency responder communications enhancement systems anywhere in NFPA 101.

**Public Comment No. 112-NFPA 101-2022 [Sections
A.9.6.2.10.4, A.9.6.2.10.5, A.9.6.2.10.7, A.9.6.2....]**

Sections A.9.6.2.10.4, A.9.6.2.10.5, A.9.6.2.10.7, A.9.6.2.10.10

9.

A. 9. 6. 2.10.4 —

~~NEPA 72 mandates smoke alarms in all sleeping rooms, and interconnection of smoke alarms is required for both new and existing installations. Per~~

6.2.10.

~~1, the residential occupancy chapters determine whether smoke alarms are needed within sleeping rooms. Paragraph 9.6.2.10.4 limits the requirement for interconnection of smoke alarms to those in new construction. This Code does not intend to require compliant, existing smoke alarm installations to be interconnected. This Code is periodically revised to add retrospective requirements only where the need is clearly substantiated.~~

A.9.6.2.10. 5 —

As per annex material located in A.29.5.1 of *NFPA 72*, it is not normally recommended that smoke alarms or smoke detectors be placed in kitchen spaces. This section of the code provides guidelines for safe installation if a need exists to install a smoke alarm or smoke detector in a residential kitchen space or cooking area.

Within this *Code* section, a fixed cooking appliance is any appliance that is intended to be permanently connected electrically to the wiring system or the fuel source. A stationary cooking appliance is any appliance that is intended to be fastened in place or located in a dedicated space and is connected to the supply circuit or fuel source.

Smoke alarms and smoke detectors that are currently available to consumers are susceptible to particles released into the air during normal cooking procedures. If smoke alarms and smoke detectors are placed too close to the area where the cooking source originates, a high level of nuisance alarms can occur. Frequent nuisance alarms can result in an occupant disabling the smoke alarm or smoke detector.

Nuisance alarm studies show that commercially available residential smoke alarms and smoke detectors are susceptible to nuisance alarms when installed too close to cooking appliances. As the horizontal distance between the smoke alarm or smoke detectors and the cooking appliance increases, the frequency of nuisance alarms decreases. Smoke alarms or smoke detectors that use ionization smoke detection have been shown to be more susceptible to cooking nuisance alarms than those that use photoelectric smoke detection when the alarms or detectors are installed within 10 ft (3.0 m) along a horizontal smoke travel path from a cooking appliance. Smoke alarms or smoke detectors that use photoelectric smoke detection produce nuisance alarms when installed less than 10 ft (3.0 m) from a cooking appliance, though to a lesser degree.

The occurrence of the higher frequency of nuisance alarms observed in smoke alarms or smoke detectors that use ionization detection have been documented in the fire research data. Due to the differences in technology between ionization detection and photoelectric detection, the sensitivity typically used for ionization detection is much higher than that used for photoelectric detection. This sensitivity difference is a result of each type of the detection being required to satisfy UL 217, *Single and Multiple Station Smoke Alarms*, performance tests. Removing detection technology from consideration, the frequency of nuisance alarms is solely due to the sensitivity of the detection method used. Thus, both ionization and photoelectric detector technologies will produce nuisance alarms due to cooking, but currently available smoke alarms and smoke detectors that use ionization detection typically produce more cooking-related nuisance alarms.

The higher sensitivities of currently available smoke alarms and smoke detectors that use ionization detection do provide a benefit at the expense of a potentially higher rate of cooking-related nuisance alarms. Research has demonstrated that ionization detection will typically respond faster than photoelectric detection to flaming fires, providing earlier warning to occupants that might allow for quicker intervention or faster egress. In general, the installation of smoke alarms or smoke detectors that use ionization detection will result in increased fire safety at the risk of a higher frequency of nuisance alarms. The installation of smoke alarms or smoke detectors that use photoelectric detection will result in reduced fire safety for flaming fires and a reduced risk of nuisance alarms. Based on the trade-off between faster response to fires and the frequency of nuisance alarms, detectors that utilize both technologies (i.e., ionization, photoelectric, and a combination) are allowed to be installed between 10 ft (3.0 m) and 20 ft (6.1 m) along a horizontal flow path from a standard or fixed cooking appliance if the specific detector is equipped with an alarm silencing means or is of the photoelectric type. Nuisance alarm studies provide data on cooking nuisances that emanate from both fixed cooking appliances and stationary cooking appliances (e.g., stove, oven) as well as portable cooking appliances (e.g., toaster). Based on these studies, which demonstrate the potential of all cooking appliances to generate nuisance sources, a zone of exclusion has been specified surrounding each stationary or fixed cooking appliance. The purpose of this zone is to limit the installation of smoke alarms and detectors in areas where stationary, fixed, or portable cooking appliances will be located within the residential kitchen space such that potential nuisance alarms are minimized. The size of the zone of exclusion is specified to attempt to take into account the unknown and transitory locations of portable cooking appliances. This zone of exclusion is determined by measuring a 10 ft (3.0 m) radial distance from the closest edge of a stationary or fixed cooking appliance. The zone of exclusion is not intended to pass through

walls or doorways. Figure A.9.6.2.10.5(a) provides an example of the zone of exclusion in a generalized residential kitchen. If other areas of this Code require that a smoke alarm or smoke detector be placed within a horizontal flow path distance between 10 ft (3.0 m) and 20 ft (6.1 m) from a stationary or fixed cooking appliance, the following method should be used to determine the distance, and only photoelectric detection or smoke alarms/detectors with alarm silencing means can be installed in this area.

To install a smoke alarm or detector between 10 ft (3.0 m) and 20 ft (6.1 m) from the cooking appliance, an installer must first determine the 10 ft (3.0 m) area of exclusion. Once the area of exclusion is determined, an installer must then determine the horizontal flow distance. This is the horizontal distance along the ceiling from the closest edge of the cooking appliance to the smoke alarm or detector. The horizontal distance can consist of line segments due to impediments, such as interior partitions. Once an impediment is met, the measurement of the distance will then continue along the new horizontal path segment until the distance requirement is met or another impediment is encountered. Figure A.9.6.2.10.5(b) provides an example for placement outside a kitchen in a nearby hallway. Figure A.9.6.2.10.5(c) provides another example of appropriate placement outside of a kitchen in an adjacent room. At a horizontal flow path distance of greater than 20 ft (6.1 m), any type of smoke alarm or smoke detector can be installed. In rare cases, a residential dwelling can be of such size and configuration that an area of exclusion of 10 ft (3.0 m) from a stationary or fixed cooking appliance excludes the placement of a smoke alarm or smoke detector required by other areas of this Code. In these cases, a smoke alarm or smoke detector using photoelectric detection can be installed at least 72 in. (1.83 m) from the fixed or stationary cooking appliance. Figure A.9.6.2.10.5(d) provides an example of this situation in practice where a smoke alarm or smoke detector is required outside of the sleeping area but the space is in close proximity to the kitchen space. [72: A.29.8.3.4(4)]

Figure A.9.6.2.10.5(a) Example of Zone of Exclusion (gray area) Within Typical Residential Kitchen. [72: Figure A.29.8.3.4(4)(a)]

Figure A.9.6.2.10.5(b) Example of Smoke Alarm or Smoke Detector Placement Between 10 ft (3.0 m) and 20 ft (6.1 m) Away in Hallway from Center of Stationary or Fixed Cooking Appliance. [72: Figure A.29.8.3.4(4)(b)]

Figure A.9.6.2.10.5(c) Example of Smoke Alarm or Smoke Detector Placement Between 10 ft (3.0 m) and 20 ft (6.1 m) Away in Hallway from Center of Stationary or Fixed Cooking Appliance. [72: Figure A.29.8.3.4(4)(c)]

Figure A.9.6.2.10.5(d) Example of Exception Placement of Photoelectric Smoke Alarm or Smoke Detector at 72 in. (1.83 m) from Stationary or Fixed Cooking Appliance. [72: Figure A.29.8.3.4(4)(d)]

A.9.6.2.10.7 —

Studies indicate that smoke alarms and smoke detectors that use ionization detection, photoelectric detection, or a combination of ionization and photoelectric detection are susceptible to nuisance alarms caused by steam. Little research has been done on the comparative response of these types of detection to steam. Steam particles, in general, are visible, reflect light easily, and are typically produced in a size range that would be more likely to activate a photoelectric sensor. Thus, it is required that smoke alarms and smoke detectors be installed greater than 36 in. (910 mm) from the bathroom door where possible. Increasing the distance between the smoke alarm or smoke detector and the bathroom door can reduce the frequency of nuisance alarms from bathroom steam. Frequent nuisance alarms can result in the occupant disabling the smoke alarm. Each incremental increase in separation, up to 10 ft (3.0 m), between the bathroom door and the smoke alarm or smoke detector is expected to reduce the frequency of nuisance alarms. [72: A.29.8.3.4(5)]

A.9.6.2.10.10 — 7.2

A dwelling unit is that structure, area, room, or combination of rooms, including hotel rooms/suites, in which a family or individual lives. A dwelling unit includes living areas only and not common usage areas in multifamily buildings, such as corridors, lobbies, and basements.

Statement of Problem and Substantiation for Public Comment

This is a second of two public comment (PC) being submitted on behalf of the NFPA 101 Building Service and Fire Protection Equipment working group (WG) that was formed during the first draft meeting and is in response to public input (PI) 199. This PC is removing annex language for 9.6.2.10.5 and 9.6.2.10.6 because PC-111 is seeking to remove these paragraphs. Also, this PC is renumbering A.9.6.2.10.7 and A.9.6.2.10.4 and A.9.6.2.10.10

Committee Statement

Committee Action: Rejected but see related SR

Resolution: [SR-6563-NFPA 101-2022](#)

Statement: This is being submitted on behalf of the NFPA 101 Building Service and Fire Protection Equipment working group (WG) that was formed during the first draft meeting and is in response to public input (PI) 199.

The reason for PI-199 was due to new cooking resistance tests being added to the UL smoke alarm/detector listing standards (UL 217 and UL 268) and because UL is continually changing the compliance date for the new requirements. Therefore, the goal of the Second Revision is to:

- Remove the technology references in section 9.6.2.10.5 and 9.6.2.10.6 relating to the placement of smoke alarms/detectors installed near fixed cooking appliances.
- Modify the smoke detection requirements in section 9.6.2.10.5 and 9.6.2.10.6 to ensure they align (and most importantly don't conflict) with the requirements in Chapter 29 of the 2022 edition of NFPA 72.
- Reduce unwanted alarm activations from smoke alarms and smoke detectors being installed near stationary or fixed cooking appliances.
- Simplify the smoke detection requirements in section 9.6.2.10.

Public Comment No. 164-NFPA 101-2022 [Section No. A.9.6.2.10.5]

A.9.6.2.10.5 —

As per annex material located in A.29.5.1 of *NFPA 72*, it is not normally recommended that smoke alarms or smoke detectors be placed in kitchen spaces. This section of the code provides guidelines for safe installation if a need exists to install a smoke alarm or smoke detector in a residential kitchen space or cooking area.

Within this *Code* section, a fixed cooking appliance is any appliance that is intended to be permanently connected electrically to the wiring system or the fuel source. A stationary cooking appliance is any appliance that is intended to be fastened in place or located in a dedicated space and is connected to the supply circuit or fuel source.

Smoke alarms and smoke detectors that are currently available to consumers are susceptible to particles released into the air during normal cooking procedures. If smoke alarms and smoke detectors are placed too close to the area where the cooking source originates, a high level of nuisance alarms can occur. Frequent nuisance alarms can result in an occupant disabling the smoke alarm or smoke detector.

Nuisance alarm studies show that commercially available residential smoke alarms and smoke detectors are susceptible to nuisance alarms when installed too close to cooking appliances. As the horizontal distance between the smoke alarm or smoke detectors and the cooking appliance increases, the frequency of nuisance alarms decreases. Smoke alarms or smoke detectors that use ionization smoke detection have been shown to be more susceptible to cooking nuisance alarms than those that use photoelectric smoke detection when the alarms or detectors are installed within 10 ft (3.0 m) along a horizontal smoke travel path from a cooking appliance. Smoke alarms or smoke detectors that use photoelectric smoke detection produce nuisance alarms when installed less than 10 ft (3.0 m) from a cooking appliance, though to a lesser degree.

The occurrence of the higher frequency of nuisance alarms observed in smoke alarms or smoke detectors that use ionization detection have been documented in the fire research data. Due to the differences in technology between ionization detection and photoelectric detection, the sensitivity typically used for ionization detection is much higher than that used for photoelectric detection. This sensitivity difference is a result of each type of the detection being required to satisfy UL 217, *Single and Multiple Station Smoke Alarms*, performance tests. Removing detection technology from consideration, the frequency of nuisance alarms is solely due to the sensitivity of the detection method used. Thus, both ionization and photoelectric detector technologies will produce nuisance alarms due to cooking, but currently available smoke alarms and smoke detectors that use ionization detection typically produce more cooking-related nuisance alarms.

The higher sensitivities of currently available smoke alarms and smoke detectors that use ionization detection do provide a benefit at the expense of a potentially higher rate of cooking-related nuisance alarms. Research has demonstrated that ionization detection will typically respond faster than photoelectric detection to flaming fires, providing earlier warning to occupants that might allow for quicker intervention or faster egress. In general, the installation of smoke alarms or smoke detectors that use ionization detection will result in increased fire safety at the risk of a higher frequency of nuisance alarms. The installation of smoke alarms or smoke detectors that use photoelectric detection will result in reduced fire safety for flaming fires and a reduced risk of nuisance alarms. Based on the trade-off between faster response to fires and the frequency of nuisance alarms, detectors that utilize both technologies (i.e., ionization, photoelectric, and a combination) are allowed to be installed between 10 ft (3.0 m) and 20 ft (6.1 m) along a horizontal flow path from a standard or fixed cooking appliance if the specific detector is equipped with an alarm silencing means or is of the photoelectric type. Nuisance alarm studies provide data on cooking nuisances that emanate from both fixed cooking appliances and stationary cooking appliances (e.g., stove, oven) as well as portable cooking appliances (e.g., toaster). Based on these studies, which demonstrate the potential of all cooking appliances to generate nuisance sources, a zone of exclusion has been specified surrounding each stationary or fixed cooking appliance. The purpose of this zone is to limit the installation of smoke alarms and detectors in areas where stationary, fixed, or portable cooking appliances will be located within the residential kitchen space such that potential nuisance alarms are minimized. The size of the zone of exclusion is specified to attempt to take into account the unknown and transitory locations of portable cooking appliances. This zone of exclusion is determined by measuring a 10 ft (3.0 m) radial distance from the closest edge of a stationary or fixed cooking appliance. The zone of exclusion is not intended to pass through

walls or doorways. Figure A.9.6.2.10.5(a) provides an example of the zone of exclusion in a generalized residential kitchen. If other areas of this Code require that a smoke alarm or smoke detector be placed within a horizontal flow path distance between 10 ft (3.0 m) and 20 ft (6.1 m) from a stationary or fixed cooking appliance, the following method should be used to determine the distance, and only photoelectric detection or smoke alarms/detectors with alarm silencing means can be installed in this area.

To install a smoke alarm or detector between 10 ft (3.0 m) and 20 ft (6.1 m) from the cooking appliance, an installer must first determine the 10 ft (3.0 m) area of exclusion. Once the area of exclusion is determined, an installer must then determine the horizontal flow distance. This is the horizontal distance along the ceiling from the closest edge of the cooking appliance to the smoke alarm or detector. The horizontal distance can consist of line segments due to impediments, such as interior partitions. Once an impediment is met, the measurement of the distance will then continue along the new horizontal path segment until the distance requirement is met or another impediment is encountered. Figure A.9.6.2.10.5(b) provides an example for placement outside a kitchen in a nearby hallway. Figure A.9.6.2.10.5(c) provides another example of appropriate placement outside of a kitchen in an adjacent room. At a horizontal flow path distance of greater than 20 ft (6.1 m), any type of smoke alarm or smoke detector can be installed. In rare cases, a residential dwelling can be of such size and configuration that an area of exclusion of 10 ft (3.0 m) from a stationary or fixed cooking appliance excludes the placement of a smoke alarm or smoke detector required by other areas of this Code. In these cases, a smoke alarm or smoke detector using photoelectric detection can be installed at least 72 in. (1.83 m) from the fixed or stationary cooking appliance. Figure A.9.6.2.10.5(d) provides an example of this situation in practice where a smoke alarm or smoke detector is required outside of the sleeping area but the space is in close proximity to the kitchen space. [72: A.29.8.3.4(4)]

Figure A.9.6.2.10.5(a) Example of Zone of Exclusion (gray area) Within Typical Residential Kitchen. [72: Figure A.29.8.3.4(4)(a)]

Figure A.9.6.2.10.5(b) Example of Smoke Alarm or Smoke Detector Placement Between 10 ft (3.0 m) and 20 ft (6.1 m) Away in Hallway from Center of Stationary or Fixed Cooking Appliance. [72: Figure A.29.8.3.4(4)(b)]

Figure A.9.6.2.10.5(c) Example of Smoke Alarm or Smoke Detector Placement Between 10 ft (3.0 m) and 20 ft (6.1 m) Away in Hallway from Center of Stationary or Fixed Cooking Appliance. [72: Figure A.29.8.3.4(4)(c)]

Figure A.9.6.2.10.5(d) Example of Exception Placement of Photoelectric Smoke Alarm or Smoke Detector at 72 in. (1.83 m) from Stationary or Fixed Cooking Appliance. [72: Figure A.29.8.3.4(4)(d)]

State:

Zip:

Submittal Date: Fri May 27 10:25:40 EDT 2022

Committee: SAF-BSF

Committee Statement

Committee Action: Rejected but see related SR

Resolution: [SR-6563-NFPA 101-2022](#)

Statement: This is being submitted on behalf of the NFPA 101 Building Service and Fire Protection Equipment working group (WG) that was formed during the first draft meeting and is in response to public input (PI) 199.

The reason for PI-199 was due to new cooking resistance tests being added to the UL

smoke alarm/detector listing standards (UL 217 and UL 268) and because UL is continually changing the compliance date for the new requirements. Therefore, the goal of the Second Revision is to:

- Remove the technology references in section 9.6.2.10.5 and 9.6.2.10.6 relating to the placement of smoke alarms/detectors installed near fixed cooking appliances.
- Modify the smoke detection requirements in section 9.6.2.10.5 and 9.6.2.10.6 to ensure they align (and most importantly don't conflict) with the requirements in Chapter 29 of the 2022 edition of NFPA 72.
- Reduce unwanted alarm activations from smoke alarms and smoke detectors being installed near stationary or fixed cooking appliances.
- Simplify the smoke detection requirements in section 9.6.2.10.

Public Comment No. 165-NFPA 101-2022 [Section No. A.9.6.2.10.7]

A.9.6.2.10.7 —

Studies indicate that smoke alarms and smoke detectors that use ionization detection, photoelectric detection, or a combination of ionization and photoelectric detection are susceptible to nuisance alarms caused by steam. Little research has been done on the comparative response of these types of detection to steam. Steam particles, in general, are visible, reflect light easily, and are typically produced in a size range that would be more likely to activate a photoelectric sensor. Thus, it is required that smoke alarms and smoke detectors be installed greater than 36 in. (910 mm) from the bathroom door where possible. Increasing the distance between the smoke alarm or smoke detector and the bathroom door can reduce the frequency of nuisance alarms from bathroom steam. Frequent nuisance alarms can result in the occupant disabling the smoke alarm. Each incremental increase in separation, up to 10 ft (3.0 m), between the bathroom door and the smoke alarm or smoke detector is expected to reduce the frequency of nuisance alarms. [72: A.29.8.3.4(5)]

SUBJECT: NFPA 101® Second Draft TC FINAL Ballot Results (A2023)

According to the final ballot results, all ballot items received the necessary affirmative votes to pass ballot.

28 **Members Eligible to Vote**

7 **Members Not Returned** (*Chen, Donga, Jardin, Lascar, Ruchala, Szmanda, Wyatt*)

The attached report shows the number of affirmative, negative, and abstaining votes as well as the explanation of the vote for **each** revision.

To pass ballot, **each** revision requires: (1) a simple majority of those eligible to vote and (2) an affirmative vote of $\frac{2}{3}$ of ballots returned. See Sections 3.3.4.3.(c) and 4.3.10.1 of the ***Regulations Governing the Development of NFPA Standards***.

Second Revision No. 6550-NFPA 101-2022 [New Section after 3.3.14.1]

3.3.14.1 Carbon Monoxide Alarm.

A single- or multiple-station alarm responsive to carbon monoxide. [72, 2022].(SAF-BSF)

Second Revision No. 6575-NFPA 101-2022 [Section No. 3.3.281]

3.3.283 Sprinkler System.

A system, commonly activated by heat from a fire and discharges water over the fire area, that consists of an integrated network of piping designed in accordance with fire protection engineering standards that includes a water supply source, a control valve, a waterflow alarm, and a drain. The portion of the sprinkler system above ground is a network of specifically sized or hydraulically designed piping installed in a building, structure, or area, generally overhead, and to which sprinklers are attached in a systematic pattern. [13, 2022] (SAF-BSF)

3.3.283.1 Automatic Sprinkler.

A fire suppression or control device that operates automatically when its heat-activated element is heated to its thermal rating or above, allowing to discharge over a specified area. [13, 2022] (SAF-BSF)

3.3.283.2 Sprinkler System (NFPA 13/13R).

A system, commonly activated by heat from a fire and discharges water over the fire area, that consists of an integrated network of piping designed in accordance with fire protection engineering standards that includes a water supply source, a control valve, a waterflow alarm, and a drain. The portion of the sprinkler system above ground is a network of specifically sized or hydraulically designed piping installed in a building, structure, or area, generally overhead, and to which sprinklers are attached in a systematic pattern. [13, 2022] (SAF-BSF).

3.3.283.3 Sprinkler System (NFPA 13D).

A system that consists of an integrated network of piping designed in accordance with fire protection engineering standards that includes a water supply source, a water control valve, and a drain. The portion of the sprinkler system above ground is a network of specifically sized or hydraulically designed piping installed in a building, structure, or area, generally overhead, and to which sprinklers are attached in a systematic pattern. The system is commonly activated by heat from a fire and discharges water over the fire area. [13D, 2022] (SAF-BSF).

Submitter Information Verification

Committee: SAF-BSF

Submittal Date: Thu Jul 21 14:36:11 EDT 2022

Committee Statement

Committee Statement: The sprinkler system definition is different from NFPA 13/13R to NFPA 13D. The NFPA 13D definition does not have the waterflow alarm. This public comment correlates the previous first draft definition extracted from NFPA 13 with the extracted definition from NFPA 13D.

NFPA 1, FCC-OCP, SR 48 made the same changes suggested in this public comment for the following reason: This addresses the concerns raised by the FCC-AAC in CN-11. The two new extracted definitions address both definitions used by NFPA 13, 13R and 13D. NFPA 13R extracts the definition from 13.

Second Revision No. 6563-NFPA 101-2022 [Section No. 9.6.2.10]

9.6.2.10 Smoke Alarms.

9.6.2.10.1

Where required by another section of this *Code*, single-station and multiple-station smoke alarms shall be in accordance with *NFPA 72* unless otherwise provided in 9.6.2.10.4, 9.6.2.10.5, 9.6.2.10.7, or 9.6.2.10.8.

9.6.2.10.2

Where automatic smoke detection is required by Chapters 11 through 43, smoke alarms shall not be used as a substitute.

9.6.2.10.3 ~~Smoke Alarms in Sleeping Rooms:~~

In new construction, where required by Chapters 11 through 43, the alarm notification signal in sleeping rooms resulting from activation of smoke alarms shall be a 520 Hz low-frequency signal complying with *NFPA 72*.

9.6.2.10.4*

~~The interconnection of smoke alarms shall apply only to new construction as provided in 9.6.2.10.10 :~~

A.9.6.2.10.7.1

~~*NFPA 72* mandates smoke alarms in all sleeping rooms, and interconnection of smoke alarms is required for both new and existing installations. Per 9.6.2.10.1, the residential occupancy chapters determine whether smoke alarms are needed within sleeping rooms. Paragraph 9.6.2.10.4 limits the requirement for interconnection of smoke alarms to those in new construction. This *Code* does not intend to require compliant, existing smoke alarm installations to be interconnected. This *Code* is periodically revised to add retrospective requirements only where the need is clearly substantiated.~~

9.6.2.10.5*

~~Unless otherwise provided in 9.6.2.10.7, smoke alarms and smoke detectors shall not be installed within an area of exclusion determined by a 10 ft (3.0 m) radial distance along a horizontal flow path from a stationary or fixed cooking appliance, unless listed for installation in close proximity to cooking appliances. Smoke alarms and smoke detectors installed between 10 ft (3.0 m) and 20 ft (6.1 m) along a horizontal flow path from a stationary or fixed cooking appliance shall be equipped with an alarm-silencing means or use photoelectric detection. [72 : 29.11.3.4(4)]~~

A.9.6.2.10.5

As per annex material located in A.29.5.1 of *NFPA 72*, it is not normally recommended that smoke alarms or smoke detectors be placed in kitchen spaces. This section of the code provides guidelines for safe installation if a need exists to install a smoke alarm or smoke detector in a residential kitchen space or cooking area:

Within this *Code* section, a fixed cooking appliance is any appliance that is intended to be permanently connected electrically to the wiring system or the fuel source. A stationary cooking appliance is any appliance that is intended to be fastened in place or located in a dedicated space and is connected to the supply circuit or fuel source:

Smoke alarms and smoke detectors that are currently available to consumers are susceptible to particles released into the air during normal cooking procedures. If smoke alarms and smoke detectors are placed too close to the area where the cooking source originates, a high level of nuisance alarms can occur. Frequent nuisance alarms can result in an occupant disabling the smoke alarm or smoke detector.

Nuisance alarm studies show that commercially available residential smoke alarms and smoke detectors are susceptible to nuisance alarms when installed too close to cooking appliances. As the horizontal distance between the smoke alarm or smoke detectors and the cooking appliance increases, the frequency of nuisance alarms decreases. Smoke alarms or smoke detectors that use ionization smoke detection have been shown to be more susceptible to cooking nuisance alarms than those that use photoelectric smoke detection when the alarms or detectors are installed within 10 ft (3.0 m) along a horizontal smoke travel path from a cooking appliance. Smoke alarms or smoke detectors that use photoelectric smoke detection produce nuisance alarms when installed less than 10 ft (3.0 m) from a cooking appliance, though to a lesser degree.

The occurrence of the higher frequency of nuisance alarms observed in smoke alarms or smoke detectors that use ionization detection have been documented in the fire research data. Due to the differences in technology between ionization detection and photoelectric detection, the sensitivity typically used for ionization detection is much higher than that used for photoelectric detection. This sensitivity difference is a result of each type of the detection being required to satisfy UL 217, *Single and Multiple Station Smoke Alarms*; performance tests. Removing detection technology from consideration, the frequency of nuisance alarms is solely due to the sensitivity of the detection method used. Thus, both ionization and photoelectric detector technologies will produce nuisance alarms due to cooking, but currently available smoke alarms and smoke detectors that use ionization detection typically produce more cooking-related nuisance alarms.

The higher sensitivities of currently available smoke alarms and smoke detectors that use ionization detection do provide a benefit at the expense of a potentially higher rate of cooking-related nuisance alarms. Research has demonstrated that ionization detection will typically respond faster than photoelectric detection to flaming fires, providing earlier warning to occupants that might allow for quicker intervention or faster egress. In general, the installation of smoke alarms or smoke detectors that use ionization detection will result in increased fire safety at the risk of a higher frequency of nuisance alarms. The installation of smoke alarms or smoke detectors that use photoelectric detection will result in reduced fire safety for flaming fires and a reduced risk of nuisance alarms. Based on the trade-off between faster response to fires and the frequency of nuisance alarms, detectors that utilize both technologies (i.e., ionization, photoelectric, and a combination) are allowed to be installed between 10 ft (3.0 m) and 20 ft (6.1 m) along a horizontal flow path from a standard or fixed cooking appliance if the specific detector is equipped with an alarm silencing means or is of the photoelectric type. Nuisance alarm studies provide data on cooking nuisances that emanate from both fixed cooking appliances and stationary cooking appliances (e.g., stove, oven) as well as portable cooking appliances (e.g., toaster). Based on these studies, which demonstrate the potential of all cooking appliances to generate nuisance sources, a zone of exclusion has been specified surrounding each stationary or fixed cooking appliance. The purpose of this zone is to limit the installation of smoke alarms and detectors in areas where stationary, fixed, or portable cooking appliances will be located within the residential kitchen space such that potential nuisance alarms are minimized. The size of the zone of exclusion is specified to attempt to take into account the unknown and transitory locations of portable cooking appliances. This zone of exclusion is determined by measuring a 10 ft (3.0 m) radial distance from the closest edge of a

stationary or fixed cooking appliance. The zone of exclusion is not intended to pass through walls or doorways. Figure A.9.6.2.10.5(a) provides an example of the zone of exclusion in a generalized residential kitchen. If other areas of this Code require that a smoke alarm or smoke detector be placed within a horizontal flow path distance between 10 ft (3.0 m) and 20 ft (6.1 m) from a stationary or fixed cooking appliance, the following method should be used to determine the distance, and only photoelectric detection or smoke alarms/detectors with alarm silencing means can be installed in this area:

To install a smoke alarm or detector between 10 ft (3.0 m) and 20 ft (6.1 m) from the cooking appliance, an installer must first determine the 10 ft (3.0 m) area of exclusion. Once the area of exclusion is determined, an installer must then determine the horizontal flow distance. This is the horizontal distance along the ceiling from the closest edge of the cooking appliance to the smoke alarm or detector. The horizontal distance can consist of line segments due to impediments, such as interior partitions. Once an impediment is met, the measurement of the distance will then continue along the new horizontal path segment until the distance requirement is met or another impediment is encountered. Figure A.9.6.2.10.5(b) provides an example for placement outside a kitchen in a nearby hallway. Figure A.9.6.2.10.5(c) provides another example of appropriate placement outside of a kitchen in an adjacent room. At a horizontal flow path distance of greater than 20 ft (6.1 m), any type of smoke alarm or smoke detector can be installed. In rare cases, a residential dwelling can be of such size and configuration that an area of exclusion of 10 ft (3.0 m) from a stationary or fixed cooking appliance excludes the placement of a smoke alarm or smoke detector required by other areas of this Code. In these cases, a smoke alarm or smoke detector using photoelectric detection can be installed at least 72 in. (1.83 m) from the fixed or stationary cooking appliance. Figure A.9.6.2.10.5(d) provides an example of this situation in practice where a smoke alarm or smoke detector is required outside of the sleeping area but the space is in close proximity to the kitchen space. [72: A.29.8.3.4(4)]

Figure A.9.6.2.10.5(a) Example of Zone of Exclusion (gray area) Within Typical Residential Kitchen. [72: Figure A.29.8.3.4(4)(a)]

Figure A.9.6.2.10.5(b) Example of Smoke Alarm or Smoke Detector Placement Between 10 ft (3.0 m) and 20 ft (6.1 m) Away in Hallway from Center of Stationary or Fixed Cooking Appliance. [72: Figure A.29.8.3.4(4)(b)]

Figure A.9.6.2.10.5(c) Example of Smoke Alarm or Smoke Detector Placement Between 10 ft (3.0 m) and 20 ft (6.1 m) Away in Hallway from Center of Stationary or Fixed Cooking Appliance. [72: Figure A.29.8.3.4(4)(c)]

Figure A.9.6.2.10.5(d) Example of Exception Placement of Photoelectric Smoke Alarm or Smoke Detector at 72 in. (1.83 m) from Stationary or Fixed Cooking Appliance. [72: Figure A.29.8.3.4(4)(d)]

9.6.2.10.6

Smoke alarms or smoke detectors that use photoelectric detection shall be permitted for installation at a radial distance greater than 6 ft (1.8 m) from any stationary or fixed cooking appliance when the following conditions are met:

The kitchen or cooking area and adjacent spaces have no clear interior partitions or headers.

The 10 ft (3.0 m) area of exclusion would prohibit the placement of a smoke alarm or smoke detector required by other sections of *NFPA 72* - [72 : 29.11.3.4(5)]

9.6.2.10.4

The installation of smoke alarms and smoke detectors near stationary or fixed cooking appliances shall be in accordance with *NFPA 72* .

9.6.2.10.5

~~Smoke~~ The installation of smoke alarms and smoke detectors shall not be installed within a 36 in. (910 mm) horizontal path from near a door to a bathroom containing a shower or tub unless listed for installation in close proximity to such locations shall be in accordance with *NFPA 72* . [72 : 29.11.3.4(7)]

A.9.6.2.10.7

~~Studies indicate that smoke alarms and smoke detectors that use ionization detection, photoelectric detection, or a combination of ionization and photoelectric detection are susceptible to nuisance alarms caused by steam. Little research has been done on the comparative response of these types of detection to steam. Steam particles, in general, are visible, reflect light easily, and are typically produced in a size range that would be more likely to activate a photoelectric sensor. Thus, it is required that smoke alarms and smoke detectors be installed greater than 36 in. (910 mm) from the bathroom door where possible. Increasing the distance between the smoke alarm or smoke detector and the bathroom door can reduce the frequency of nuisance alarms from bathroom steam. Frequent nuisance alarms can result in the occupant disabling the smoke alarm. Each incremental increase in separation, up to 10 ft (3.0 m), between the bathroom door and the smoke alarm or smoke detector is expected to reduce the frequency of nuisance alarms. [72: A.29.8.3.4(5)]~~

9.6.2.10.6

Smoke alarms, other than battery-operated smoke alarms as permitted by other sections of this *Code*, shall be powered in accordance with the requirements of *NFPA 72*.

9.6.2.10.7 Interconnection.**9.6.2.10.7.1***

The interconnection of smoke alarms shall apply only to new construction.

A.9.6.2.10.7.1

~~*NFPA 72* mandates smoke alarms in all sleeping rooms, and interconnection of smoke alarms is required for both new and existing installations. Per 9.6.2.10.1, the residential occupancy chapters determine whether smoke alarms are needed within sleeping rooms. Paragraph 9.6.2.10.4 limits the requirement for interconnection of smoke alarms to those in new construction. This *Code* does not intend to require compliant, existing smoke alarm installations to be interconnected. This *Code* is periodically revised to add retrospective requirements only where the need is clearly substantiated.~~

9.6.2.10.7.2*

In new construction, where two or more smoke alarms are required within a dwelling unit, suite of rooms, or similar area, they shall be arranged so that operation of any smoke alarm shall cause the alarm in all smoke alarms within the dwelling unit, suite of rooms, or similar area to sound, unless otherwise permitted by one of the following:

- (1) The requirement of 9.6.2.10.7.29-6.2.10.10 shall not apply where permitted by another section of this *Code*.
- (2) The requirement of 9.6.2.10.7.29-6.2.10.10 shall not apply to configurations that provide equivalent distribution of the alarm signal.

9.6.2.10.8

System smoke detectors in accordance with *NFPA 72* and arranged to function in the same manner as single-station or multiple-station smoke alarms shall be permitted in lieu of smoke alarms.

9.6.2.10.9

The alarms described in 9.6.2.10.7.2 shall sound only within an individual dwelling unit, suite of rooms, or similar area and shall not actuate the building fire alarm system, unless otherwise permitted by the authority having jurisdiction.

9.6.2.10.10

Smoke alarms shall be permitted to be connected to the building fire alarm system for the purpose of annunciation in accordance with *NFPA 72*.

Committee: SAF-BSF

Submittal Date: Tue Jul 19 13:06:14 EDT 2022

Committee Statement

Committee Statement: This is being submitted on behalf of the NFPA 101 Building Service and Fire Protection Equipment working group (WG) that was formed during the first draft meeting and is in response to public input (PI) 199.

The reason for PI-199 was due to new cooking resistance tests being added to the UL smoke alarm/detector listing standards (UL 217 and UL 268) and because UL is continually changing the compliance date for the new requirements. Therefore, the goal of the Second Revision is to:

- Remove the technology references in section 9.6.2.10.5 and 9.6.2.10.6 relating to the placement of smoke alarms/detectors installed near fixed cooking appliances.
- Modify the smoke detection requirements in section 9.6.2.10.5 and 9.6.2.10.6 to ensure they align (and most importantly don't conflict) with the requirements in Chapter 29 of the 2022 edition of NFPA 72.
- Reduce unwanted alarm activations from smoke alarms and smoke detectors being installed near stationary or fixed cooking appliances.
- Simplify the smoke detection requirements in section 9.6.2.10.

The reference in A.9.6.2.10.7.1 to “9.6.2.10.4” appears to be incorrect. I believe that it should reference “9.6.2.10.7.1”.

Public Comment No. 66-NFPA 101-2022 [Section No. 22.4.5.3]

22.4.5.3* Horizontal Exit Duct Penetrations (Nonsprinklered Buildings).

Ducts shall be permitted to penetrate horizontal exits in accordance with 7.2.4.3.5(3) if protected by combination fire- ~~dampers/smoke-leakage-rated~~ -smoke dampers that meet the smoke damper actuation requirements of 8.5.5.

Statement of Problem and Substantiation for Public Comment

SAF-AAC appointed a task group to review damper terminology throughout NFPA 101 based upon FR 6516 which modified the definitions for various dampers and made the change to extract the definitions from NFPA 90A. The purpose of this Public Comment, submitted on behalf of the Task Group, is to revise the language to be consistent with the defined terms in Chapter 3. It should be noted that the terms proposed are based upon the First Draft Report of NFPA 90A and not necessarily the definitions in Chapter 3 of the First Draft Report for NFPA 101. If NFPA 90A is revised during the Public Comment period it is the intent that these terms would be revised to be consistent with the defined terms being extracted from NFPA 90A.

It should be noted that although Koffel Associates is a consultant to AMCA International, the Public Comment is not identified as being submitted on behalf of AMCA International since the Public Comment was the result of the SAF-AAC Task Group.

Public Comment No. 68-NFPA 101-2022 [Section No. A.22.4.5.3]

A.22.4.5.3

This provision is intended to promote the use of horizontal exits in detention and correctional occupancies. Horizontal exits provide an especially effective egress system for an occupancy in which the occupants, due to security concerns, are not commonly released to the outside. This provision offers a *Code*-specified equivalent alternative to the requirement of 7.2.4.3.5 that horizontal exits are not to be penetrated by ducts in nonsprinklered buildings. The intended continuity of the fire-resistance-rated and smoke-resisting barrier is maintained by requiring that duct penetrations of horizontal exits be protected by combination fire- ~~dampers/smoke-leakage-rated~~ -smoke dampers that will close upon activation of a smoke detector and a heat-actuated mechanism before the barrier's ability to resist the passage of smoke and fire is compromised.

Committee Statement

Committee Action: Rejected

Resolution: The TC is supportive of referencing 9.7.2 for electrical supervision and 9.7.1 for sprinkler systems, but is concerned about creating consistent language throughout the Code and would like to see direction from the Correlating Committee. The language in the public comment creates two requirements within the same section.

Public Comment No. 172-NFPA 101-2022 [New Section after 14.3.5.5]

14.3.5.6 Portable Fire Extinguishers.

Portable fire extinguishers shall be provided in accordance with Section 9.9.

Statement of Problem and Substantiation for Public Comment

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Under the Scope of the Life Safety Code, Subsection 1.1.2 entitled, "Danger to Life from Fire," the Code states the following: "The Code addresses those construction, protection, and occupancy features necessary to minimize danger to life from the effects of fire, including smoke, heat, and toxic gases created during a fire." Further, it states in Subsection 1.1.4 entitled, "Other Fire-Related Considerations," the following: "The Code addresses other considerations that are essential to life safety in recognition of the fact that life safety is more than a matter of egress. The Code also addresses protective features and systems, building services, operating features, maintenance activities, and other provisions in recognition of the fact that achieving an acceptable degree of life safety depends on additional safeguards to provide adequate egress time or protection for people exposed to fire."

Studies of building fires indicate that occupants typically exhibit altruistic behavior toward others. Human response to a threatening situation might follow one of a variety of behaviors. Individuals might choose to investigate, sound an alarm, assist with rescue, seek help, or flee. Such actions constitute normal behavior, even when taken collectively. Most people avoid direct contact with a fire while undertaking another action.

There is a fundamental discrepancy between official/policy assumptions and the public in relation to priorities in the event of a fire. Government and professionals focus on avoiding injuries and see that as the sole aspiration, in the pursuit of which everything else is secondary. In contrast, the public have a wide and largely unrecognized range of priorities when encountering a fire, based on their individual circumstances. These include: the avoidance of embarrassment/inconvenience; mitigating the impact of damage to the property, e.g. avoiding the risk of being unable to remain in their place of business; and their concern for the wellbeing of other people. Each are invested by different aspirations in the fire safety ecosystem.

A desire to achieve their self-appointed tasks is a strong motivation for the public's behavior when encountering a fire. For most, this will involve an active response of on average five actions, although for some it will be as many as 11. This includes investigating the initial cues and tackling the fire, often using improvised means. They are usually successful in doing so, with 70% to 80% of fires dealt with by the public without requiring professional assistance. It is important to note that in doing so, they are willingly acting against official advice and are not being coerced into this. The evidence shows the

public to be effective and capable in tackling fires, even in the absence of any professional support, or often without specialized equipment. This is supported by the pioneering studies of the public experience of dwelling fires undertaken by Bryan (1977) and Wood (1972) in the USA and UK, respectively. Their studies supported by their findings that the public did undertake a range of self-appointed tasks including investigating and tackling fires. Recent studies have confirmed similar findings and these behaviors appear consistent over time.

The evidence further identifies that the public is willing and will accept minor consequences in their pursuit of achieving personal humanistic priorities and instinct. Concern for people, pets and possessions are strong and established drivers of behavior in the event of a fire. Therefore, this should be no surprise to see it as an influential feature of most individual's response to a fire.

2013 NFPA Report: "U.S. Experience with Sprinklers" reports that there were 48,460 reported structure fires annually in buildings equipped with sprinkler systems between 2007-2011, and 40,440 (83 percent) never grew large enough to activate the system. Based on this report alone, it's clear that people are reacting to small fires and extinguishing them prior to sprinkler activation. Limiting a fire to the smallest area within a building is a sensible aspiration.

A 2003 UK survey found that across all categories of location, extinguishers were successful in extinguishing 79.9% of fires. Note: Private houses accounted for only 3.3% of extinguisher use. It reported that 58.6% were operated by trained staff, 36.4% were operated by untrained staff and in 5% of incidents, this was unknown.

Data from the National Association of Fire Equipment Distributors (NAFED) provides even more robust validation of the influence of fire extinguishers as used by 'ordinary civilians. Their research and data indicate, "Of 13,221 fire incidents reported, portable fire extinguishers successfully extinguished 12,505 fires (95%)." (NAFED 2010: 2) The combined results of the 34 years of data are based on the performance of 32,756 fire extinguishers used on 13,453 incidents.

Fortunately, most people encountering a fire will avoid any injury or will be exposed to a low, and often considered risk of a minor injury at worst. This is not a matter of luck but due to a combination of their own abilities and to the low level of risk presented by most fires individuals would choose to fight at the incipient stage. A 2015 study identified that there was a disconnect between the fire service/government and the public in terms of what they referred to as 'risk tolerance'. This was most evident in attitude to injuries. Official policy seems to place avoidance of any injury as its highest priority and assumes this to also be the public's main motivation and enough to dictate any response to the discovery of a fire. However, the same study found that almost all those who incurred a minor injury accepted it as a reasonable cost in relation to pursuing or achieving their personal priorities. Further, they stated, in hindsight, they would do the same again.

It should be noted that numerous every day and discretionary activities carry similar or higher levels of risk to those resulting from using an extinguisher. Do-It-Yourself and sport for example are frequently responsible for injuries or even fatalities. In response, the government and industry seek to help make products safer or provide advice. This is preferred to denying people the option to participate in either activity by withdrawing public access to tools or sports equipment. The benefits achieved by the public using extinguishers are significant, given the potential for a fire to otherwise lead to detrimental and life-changing outcomes. A low and calculated level of personal risk willingly accepted by an individual tackling a fire can avoid, or reduce, a much higher risk to others should they ignore the fire and allow it to develop. Where current guidance discourages the provision of extinguishers in public spaces, this policy is neither supported by the evidence or justifiable through a consensus from the public. Rather it is imposed on them and is inconsistent with other approaches to public health.

The fire service's response time to structure fires has increased significantly over the past 25 years for several reasons like traffic, infrastructures, and lately staffing. Hence, the ability for the early interventions of the public are likely to be the most significant determinant of the outcome of a fire event. Most people do respond appropriately, and the literature confirms that they do not panic. Typically, most people are at risk of a minor injury at worst, due to the low risk from the fire and their own ability to assess and act in accordance with the situation.

A significant amount of data has been collected to support the requirement for portable extinguishers, including: WPI/EKU Study: "Ordinary People and the Effective Operation of Fire Extinguishers", which clearly showed that the vast majority of people who have never used an extinguisher can operate one

safely and effectively. This willingness of the public to accept minor injuries to protect individuals, the facility or their personal property is supported by literature and data and shows these to be well established behaviors which policy makers need to work with, rather than against.

Reflecting official policy, national and local fire safety messaging has, for some time, urged the public, on discovering a fire in the home, to "Get out, stay out", "Don't put yourself at risk" and 'Leave it to the professionals.' This paternalistic messaging confirms the government policy makers and fire services' belief that a professional response is the only intervention capable of safely tackling fires. Again, this starkly contrasts with the reality that between 70% and 80% of dwelling fires are tackled effectively and at low risk, by the public. The policy also fails to accord with the public who have been shown to be tolerant, or accepting, of the incurrence of minor injuries in pursuit of their personal priorities.

Surveys from the National Association of Fire Equipment Distributors (NAFED) in America reveals the same trend of public firefighting, with even higher percentages not needing the fire service. "In both the 1979 and 1985 surveys, the fire department was only called for 13% of the reported fires. In the 1996 survey, the fire department was called in 24% of the reported fires. However, in the 2010 survey the number dropped to 17% of the time'. And 'These results are not unique to NAFED surveys. A 1978 publication by the U.S. Department of Commerce stated that about 90% of fires in households are not reported, based on their survey of 33,000 fires." (NAFED, 2010: 9)

The public are likely to encounter a fire that is relatively small and often contained to the item first ignited. They are often the ones present when fire starts. In summary, there is a significant difference between official assumptions/guidance and actual public behavior. However, the government and FRS seek to deter this behavior, and, in singularly promoting there, "Get out' message," and remove the simple yet potential life saving devices in sprinklered buildings.

A recent study also showed that the public do not just get out, with 49% never leaving the property during the fire. While this may surprise or concern many professionals, it is likely to be explained by a difference between the fire as perceived by professionals and the lived experience of the public. There is nothing to suggest that the public routinely take unnecessary risks. A more likely explanation is that the fire was small and not sufficiently well-developed to pose an imminent injury or life threat. As such, they were able to remain in the premises safely and relatively comfortably, which is supported by the evidence in relation to the majority of fires not spreading beyond the item first ignited or the room of origin. Inclement weather or other factors may also make remaining in the premises a safer or more comfortable option. Fires, like other emergencies, must also be understood in human terms.

The concept of trading off portable extinguishers in sprinklered buildings has been largely abandoned by fire protection principles. NFPA 10 states in subsection 5.1.2, "The selection of extinguishers shall be independent of whether the building is equipped with automatic sprinklers, standpipe and hose, or other fixed protection equipment." Other codes, and other occupancy chapters have abandoned this concept in recognition of the fact that portable extinguishers are a valuable, cost-effective layer of fire protection, and are intended for a different purpose than sprinklers. Recognition of the valuable role of extinguishers came from a 2003 report which concluded, 'Fire extinguishers are designed to prevent relatively minor incidents becoming major conflagrations.' It is, of course, difficult to prove how many and which fires would have developed to pose a serious risk if not tackled and contained early on. Events such as the Grenfell fire are a reminder of the consequences when this happens.

The National Fire Codes of both NFPA and the ICC require portable fire extinguishers in all occupancy classes including storage which addresses property protection and property loss as well as, the safety of the building occupants. Fire safety is grounded in the engineering discipline which brings many strengths to codes requirements, but it is insufficient, and fire safety effectiveness is limited by ignoring the social sciences of human behavior. It is important to appreciate that while different to official assumptions and desire for evacuation, research shows the public's priorities to be rational and appropriate. The public's experience of fire is vastly different to that of the professionals involved in the planning for and responding to fire.

Official policy and attitudes of the Technical Committee are most singularly directed at avoiding the risk when the public encounters a fire. This is well meaning but the research has shown that this DOES NOT I REPEAT DOES NOT align with the public's attitude or the ability of the general public. The belief that 'undesirable' behavior can be changed by advice, campaigns or other measures has been shown to be inaccurate. The paternalistic approach by which government and the building safety regulatory sector seek to change human behavior by removing proven and effective appliances such

as portable fire extinguishers is WRONG. However, the building safety regulatory sector continue this approach despite the evidence that public behaviors are safe, effective, and largely unaltered by current guidance and campaigns rather than providing appropriate safety devices for use by the public. A portable fire extinguisher is an effective item of fire protection which allows for small fires to be tackled by the occupants of a building and saves 100s of thousands of dollars in property loss.

Concerns have been indicted regarding the requirement for training. Training in the use of extinguishers is an important issue and one in which opinion appears more influential than the evidence. Whether purchased for a private dwelling or provided through regulatory processes, there is no mandatory requirement for training to use an extinguisher, and studies do not reveal training to be a requirement for their safe or effective use. In fact, the available data and studies demonstrate the opposite to be the case.

The Technical Committee should also note that portable fire extinguishers are designed for the novice user. Although, training is recommended for proper use and technique and is wide available through a variety of resources including at online training; there are no specified training requirements even under OSHA unless that is an assigned duty employee by the employer. The proposed requirement is intended as a provision for layered fire protection for the general public and employees for general safety.

Although there is limited data available related to extinguisher use since the removal of portable fire extinguishers in the NIFRS data field, there is little to no data supporting the removal of portable fire extinguishers and sole reliance on building fire sprinkler systems. Limiting a fire to the smallest area within a building is a sensible aspiration.

Cost has been another point of contention. A study by Richard Bukowski in 2014, the life cycle cost of portable fire extinguishers was determined to be between one and a half and four cents per foot annually; if coverage could be maximized to that allowable by code, the cost drops to between a half cent and one cent per foot annually. It's unlikely that any other layer of fire protection is so cost-effective.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Public Comment No. 16-NFPA 101-2022 [Section No. 15.2.2.2.4.1]

15.2.2.2.4.1

Classroom doors and doors to other instructional spaces shall be permitted to be locked provided that the locking means is approved and all of the following conditions are met:

- (1) The locking means shall be capable of being engaged from the egress side of the door without opening the door.
- (2) The unlocking and unlatching from the egress side of the door shall be accomplished without the use of a key, a tool, or special knowledge or effort.
- (3)* Two nonsimultaneous releasing motions shall be permitted where approved by the authority having jurisdiction provided that releasing does not require simultaneous operations, and provided the door is not equipped with panic hardware or fire exit hardware.
- (4) The releasing mechanism for unlocking and unlatching shall be located at a height not less than 34 in. (865 mm) and not exceeding 48 in. (1220 mm) above the finished floor.
- (5) Locks, if remotely engaged, shall be unlockable from the egress side of the door without the use of a key, a tool, or special knowledge or effort.
- (6) The door shall be capable of being unlocked and opened from outside the room with the necessary key or other credential.
- (7) The locking means shall not impair the operation or affect the listing of the door closer, lockset, panic hardware, or fire exit hardware.
- (8) Modifications to fire door assemblies, including door hardware, shall be in accordance with NFPA 80.
- (9) The emergency action plan, required by 15.7.1, shall address the use of the locking and unlocking means from both sides of the door.
- (10) Staff shall be drilled in the engagement and release of the locking means, from both sides of the door, as part of the emergency egress drills required by 15.7.2.

Committee Statement

Committee Action: Rejected

Resolution:

The committee carefully considered the negative vote referenced and decided it is essential to have recorded and live voice communications during all emergencies for the life safety of the occupants. The committee decided to draw this line specifically to address that when the fire alarm panel is replaced, it is time to bring it up to date in order to incorporate technological integrations and enhance emergency action plan options.

Public Comment No. 173-NFPA 101-2022 [New Section after 15.3.5.5]

15.3.5.6 Portable Fire Extinguishers.

Portable fire extinguishers shall be provided in accordance with Section 9.9.

Statement of Problem and Substantiation for Public Comment

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Under the Scope of the Life Safety Code, Subsection 1.1.2 entitled, "Danger to Life from Fire," the Code states the following: "The Code addresses those construction, protection, and occupancy features necessary to minimize danger to life from the effects of fire, including smoke, heat, and toxic gases created during a fire." Further, it states in Subsection 1.1.4 entitled, "Other Fire-Related Considerations," the following: "The Code addresses other considerations that are essential to life safety in recognition of the fact that life safety is more than a matter of egress. The Code also addresses protective features and systems, building services, operating features, maintenance activities, and other provisions in recognition of the fact that achieving an acceptable degree of life safety depends on additional safeguards to provide adequate egress time or protection for people exposed to fire."

Studies of building fires indicate that occupants typically exhibit altruistic behavior toward others. Human response to a threatening situation might follow one of a variety of behaviors. Individuals might choose to investigate, sound an alarm, assist with rescue, seek help, or flee. Such actions constitute normal behavior, even when taken collectively. Most people avoid direct contact with a fire while undertaking another action.

There is a fundamental discrepancy between official/policy assumptions and the public in relation to priorities in the event of a fire. Government and professionals focus on avoiding injuries and see that as the sole aspiration, in the pursuit of which everything else is secondary. In contrast, the public have a wide and largely unrecognized range of priorities when encountering a fire, based on their individual circumstances. These include: the avoidance of embarrassment/inconvenience; mitigating the impact of damage to the property, e.g. avoiding the risk of being unable to remain in their place of business; and their concern for the wellbeing of other people. Each are invested by different aspirations in the fire safety ecosystem.

A desire to achieve their self-appointed tasks is a strong motivation for the public's behavior when encountering a fire. For most, this will involve an active response of on average five actions, although for some it will be as many as 11. This includes investigating the initial cues and tackling the fire, often using improvised means. They are usually successful in doing so, with 70% to 80% of fires dealt with by the public without requiring professional assistance. It is important to note that in doing so, they are willingly acting against official advice and are not being coerced into this. The evidence shows the

public to be effective and capable in tackling fires, even in the absence of any professional support, or often without specialized equipment. This is supported by the pioneering studies of the public experience of dwelling fires undertaken by Bryan (1977) and Wood (1972) in the USA and UK, respectively. Their studies supported by their findings that the public did undertake a range of self-appointed tasks including investigating and tackling fires. Recent studies have confirmed similar findings and these behaviors appear consistent over time.

The evidence further identifies that the public is willing and will accept minor consequences in their pursuit of achieving personal humanistic priorities and instinct. Concern for people, pets and possessions are strong and established drivers of behavior in the event of a fire. Therefore, this should be no surprise to see it as an influential feature of most individual's response to a fire.

2013 NFPA Report: "U.S. Experience with Sprinklers" reports that there were 48,460 reported structure fires annually in buildings equipped with sprinkler systems between 2007-2011, and 40,440 (83 percent) never grew large enough to activate the system. Based on this report alone, it's clear that people are reacting to small fires and extinguishing them prior to sprinkler activation. Limiting a fire to the smallest area within a building is a sensible aspiration.

A 2003 UK survey found that across all categories of location, extinguishers were successful in extinguishing 79.9% of fires. Note: Private houses accounted for only 3.3% of extinguisher use. It reported that 58.6% were operated by trained staff, 36.4% were operated by untrained staff and in 5% of incidents, this was unknown.

Data from the National Association of Fire Equipment Distributors (NAFED) provides even more robust validation of the influence of fire extinguishers as used by 'ordinary civilians. Their research and data indicate, "Of 13,221 fire incidents reported, portable fire extinguishers successfully extinguished 12,505 fires (95%)." (NAFED 2010: 2) The combined results of the 34 years of data are based on the performance of 32,756 fire extinguishers used on 13,453 incidents.

Fortunately, most people encountering a fire will avoid any injury or will be exposed to a low, and often considered risk of a minor injury at worst. This is not a matter of luck but due to a combination of their own abilities and to the low level of risk presented by most fires individuals would choose to fight at the incipient stage. A 2015 study identified that there was a disconnect between the fire service/government and the public in terms of what they referred to as 'risk tolerance'. This was most evident in attitude to injuries. Official policy seems to place avoidance of any injury as its highest priority and assumes this to also be the public's main motivation and enough to dictate any response to the discovery of a fire. However, the same study found that almost all those who incurred a minor injury accepted it as a reasonable cost in relation to pursuing or achieving their personal priorities. Further, they stated, in hindsight, they would do the same again.

It should be noted that numerous every day and discretionary activities carry similar or higher levels of risk to those resulting from using an extinguisher. Do-It-Yourself and sport for example are frequently responsible for injuries or even fatalities. In response, the government and industry seek to help make products safer or provide advice. This is preferred to denying people the option to participate in either activity by withdrawing public access to tools or sports equipment. The benefits achieved by the public using extinguishers are significant, given the potential for a fire to otherwise lead to detrimental and life-changing outcomes. A low and calculated level of personal risk willingly accepted by an individual tackling a fire can avoid, or reduce, a much higher risk to others should they ignore the fire and allow it to develop. Where current guidance discourages the provision of extinguishers in public spaces, this policy is neither supported by the evidence or justifiable through a consensus from the public. Rather it is imposed on them and is inconsistent with other approaches to public health.

The fire service's response time to structure fires has increased significantly over the past 25 years for several reasons like traffic, infrastructures, and lately staffing. Hence, the ability for the early interventions of the public are likely to be the most significant determinant of the outcome of a fire event. Most people do respond appropriately, and the literature confirms that they do not panic. Typically, most people are at risk of a minor injury at worst, due to the low risk from the fire and their own ability to assess and act in accordance with the situation.

A significant amount of data has been collected to support the requirement for portable extinguishers, including: WPI/EKU Study: "Ordinary People and the Effective Operation of Fire Extinguishers", which clearly showed that the vast majority of people who have never used an extinguisher can operate one

safely and effectively. This willingness of the public to accept minor injuries to protect individuals, the facility or their personal property is supported by literature and data and shows these to be well established behaviors which policy makers need to work with, rather than against. Reflecting official policy, national and local fire safety messaging has, for some time, urged the public, on discovering a fire in the home, to "Get out, stay out", "Don't put yourself at risk" and 'Leave it to the professionals.' This paternalistic messaging confirms the government policy makers and fire services' belief that a professional response is the only intervention capable of safely tackling fires. Again, this starkly contrasts with the reality that between 70% and 80% of dwelling fires are tackled effectively and at low risk, by the public. The policy also fails to accord with the public who have been shown to be tolerant, or accepting, of the incurrence of minor injuries in pursuit of their personal priorities.

Surveys from the National Association of Fire Equipment Distributors (NAFED) in America reveals the same trend of public firefighting, with even higher percentages not needing the fire service. "In both the 1979 and 1985 surveys, the fire department was only called for 13% of the reported fires. In the 1996 survey, the fire department was called in 24% of the reported fires. However, in the 2010 survey the number dropped to 17% of the time'. And 'These results are not unique to NAFED surveys. A 1978 publication by the U.S. Department of Commerce stated that about 90% of fires in households are not reported, based on their survey of 33,000 fires." (NAFED, 2010: 9)

The public are likely to encounter a fire that is relatively small and often contained to the item first ignited. They are often the ones present when fire starts. In summary, there is a significant difference between official assumptions/guidance and actual public behavior. However, the government and FRS seek to deter this behavior, and, in singularly promoting there, "Get out' message," and remove the simple yet potential life saving devices in sprinklered buildings.

A recent study also showed that the public do not just get out, with 49% never leaving the property during the fire. While this may surprise or concern many professionals, it is likely to be explained by a difference between the fire as perceived by professionals and the lived experience of the public. There is nothing to suggest that the public routinely take unnecessary risks. A more likely explanation is that the fire was small and not sufficiently well-developed to pose an imminent injury or life threat. As such, they were able to remain in the premises safely and relatively comfortably, which is supported by the evidence in relation to the majority of fires not spreading beyond the item first ignited or the room of origin. Inclement weather or other factors may also make remaining in the premises a safer or more comfortable option. Fires, like other emergencies, must also be understood in human terms.

The concept of trading off portable extinguishers in sprinklered buildings has been largely abandoned by fire protection principles. NFPA 10 states in subsection 5.1.2, "The selection of extinguishers shall be independent of whether the building is equipped with automatic sprinklers, standpipe and hose, or other fixed protection equipment." Other codes, and other occupancy chapters have abandoned this concept in recognition of the fact that portable extinguishers are a valuable, cost-effective layer of fire protection, and are intended for a different purpose than sprinklers. Recognition of the valuable role of extinguishers came from a 2003 report which concluded, 'Fire extinguishers are designed to prevent relatively minor incidents becoming major conflagrations.' It is, of course, difficult to prove how many and which fires would have developed to pose a serious risk if not tackled and contained early on. Events such as the Grenfell fire are a reminder of the consequences when this happens.

The National Fire Codes of both NFPA and the ICC require portable fire extinguishers in all occupancy classes including storage which addresses property protection and property loss as well as, the safety of the building occupants. Fire safety is grounded in the engineering discipline which brings many strengths to codes requirements, but it is insufficient, and fire safety effectiveness is limited by ignoring the social sciences of human behavior. It is important to appreciate that while different to official assumptions and desire for evacuation, research shows the public's priorities to be rational and appropriate. The public's experience of fire is vastly different to that of the professionals involved in the planning for and responding to fire.

Official policy and attitudes of the Technical Committee are most singularly directed at avoiding the risk when the public encounters a fire. This is well meaning but the research has shown that this DOES NOT I REPEAT DOES NOT align with the public's attitude or the ability of the general public. The belief that 'undesirable' behavior can be changed by advice, campaigns or other measures has been shown to be inaccurate. The paternalistic approach by which government and the building safety regulatory sector seek to change human behavior by removing proven and effective appliances such as portable fire extinguishers is WRONG. However, the building safety regulatory sector continue this

approach despite the evidence that public behaviors are safe, effective, and largely unaltered by current guidance and campaigns rather than providing appropriate safety devices for use by the public. A portable fire extinguisher is an effective item of fire protection which allows for small fires to be tackled by the occupants of a building and saves 100s of thousands of dollars in property loss.

Concerns have been indicted regarding the requirement for training. Training in the use of extinguishers is an important issue and one in which opinion appears more influential than the evidence. Whether purchased for a private dwelling or provided through regulatory processes, there is no mandatory requirement for training to use an extinguisher, and studies do not reveal training to be a requirement for their safe or effective use. In fact, the available data and studies demonstrate the opposite to be the case.

The Technical Committee should also note that portable fire extinguishers are designed for the novice user. Although, training is recommended for proper use and technique and is wide available through a variety of resources including at online training; there are no specified training requirements even under OSHA unless that is an assigned duty employee by the employer. The proposed requirement is intended as a provision for layered fire protection for the general public and employees for general safety.

Although there is limited data available related to extinguisher use since the removal of portable fire extinguishers in the NIFRS data field, there is little to no data supporting the removal of portable fire extinguishers and sole reliance on building fire sprinkler systems. Limiting a fire to the smallest area within a building is a sensible aspiration.

Cost has been another point of contention. A study by Richard Bukowski in 2014, the life cycle cost of portable fire extinguishers was determined to be between one and a half and four cents per foot annually; if coverage could be maximized to that allowable by code, the cost drops to between a half cent and one cent per foot annually. It's unlikely that any other layer of fire protection is so cost-effective.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Public Comment No. 174-NFPA 101-2022 [New Section after 16.3.5.4]

16.3.5.5 Portable Fire Extinguishers.

Portable fire extinguishers shall be provided in accordance with Section 9.9.

Statement of Problem and Substantiation for Public Comment

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Under the Scope of the Life Safety Code, Subsection 1.1.2 entitled, "Danger to Life from Fire," the Code states the following: "The Code addresses those construction, protection, and occupancy features necessary to minimize danger to life from the effects of fire, including smoke, heat, and toxic gases created during a fire." Further, it states in Subsection 1.1.4 entitled, "Other Fire-Related Considerations," the following: "The Code addresses other considerations that are essential to life safety in recognition of the fact that life safety is more than a matter of egress. The Code also addresses protective features and systems, building services, operating features, maintenance activities, and other provisions in recognition of the fact that achieving an acceptable degree of life safety depends on additional safeguards to provide adequate egress time or protection for people exposed to fire."

Studies of building fires indicate that occupants typically exhibit altruistic behavior toward others. Human response to a threatening situation might follow one of a variety of behaviors. Individuals might choose to investigate, sound an alarm, assist with rescue, seek help, or flee. Such actions constitute normal behavior, even when taken collectively. Most people avoid direct contact with a fire while undertaking another action.

There is a fundamental discrepancy between official/policy assumptions and the public in relation to priorities in the event of a fire. Government and professionals focus on avoiding injuries and see that as the sole aspiration, in the pursuit of which everything else is secondary. In contrast, the public have a wide and largely unrecognized range of priorities when encountering a fire, based on their individual circumstances. These include: the avoidance of embarrassment/inconvenience; mitigating the impact of damage to the property, e.g. avoiding the risk of being unable to remain in their place of business; and their concern for the wellbeing of other people. Each are invested by different aspirations in the fire safety ecosystem.

A desire to achieve their self-appointed tasks is a strong motivation for the public's behavior when encountering a fire. For most, this will involve an active response of on average five actions, although for some it will be as many as 11. This includes investigating the initial cues and tackling the fire, often using improvised means. They are usually successful in doing so, with 70% to 80% of fires dealt with by the public without requiring professional assistance. It is important to note that in doing so, they are willingly acting against official advice and are not being coerced into this. The evidence shows the

public to be effective and capable in tackling fires, even in the absence of any professional support, or often without specialized equipment. This is supported by the pioneering studies of the public experience of dwelling fires undertaken by Bryan (1977) and Wood (1972) in the USA and UK, respectively. Their studies supported by their findings that the public did undertake a range of self-appointed tasks including investigating and tackling fires. Recent studies have confirmed similar findings and these behaviors appear consistent over time.

The evidence further identifies that the public is willing and will accept minor consequences in their pursuit of achieving personal humanistic priorities and instinct. Concern for people, pets and possessions are strong and established drivers of behavior in the event of a fire. Therefore, this should be no surprise to see it as an influential feature of most individual's response to a fire.

2013 NFPA Report: "U.S. Experience with Sprinklers" reports that there were 48,460 reported structure fires annually in buildings equipped with sprinkler systems between 2007-2011, and 40,440 (83 percent) never grew large enough to activate the system. Based on this report alone, it's clear that people are reacting to small fires and extinguishing them prior to sprinkler activation. Limiting a fire to the smallest area within a building is a sensible aspiration.

A 2003 UK survey found that across all categories of location, extinguishers were successful in extinguishing 79.9% of fires. Note: Private houses accounted for only 3.3% of extinguisher use. It reported that 58.6% were operated by trained staff, 36.4% were operated by untrained staff and in 5% of incidents, this was unknown.

Data from the National Association of Fire Equipment Distributors (NAFED) provides even more robust validation of the influence of fire extinguishers as used by 'ordinary civilians. Their research and data indicate, "Of 13,221 fire incidents reported, portable fire extinguishers successfully extinguished 12,505 fires (95%)." (NAFED 2010: 2) The combined results of the 34 years of data are based on the performance of 32,756 fire extinguishers used on 13,453 incidents.

Fortunately, most people encountering a fire will avoid any injury or will be exposed to a low, and often considered risk of a minor injury at worst. This is not a matter of luck but due to a combination of their own abilities and to the low level of risk presented by most fires individuals would choose to fight at the incipient stage. A 2015 study identified that there was a disconnect between the fire service/government and the public in terms of what they referred to as 'risk tolerance'. This was most evident in attitude to injuries. Official policy seems to place avoidance of any injury as its highest priority and assumes this to also be the public's main motivation and enough to dictate any response to the discovery of a fire. However, the same study found that almost all those who incurred a minor injury accepted it as a reasonable cost in relation to pursuing or achieving their personal priorities. Further, they stated, in hindsight, they would do the same again.

It should be noted that numerous every day and discretionary activities carry similar or higher levels of risk to those resulting from using an extinguisher. Do-It-Yourself and sport for example are frequently responsible for injuries or even fatalities. In response, the government and industry seek to help make products safer or provide advice. This is preferred to denying people the option to participate in either activity by withdrawing public access to tools or sports equipment. The benefits achieved by the public using extinguishers are significant, given the potential for a fire to otherwise lead to detrimental and life-changing outcomes. A low and calculated level of personal risk willingly accepted by an individual tackling a fire can avoid, or reduce, a much higher risk to others should they ignore the fire and allow it to develop. Where current guidance discourages the provision of extinguishers in public spaces, this policy is neither supported by the evidence or justifiable through a consensus from the public. Rather it is imposed on them and is inconsistent with other approaches to public health.

The fire service's response time to structure fires has increased significantly over the past 25 years for several reasons like traffic, infrastructures, and lately staffing. Hence, the ability for the early interventions of the public are likely to be the most significant determinant of the outcome of a fire event. Most people do respond appropriately, and the literature confirms that they do not panic. Typically, most people are at risk of a minor injury at worst, due to the low risk from the fire and their own ability to assess and act in accordance with the situation.

A significant amount of data has been collected to support the requirement for portable extinguishers, including: WPI/EKU Study: "Ordinary People and the Effective Operation of Fire Extinguishers", which clearly showed that the vast majority of people who have never used an extinguisher can operate one

safely and effectively. This willingness of the public to accept minor injuries to protect individuals, the facility or their personal property is supported by literature and data and shows these to be well established behaviors which policy makers need to work with, rather than against. Reflecting official policy, national and local fire safety messaging has, for some time, urged the public, on discovering a fire in the home, to "Get out, stay out", "Don't put yourself at risk" and 'Leave it to the professionals.' This paternalistic messaging confirms the government policy makers and fire services' belief that a professional response is the only intervention capable of safely tackling fires. Again, this starkly contrasts with the reality that between 70% and 80% of dwelling fires are tackled effectively and at low risk, by the public. The policy also fails to accord with the public who have been shown to be tolerant, or accepting, of the incurrence of minor injuries in pursuit of their personal priorities.

Surveys from the National Association of Fire Equipment Distributors (NAFED) in America reveals the same trend of public firefighting, with even higher percentages not needing the fire service. "In both the 1979 and 1985 surveys, the fire department was only called for 13% of the reported fires. In the 1996 survey, the fire department was called in 24% of the reported fires. However, in the 2010 survey the number dropped to 17% of the time'. And 'These results are not unique to NAFED surveys. A 1978 publication by the U.S. Department of Commerce stated that about 90% of fires in households are not reported, based on their survey of 33,000 fires." (NAFED, 2010: 9)

The public are likely to encounter a fire that is relatively small and often contained to the item first ignited. They are often the ones present when fire starts. In summary, there is a significant difference between official assumptions/guidance and actual public behavior. However, the government and FRS seek to deter this behavior, and, in singularly promoting there, "Get out' message," and remove the simple yet potential life saving devices in sprinklered buildings.

A recent study also showed that the public do not just get out, with 49% never leaving the property during the fire. While this may surprise or concern many professionals, it is likely to be explained by a difference between the fire as perceived by professionals and the lived experience of the public. There is nothing to suggest that the public routinely take unnecessary risks. A more likely explanation is that the fire was small and not sufficiently well-developed to pose an imminent injury or life threat. As such, they were able to remain in the premises safely and relatively comfortably, which is supported by the evidence in relation to the majority of fires not spreading beyond the item first ignited or the room of origin. Inclement weather or other factors may also make remaining in the premises a safer or more comfortable option. Fires, like other emergencies, must also be understood in human terms.

The concept of trading off portable extinguishers in sprinklered buildings has been largely abandoned by fire protection principles. NFPA 10 states in subsection 5.1.2, "The selection of extinguishers shall be independent of whether the building is equipped with automatic sprinklers, standpipe and hose, or other fixed protection equipment." Other codes, and other occupancy chapters have abandoned this concept in recognition of the fact that portable extinguishers are a valuable, cost-effective layer of fire protection, and are intended for a different purpose than sprinklers. Recognition of the valuable role of extinguishers came from a 2003 report which concluded, 'Fire extinguishers are designed to prevent relatively minor incidents becoming major conflagrations.' It is, of course, difficult to prove how many and which fires would have developed to pose a serious risk if not tackled and contained early on. Events such as the Grenfell fire are a reminder of the consequences when this happens.

The National Fire Codes of both NFPA and the ICC require portable fire extinguishers in all occupancy classes including storage which addresses property protection and property loss as well as, the safety of the building occupants. Fire safety is grounded in the engineering discipline which brings many strengths to codes requirements, but it is insufficient, and fire safety effectiveness is limited by ignoring the social sciences of human behavior. It is important to appreciate that while different to official assumptions and desire for evacuation, research shows the public's priorities to be rational and appropriate. The public's experience of fire is vastly different to that of the professionals involved in the planning for and responding to fire.

Official policy and attitudes of the Technical Committee are most singularly directed at avoiding the risk when the public encounters a fire. This is well meaning but the research has shown that this DOES NOT I REPEAT DOES NOT align with the public's attitude or the ability of the general public. The belief that 'undesirable' behavior can be changed by advice, campaigns or other measures has been shown to be inaccurate. The paternalistic approach by which government and the building safety regulatory sector seek to change human behavior by removing proven and effective appliances such as portable fire extinguishers is WRONG. However, the building safety regulatory sector continue this

approach despite the evidence that public behaviors are safe, effective, and largely unaltered by current guidance and campaigns rather than providing appropriate safety devices for use by the public. A portable fire extinguisher is an effective item of fire protection which allows for small fires to be tackled by the occupants of a building and saves 100s of thousands of dollars in property loss.

Concerns have been indicted regarding the requirement for training. Training in the use of extinguishers is an important issue and one in which opinion appears more influential than the evidence. Whether purchased for a private dwelling or provided through regulatory processes, there is no mandatory requirement for training to use an extinguisher, and studies do not reveal training to be a requirement for their safe or effective use. In fact, the available data and studies demonstrate the opposite to be the case.

The Technical Committee should also note that portable fire extinguishers are designed for the novice user. Although, training is recommended for proper use and technique and is wide available through a variety of resources including at online training; there are no specified training requirements even under OSHA unless that is an assigned duty employee by the employer. The proposed requirement is intended as a provision for layered fire protection for the general public and employees for general safety.

Although there is limited data available related to extinguisher use since the removal of portable fire extinguishers in the NIFRS data field, there is little to no data supporting the removal of portable fire extinguishers and sole reliance on building fire sprinkler systems. Limiting a fire to the smallest area within a building is a sensible aspiration.

Cost has been another point of contention. A study by Richard Bukowski in 2014, the life cycle cost of portable fire extinguishers was determined to be between one and a half and four cents per foot annually; if coverage could be maximized to that allowable by code, the cost drops to between a half cent and one cent per foot annually. It's unlikely that any other layer of fire protection is so cost-effective.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Action:

Resolution: The committee agrees that the installation of alcohol-based hand rub dispensers and the storage of alcohol-based hand-rub solutions as defined in 8.7.3.3 is appropriate in educational and day-care occupancies. The recent increase in the deployment of these dispensers and solutions throughout educational and day-care facilities, including in corridors, due to the Covid-19 situation has not resulted in an increase of fire incidents.

Public Comment No. 179-NFPA 101-2022 [New Section after 16.6.3.5]

16.6.3.6 Portable Fire Extinguishers.

Portable fire extinguishers shall be provided in accordance with Section 9.9.

Statement of Problem and Substantiation for Public Comment

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Under the Scope of the Life Safety Code, Subsection 1.1.2 entitled, "Danger to Life from Fire," the Code states the following: "The Code addresses those construction, protection, and occupancy features necessary to minimize danger to life from the effects of fire, including smoke, heat, and toxic gases created during a fire." Further, it states in Subsection 1.1.4 entitled, "Other Fire-Related Considerations," the following: "The Code addresses other considerations that are essential to life safety in recognition of the fact that life safety is more than a matter of egress. The Code also addresses protective features and systems, building services, operating features, maintenance activities, and other provisions in recognition of the fact that achieving an acceptable degree of life safety depends on additional safeguards to provide adequate egress time or protection for people exposed to fire."

Studies of building fires indicate that occupants typically exhibit altruistic behavior toward others. Human response to a threatening situation might follow one of a variety of behaviors. Individuals might choose to investigate, sound an alarm, assist with rescue, seek help, or flee. Such actions constitute normal behavior, even when taken collectively. Most people avoid direct contact with a fire while undertaking another action.

There is a fundamental discrepancy between official/policy assumptions and the public in relation to priorities in the event of a fire. Government and professionals focus on avoiding injuries and see that as the sole aspiration, in the pursuit of which everything else is secondary. In contrast, the public have a wide and largely unrecognized range of priorities when encountering a fire, based on their individual circumstances. These include: the avoidance of embarrassment/inconvenience; mitigating the impact of damage to the property, e.g. avoiding the risk of being unable to remain in their place of business; and their concern for the wellbeing of other people. Each are invested by different aspirations in the fire safety ecosystem.

A desire to achieve their self-appointed tasks is a strong motivation for the public's behavior when encountering a fire. For most, this will involve an active response of on average five actions, although for some it will be as many as 11. This includes investigating the initial cues and tackling the fire, often using improvised means. They are usually successful in doing so, with 70% to 80% of fires dealt with by the public without requiring professional assistance. It is important to note that in doing so, they are willingly acting against official advice and are not being coerced into this. The evidence shows the

public to be effective and capable in tackling fires, even in the absence of any professional support, or often without specialized equipment. This is supported by the pioneering studies of the public experience of dwelling fires undertaken by Bryan (1977) and Wood (1972) in the USA and UK, respectively. Their studies supported by their findings that the public did undertake a range of self-appointed tasks including investigating and tackling fires. Recent studies have confirmed similar findings and these behaviors appear consistent over time.

The evidence further identifies that the public is willing and will accept minor consequences in their pursuit of achieving personal humanistic priorities and instinct. Concern for people, pets and possessions are strong and established drivers of behavior in the event of a fire. Therefore, this should be no surprise to see it as an influential feature of most individual's response to a fire.

2013 NFPA Report: "U.S. Experience with Sprinklers" reports that there were 48,460 reported structure fires annually in buildings equipped with sprinkler systems between 2007-2011, and 40,440 (83 percent) never grew large enough to activate the system. Based on this report alone, it's clear that people are reacting to small fires and extinguishing them prior to sprinkler activation. Limiting a fire to the smallest area within a building is a sensible aspiration.

A 2003 UK survey found that across all categories of location, extinguishers were successful in extinguishing 79.9% of fires. Note: Private houses accounted for only 3.3% of extinguisher use. It reported that 58.6% were operated by trained staff, 36.4% were operated by untrained staff and in 5% of incidents, this was unknown.

Data from the National Association of Fire Equipment Distributors (NAFED) provides even more robust validation of the influence of fire extinguishers as used by 'ordinary civilians. Their research and data indicate, "Of 13,221 fire incidents reported, portable fire extinguishers successfully extinguished 12,505 fires (95%)." (NAFED 2010: 2) The combined results of the 34 years of data are based on the performance of 32,756 fire extinguishers used on 13,453 incidents.

Fortunately, most people encountering a fire will avoid any injury or will be exposed to a low, and often considered risk of a minor injury at worst. This is not a matter of luck but due to a combination of their own abilities and to the low level of risk presented by most fires individuals would choose to fight at the incipient stage. A 2015 study identified that there was a disconnect between the fire service/government and the public in terms of what they referred to as 'risk tolerance'. This was most evident in attitude to injuries. Official policy seems to place avoidance of any injury as its highest priority and assumes this to also be the public's main motivation and enough to dictate any response to the discovery of a fire. However, the same study found that almost all those who incurred a minor injury accepted it as a reasonable cost in relation to pursuing or achieving their personal priorities. Further, they stated, in hindsight, they would do the same again.

It should be noted that numerous every day and discretionary activities carry similar or higher levels of risk to those resulting from using an extinguisher. Do-It-Yourself and sport for example are frequently responsible for injuries or even fatalities. In response, the government and industry seek to help make products safer or provide advice. This is preferred to denying people the option to participate in either activity by withdrawing public access to tools or sports equipment. The benefits achieved by the public using extinguishers are significant, given the potential for a fire to otherwise lead to detrimental and life-changing outcomes. A low and calculated level of personal risk willingly accepted by an individual tackling a fire can avoid, or reduce, a much higher risk to others should they ignore the fire and allow it to develop. Where current guidance discourages the provision of extinguishers in public spaces, this policy is neither supported by the evidence or justifiable through a consensus from the public. Rather it is imposed on them and is inconsistent with other approaches to public health.

The fire service's response time to structure fires has increased significantly over the past 25 years for several reasons like traffic, infrastructures, and lately staffing. Hence, the ability for the early interventions of the public are likely to be the most significant determinant of the outcome of a fire event. Most people do respond appropriately, and the literature confirms that they do not panic. Typically, most people are at risk of a minor injury at worst, due to the low risk from the fire and their own ability to assess and act in accordance with the situation.

A significant amount of data has been collected to support the requirement for portable extinguishers, including: WPI/EKU Study: "Ordinary People and the Effective Operation of Fire Extinguishers", which clearly showed that the vast majority of people who have never used an extinguisher can operate one

safely and effectively. This willingness of the public to accept minor injuries to protect individuals, the facility or their personal property is supported by literature and data and shows these to be well established behaviors which policy makers need to work with, rather than against. Reflecting official policy, national and local fire safety messaging has, for some time, urged the public, on discovering a fire in the home, to "Get out, stay out", "Don't put yourself at risk" and 'Leave it to the professionals.' This paternalistic messaging confirms the government policy makers and fire services' belief that a professional response is the only intervention capable of safely tackling fires. Again, this starkly contrasts with the reality that between 70% and 80% of dwelling fires are tackled effectively and at low risk, by the public. The policy also fails to accord with the public who have been shown to be tolerant, or accepting, of the incurrence of minor injuries in pursuit of their personal priorities.

Surveys from the National Association of Fire Equipment Distributors (NAFED) in America reveals the same trend of public firefighting, with even higher percentages not needing the fire service. "In both the 1979 and 1985 surveys, the fire department was only called for 13% of the reported fires. In the 1996 survey, the fire department was called in 24% of the reported fires. However, in the 2010 survey the number dropped to 17% of the time'. And 'These results are not unique to NAFED surveys. A 1978 publication by the U.S. Department of Commerce stated that about 90% of fires in households are not reported, based on their survey of 33,000 fires." (NAFED, 2010: 9)

The public are likely to encounter a fire that is relatively small and often contained to the item first ignited. They are often the ones present when fire starts. In summary, there is a significant difference between official assumptions/guidance and actual public behavior. However, the government and FRS seek to deter this behavior, and, in singularly promoting there, "Get out' message," and remove the simple yet potential life saving devices in sprinklered buildings.

A recent study also showed that the public do not just get out, with 49% never leaving the property during the fire. While this may surprise or concern many professionals, it is likely to be explained by a difference between the fire as perceived by professionals and the lived experience of the public. There is nothing to suggest that the public routinely take unnecessary risks. A more likely explanation is that the fire was small and not sufficiently well-developed to pose an imminent injury or life threat. As such, they were able to remain in the premises safely and relatively comfortably, which is supported by the evidence in relation to the majority of fires not spreading beyond the item first ignited or the room of origin. Inclement weather or other factors may also make remaining in the premises a safer or more comfortable option. Fires, like other emergencies, must also be understood in human terms.

The concept of trading off portable extinguishers in sprinklered buildings has been largely abandoned by fire protection principles. NFPA 10 states in subsection 5.1.2, "The selection of extinguishers shall be independent of whether the building is equipped with automatic sprinklers, standpipe and hose, or other fixed protection equipment." Other codes, and other occupancy chapters have abandoned this concept in recognition of the fact that portable extinguishers are a valuable, cost-effective layer of fire protection, and are intended for a different purpose than sprinklers. Recognition of the valuable role of extinguishers came from a 2003 report which concluded, 'Fire extinguishers are designed to prevent relatively minor incidents becoming major conflagrations.' It is, of course, difficult to prove how many and which fires would have developed to pose a serious risk if not tackled and contained early on. Events such as the Grenfell fire are a reminder of the consequences when this happens.

The National Fire Codes of both NFPA and the ICC require portable fire extinguishers in all occupancy classes including storage which addresses property protection and property loss as well as, the safety of the building occupants. Fire safety is grounded in the engineering discipline which brings many strengths to codes requirements, but it is insufficient, and fire safety effectiveness is limited by ignoring the social sciences of human behavior. It is important to appreciate that while different to official assumptions and desire for evacuation, research shows the public's priorities to be rational and appropriate. The public's experience of fire is vastly different to that of the professionals involved in the planning for and responding to fire.

Official policy and attitudes of the Technical Committee are most singularly directed at avoiding the risk when the public encounters a fire. This is well meaning but the research has shown that this DOES NOT I REPEAT DOES NOT align with the public's attitude or the ability of the general public. The belief that 'undesirable' behavior can be changed by advice, campaigns or other measures has been shown to be inaccurate. The paternalistic approach by which government and the building safety regulatory sector seek to change human behavior by removing proven and effective appliances such as portable fire extinguishers is WRONG. However, the building safety regulatory sector continue this

approach despite the evidence that public behaviors are safe, effective, and largely unaltered by current guidance and campaigns rather than providing appropriate safety devices for use by the public. A portable fire extinguisher is an effective item of fire protection which allows for small fires to be tackled by the occupants of a building and saves 100s of thousands of dollars in property loss.

Concerns have been indicted regarding the requirement for training. Training in the use of extinguishers is an important issue and one in which opinion appears more influential than the evidence. Whether purchased for a private dwelling or provided through regulatory processes, there is no mandatory requirement for training to use an extinguisher, and studies do not reveal training to be a requirement for their safe or effective use. In fact, the available data and studies demonstrate the opposite to be the case.

The Technical Committee should also note that portable fire extinguishers are designed for the novice user. Although, training is recommended for proper use and technique and is wide available through a variety of resources including at online training; there are no specified training requirements even under OSHA unless that is an assigned duty employee by the employer. The proposed requirement is intended as a provision for layered fire protection for the general public and employees for general safety.

Although there is limited data available related to extinguisher use since the removal of portable fire extinguishers in the NIFRS data field, there is little to no data supporting the removal of portable fire extinguishers and sole reliance on building fire sprinkler systems. Limiting a fire to the smallest area within a building is a sensible aspiration.

Cost has been another point of contention. A study by Richard Bukowski in 2014, the life cycle cost of portable fire extinguishers was determined to be between one and a half and four cents per foot annually; if coverage could be maximized to that allowable by code, the cost drops to between a half cent and one cent per foot annually. It's unlikely that any other layer of fire protection is so cost-effective.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Statement: The reference to security features being covered by emergency action plan is clarified and relocated to a more appropriate section, see SR-6609. The change to 16.7.6 returns it to the 2021 language.

Public Comment No. 24-NFPA 101-2022 [Section No. 17.2.2.2.6.1]

17.2.2.2.6.1

Classroom doors and doors to other client care spaces shall be permitted to be locked provided that the locking means is approved and all of the following conditions are met:

- (1) The locking means shall be capable of being engaged from the egress side of the door without opening the door.
- (2) The unlocking and unlatching from the egress side of the door shall be accomplished without the use of a key, a tool, or special knowledge or effort.
- (3)* Two nonsimultaneous releasing motions shall be permitted where approved by the authority having jurisdiction provided that releasing does not require simultaneous operations and provided the door is not equipped with panic hardware or fire exit hardware.
- (4) The releasing mechanism for unlocking and unlatching shall be located at a height not less than 34 in. (865 mm) and not exceeding 48 in. (1220 mm) above the finished floor.
- (5) Locks, if remotely engaged, shall be unlockable from the egress side of the door without the use of a key, a tool, or special knowledge or effort.
- (6) The door shall be capable of being unlocked and opened from outside the room with the necessary key or other credential.
- (7) The locking means shall not impair the operation or affect the listing of the door closer, lockset, panic hardware, or fire exit hardware.
- (8) Modifications to fire door assemblies, including door hardware, shall be in accordance with NFPA 80.
- (9) The emergency action plan, required by 17.7.1, shall address the use of the locking and unlocking means from both sides of the door.
- (10) Staff shall be drilled in the engagement and release of the locking means, from both sides of the door, as part of the emergency egress drills required by 17.7.2.

Committee Action: Rejected but see related SR

Resolution: [SR-6602-NFPA 101-2022](#)

Statement: This clarifies the intent of the committee to provide a requirement for the clear width of a single window opening or 36 inches, whichever is greater. The committee's concern for stairs that may be narrower than the window opening is that someone may fall out of the opening.

In A.17.2.11.1.2, the name of the school was corrected to "Our Lady of the Angels."

Public Comment No. 180-NFPA 101-2022 [New Section after 17.3.5.4]

17.3.5.5 Portable Fire Extinguishers.

Portable fire extinguishers shall be provided in accordance with Section 9.9.

Statement of Problem and Substantiation for Public Comment

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Under the Scope of the Life Safety Code, Subsection 1.1.2 entitled, "Danger to Life from Fire," the Code states the following: "The Code addresses those construction, protection, and occupancy features necessary to minimize danger to life from the effects of fire, including smoke, heat, and toxic gases created during a fire." Further, it states in Subsection 1.1.4 entitled, "Other Fire-Related Considerations," the following: "The Code addresses other considerations that are essential to life safety in recognition of the fact that life safety is more than a matter of egress. The Code also addresses protective features and systems, building services, operating features, maintenance activities, and other provisions in recognition of the fact that achieving an acceptable degree of life safety depends on additional safeguards to provide adequate egress time or protection for people exposed to fire."

Studies of building fires indicate that occupants typically exhibit altruistic behavior toward others. Human response to a threatening situation might follow one of a variety of behaviors. Individuals might choose to investigate, sound an alarm, assist with rescue, seek help, or flee. Such actions constitute normal behavior, even when taken collectively. Most people avoid direct contact with a fire while undertaking another action.

There is a fundamental discrepancy between official/policy assumptions and the public in relation to priorities in the event of a fire. Government and professionals focus on avoiding injuries and see that as the sole aspiration, in the pursuit of which everything else is secondary. In contrast, the public have a wide and largely unrecognized range of priorities when encountering a fire, based on their individual circumstances. These include: the avoidance of embarrassment/inconvenience; mitigating the impact of damage to the property, e.g. avoiding the risk of being unable to remain in their place of business; and their concern for the wellbeing of other people. Each are invested by different aspirations in the fire safety ecosystem.

A desire to achieve their self-appointed tasks is a strong motivation for the public's behavior when encountering a fire. For most, this will involve an active response of on average five actions, although for some it will be as many as 11. This includes investigating the initial cues and tackling the fire, often using improvised means. They are usually successful in doing so, with 70% to 80% of fires dealt with by the public without requiring professional assistance. It is important to note that in doing so, they are willingly acting against official advice and are not being coerced into this. The evidence shows the

public to be effective and capable in tackling fires, even in the absence of any professional support, or often without specialized equipment. This is supported by the pioneering studies of the public experience of dwelling fires undertaken by Bryan (1977) and Wood (1972) in the USA and UK, respectively. Their studies supported by their findings that the public did undertake a range of self-appointed tasks including investigating and tackling fires. Recent studies have confirmed similar findings and these behaviors appear consistent over time.

The evidence further identifies that the public is willing and will accept minor consequences in their pursuit of achieving personal humanistic priorities and instinct. Concern for people, pets and possessions are strong and established drivers of behavior in the event of a fire. Therefore, this should be no surprise to see it as an influential feature of most individual's response to a fire.

2013 NFPA Report: "U.S. Experience with Sprinklers" reports that there were 48,460 reported structure fires annually in buildings equipped with sprinkler systems between 2007-2011, and 40,440 (83 percent) never grew large enough to activate the system. Based on this report alone, it's clear that people are reacting to small fires and extinguishing them prior to sprinkler activation. Limiting a fire to the smallest area within a building is a sensible aspiration.

A 2003 UK survey found that across all categories of location, extinguishers were successful in extinguishing 79.9% of fires. Note: Private houses accounted for only 3.3% of extinguisher use. It reported that 58.6% were operated by trained staff, 36.4% were operated by untrained staff and in 5% of incidents, this was unknown.

Data from the National Association of Fire Equipment Distributors (NAFED) provides even more robust validation of the influence of fire extinguishers as used by 'ordinary civilians. Their research and data indicate, "Of 13,221 fire incidents reported, portable fire extinguishers successfully extinguished 12,505 fires (95%)." (NAFED 2010: 2) The combined results of the 34 years of data are based on the performance of 32,756 fire extinguishers used on 13,453 incidents.

Fortunately, most people encountering a fire will avoid any injury or will be exposed to a low, and often considered risk of a minor injury at worst. This is not a matter of luck but due to a combination of their own abilities and to the low level of risk presented by most fires individuals would choose to fight at the incipient stage. A 2015 study identified that there was a disconnect between the fire service/government and the public in terms of what they referred to as 'risk tolerance'. This was most evident in attitude to injuries. Official policy seems to place avoidance of any injury as its highest priority and assumes this to also be the public's main motivation and enough to dictate any response to the discovery of a fire. However, the same study found that almost all those who incurred a minor injury accepted it as a reasonable cost in relation to pursuing or achieving their personal priorities. Further, they stated, in hindsight, they would do the same again.

It should be noted that numerous every day and discretionary activities carry similar or higher levels of risk to those resulting from using an extinguisher. Do-It-Yourself and sport for example are frequently responsible for injuries or even fatalities. In response, the government and industry seek to help make products safer or provide advice. This is preferred to denying people the option to participate in either activity by withdrawing public access to tools or sports equipment. The benefits achieved by the public using extinguishers are significant, given the potential for a fire to otherwise lead to detrimental and life-changing outcomes. A low and calculated level of personal risk willingly accepted by an individual tackling a fire can avoid, or reduce, a much higher risk to others should they ignore the fire and allow it to develop. Where current guidance discourages the provision of extinguishers in public spaces, this policy is neither supported by the evidence or justifiable through a consensus from the public. Rather it is imposed on them and is inconsistent with other approaches to public health.

The fire service's response time to structure fires has increased significantly over the past 25 years for several reasons like traffic, infrastructures, and lately staffing. Hence, the ability for the early interventions of the public are likely to be the most significant determinant of the outcome of a fire event. Most people do respond appropriately, and the literature confirms that they do not panic. Typically, most people are at risk of a minor injury at worst, due to the low risk from the fire and their own ability to assess and act in accordance with the situation.

A significant amount of data has been collected to support the requirement for portable extinguishers, including: WPI/EKU Study: "Ordinary People and the Effective Operation of Fire Extinguishers", which clearly showed that the vast majority of people who have never used an extinguisher can operate one

safely and effectively. This willingness of the public to accept minor injuries to protect individuals, the facility or their personal property is supported by literature and data and shows these to be well established behaviors which policy makers need to work with, rather than against. Reflecting official policy, national and local fire safety messaging has, for some time, urged the public, on discovering a fire in the home, to "Get out, stay out", "Don't put yourself at risk" and 'Leave it to the professionals.' This paternalistic messaging confirms the government policy makers and fire services' belief that a professional response is the only intervention capable of safely tackling fires. Again, this starkly contrasts with the reality that between 70% and 80% of dwelling fires are tackled effectively and at low risk, by the public. The policy also fails to accord with the public who have been shown to be tolerant, or accepting, of the incurrence of minor injuries in pursuit of their personal priorities.

Surveys from the National Association of Fire Equipment Distributors (NAFED) in America reveals the same trend of public firefighting, with even higher percentages not needing the fire service. "In both the 1979 and 1985 surveys, the fire department was only called for 13% of the reported fires. In the 1996 survey, the fire department was called in 24% of the reported fires. However, in the 2010 survey the number dropped to 17% of the time'. And 'These results are not unique to NAFED surveys. A 1978 publication by the U.S. Department of Commerce stated that about 90% of fires in households are not reported, based on their survey of 33,000 fires." (NAFED, 2010: 9)

The public are likely to encounter a fire that is relatively small and often contained to the item first ignited. They are often the ones present when fire starts. In summary, there is a significant difference between official assumptions/guidance and actual public behavior. However, the government and FRS seek to deter this behavior, and, in singularly promoting there, "Get out' message," and remove the simple yet potential life saving devices in sprinklered buildings.

A recent study also showed that the public do not just get out, with 49% never leaving the property during the fire. While this may surprise or concern many professionals, it is likely to be explained by a difference between the fire as perceived by professionals and the lived experience of the public. There is nothing to suggest that the public routinely take unnecessary risks. A more likely explanation is that the fire was small and not sufficiently well-developed to pose an imminent injury or life threat. As such, they were able to remain in the premises safely and relatively comfortably, which is supported by the evidence in relation to the majority of fires not spreading beyond the item first ignited or the room of origin. Inclement weather or other factors may also make remaining in the premises a safer or more comfortable option. Fires, like other emergencies, must also be understood in human terms.

The concept of trading off portable extinguishers in sprinklered buildings has been largely abandoned by fire protection principles. NFPA 10 states in subsection 5.1.2, "The selection of extinguishers shall be independent of whether the building is equipped with automatic sprinklers, standpipe and hose, or other fixed protection equipment." Other codes, and other occupancy chapters have abandoned this concept in recognition of the fact that portable extinguishers are a valuable, cost-effective layer of fire protection, and are intended for a different purpose than sprinklers. Recognition of the valuable role of extinguishers came from a 2003 report which concluded, 'Fire extinguishers are designed to prevent relatively minor incidents becoming major conflagrations.' It is, of course, difficult to prove how many and which fires would have developed to pose a serious risk if not tackled and contained early on. Events such as the Grenfell fire are a reminder of the consequences when this happens.

The National Fire Codes of both NFPA and the ICC require portable fire extinguishers in all occupancy classes including storage which addresses property protection and property loss as well as, the safety of the building occupants. Fire safety is grounded in the engineering discipline which brings many strengths to codes requirements, but it is insufficient, and fire safety effectiveness is limited by ignoring the social sciences of human behavior. It is important to appreciate that while different to official assumptions and desire for evacuation, research shows the public's priorities to be rational and appropriate. The public's experience of fire is vastly different to that of the professionals involved in the planning for and responding to fire.

Official policy and attitudes of the Technical Committee are most singularly directed at avoiding the risk when the public encounters a fire. This is well meaning but the research has shown that this DOES NOT I REPEAT DOES NOT align with the public's attitude or the ability of the general public. The belief that 'undesirable' behavior can be changed by advice, campaigns or other measures has been shown to be inaccurate. The paternalistic approach by which government and the building safety regulatory sector seek to change human behavior by removing proven and effective appliances such as portable fire extinguishers is WRONG. However, the building safety regulatory sector continue this

approach despite the evidence that public behaviors are safe, effective, and largely unaltered by current guidance and campaigns rather than providing appropriate safety devices for use by the public. A portable fire extinguisher is an effective item of fire protection which allows for small fires to be tackled by the occupants of a building and saves 100s of thousands of dollars in property loss.

Concerns have been indicted regarding the requirement for training. Training in the use of extinguishers is an important issue and one in which opinion appears more influential than the evidence. Whether purchased for a private dwelling or provided through regulatory processes, there is no mandatory requirement for training to use an extinguisher, and studies do not reveal training to be a requirement for their safe or effective use. In fact, the available data and studies demonstrate the opposite to be the case.

The Technical Committee should also note that portable fire extinguishers are designed for the novice user. Although, training is recommended for proper use and technique and is wide available through a variety of resources including at online training; there are no specified training requirements even under OSHA unless that is an assigned duty employee by the employer. The proposed requirement is intended as a provision for layered fire protection for the general public and employees for general safety.

Although there is limited data available related to extinguisher use since the removal of portable fire extinguishers in the NIFRS data field, there is little to no data supporting the removal of portable fire extinguishers and sole reliance on building fire sprinkler systems. Limiting a fire to the smallest area within a building is a sensible aspiration.

Cost has been another point of contention. A study by Richard Bukowski in 2014, the life cycle cost of portable fire extinguishers was determined to be between one and a half and four cents per foot annually; if coverage could be maximized to that allowable by code, the cost drops to between a half cent and one cent per foot annually. It's unlikely that any other layer of fire protection is so cost-effective.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Public Comment No. 25-NFPA 101-2022 [Section No. 17.7.6]

17.7.6 Integrated Fire Protection and Life Safety Systems.

17.7.6.1

Building security features shall be integrated with the building life safety features in this chapter and the building's emergency action plan in accordance with Section 4.8.

17.7.6.2

Integrated fire protection and life safety systems shall be tested in accordance with 9.11.4.1.

17.7.6.3

Integrated fire protection and life safety systems in high-rise buildings shall be tested in accordance with 9.11.4.2.

Additional Proposed Changes

<u>File Name</u>	<u>Description</u>	<u>Approved</u>
101_A2023_SAF_AAC_CCN_25.pdf	101_Correlating Committee Note No. 25	

Statement of Problem and Substantiation for Public Comment

NOTE: The following CC Note No. 25 appeared in the First Draft Report on First Revision No. 6742. Consider the negative vote of T. Julka: "The code lacks a definition for building security systems. The TC statement intends for MNS and ECS to be integrated. However, without a definition or specific reference to the intended systems, the application of this new language is very broad. Adding security systems in this END subchapter to integrate with fire protection and life safety systems confuses the user when applying the basic integration requirements of 9.11.4.1 or NFPA 4 in Section 9.11.4.2. Subchapter 9.11.4 should have the requirement for integrating security systems and the applicable standard, i.e. NFPA 731, should be referenced." Clarify what is meant by, "Building security features shall be integrated with the building life safety features in this chapter and the building's emergency action plan..."

FROM: Jenny Depew, *Committee Administrator*
DATE: November 8, 2022
SUBJECT: NFPA 101® Second Draft TC FINAL Ballot Results (A2023)

According to the final ballot results, all ballot items received the necessary affirmative votes to pass ballot.

26 **Members Eligible to Vote**

7 **Members Not Returned** (*Blaser, Day, Ellis, Frangiamore, Frye, Merck, Ramseur*)

The attached report shows the number of affirmative, negative, and abstaining votes as well as the explanation of the vote for **each** revision.

To pass ballot, **each** revision requires: (1) a simple majority of those eligible to vote and (2) an affirmative vote of $\frac{2}{3}$ of ballots returned. See Sections 3.3.4.3.(c) and 4.3.10.1 of the ***Regulations Governing the Development of NFPA Standards***.

**Second Revision No. 6605-NFPA 101-2022 [Section No. 14.7.1]****14.7.1 Emergency Action Plan.**

~~Emergency action plans shall be provided in accordance with Section 4.8 :~~

14.7.1.1

Emergency action plans shall be provided in accordance with Section 4.8.

14.7.1.2*

The operation of security features, fire protection systems, and life safety systems shall be documented in the building's emergency action plan.

A.14.7.1.2

The built environment of schools often uses both passive and active security features. These features should be considered part of the approved emergency action plans for these facilities. Assessing how these systems perform under normal circumstances, in emergency situations, and when the power fails is recommended.

Second Revision No. 6600-NFPA 101-2022 [Section No. 15.2.2.2.4.1]

15.2.2.2.4.1

Classroom doors and doors to other instructional spaces shall be permitted to be locked provided that the locking means is approved and all of the following conditions are met:

- (1) The locking means shall be capable of being engaged from the egress side of the door without opening the door.
- (2) The unlocking and unlatching from the egress side of the door shall be accomplished without the use of a key, a tool, or special knowledge or effort.
- (3)* Two ~~nonsimultaneous~~ releasing motions shall be permitted where approved by the authority having jurisdiction provided that releasing does not require simultaneous operations, and provided the door is not equipped with panic hardware or fire exit hardware.
- (4) The releasing mechanism for unlocking and unlatching shall be located at a height not less than 34 in. (865 mm) and not exceeding 48 in. (1220 mm) above the finished floor.
- (5) Locks, if remotely engaged, shall be unlockable from the egress side of the door without the use of a key, a tool, or special knowledge or effort.
- (6) The door shall be capable of being unlocked and opened from outside the room with the necessary key or other credential.
- (7) The locking means shall not impair the operation or affect the listing of the door closer, lockset, panic hardware, or fire exit hardware.
- (8) Modifications to fire door assemblies, including door hardware, shall be in accordance with NFPA 80.
- (9) The emergency action plan, required by 15.7.1, shall address the use of the locking and unlocking means from both sides of the door.
- (10) Staff shall be drilled in the engagement and release of the locking means, from both sides of the door, as part of the emergency egress drills required by 15.7.2.

Submitter Information Verification

Committee: SAF-END

Submittal Date: Thu Aug 11 14:39:22 EDT 2022

Committee Statement

Committee Statement: This is a strictly editorial change as there is no reason to reference "nonsimultaneous" and "does not require simultaneous operation" in the same section. The provision does continue to permit two non simultaneous releasing motions provided they are approved by the AHJ and follow the remaining requirements of this section.

Second Revision No. 6599-NFPA 101-2022 [Section No. 15.2.11.1.2]

15.2.11.1.2*

Permanently fixed stairs that comply with Table 7.2.2.2.1.1(b) or permanently fixed ramps that comply with Table 7.2.5.3(b) shall be permitted to be used to allow occupants to be within 44 in. (1120 mm) of the bottom of the windowsill where all of the following apply:

- (1) The clear width of the stairs or ramp shall be ~~at least the width of the window or not less than~~ 36 in. (915 mm) or the clear width of a single window opening, whichever is greater.
- (2) The stairs or ramp and access thereto shall not be obstructed.
- (3) The opening shall be readily identifiable from both the exterior and interior.

A.15.2.11.1.2

Windows for rescue are a nonconventional application provided in educational and day-care occupancies as a result of the 1958 Our Lady of ~~the~~ Angels fire in Chicago. The *Code* intends for the fire department or others to assist students, especially over ladders, once students have moved through the window opening. Windows for rescue are not considered a component of the means of egress and therefore only comply with the criteria spelled out in 15.2.11.1.2 and not Chapter 7. Therefore landings, handrails, and guardrails are not required nor are the geometrical design requirements found in 7.2.2.2.1 for stairs or 7.2.5 for ramps, except as required in 15.2.11.1.2.

Submitter Information Verification

Committee: SAF-END

Submittal Date: Tue Aug 09 16:25:11 EDT 2022

Committee Statement

Committee Statement: This clarifies the intent of the committee to provide a requirement for the clear width of a single window opening or 36 inches, whichever is greater. The committee's concern for stairs that may be narrower than the window opening is that someone may fall out of the opening.

In A.15.2.11.1.2, the name of the school was corrected to "Our Lady of the Angels."

Second Revision No. 6601-NFPA 101-2022 [Section No. 17.2.2.2.6.1]

17.2.2.2.6.1

Classroom doors and doors to other client care spaces shall be permitted to be locked provided that the locking means is approved and all of the following conditions are met:

- (1) The locking means shall be capable of being engaged from the egress side of the door without opening the door.
- (2) The unlocking and unlatching from the egress side of the door shall be accomplished without the use of a key, a tool, or special knowledge or effort.
- (3)* Two ~~nonsimultaneous~~ releasing motions shall be permitted where approved by the authority having jurisdiction provided that releasing does not require simultaneous operations and provided the door is not equipped with panic hardware or fire exit hardware.
- (4) The releasing mechanism for unlocking and unlatching shall be located at a height not less than 34 in. (865 mm) and not exceeding 48 in. (1220 mm) above the finished floor.
- (5) Locks, if remotely engaged, shall be unlockable from the egress side of the door without the use of a key, a tool, or special knowledge or effort.
- (6) The door shall be capable of being unlocked and opened from outside the room with the necessary key or other credential.
- (7) The locking means shall not impair the operation or affect the listing of the door closer, lockset, panic hardware, or fire exit hardware.
- (8) Modifications to fire door assemblies, including door hardware, shall be in accordance with NFPA 80.
- (9) The emergency action plan, required by 17.7.1, shall address the use of the locking and unlocking means from both sides of the door.
- (10) Staff shall be drilled in the engagement and release of the locking means, from both sides of the door, as part of the emergency egress drills required by 17.7.2.

Submitter Information Verification

Committee: SAF-END

Submittal Date: Thu Aug 11 17:34:25 EDT 2022

Committee Statement

Committee Statement: This is a strictly editorial change as there is no reason to reference "nonsimultaneous" and "does not require simultaneous operation" in the same section. The provision does continue to permit two non simultaneous releasing motions provided they are approved by the AHJ and follow the remaining requirements of this section.

Second Revision No. 6603-NFPA 101-2022 [Section No. 17.2.11.1.1]

17.2.11.1.1

Every room or space greater than 250 ft² (23.2 m²) and normally subject to client occupancy shall have not less than one outside window for emergency rescue that complies with all of the following, unless otherwise permitted by 17.2.11.1.3:

- (1) Such windows shall be openable from the inside without the use of tools and shall provide a clear opening of not less than 20 in. (510 mm) in width, 24 in. (610 mm) in height, and 5.7 ft² (0.5 m²) in area.
- (2) The bottom of the opening shall be not more than 44 in. (1120 mm) above the floor, and any latching device shall be capable of being operated from not more than 54 in. (1370 mm) above the finished floor.
- (3) The clear opening shall allow a rectangular solid, with a width and height that provides not less than the required 5.7 ft² (0.5 m²) opening and a depth of not less than 20 in. (510 mm), to pass fully through the opening.
- (4) Windows for rescue that have a sill height below the adjacent finished ground level shall comply with 24.2.2.3.3(4).

Second Revision No. 6602-NFPA 101-2022 [Section No. 17.2.11.1.2]

17.2.11.1.2*

Permanently fixed stairs that comply with Table 7.2.2.2.1.1(b) or permanently fixed ramps that comply with Table 7.2.5.3(b) shall be permitted to be used to allow occupants to be within 44 in. (1120 mm) of the bottom of the windowsill where all of the following apply:

- (1) The clear width of the stairs or ramp shall be ~~at least the width of the window or not less than~~ 36 in. (915 mm) or the clear width of a single window opening, whichever is greater.
- (2) The stairs or ramp and access thereto shall not be obstructed.
- (3) The opening shall be readily identifiable from both the exterior and interior.

A.17.2.11.1.2

Windows for rescue are a nonconventional application provided in educational and day-care occupancies as a result of the 1958 Our Lady of the Angels fire in Chicago. The *Code* intends for the fire department or others to assist clients, especially over ladders, once clients have moved through the window opening. Windows for rescue are not considered a component of the means of egress and therefore only comply with the criteria spelled out in 17.2.11.1.2 and not Chapter 7. Therefore landings, handrails, and guardrails are not required nor are the geometrical design requirements found in 7.2.2.2.1 for stairs or 7.2.5 for ramps, except as required in 17.2.11.1.2.

Submitter Information Verification

Committee: SAF-END

Submittal Date: Thu Aug 11 17:41:21 EDT 2022

Committee Statement

Committee Statement: This clarifies the intent of the committee to provide a requirement for the clear width of a single window opening or 36 inches, whichever is greater. The committee's concern for stairs that may be narrower than the window opening is that someone may fall out of the opening.

In A.17.2.11.1.2, the name of the school was corrected to "Our Lady of the Angels."

Second Revision No. 6611-NFPA 101-2022 [Section No. 17.7.1]

17.7.1* Emergency Action Plans.

17.7.1.1

Emergency action plans shall be provided in accordance with Section 4.8.

17.7.1.2*

The operation of security features, fire protection systems, and life safety systems shall be documented in the building's emergency action plan.

A.17.7.1.2

The built environment of day-care occupancies often uses both passive and active security features. These features should be considered part of the approved emergency action plans for these facilities. Assessing how these systems perform under normal circumstances, in emergency situations, and when the power fails is recommended.

Submitter Information Verification

Committee Comment No. 6579-NFPA 101-2022 [Section No. 8.7.3.3]

This was a Second Revision that has been modified or deleted as the result of Second Correlating Revision:

[See attached word document]

8.7.3.3* Alcohol-Based Hand-Rub Dispensers.

Where permitted by Chapters 11 through 43, alcohol-based hand-rub dispensers shall be permitted provided they meet all of the following criteria:

- (1) The maximum individual dispenser fluid capacity shall be as follows:
 - (2) 0.32 gal (1.2 L) for dispensers in corridors and areas open to corridors
 - (3) 0.53 gal (2.0 L) for dispensers in rooms or suites of rooms separated from corridors
- (4) Where aerosol containers are used, the maximum capacity of the aerosol dispenser shall be 18 oz (0.51 kg) and shall be limited to Level 1 aerosols as defined in NFPA 30B.
- (5) Dispensers shall be separated from each other by horizontal spacing of not less than 48 in. (1220 mm).
- (6) Not more than an aggregate 10 gal (37.8 L) of alcohol-based hand-rub solution or 1135 oz (32.2 kg) of Level 1 aerosols, or a combination of liquids and Level 1 aerosols not to exceed, in total, the equivalent of 10 gal (37.8 L) or 1135 oz (32.2 kg,) shall be in use outside of a storage cabinet in a single smoke compartment or fire compartment or story, whichever is less in area. One dispenser complying with 8.7.3.3(1) per room and located in that room shall not be included in the aggregated quantity.
- (7) Storage of quantities greater than 5 gal (18.9 L) in a single smoke compartment or fire compartment or story, whichever is less in area, shall meet the requirements of NFPA 30.
- (8) Dispensers shall not be installed in the following locations:
 - (9) Above an ignition source for a horizontal distance of 1 in. (25 mm) to each side of the ignition source
 - (10) To the side of an ignition source within a 1 in. (25 mm) horizontal distance from the ignition source
 - (11) Beneath an ignition source within a 1 in. (25 mm) vertical distance from the ignition source
- (12) Dispensers installed directly over carpeted floors shall be permitted only in sprinklered areas of the building.
- (13) The alcohol-based hand-rub solution shall not exceed 95 percent alcohol content by volume.
- (14) Operation of the dispenser shall comply with the following criteria:
 - (15) The dispenser shall not release its contents except when the dispenser is activated, either manually or automatically by touch-free activation.
 - (16) Any activation of the dispenser shall only occur when an object is placed within 4 in. (100 mm) of the sensing device.
 - (17) An object placed within the activation zone and left in place shall not cause more than one activation.
 - (18) The dispenser shall not dispense more solution than the amount required for hand hygiene consistent with label instructions.
 - (19) The dispenser shall be designed, constructed, and operated in a manner that ensures accidental or malicious activation of the dispensing device is minimized.
 - (20) The dispenser shall be tested in accordance with the manufacturer's care and use instructions each time a new refill is installed.

8.7.3.3* Alcohol-Based Hand-Rub Dispensers.

Where permitted by Chapters 11 through 43, alcohol-based hand-rub (ABHR) dispensers shall be permitted provided they meet all of the ~~following~~ criteria in 8.7.3.3.1 through 8.7.3.3.6.

8.7.3.3.1 Personal Use Containers.

The requirements of 8.7.3.3 shall not apply to individual personal use ABHR containers with a volume less than 16 ounces (0.5 L).

8.7.3.3.2 ABHR Dispenser Capacity.

The capacity of ABHR dispensers shall comply with all of the following:

- (1) The maximum individual dispenser fluid capacity shall be as follows:
 - (a) 0.32-53 gal (1.22-0 L) for dispensers in corridors and areas open to corridors
 - (a)(b) 1.06 gal (4.0 L) for dispensers in corridors and areas open to corridors in buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with section 9.7
 - (b)(c) 0.531.06 gal (2.04-0 L) for dispensers in rooms or suites of rooms separated from corridors
- (2) Where aerosol containers are used, the maximum capacity of the aerosol dispenser shall be 18 oz (0.51 kg) and shall be limited to Level 1 aerosols as defined in NFPA 30B.
- ~~(3) Dispensers shall be separated from each other by horizontal spacing of not less than 48 in. (1220 mm).~~
- (3) In buildings without an automatic sprinkler system, Not more than an aggregate 10 gal (37.8 L) of alcohol-based hand-rub ABHR solution or 1135 oz (32.2 kg) of Level 1 aerosols, or a combination of liquids and Level 1 aerosols not to exceed, in total, the equivalent of 10 gal (37.8 L) or 1135 oz (32.2 kg,) shall be in use outside of a storage cabinet in a single smoke compartment or fire compartment or story, whichever is less in area. One dispenser complying with 8.7.3.3.2(1) per room and located in that room shall not be included in the aggregated quantity.
- (4) In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7, not more than an aggregate 20 gal (75.6 L) of ABHR solution shall be in use outside of a storage cabinet in a single smoke compartment or fire compartment or story, whichever is less in area. One dispenser complying with 8.7.3.3.2(1) per room and located in that room shall not be included in the aggregated quantity.
- ~~(5) Storage of quantities greater than 5 gal (18.9 L) in a single smoke compartment or fire compartment or story, whichever is less in area, shall meet the requirements of NFPA 30.~~

8.7.3.3.3 ABHR Dispenser Location.

The locations of ABHR dispensers shall comply with all of the following:

- (1) Dispensers shall not be installed in the following locations:
 - (a) Above an ignition source for a horizontal distance of 1 in. (25 mm) to each side of the ignition source
 - (b) To the side of an ignition source within a 1 in. (25 mm) horizontal distance from the ignition source

(c) Beneath an ignition source within a 1 in. (25 mm) vertical distance from the ignition source

(2) Dispensers installed directly over carpeted floors shall be permitted only in sprinklered areas of the building.

(3) ABHR Dispensers shall be separated from each other by horizontal spacing of not less than 48 in (1220mm).

(4) In detention and correctional occupancies, ABHR dispensers shall only be allowed where permitted by the facility.

~~(2) The alcohol-based hand-rub solution shall not exceed 95 percent alcohol content by volume.~~

8.7.3.3.4 ABHR Dispenser Operation and Testing.

The Operation-operation of the dispenser shall comply with the following ~~criteria~~:

- (1) The dispenser shall not release its contents except when the dispenser is activated, either manually or automatically by touch-free activation.
- (2) Any activation of the dispenser shall only occur when an object is placed within 4 in. (100 mm) of the sensing device.
- (3) An object placed within the activation zone and left in place shall not cause more than one activation.
- (4) The dispenser shall not dispense more solution than the amount required for hand hygiene consistent with label instructions.
- (5) The dispenser shall be designed, constructed, and operated in a manner that ensures accidental or malicious activation of the dispensing device is minimized.
- (6) The dispenser shall be tested in accordance with the manufacturer's care and use instructions each time a new refill is installed.

8.7.3.3.5 Spill Containment and Maintenance

Maintenance and Spill Containment of the dispenser shall comply with the following:

(1) Spill containment for dispensers shall be provided.

(2) Any ABHR spilled during a refill process shall be removed following the refill operation.

(3) Catch basins or spill collection means shall be kept free of accumulated ABHR material and refuse.

Negative with Comment

Cook, David

Although I agree with most of the Committee's work on this ABHR language and direction, I disagree that this topic and regulations should be placed within the Features of Fire Protection Chapter. This chapter is for "items built into the building" (ie: smoke and fire dampers, rated walls, etc.), not "items placed and used within the building" (ie: Christmas trees, automobiles on display, chemical use and storage, etc.) Just running down through the titles of the sections of the Chapter, and then coming across the ABHR Section, it sticks out as "what is different within this set of items". I think this work is better placed in the NFPA 1 or at least NFPA 30. I will yield to the decision of the Technical Correlating Committee.

Public Comment No. 140-NFPA 101-2022 [New Section after 3.3.14.3]

3.3.X Alcohol-Based Hand-Rub (ABHR).

An alcohol-containing preparation designed for application to the hands for reducing the number of visible microorganisms on the hands and containing ethanol or isopropanol in an amount not exceeding 95 percent by volume. [NFPA 30 3.3.1].

Statement of Problem and Substantiation for Public Comment

Our current health situation with the latest viral outbreak has led to an increased need to install alcohol based hand sanitizer within many different types of occupancies.

This Public Comment extracts the definition for Alcohol-Based Hand Rub (ABHR) from NFPA 30. ABHR is classified as a Type IB ignitable liquid based on its flash-point, which is typically around 63°F, however the alcohol-based sanitizing solution is water-soluble and similar in fire risk to distilled spirits due to its quick evaporation rate.

Similar to the existing need found in the standard to allow ABHR dispensers in hospitals and health care facilities, that was addressed back in the 1990s in order to mitigate infection risk in those occupancies, the same infection risks exist in all occupancies and needs to be safely mitigated as the world continues to face the challenges associated with the COVID-19 Pandemic.

This Public Comment provides reasonable increases to the total allowable volumes of ABHR in ABHR dispensers based on the practices and experiences over the past several years and adds reasonable limitations on ABHR volume to address the risks of infection with a balanced approach that also considers the fire-risk of ABHR..

The changes made in this section are suggested to categorize the requirements into individual categories. The sections would encompass each of the following subjects:

- c. Dispenser Capacity.
- d. Storage Volume.
- e. Dispenser Location.
- f. Dispenser Operation, and Testing.
- g. Spill Containment and Maintenance.

Adding this information will allow the AHJ to easily define the overall requirements related to alcohol based hand-rubs. Since ABHR solution is typically classified as Type IB ignitable (flammable or combustible) liquid certain occupancies, such as business, mercantile and educational, currently have special requirements for maximum allowable quantities (MAQ) that are much more restrictive in the quantity of Type IB ignitable that is permitted to be stored and in use.

The intent is for NFPA 101 to extract and incorporate MAQ's from NFPA 30 into this document to allow one centralized location for the information needed to fully understand the requirements related to storage and use of alcohol-based hand sanitizer for each of the types of occupancies. This is an attempt to make this the all-inclusive section for locating the requirements covering Alcohol Based Hand-Rubs.

Committee Statement

Committee Action: Rejected but see related SR

Resolution: [SR-6578-NFPA 101-2022](#)

Statement: This adds a new definition for what is classified as ABHR.

Public Comment No. 219-NFPA 101-2022 [Section No. 3.3.54]

3.3.54 Damper.

3.3.54.1 Combination Fire- and - Smoke Damper.

A ~~device that~~ listed device installed in teh ducts or air transfer openings of fire-resistance-rated walls, barriers, partitions, or floors that meets both fire damper and smoke damper requirements. [90A, 2021] (SAF-FIR)

3.3.54.2* Fire Damper.

A listed device installed in an air distribution system and designed to close automatically upon detection of heat, to interrupt migratory airflow, and to restrict the passage of flame. [90A, 2021] (SAF-FIR)

3.3.54.3* Smoke Damper.

A listed device within an air-distribution system to control the movement of smoke. [90A, 2021] (SAF-FIR)

Statement of Problem and Substantiation for Public Comment

SAF-AAC appointed a task group to review damper terminology throughout NFPA 101 based upon FR 6516 which modified the definitions for various dampers and made the change to extract the definitions from NFPA 90A. The purpose of this Public Comment, submitted on behalf of the Task Group, is to revise the language to be consistent with the definitions in NFPA 90A. It should be noted that the terms proposed are based upon the First Draft Report of NFPA 90A and not necessarily the definitions in Chapter 3 of the First Draft Report for NFPA 101. If NFPA 90A is revised during the Public Comment period it is the intent that these terms would be revised to be consistent with the defined terms being extracted from NFPA 90A.

It should be noted that although Koffel Associates is a consultant to AMCA International, the Public Comment is not identified as being submitted on behalf of AMCA International since the Public Comment was the result of the SAF-AAC Task Group.

Action:**Resolution:** [SR-6576-NFPA 101-2022](#)**Statement:** The purpose of extracting definitions is to be consistent with the definitions in NFPA 90A and other NFPA codes and standards.

**Public Comment No. 45-NFPA 101-2022 [Section No. 8.2.1.3]****8.2.1.3**

Where the building or facility includes additions or connected structures of different construction types, the rating and classification of the structure shall be based on one of the following:

- (1) Separate buildings, if a 2-hour or greater vertically aligned fire barrier wall in accordance with NFPA 221 exists between the portions of the building
- (2) Separate buildings, if provided with previously approved separations
- (3) Least fire-resistive construction type of the connected portions, if separation as specified in 8.2.1.3(1) or 8.2.1.3(2) is not provided

Additional Proposed Changes

101_A2023_SAF_AAC_CCN_46.pdf	101_Correlating Committee Note No. 46	

Statement of Problem and Substantiation for Public Comment

NOTE: The following CC Note No. 45 appeared in the First Draft Report on Committee Input No. 6514. Reconsider the action proposed in CI-6514. No code language has been proposed; language proposed for second draft might be construed as new material. Podium/pedestal construction as it relates to "stories in height" is currently addressed by SAF-FUN in 4.6.3(5). Stories in height definitions in 101 and 5000 are currently in alignment; number of stories and stories in height are determined differently (relative to grade plane and level of exit discharge, respectively). Stories in height criteria need to be consistent between 101 and 5000 for occupancy requirements predicated on stories in height. BLD-BLC does not necessarily have the expertise to draft language on the subject applicable to the scope of NFPA 101. Consider appointing a task group to provide recommended revisions to 4.6.3(5) for the next revision cycle.

Public Comment No. 63-NFPA 101-2022 [Section No. 8.4.6]

8.4.6 Air-Transfer Openings.

8.4.6.1 General.

The provisions of 8.4.6 shall govern the materials and methods of construction used to protect air-transfer openings in smoke partitions.

8.4.6.2* Smoke Dampers.

Air-transfer openings in smoke partitions shall be provided with approved smoke dampers designed and tested in accordance with the requirements of UL 555S, *Smoke Dampers*, to limit the transfer of smoke.

8.4.6.3 Smoke Damper Ratings.

Smoke damper leakage ratings shall be not less than Class II. Elevated temperature ratings shall be not less than 250°F (140°C).

8.4.6.4 Smoke Detectors.

~~Dampers~~ Smoke dampers in air-transfer openings shall close upon detection of smoke by approved smoke detectors installed in accordance with *NFPA 72*.

Statement of Problem and Substantiation for Public Comment

SAF-AAC appointed a task group to review damper terminology throughout NFPA 101 based upon FR 6516 which modified the definitions for various dampers and made the change to extract the definitions from NFPA 90A. The purpose of this Public Comment, submitted on behalf of the Task Group, is to revise the language to be consistent with the defined terms in Chapter 3. It should be noted that the terms proposed are based upon the First Draft Report of NFPA 90A and not necessarily the definitions in Chapter 3 of the First Draft Report for NFPA 101. If NFPA 90A is revised during the Public Comment period it is the intent that these terms would be revised to be consistent with the defined terms being extracted from NFPA 90A.

It should be noted that although Koffel Associates is a consultant to AMCA International, the Public Comment is not identified as being submitted on behalf of AMCA International since the Public Comment was the result of the SAF-AAC Task Group.

Statement: This change is to correlate with the defined terms as modified by SR-6576.

Public Comment No. 141-NFPA 101-2022 [Section No. 8.7.3.3]

8.7.3.3* Alcohol-Based Hand-Rub Dispensers.

Where permitted by Chapters 11 through 43, alcohol-based hand-rub dispensers shall be permitted provided they meet all of the

following criteria:

criteria in 8.7.3.3.1 through 8.7.3.3.5.

EXCEPTION: These requirements shall not apply to individual personal use ABHR containers less than 16 ounces.

8.7.3.3.1 ABHR Dispenser Capacity

(1) The maximum individual dispenser fluid capacity shall be as follows:

(2) 0.

32

(a) 53 gal (

1.2 L

(a) 2.0 L) for dispensers in corridors and areas open to corridors

(b) 1.06 gal (4.0 L) for dispensers in corridors and areas open to corridors

0.53 gal (2

(a) in buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 7.

(b) 1.06 gal (4.0 L) for dispensers in rooms or suites of rooms

separated

(a) separated from corridors.

(3) Where aerosol containers are used, the maximum capacity of the aerosol dispenser shall be 18 oz (0.51 kg) and shall be limited to Level 1 aerosols as defined in NFPA 30B.

(4) Dispensers shall be separated from each other by horizontal spacing of not less than 48 in. (1220 mm).

Not

(5) In buildings without an automatic sprinkler system, not more than an aggregate 10 gal (37.8 L) of alcohol-based hand-rub solution or 1135 oz (32.2 kg) of Level 1 aerosols, or a combination of liquids and Level 1 aerosols not to exceed, in total, the equivalent of 10 gal (37.8 L) or 1135 oz (32.2 kg,) shall be in use outside of a storage cabinet in a single smoke compartment or fire compartment or story, whichever is less in area. One dispenser complying with 8.7.3.3.1 (1) per room and located in that room shall not be included in the aggregated quantity.

Storage of quantities greater than 5 gal (18.9 L) in a

(6) In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7, not more than an aggregate 20 gal (75.6 L) of alcohol-based hand-rub solution shall be in use outside of a storage cabinet in a single smoke compartment or fire compartment or story, whichever is less in area, shall meet the requirements of NFPA 30.

(7) One dispenser complying with 8.7.3.3.1(1) per room and located in that room shall not be included in the aggregated quantity.

8.7.3.3.2 ABHR Dispenser Location

(1) Dispensers shall not be installed in the following locations:

(2) Above an ignition source for a horizontal distance of 1 in. (25 mm) to each side of the ignition source

- (3) To the side of an ignition source within a 1 in. (25 mm) horizontal distance from the ignition source
- (4) Beneath an ignition source within a 1 in. (25 mm) vertical distance from the ignition source
- (5) Dispensers installed directly over carpeted floors shall be permitted only in sprinklered areas of the building.
- (6) ~~The alcohol-based hand-rub solution shall not exceed 95 percent alcohol content by volume.~~
Operation
- (7) ABHR Dispensers shall be separated from each other by horizontal spacing of not less than 48 in (1220mm).
- (8) In Detention Facilities, ABHR dispensers shall only be allowed where permitted by the facility.

8.7.3.3.3 ABHR Dispenser Operation and Testing

- (1) Operation of the dispenser shall comply with the following criteria:
 - (2) The dispenser shall not release its contents except when the dispenser is activated, either manually or automatically by touch-free activation.
 - (3) Any activation of the dispenser shall only occur when an object is placed within 4 in. (100 mm) of the sensing device.
 - (4) An object placed within the activation zone and left in place shall not cause more than one activation.
 - (5) The dispenser shall not dispense more solution than the amount required for hand hygiene consistent with label instructions.
 - (6) The dispenser shall be designed, constructed, and operated in a manner that ensures accidental or malicious activation of the dispensing device is minimized.
 - (7) The dispenser shall be tested in accordance with the manufacturer's care and use instructions each time a new refill is installed.

8.7.3.3.4 Spill Containment and Maintenance

Maintenance and Spill Containment of the dispenser shall comply with the following criteria:

- (1) Spill containment for dispensers shall be provided.
- (2) Any alcohol hand rub spilled during a refill process shall be removed following the refill operation.
- (3) Catch basins or spill collection means shall be kept free of accumulated alcohol based hand-rub material and refuse.

Statement of Problem and Substantiation for Public Comment

Our current health situation with the latest viral outbreak has led to an increased need to install alcohol based hand sanitizer within many different types of occupancies.

This Public Comment extracts the definition for Alcohol-Based Hand Rub (ABHR) from NFPA 30. ABHR is classified as a Type IB ignitable liquid based on its flash-point, which is typically around 63°F, however the alcohol-based sanitizing solution is water-soluble and similar in fire risk to distilled spirits due to its quick evaporation rate.

Similar to the existing need found in the standard to allow ABHR dispensers in hospitals and health

care facilities, that was addressed back in the 1990s in order to mitigate infection risk in those occupancies, the same infection risks exist in all occupancies and needs to be safely mitigated as the world continues to face the challenges associated with the COVID-19 Pandemic.

This Public Comment provides reasonable increases to the total allowable volumes of ABHR in ABHR dispensers based on the practices and experiences over the past several years and adds reasonable limitations on ABHR volume to address the risks of infection with a balanced approach that also considers the fire-risk of ABHR..

The changes made in this section are suggested to categorize the requirements into individual categories. The sections would encompass each of the following subjects:

- c. Dispenser Capacity.
- d. Storage Volume.
- e. Dispenser Location.
- f. Dispenser Operation, and Testing.
- g. Spill Containment and Maintenance.

Adding this information will allow the AHJ to easily define the overall requirements related to alcohol based hand-rubs. Since ABHR solution is typically classified as Type IB ignitable (flammable or combustible) liquid certain occupancies, such as business, mercantile and educational, currently have special requirements for maximum allowable quantities (MAQ) that are much more restrictive in the quantity of Type IB ignitable that is permitted to be stored and in use.

The intent is for NFPA 101 to extract and incorporate MAQ's from NFPA 30 into this document to allow one centralized location for the information needed to fully understand the requirements related to storage and use of alcohol-based hand sanitizer for each of the types of occupancies. This is an attempt to make this the all-inclusive section for locating the requirements covering Alcohol Based Hand-Rubs.

One dispenser complying with 8.7.3.3(1) per room and located in that room shall not be included in the aggregated quantity.
- (7) Storage of quantities greater than 5 gal (18.9 L) in a single smoke compartment or fire compartment or story, whichever is less in area, shall meet the requirements of NFPA 30.
- (8) Dispensers shall not be installed in the following locations:
 - (9) Above an ignition source for a horizontal distance of 1 in. (25 mm) to each side of the ignition source
 - (10) To the side of an ignition source within a 1 in. (25 mm) horizontal distance from the ignition source
 - (11) Beneath an ignition source within a 1 in. (25 mm) vertical distance from the ignition source
- (12) Dispensers installed directly over carpeted floors shall be permitted only in sprinklered areas of the building.
- (13) The alcohol-based hand-rub solution shall not exceed 95 percent alcohol content by volume.
- (14) Operation of the dispenser shall comply with the following criteria:
 - (15) The dispenser shall not release its contents except when the dispenser is activated, either manually or automatically by touch-free activation.
 - (16) Any activation of the dispenser shall only occur when an object is placed within 4 in. (100 mm) of the sensing device.
 - (17) An object placed within the activation zone and left in place shall not cause more than one activation.
 - (18) The dispenser shall not dispense more solution than the amount required for hand hygiene consistent with label instructions.
 - (19) The dispenser shall be designed, constructed, and operated in a manner that ensures accidental or malicious activation of the dispensing device is minimized.
- (20) ~~The dispenser shall be tested in accordance with the manufacturer's care and use instructions each time a new refill is installed.~~

Statement of Problem and Substantiation for Public Comment

This provides unnecessary burden on the support services team to potentially document that ABHRs are tested each time it is changed out. There are sufficient ABHR dispensers inside and outside plus handsinks for proper hand hygiene. The quantity and location are not a life safety requirement and should not fall under the Life Safety code with exception to the maximum quantity permitted within a smoke compartment or non-rated/rated space.

Second Revision No. 6576-NFPA 101-2022 [Section No. 3.3.54]

3.3.54 Damper.

3.3.54.1 Combination Fire ~~and~~ – Smoke Damper.

A ~~device that~~ listed device installed in the ducts or air transfer openings of fire-resistance-rated walls, barriers, partitions, or floors that meets both fire damper and smoke damper requirements. [90A,2021 2024] (SAF-FIR)

3.3.54.2* Fire Damper.

A listed device installed in an air distribution system and designed to close automatically upon detection of heat, to interrupt migratory airflow, and to restrict the passage of flame. [90A,2021 2024] (SAF-FIR)

3.3.54.3* Smoke Damper.

A listed device within an air distribution system to control the movement of smoke. [90A,2021 2024] (SAF-FIR)

In accordance with the policy of the Standards Council, I have abstained from voting on this Second Revision.

Second Revision No. 6577-NFPA 101-2022 [Section No. 8.2.1.3]

8.2.1.3

Where the building or facility includes additions or connected structures of different construction types, the rating and classification of the structure shall be based on one of the following:

- (1) Separate buildings, if a 2-hour or greater vertically aligned fire barrier wall in accordance with NFPA 221 exists between the portions of the building
- (2) Separate buildings, if provided with previously approved separations
- (3) Least fire-resistive construction type of the connected portions, if separation as specified in 8.2.1.3(1) or 8.2.1.3(2) is not provided
- (4) Separate vertical buildings, where permitted by NFPA 221

Submitter Information Verification

Committee: SAF-FIR

Submittal Date: Mon Aug 01 13:13:59 EDT 2022

Committee Statement

Committee Statement: This change is to correlate with the changes made to 5000 via SR-8176 and 221 via SR-11, which allow for separate vertical buildings. The use of vertically aligned buildings is a common type of construction, this change will clarify the application of NFPA 101 to these types of podium/pedestal buildings.

Second Revision No. 6580-NFPA 101-2022 [Section No. 8.4.6]

8.4.6 Air-Transfer Openings.

8.4.6.1 General.

The provisions of 8.4.6 shall govern the materials and methods of construction used to protect air-transfer openings in smoke partitions.

8.4.6.2* Smoke Dampers.

Air-transfer openings in smoke partitions shall be provided with approved smoke dampers designed and tested in accordance with the requirements of UL 555S, *Smoke Dampers*, to limit the transfer of smoke.

8.4.6.3 Smoke Damper Ratings.

Smoke damper leakage ratings shall be not less than Class II. Elevated temperature ratings shall be not less than 250°F (140°C).

8.4.6.4 Smoke Detectors.

~~Dampers~~ Smoke dampers in air-transfer openings shall close upon detection of smoke by approved smoke detectors installed in accordance with *NFPA 72*.

In accordance with the policy of the Standards Council, I have abstained from voting on this Second Revision.

Second Revision No. 6579-NFPA 101-2022 [Section No. 8.7.3.3]

8.7.3.3* Alcohol-Based Hand-Rub (ABHR) Dispensers.

Where permitted by Chapters 11 through 43, ~~alcohol-based hand-rub~~ ABHR dispensers shall be permitted provided they meet all of the following criteria in 8.7.3.3.1 through 8.7.3.3.5 :

~~The maximum individual dispenser fluid capacity shall be as follows:~~

~~0.32 gal (1.2 L) for dispensers in corridors and areas open to corridors~~

~~0.53 gal (2.0 L) for dispensers in rooms or suites of rooms separated from corridors~~

~~Where aerosol containers are used, the maximum capacity of the aerosol dispenser shall be 18 oz (0.51 kg) and shall be limited to Level 1 aerosols as defined in NFPA 30B :~~

~~Dispensers shall be separated from each other by horizontal spacing of not less than 48 in. (1220 mm):~~

~~Not more than an aggregate 10 gal (37.8 L) of alcohol-based hand-rub solution or 1135 oz (32.2 kg) of Level 1 aerosols, or a combination of liquids and Level 1 aerosols not to exceed, in total, the equivalent of 10 gal (37.8 L) or 1135 oz (32.2 kg,) shall be in use outside of a storage cabinet in a single smoke compartment or fire compartment or story, whichever is less in area. One dispenser complying with 8.7.3.3(1) per room and located in that room shall not be included in the aggregated quantity.~~

~~Storage of quantities greater than 5 gal (18.9 L) in a single smoke compartment or fire compartment or story, whichever is less in area, shall meet the requirements of NFPA 30 :~~

~~Dispensers shall not be installed in the following locations:~~

~~Above an ignition source for a horizontal distance of 1 in. (25 mm) to each side of the ignition source~~

~~To the side of an ignition source within a 1 in. (25 mm) horizontal distance from the ignition source~~

~~Beneath an ignition source within a 1 in. (25 mm) vertical distance from the ignition source~~

~~Dispensers installed directly over carpeted floors shall be permitted only in sprinklered areas of the building:~~

~~The alcohol-based hand-rub solution shall not exceed 95 percent alcohol content by volume:~~

~~Operation of the dispenser shall comply with the following criteria:~~

~~The dispenser shall not release its contents except when the dispenser is activated, either manually or automatically by touch-free activation:~~

~~Any activation of the dispenser shall only occur when an object is placed within 4 in. (100 mm) of the sensing device:~~

~~An object placed within the activation zone and left in place shall not cause more than one activation:~~

~~The dispenser shall not dispense more solution than the amount required for hand hygiene consistent with label instructions:~~

~~The dispenser shall be designed, constructed, and operated in a manner that ensures accidental or malicious activation of the dispensing device is minimized:~~

~~The dispenser shall be tested in accordance with the manufacturer's care and use instructions each time a new refill is installed:~~

8.7.3.3.1 Personal Use Containers.

The requirements of 8.7.3.3 shall not apply to individual personal use ABHR containers with a volume less than 16 oz (0.5 L).

8.7.3.3.2 ABHR Dispenser Capacity.

The capacity of ABHR dispensers shall comply with all of the following:

- (1) The maximum individual dispenser fluid capacity shall be as follows:
 - (a) ~~0.32~~ 0.53 gal (~~1.2~~ 2.0 L) for dispensers in corridors and areas open to corridors
 - (b) 1.06 gal (4.0 L) for dispensers in corridors and areas open to corridors in buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7
 - (c) ~~0.53~~ 1.06 gal (~~2.0~~ 4.0 L) for dispensers in rooms or suites of rooms separated from corridors
- (2) Where aerosol containers are used, the maximum capacity of the aerosol dispenser shall be 18 oz (0.51 kg) and shall be limited to Level 1 aerosols as defined in NFPA 30B.
- (3) ~~Not in buildings without an automatic sprinkler system, not~~ more than an aggregate 10 gal (37.8 L) of ~~alcohol-based hand-rub~~ ABHR solution or 1135 oz (32.2 kg) of Level 1 aerosols, or a combination of liquids and Level 1 aerosols not to exceed, in total, the equivalent of 10 gal (37.8 L) or 1135 oz (32.2 kg), shall be in use outside of a storage cabinet in a single smoke compartment or fire compartment or story, whichever is less in area. One dispenser complying with 8.7.3.3.2(1) per room and located in that room shall not be included in the aggregated quantity.
- (4) In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7, not more than an aggregate 20 gal (75.6 L) of ABHR solution shall be in use outside of a storage cabinet in a single smoke compartment or fire compartment or story, whichever is less in area. One dispenser complying with 8.7.3.3.2(1) per room and located in that room shall not be included in the aggregated quantity.

8.7.3.3.3 ABHR Dispenser Location.

The locations of ABHR dispensers shall comply with all of the following:

- (1) Dispensers shall not be installed in the following locations:
 - (a) Above an ignition source for a horizontal distance of 1 in. (25 mm) to each side of the ignition source
 - (b) To the side of an ignition source within a 1 in. (25 mm) horizontal distance from the ignition source
 - (c) Beneath an ignition source within a 1 in. (25 mm) vertical distance from the ignition source
- (2) Dispensers installed directly over carpeted floors shall be permitted only in sprinklered areas of the building.
- (3) ABHR dispensers shall be separated from each other by horizontal spacing of not less than 48 in. (1220 mm).
- (4) In detention and correctional occupancies, ABHR dispensers shall only be allowed where permitted by the facility.

8.7.3.3.4 ABHR Dispenser Operation and Testing.

~~Operation~~ The operation of the dispensers shall comply with all of the following criteria :

- (1) ~~The dispenser~~ Dispensers shall not release ~~its~~ their contents except when ~~the dispenser~~ is activated, either manually or automatically by touch-free activation.
- (2) Any activation of ~~the a~~ dispenser shall only occur when an object is placed within 4 in. (100 mm) of the sensing device.
- (3) An object placed within ~~the an~~ activation zone and left in place shall not cause more than one activation.
- (4) ~~The dispenser~~ Dispensers shall not dispense more solution than the amount required for hand hygiene consistent with label instructions.
- (5) ~~The dispenser~~ Dispensers shall be designed, constructed, and operated in a manner that ensures accidental or malicious activation of ~~the~~ dispensing devices is minimized.
- (6) ~~The dispenser~~ Dispensers shall be tested in accordance with the manufacturer's care and use instructions each time ~~a~~ new refills are ~~is~~ installed.

8.7.3.3.5 Spill Containment and Maintenance.

Maintenance and spill containment of dispensers shall comply with all of the following:

- (1) Spill containment for dispensers shall be provided.
- (2) Any ABHR solution spilled during a refill process shall be removed following the refill operation.
- (3) Catch basins or spill collection means shall be kept free of accumulated ABHR material and refuse.

Although I agree with most of the Committee's work on this ABHR language and direction, I disagree that this topic and regulations should be placed within the Features of Fire Protection Chapter. This

chapter is for "items built into the building" (ie: smoke and fire dampers, rated walls, etc.), not "items placed and used within the building" (ie: Christmas trees, automobiles on display, chemical use and storage, etc.) Just running down through the titles of the sections of the Chapter, and then coming across the ABHR Section, it sticks out as "what is different within this set of items". I think this work is better placed in the NFPA 1 or at least NFPA 30. I will yield to the decision of the Technical Correlating Committee.

**Public Comment No. 150-NFPA 101-2022 [Section No. 3.3.267]****3.3.267** Sleep Pod.

A modular room that special type of enclosed compartment that is designed and used for sleeping purposes. (SAF-FUN)

Additional Proposed Changes

<u>File Name</u>	<u>Description</u>	<u>Approved</u>
US-airports-with-sleep-pods-JFK-GoSleep.jpg	Sleep pod image in airport	

Statement of Problem and Substantiation for Public Comment

I believe the current definition of sleep pod is flawed. Based on the current definition of "modular room", a sleep pod would be enclosed by walls, ceilings, and floors. Not all sleep pod configurations on the market are enclosed by walls and ceilings and therefore will cause enforcement confusion in the field based on the current definition. Therefore, I have proposed defining a sleep pod as a special type of enclosed compartment. See accompanying example image.

Committee: SAF-FUN

Committee Statement

Committee Action: Rejected

Resolution: The current reference to 9.11.4.2.1 is correct in regards to new high-rise buildings, which are addressed by Section 11.8.

Public Comment No. 168-NFPA 101-2022 [Section No. 43.6.5.2]

43.6.5.2

Where the rehabilitation work area is located in residential board and care occupancies or one- and two-family dwelling units, smoke alarms or detectors, and carbon monoxide alarms or detectors, complying with the requirements of other sections of this *Code* applicable to new construction for the occupancy shall be provided.

Statement of Problem and Substantiation for Public Comment

Chapter 33 for existing Board and Care does not include a requirement for carbon monoxide detection. There was discussion to propose the requirement for carbon monoxide detection within Chapter 33, however a carbon monoxide alarm listed to UL 2034 standards is intended for use only in dwelling units, including recreational vehicles, mobile homes, and recreational boats with enclosed accommodation spaces and cockpit areas and therefore should not be recommended for use in common areas of board and care. Carbon monoxide "detectors" with a UL 2075 listing should be utilized in this application, but NFPA 72 requires ANSI Temporal 4 notification of carbon monoxide alarms. In addition to the requirement for the unique notification, many existing board and care facilities many not have expansion capabilities on their existing fire alarms. Adding a requirement to Chapter 33 could create the unintended consequence of forcing a fire alarm update for existing fire alarms. Placing this language in chapter 43 ensures that at the point that any fire alarms are updated they are also updated to include the requirements for carbon monoxide.

**Second Revision No. 6535-NFPA 101-2022 [Section No. 3.3.128]****3.3.128*** Fuel-Burning Appliance.

A device that burns solid, liquid, or gaseous fuel or a combination thereof. (SAF-FUN)

A.3.3.128 Fuel-Burning Appliance.

Fuel-burning appliances include, but are not limited to, devices used for cooking, heating, lighting, or decorative purposes. Examples are wood stoves, portable space heaters, ranges, furnaces, water heaters, clothes dryers, gas refrigerators, gas lamps, and fuel-burning fireplaces.

Second Revision No. 6507-NFPA 101-2022 [Section No. 3.3.267]

3.3.269 Sleep Pod.

~~A modular room~~ An occupiable, prefabricated structure that might include integral electrical wiring, ventilation, and furnishings, and that is designed and used for sleeping purposes. (SAF-FUN)

Submitter Information Verification

Committee: SAF-FUN

Submittal Date: Mon Jul 11 12:45:02 EDT 2022

Committee Statement

Committee Statement: Based on the current definition of "modular room," a sleep pod would be enclosed by walls, ceilings, and floors. Not all sleep pod configurations on the market are enclosed by walls and ceilings and therefore will cause enforcement confusion in the field based on the current definition. The committee requests that the correlating committee coordinate any requirements for modular rooms to ensure appropriate requirements also apply to sleep pods.

Second Revision No. 6501-NFPA 101-2022 [Section No. 4.6.1.4]

4.6.1.4 Technical Assistance.

4.6.1.4.1

The authority having jurisdiction shall be permitted to require a review by an approved independent third party with expertise in the matter to be reviewed at the submitter's expense. [~~1:4.15.1~~ 1.16.1]

4.6.1.4.2

The independent reviewer shall provide an evaluation and recommend necessary changes of the proposed design, operation, process, or new technology to the authority having jurisdiction. [~~1:4.15.2~~ 1.16.2]

4.6.1.4.3

The authority having jurisdiction shall be authorized to require design submittals to bear the stamp of a registered design professional. [~~1:4.15.3~~ 1.16.3]

Second Revision No. 6502-NFPA 101-2022 [Section No. 4.6.15]

4.6.15 Fire-Retardant-Treated Wood.

Fire-retardant-treated wood shall be a wood product impregnated with chemical by a pressure process or ~~impregnated with chemical by~~ other means during manufacture meeting the requirements in 4.6.15.2 through 4.6.15.2.5. [703:4.1.1]

4.6.15.1

Materials treated by means other than those specified in 4.6.15 shall be considered a fire-retardant-coated material and shall meet the requirements of fire-retardant coatings in Chapter 5 of NFPA 5000 . [703: 4.1.1.1]

4.6.15.2

Fire-retardant-treated wood shall be tested in accordance with ASTM E84, *Standard Test Method for Surface Burning Characteristics of Building Materials*, or UL 723, *Test for Surface Burning Characteristics of Building Materials*. [703:4.1.1.4 4.1.1.2]

4.6.15.2.1

Fire-retardant-treated wood shall have a listed flame spread index of 25 or less. [703:4.1.1.2 4.1.1.2.1]

4.6.15.2.2

The flame front shall not progress more than 10.5 ft (3.2 m) beyond the centerline of the burners at any time during the test, when the test is continued for an additional 20-minute period . [703:4.1.1.4 4.1.1.2.2]

4.6.15.2.3

A wood product that has been impregnated with chemicals by a pressure process or other means during manufacture and has met the requirements of 4.6.15.2.1 and 4.6.15.2.2 when tested on the front and back faces in accordance with ASTM E2768, *Standard Test Method for Extended Duration Surface Burning Characteristics of Building Materials (30 min Tunnel Test)* , shall be considered fire-retardant-treated wood. [703: 4.1.1.2.3]

4.6.15.2.4

Wood structural panels shall be permitted to ~~test be tested~~ only on the front and back faces. [703:4.1.1.6 4.1.1.2.4]

4.6.15.2.5

Wood structural panels that meet all of the following conditions shall be considered fire-retardant-treated wood:

- (1) They have been impregnated with chemicals.
- (2) They have been tested on the front and back faces in accordance with ASTM E2768, *Standard Test Method for Extended Duration Surface Burning Characteristics of Building Materials (30 min Tunnel Test)* , with a ripped or cut longitudinal gap of $\frac{1}{8}$ in. (3.2 mm).
- (3) They are listed to meet the requirements of 4.6.15.2.1 and 4.6.15.2.2 . [703: 4.1.1.2.5]

4.6.15.4

~~Fire-retardant-treated wood shall not show evidence of significant progressive combustion when the test is continued for an additional 20-minute period. [703: 4.1.1.3]~~

Public Comment No. 237-NFPA 101-2022 [Section No. 18.1.3.11]

~~18.1.3.11 –~~

~~Any area with a hazard of contents classified higher than that of the health care occupancy and located in the same building shall be protected as required by 18.3.2 .~~

Statement of Problem and Substantiation for Public Comment

There is no need for this requirement. If a space is in an occupancy other than a healthcare occupancy and it is in the same building that contains the healthcare occupancy, the occupancy separation requirements of Chapter 6 that mandate a two hour fire resistance separation is more than adequate and this chapter should not be requiring a fire rated enclosure for a space in an occupancy that is outside of the healthcare occupancy that is already properly separated. If there is no two hour fire resistant separation between the healthcare occupancy and the other occupancies, then the hazardous area requirements of NFPA 101, 18/19.3.2 already apply. This requirement is more often missed than applied during design because designers don't refer to the healthcare occupancy requirements in Chapter 18/19 when designing spaces to the requirements of other occupancies within the same building that might contain a healthcare occupancy.

Resolution: The proposed revision is deemed to be new material and will be held for the next revision cycle.

**Public Comment No. 86-NFPA 101-2022 [Section No. 18.2.2.2.4]****18.2.2.2.4**

Doors within a required means of egress shall not be equipped with a latch or lock that requires the use of a tool or key from the egress side, unless otherwise permitted by one of the following:

- (1) Locks complying with 18.2.2.2.5 shall be permitted.
- (2)* Delayed-egress electrical locking systems complying with 7.2.1.6.1 shall be ~~permitted~~ permitted where inspected in accordance with 7.2.1.14.
- (3)* Sensor-release of electrical locking systems complying with 7.2.1.6.2 shall be permitted where inspected in accordance with 7.2.1.14.
- (4) Elevator lobby exit access door locking in accordance with 7.2.1.6.4 shall be permitted where inspected in accordance with 7.2.1.14.

Statement of Problem and Substantiation for Public Comment

While is true that PI #59-NFPA 101-2021 was not submitted with any "technical substantiation or loss data" to substantiate the change, statistically over the course of their service life, a portion of these devices will fail. In addition, anecdotally I have come across countless installations that are not functioning, incorrectly installed, and/or missing required signage in my short ~10 years primarily conducting health care life safety assessments. If/when a failure happens that leads to loss of life/injury, it is possible that the specific reason would not be announced publicly. Fire alarm, suppression, smoke control, and other life safety systems are required to undergo ITM procedures at prescribed frequencies. It is unlikely that every component in those systems that requires an ITM procedure had loss data to support it's inclusion as an item requiring testing. It is more likely that statistics concluded that a certain percentage of devices will fail over the course of their life, thus it is important to test devices regularly to avoid an incident where failure causes injury or loss of life. In this case, these devices failing could prevent egress and lead to loss of life in a fire. This proposal contemplates that devices on doors that otherwise prevent occupants from egressing the building be tested with a similar frequency as other life safety systems to proactively mitigate loss.

Another anecdotal note on this is that locking arrangements are one of the most common items that I bring up in life safety plan review and when consulting for architects/owners on construction projects. A typical response is that the door "drops on fire alarm" which is not a code compliant means of release in and of itself. I have not doubt that this method of door release is widely adopted/installed throughout the industry. While a code change such as this cannot fix initial incorrect application of the code, inspection of existing locking arrangements can get more sets of eyes on existing installations to ensure they have all functionality required by the code. Note this would also apply to the related section in the existing occupancy chapter 19 as well (19.2.2.2.4)

Street Address:

City:

State:

Zip:

Submittal Date: Wed May 11 14:31:27 EDT 2022

Committee: SAF-HEA

Committee Statement

Committee Action: Rejected

Resolution: Insufficient data has been provided to determine the failure modes occurring in the field to justify the proposed requirement for annual inspections of the noted systems. Testing requirements should be in a standalone section if included. The substantiation provided by the submitter does not provide the additional justification requested by the committee at the first draft stage.

**Public Comment No. 211-NFPA 101-2022 [Section No. 18.2.2.2.5.1]****18.2.2.2.5.1***

Door-locking arrangements shall be permitted where the clinical needs of patients require specialized security measures or where patients pose a security threat, ~~provided that staff can readily unlock doors at all times in accordance with 18.2.2.2.6.~~

Statement of Problem and Substantiation for Public Comment

Compliance with 18/19.2.2.2.6 is required by that section in order to use the provisions of 18/19.2.2.2.5, thus the reference is redundant when included in 18.2.2.2.5.1.

**Public Comment No. 121-NFPA 101-2022 [Section No. 18.2.2.2.5.2]****18.2.2.2.5.2***

Door-locking arrangements shall be permitted where patient special needs require specialized protective measures for their safety, provided that all of the following criteria are met:

- (1) Staff can readily unlock doors at all times in accordance with 18.2.2.2.6.
- (2) A total (complete) smoke detection system is provided throughout the locked space in accordance with 9.6.2.9, or locked doors can be remotely unlocked at an approved, constantly attended location within the locked space.
- (3) The smoke compartment containing the secured area, all adjacent smoke compartments, and all smoke compartments leading to the required exits from the secured area are protected throughout by an approved, supervised automatic sprinkler system in accordance with 18.3.5.1.
- (4) The locks are electrical locks that fail safely so as to release upon loss of power to the device.
- (5) The locks release by independent activation of each of the following:
 - (6) Activation of the smoke detection system required by 18.2.2.2.5.2(2)
 - (7) Waterflow in the automatic sprinkler system required by 18.2.2.2.5.2(3)
- (8)* ~~Door electrical~~ Door electro-mechanical or electromagnetic locking hardware for new electric lock installations ~~is listed for the purpose~~ shall be listed in accordance with UL 294, Access Control System Units or UL 1034, Burglary-Resistant Locking Mechanisms.

Additional Proposed Changes

<u>File Name</u>	<u>Description</u>	<u>Approved</u>
2024_NFPA_101_UL_294_and_UL_1034_Public_Comments_20220520.pdf	NFPA 101 2024 proposal to add UL 1034 as an option where door hardware is required to be listed to UL 294.	

Statement of Problem and Substantiation for Public Comment

Because of implications to life safety with electrical locking systems potentially affecting egress on these doors in the means of egress, it is prudent to require listing of door electrical locking hardware used in these applications. Requiring listing to either UL 294 or to UL 1034 appropriately revises this important listing requirement to help assure the electrical locking hardware performs as intended for these life-safety applications.

The Life Safety Code, in chapters 18 and 19, first required this electrical door hardware to be listed to UL 294 in the 2018 edition of NFPA 101.

UL 294 and 1034 address efficacy and safety considerations for door access control applications (ingress control) to assure the door hardware would perform as intended and expected. Typically, access control systems incorporating card readers, keypads, iris scanners, etc. are tested and listed to UL 294. Additionally, delayed egress electrical locking systems, sensor-release electrical locking systems, and certain types of door hardware release electrical locking systems are all typically tested and listed to UL 294. On the other hand, components such as electromagnetic locks, electric dead bolts, electric strikes, and other door electrically operated locking mechanisms are typically listed to UL 1034. UL 294 and UL 1034 are collateral standards that complement each other.

These examples illustrate that many of the same systems and components used to control access (ingress) to a space are also used for egress-side electrical locking systems. Considering that egress-side electrical locking systems have life safety implications, NFPA 101 was enhanced (in 2009) to require listing of electrical locking hardware to UL 294. In hindsight, what's proposed here – meeting a mandatory listing requirement with the collateral listing to UL 1034 – should have been the language included in NFPA 101 in the earlier editions.

In addition to the option to list to UL 1034, this proposal brings consistency in the text where UL 294 (and UL 1034) are referenced in NFPA 101. The additions of Annex A text complement the revisions to the mandatory language of these special locking arrangements.

The revisions of the Annex A text complement the revisions to 18.2.2.2.5.2(6)

Resolution: [SR-6657-NFPA 101-2022](#)
Statement: The revision was developed by a task group on health care door locking to recognize alternative means of providing security where patient special needs require specialized protective measures for their safety.

2021 / 2024 NFPA 101 UL 294 and UL 1034

Revised 20, 2022

BHMA, John Woestman

Proposed public comment revisions are based on NFPA 101 language as revised, or not, per the First Draft Report.

Chapter 2 Referenced Publications

UL 294, Access Control System Units, 2018.

UL 1034, *Burglary-Resistant Electric Locking Mechanisms*, 2011, revised 2020

Commented [WJ1]: Public Input No. 277-NFPA 101-2021

The approved First Revision is the **highlighted** text. No revisions needed for public comment.

Chapter 7 Means of Egress

7.2.1.5.7 * Stair Enclosure Re-entry.

Every door assembly in a stair enclosure serving more than four stories, unless permitted by 7.2.1.5.7.2, shall meet one of the following conditions:

1. Re-entry from the stair enclosure to the interior of the building shall be provided.
2. An automatic release shall be provided that meets all of the following:
 - a) The automatic release shall unlock all stair enclosure door assemblies to allow re-entry.
 - b) The automatic release shall be actuated with the initiation of the building fire alarm system.
 - c) *Door **electrical** ~~electro-mechanical or electromagnetic~~ locking hardware for new installations shall be listed in accordance with UL 294, *Access Control System Units* or UL 1034, *Burglary-Resistant Electric Locking Mechanisms*.
3. Selected re-entry shall be provided in accordance with 7.2.1.5.7.1.

Commented [WJ2]: Public Input No. 278-NFPA 101-2021

The approved First Revision is with the **highlighted** text with potential further revisions via public comment.

Commented [JW3]: PC 114

A.7.2.1.5.7(2)(c)

The electrical locking hardware may be a component of an electrical locking system (e.g. access control system) or the electrical locking hardware may be a device with an individual listing. **Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.**

Commented [WJ4]: Public Input No. 278-NFPA 101-2021

The approved First Revision is the **highlighted** text. No revisions via public comment needed.

Commented [JW5]: PC 115

Reason:

The proposed revisions help clarify the door electrical locking hardware that is required to be listed for these electrical locking applications. In addition of adding the option to list to UL 1034 included in the First Revision, this proposal brings consistency in the text where UL 294 and UL 1034 are referenced in NFPA 101. The additions of the Annex A text complement the revisions to the mandatory language of these special locking arrangements.

Because of implications to life safety with electrical locking systems potentially affecting egress on doors in the means of egress, it is prudent to require listing of door electrical locking hardware used in these applications. Listing to either UL 294 or to UL 1034 appropriately revises this important listing requirement to help assure the electrical locking hardware performs as intended for this life-safety application.

The Life Safety Code first required door hardware to be listed to UL 294 in the 2009 edition of NFPA 101. This section of NFPA 101, Stair Enclosure Re-entry, first required listing of door locking hardware to UL 294 with the 2021 edition of NFPA 101.

UL 294 and 1034 address efficacy and safety considerations for door access control applications (ingress control) to help assure the door hardware and access control solutions would perform as intended and expected. Typically, access control systems incorporating card readers, keypads, iris scanners, etc. are tested and listed to UL 294. Additionally, delayed egress electrical locking systems, sensor-release electrical locking systems, and certain types of door hardware release electrical locking systems are all typically tested and listed to UL 294. On the other hand, components such as electromagnetic locks, electric dead bolts, electric strikes, and other door electrically operated locking mechanisms are typically listed to UL 1034. UL 294 and UL 1034 are collateral standards that complement each other.

These examples illustrate that some of the same systems and components used to control access (ingress) to a space are also used for egress-side electrical locking systems. Considering that egress-side electrical locking systems have life safety implications, NFPA 101 was enhanced (in 2009) to require listing of electrical locking hardware to UL 294. In hindsight, the collateral listing to UL 1034 should have been the language included in NFPA 101 in the earlier editions.

7.2.1.6* Special Locking Arrangements.

7.2.1.6.1 * Delayed-Egress Electrical Locking Systems.

7.2.1.6.1.1

Approved, delayed-egress electrical locking systems shall be permitted to be installed on door assemblies serving low- and ordinary-hazard contents in buildings protected throughout by an approved, supervised automatic fire detection system in accordance with Section 9.6 or an approved, supervised automatic sprinkler system in accordance with Section 9.7, and where permitted in Chapters 11 through 43, provided that all of the following criteria are met:

1. The delay of the delayed-egress electrical locking system shall deactivate allowing unobstructed egress upon actuation of one of the following:
 - a) Approved, supervised automatic sprinkler system in accordance with Section 9.7
 - b) Not more than one heat detector of an approved, supervised automatic fire detection system in accordance with Section 9.6
 - c) Not more than two smoke detectors of an approved, supervised automatic fire detection system in accordance with Section 9.6
2. The delay of the delayed-egress electrical locking system shall deactivate allowing unobstructed egress upon loss of power controlling the lock or locking mechanism.
3. *An irreversible process shall release the electrical lock in the direction of egress within 15 seconds, or 30 seconds where approved by the authority having jurisdiction, upon application of a force to the release device required in 7.2.1.5.3 under all of the following conditions:
 - a) The force shall not be required to exceed 15 lbf (67 N).
 - b) The force shall not be required to be continuously applied for more than 3 seconds.
 - c) The initiation of the release process shall activate an audible signal in the vicinity of the door opening.
 - d) Once the electrical lock has been released by the application of force to the releasing device, rearming the delay electronics shall be by manual means only.

Commented [WJ6]: Public Input No. 279-NFPA 101-2021

Commented [JW7]: PC 116 is the mandatory text (Chapter 7). Separate PC for the Annex revisions.

4. *A readily visible, durable sign that conforms to the visual characters requirements of ICC A117.1, *Accessible and Usable Buildings and Facilities*, shall be located on the door leaf adjacent to the release device in the direction of egress, and shall read as follows:
 - a) PUSH UNTIL ALARM SOUNDS, DOOR CAN BE OPENED IN 15 SECONDS, for doors that swing in the direction of egress travel
 - b) PULL UNTIL ALARM SOUNDS, DOOR CAN BE OPENED IN 15 SECONDS, for doors that swing against the direction of egress travel
5. The egress side of doors equipped with delayed-egress electrical locking systems shall be provided with emergency lighting in accordance with Section 7.9.
6. ~~*Door electro-mechanical or electromagnetic locking hardware~~ for new installations shall be listed in accordance with UL 294, *Access Control System Units* or UL 1034, *Burglary-Resistant Electric Locking Mechanisms*.

A.7.2.1.6.1.1(6)

The electrical locking hardware may be a component of an electrical locking system, or the electrical locking hardware may be a device with an individual listing. Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

Commented [JW8]: PC 117

7.2.1.6.2 * Sensor-Release of Electrical Locking Systems.

7.2.1.6.2.1

Where permitted in Chapters 11 through 43, door assemblies in the means of egress shall be permitted to be equipped with sensor-release electrical locking system hardware provided that all of the following criteria are met:

1. A sensor shall be provided on the egress side, arranged to electrically unlock the door leaf in the direction of egress upon detection of an approaching occupant.
2. Door leaves shall automatically electrically unlock in the direction of egress upon loss of power to the sensor or to the part of the locking system that electrically locks the door leaves.
3. Door locks shall be arranged to electrically unlock in the direction of egress from a manual release device complying with all of the following criteria:
 - a) The manual release device shall be located on the egress side, 40 in. to 48 in. (1015 mm to 1220 mm) vertically above the floor, and within 60 in. (1525 mm) of the secured door openings, except as otherwise permitted by 7.2.1.6.2(3)(c).
 - b) The requirement of 7.2.1.6.2(3)(a) to locate the manual release device within 60 in. (1525 mm) of the secured door opening shall not apply to previously approved existing installations.
 - c) The manual release device shall be readily accessible and clearly identified by a sign that reads as follows: PUSH TO EXIT.
 - d) When operated, the manual release device shall result in direct interruption of power to the electrical lock — independent of the locking system electronics — and the lock shall remain unlocked for not less than 30 seconds.
4. Activation of the building fire-protective signaling system, if provided, shall automatically electrically unlock the door leaves in the direction of egress, and the door leaves shall remain electrically unlocked until the fire-protective signaling system has been manually reset.
5. The activation of manual fire alarm boxes that activate the building fire-protective signaling system specified in 7.2.1.6.2(4) shall not be required to unlock the door leaves.
6. Activation of the building automatic sprinkler or fire detection system, if provided, shall automatically electrically unlock the door leaves in the direction of egress, and the door leaves shall remain electrically unlocked until the fire-protective signaling system has been manually reset.

7. The egress side of sensor-release electrically locked egress doors, other than existing sensor-release electrically locked egress doors, shall be provided with emergency lighting in accordance with Section 7.9.
8. ~~*Door electro-mechanical or electromagnetic locking. Hardware~~ for new installations shall be listed in accordance with UL 294, *Access Control System Units* or UL 1034, *Burglary-Resistant Electric Locking Mechanisms*.

A.7.2.1.6.2.1(8)

The electrical locking hardware may be a component of an electrical locking system, or the electrical locking hardware may be a device with an individual listing. Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

Commented [JW9]: PC 118

7.2.1.6.3 Door Hardware Release of Electrically Locked Egress Door Assemblies.

7.2.1.6.3.1

Door assemblies in the means of egress shall be permitted to be equipped with approved electrical locking systems released by the operation of door hardware provided that all of the following conditions are met:

1. The hardware for egress-side occupant release of the electrical lock is affixed to the door leaf.
2. The hardware has an obvious method of operation that is readily operated in the direction of egress under all lighting conditions.
3. The hardware is capable of being operated with one hand in the direction of egress.
4. Operation of the hardware directly and immediately interrupts the power supply to the electric lock to unlock the door assembly in the direction of egress.
5. *Loss of power to the listed releasing hardware automatically unlocks the door assembly in the direction of egress.
6. ~~*Door electro-mechanical or electromagnetic locking. Hardware~~ for new installations ~~is shall be~~ listed in accordance with UL 294, *Access Control System Units* or UL 1034, *Burglary-Resistant Electric Locking Mechanisms*.

A.7.2.1.6.3.1(6)

The electrical locking hardware may be a component of an electrical locking system, or the electrical locking hardware may be a device with an individual listing. Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

Commented [JW10]: PC 119

7.2.1.6.4 * Elevator Lobby Exit Access Door Assemblies Locking.

7.2.1.6.4.1

Where permitted in Chapters 11 through 43, door assemblies separating the elevator lobby from the exit access required by 7.4.1.6.1 shall be permitted to be electrically locked, provided that all the following criteria are met:

1. ~~*The Door electro-mechanical or electromagnetic~~ locking hardware ~~is shall be~~ listed in accordance with UL 294, *Access Control System Units* or UL 1034, *Burglary-Resistant Locking Mechanisms*.
2. The building is protected throughout by a fire alarm system in accordance with Section 9.6.
3. The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.
4. Waterflow in the sprinkler system required by 7.2.1.6.4.1 is arranged to initiate the building fire alarm system.
5. The elevator lobby is protected by an approved, supervised smoke detection system in accordance with Section 9.6.
6. Detection of smoke by the detection system required by 7.2.1.6.4.1 is arranged to initiate the building fire alarm system and notify building occupants.

7. Initiation of the building fire alarm system by other than manual fire alarm boxes unlocks the electrical locks on the elevator lobby door assembly.
8. Loss of power to the elevator lobby electrical lock system unlocks the electrical locks on the elevator lobby door assemblies.
9. Once unlocked, the elevator lobby door assemblies remain electrically unlocked until the building fire alarm system has been manually reset.
10. Where the elevator lobby door assemblies remain mechanically latched after being electrically unlocked, latch-releasing hardware in accordance with 7.2.1.5.3 is affixed to the door leaves.
11. A two-way communication system is provided for communication between the elevator lobby and a central control point that is constantly staffed.
12. The central control point staff required by 7.2.1.6.4 is capable, trained, and authorized to provide emergency assistance.

A.7.2.1.6.4.1(1)

The electrical locking hardware may be a component of an electrical locking system, or the electrical locking hardware may be a device with an individual listing. Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

Commented [JW11]: PC 120

Reason:

Because of implications to life safety with electrical locking systems potentially affecting egress on doors in the means of egress, it is prudent to require listing of door electrical locking hardware used in these special locking arrangements. Listing to either UL 294 or to UL 1034 appropriately revises this important listing requirement to help assure the electrical locking hardware performs as intended for these life-safety applications.

The Life Safety Code first required door hardware to be listed to UL 294 in the 2009 edition of NFPA 101 on elevator lobby exit access door assemblies. Special locking arrangements included the UL 294 listing requirement with the 2012 and 2018 editions of NFPA 101.

UL 294 and 1034 address efficacy and safety considerations for door access control applications (ingress control) to assure the door hardware and access control solutions would perform as intended and expected. Typically, access control systems incorporating card readers, keypads, iris scanners, etc. are tested and listed to UL 294. Additionally, delayed egress electrical locking systems, sensor-release electrical locking systems, and certain types of door hardware release electrical locking systems are all typically tested and listed to UL 294. On the other hand, components such as electromagnetic locks, electric dead bolts, electric strikes, and other door electrically operated locking mechanisms are typically listed to UL 1034. UL 294 and UL 1034 are collateral standards that complement each other.

These examples illustrate that many of the same systems and components used to control access (ingress) to a space are also used for egress-side electrical locking systems. Considering that egress-side electrical locking systems have life safety implications, NFPA 101 was enhanced (in 2009) to require listing of electrical locking hardware to UL 294. In hindsight, what's proposed here – the collateral listing to UL 1034 – should have been the language included in NFPA 101 in the earlier editions.

In addition to the option to list to UL 1034, this proposal brings consistency in the text where UL 294 (and UL 1034) are referenced in NFPA 101. The additions of Annex A text complement the revisions to the mandatory language of these special locking arrangements.

Chapter 18 New Health Care Occupancies

18.2.2.2.5

Door-locking arrangements shall be permitted in accordance with either 18.2.2.2.5.1 or 18.2.2.2.5.2.

18.2.2.2.5.1 *

Door-locking arrangements shall be permitted where the clinical needs of patients require specialized security measures or where patients pose a security threat, provided that staff can readily unlock doors at all times in accordance with 18.2.2.2.6.

18.2.2.2.5.2 *

Door-locking arrangements shall be permitted where patient special needs require specialized protective measures for their safety, provided that all of the following criteria are met:

1. Staff can readily unlock doors at all times in accordance with 18.2.2.2.6.
2. A total (complete) smoke detection system is provided throughout the locked space in accordance with 9.6.2.9, or locked doors can be remotely unlocked at an approved, constantly attended location within the locked space.
3. *The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with 18.3.5.1.
4. The locks are electrical locks that fail safely so as to release upon loss of power to the device.
5. The locks release by independent activation of each of the following:
 - a) Activation of the smoke detection system required by 18.2.2.2.5.2(2)
 - b) Waterflow in the automatic sprinkler system required by 18.2.2.2.5.2(3)

6. ~~*Door electrical locking hardware for new electric lock installations is listed for the purpose: *Door electro-mechanical or electromagnetic locking hardware for new installations shall be listed in accordance with UL 294, Access Control System Units or UL 1034, Burglary-Resistant Electric Locking Mechanisms.~~

A. 18.2.2.2.5.2(6)

~~UL 294, Access Control System Units, and UL 1034, Burglary-Resistant Electric Locking Mechanisms, are two standards that provide criteria for listed door-locking hardware. The electrical locking hardware might be a component of an electrical locking system or the electrical locking hardware might be a device with an individual listing. Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.~~

Reason:

~~Because of implications to life safety with electrical locking systems potentially affecting egress on these doors in the means of egress, it is prudent to require listing of door electrical locking hardware used in these applications. Requiring listing to either UL 294 or to UL 1034 appropriately revises this important listing requirement to help assure the electrical locking hardware performs as intended for these life-safety applications.~~

~~The Life Safety Code, in chapters 18 and 19, first required this electrical door hardware to be listed to UL 294 in the 2018 edition of NFPA 101.~~

~~UL 294 and 1034 address efficacy and safety considerations for door access control applications (ingress control) to assure the door hardware would perform as intended and expected. Typically, access control systems incorporating card readers, keypads, iris scanners, etc. are tested and listed to UL 294. Additionally, delayed egress electrical locking systems, sensor-release electrical locking systems, and certain types of door hardware release electrical locking systems are all typically tested and listed to UL 294. and other door electrically operated locking mechanisms are typically listed to UL 1034. UL 294 and UL 1034 are collateral standards that complement each other.

These examples illustrate that many of the same systems and components used to control access (ingress) to a space are also used for egress-side electrical locking systems. Considering that egress-side electrical locking systems have life safety implications, NFPA 101 was enhanced (in 2009) to require listing of electrical locking hardware to UL 294. In hindsight, what's proposed here – meeting a mandatory listing requirement with the collateral listing to UL 1034 – should have been the language included in NFPA 101 in the earlier editions.

In addition to the option to list to UL 1034, this proposal brings consistency in the text where UL 294 (and UL 1034) are referenced in NFPA 101. The additions of Annex A text complement the revisions to the mandatory language of these special locking arrangements.

The revisions of the Annex A text complement the revisions to 18.2.2.2.5.2(6)

Chapter 19 Existing Health Care Occupancies

19.2.2.2.5

Door-locking arrangements shall be permitted in accordance with either 19.2.2.2.5.1 or 19.2.2.2.5.2.

19.2.2.2.5.1 *

Door-locking arrangements shall be permitted where the clinical needs of patients require specialized security measures or where patients pose a security threat, provided that staff can readily unlock doors at all times in accordance with 19.2.2.2.6.

19.2.2.2.5.2 *

Door-locking arrangements shall be permitted where patient special needs require specialized protective measures for their safety, provided that all of the following are met:

1. Staff can readily unlock doors at all times in accordance with 19.2.2.2.6.
2. A total (complete) smoke detection system is provided throughout the locked space in accordance with 9.6.2.9, or locked doors can be remotely unlocked at an approved, constantly attended location within the locked space.
3. *The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with 19.3.5.7.
4. The locks are electrical locks that fail safely so as to release upon loss of power to the device.
5. The locks release by independent activation of each of the following:
 1. Activation of the smoke detection system required by 19.2.2.2.5.2(2)
 2. Waterflow in the automatic sprinkler system required by 19.2.2.2.5.2(3)
6. *Door electrical locking hardware for new electric lock installations is listed for the purpose: *Door electro-mechanical or electromagnetic locking hardware for new installations shall be listed in accordance with UL 294, Access Control System Units or UL 1034, Burglary-Resistant Electric Locking Mechanisms.

A. 19.2.2.2.5.2(6)

UL 294, Access Control System Units, and UL 1034, Burglary-Resistant Electric Locking Mechanisms, are two standards that provide criteria for listed door-locking hardware. The electrical locking hardware might be a component of an electrical locking system or the electrical locking hardware might be a device with an individual listing. Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

Commented [WJ13]: Public Input No. 283- NFPA 101-2021

The approved First Revision is the highlighted text.

Reason:

Because of implications to life safety with electrical locking systems potentially affecting egress on these doors in the means of egress, it is prudent to require listing of door electrical locking hardware used in these applications. Requiring listing to either UL 294 or to UL 1034 appropriately revises this important listing requirement to help assure the electrical locking hardware performs as intended for these life-safety applications.

The Life Safety Code, in chapters 18 and 19, first required this electrical door hardware to be listed to UL 294 in the 2018 edition of NFPA 101.

UL 294 and 1034 address efficacy and safety considerations for door access control applications (ingress control) to assure the door hardware would perform as intended and expected. Typically, access control systems incorporating card readers, keypads, iris scanners, etc. are tested and listed to UL 294. Additionally, delayed egress electrical locking systems, sensor-release electrical locking systems, and certain types of door hardware release electrical locking systems are all typically tested and listed to UL 294. On the other hand, components such as electromagnetic locks, electric dead bolts, electric strikes, and other door electrically operated locking mechanisms are typically listed to UL 1034. UL 294 and UL 1034 are collateral standards that complement each other.

These examples illustrate that many of the same systems and components used to control access (ingress) to a space are also used for egress-side electrical locking systems. Considering that egress-side electrical locking systems have life safety implications, NFPA 101 was enhanced (in 2009) to require listing of electrical locking hardware to UL 294. In hindsight, what's proposed here – meeting a mandatory listing requirement with the collateral listing to UL 1034 – should have been the language included in NFPA 101 in the earlier editions.

In addition to the option to list to UL 1034, this proposal brings consistency in the text where UL 294 (and UL 1034) are referenced in NFPA 101. The additions of Annex A text complement the revisions to the mandatory language of these special locking arrangements.

The revisions of the Annex A text complement the revisions to 19.2.2.2.5.2(6)

Public Comment No. 203-NFPA 101-2022 [Section No. 18.2.2.2.5.2]

18.2.2.2.5.2*

Door-locking arrangements shall be permitted where patient special needs require specialized protective measures for their safety

~~, provided that all of the following criteria are met: Staff can readily unlock doors at all times in accordance with 18.2.2.2.~~

~~6.A total (complete)~~

PI_-_Task_Group_-_1822252.docx	Public Input comments on behalf of Locking Doors task group regarding clarification of 18.2.2.2.5.2.	

LSC_18.2.2.2.5.2_3_Diagram.pdf

There was some previous email discussion related to the new language in Item #2 with regards to the requirement for sprinkler protection for the smoke compartment, adjacent smoke compartments and all smoke compartments leading to the requires exists. A member of the Task Group submitted a drawing that may be helpful to illustrate this requirement and could possibly be used as handbook material.

Statement of Problem and Substantiation for Public Comment

As a result of FR-6699 (deleting existing language) and FR-6725 (adding new language), the Health Care Door Locking Task Group felt that 18.2.2.2.5.2 was confusing and proposed a revised re-organization of the section to read as submitted.

As a side note, there was some previous email discussion related to the new language in Item #2 with regards to the requirement for sprinkler protection for the smoke compartment, adjacent smoke compartments and all smoke compartments leading to the requires exists. Ajay Prasad had submitted a drawing that may be helpful to illustrate this requirement and could possibly be used as handbook material. I have attached that drawing for your review.

101_A2023_SAF_AAC_CCN_26.pdf	101_Correlating Committee Note No. 26	

Statement of Problem and Substantiation for Public Comment

NOTE: The following CC Note No. 26 appeared in the First Draft Report on First Revision No. 6725. Consider the negative votes of S. Dannaway and K. Bush: "This should not be automatic. The current annex note A.18.2.2.2.5.2(3) provides AHJs with guidance to determine if locking arrangement is permissible in a building that is not fully sprinklered" "The extent of sprinkler protection should be defined by fire barriers or fire walls and not by smoke barriers. The fire resistance rating for such separations should align with those designating fire areas and not simply defined by smoke compartments. In addition, the identification of adjacent smoke compartments and the designated means of egress can be confusing and subject to multiple interpretations."

Committee Statement and Meeting Notes

Committee Statement: Consider the negative votes of S. Dannaway and K. Bush: "This should not be automatic. The current annex note A.18.2.2.5.2(3) provides AHJs with guidance to determine if locking arrangement is permissible in a building that is not fully sprinklered"

"The extent of sprinkler protection should be defined by fire barriers or fire walls and not by smoke barriers. The fire resistance rating for such separations should align with those designating fire areas and not simply defined by smoke compartments. In addition, the identification of adjacent smoke compartments and the designated means of egress can be confusing and subject to multiple interpretations."

First Revision No. 6725-NFPA 101-2021 [Detail]

Revise 18.2.2.2.5.2(3) to read as follows:

(3) The smoke compartment containing the secured area, all adjacent smoke compartments, and all smoke compartments leading to the required exits from the secured area are protected throughout by an approved, supervised automatic sprinkler system in accordance with 18.3.5.1.

Public Comment No. 87-NFPA 101-2022 [Section No. 18.2.2.2.5.2]

18.2.2.2.5.2*

Door-locking arrangements shall be permitted where patient special needs require specialized protective measures for their safety, provided that all of the following criteria are met:

- Staff can readily unlock doors at all times in accordance with 18.2.2.2.6 .
- A total (complete) smoke detection system is provided throughout the locked space in accordance with 9.6.2.9 , or locked doors can be remotely unlocked at an approved, constantly attended location within the locked space. The smoke compartment containing the secured area, all adjacent smoke compartments, and all smoke compartments leading to the required exits from the secured area are

(1) * The building is protected throughout by an approved, supervised automatic sprinkler system in accordance

with

with 18.3.5.1 . and the locks release by activation of waterflow in the automatic sprinkler system.

(2) The locks are electrical locks that fail safely so as to release upon loss of power to the device.

(3) The locks release by independent activation of

each

one of the following:

Activation of the

(a) A total (complete) smoke detection system

required by 18.2

that is provided throughout the locked unit in accordance with 9.6 .2.

2.5.2(2)

- Waterflow in the automatic sprinkler system required by 18.2.2.2.5.2(3)

* Door electrical locking hardware

9 ,

(b) Locked doors can be remotely unlocked at an approved, constantly attended location within the locked unit.

(4) Hardware for new electric lock installations is listed

for the purpose

in accordance with UL 294, Access Control System Units .

Additional Proposed Changes

<u>File Name</u>	<u>Description</u>	<u>Approved</u>
PC_87-NFPA_101-2022_Locking_Markup.PNG	Potential Locking Markup	
Door_Locking_for_NFPA_101_Comments.docx	Word Document Edit Markup and Comments	

Statement of Problem and Substantiation for Public Comment

This change would consolidate the requirements of this section for clarity. Currently, providing a remote release device from within the locked area at an approved constantly attended location meets the requirements of both 18.2.2.2.5.2(1) and 18.2.2.2.5.2(2), but the code language is confusing which can lead to extra equipment being installed. In addition, reference from 18.2.2.2.5.2 to 18.2.2.2.6 is not required as 18.2.2.2.6 is required by itself to be implemented once 18.2.2.2.5 used. The change clarifies if the remote release is provided at an approved constantly attended location, there is no need for staff to carry keys or achieve other reliable means to unlock, and complete smoke detection would not be required.

Committee response indicated change of wording resulted in unintended change requiring releasing mechanism to be "within the locked smoke compartment" rather than "within the locked space." This was an inadvertent change, however it raises a point that these requirements should be worded the same. Often times these locking arrangements are used to lock doors into and out of units. The previous requirement stated the remote release device was required "within the locked space." If egress is required in both directions, this would result in two releasing mechanisms being required. The change to "within the secured unit" (as proposed by Public Comment # 88-NFPA 101-2022) indicates what the code

intends: that the staff within the secured unit are responsible for choosing if/when to remotely unlock the doors. An adjacent unit should not be required to unlock the doors into or out of a secured unit, which is what would technically be required for doors secured in both directions.

Note additional related change to 18.2.2.2.6(1)(a) has been submitted as Public Comment # 88-NFPA 101-2022. Note this would also apply to the related section in the existing occupancy chapter 19 as well (19.2.2.2.5.2)

Submittal Date: Wed May 11 15:13:05 EDT 2022

Committee: SAF-HEA

Committee Statement

Committee Action: Rejected but see related SR

Resolution: SR-6657-NFPA 101-2022

Statement: The revision was developed by a task group on health care door locking to recognize alternative means of providing security where patient special needs require specialized protective measures for their safety.

18.2.2.2.5.1 *

Door-locking arrangements shall be permitted where the clinical needs of patients require specialized security measures or where patients pose a security threat, ~~provided that staff can readily unlock doors at all times in accordance with 18.2.2.2.6.~~

Commented [AG1]: This is a redundant reference as the provisions of 18.2.2.2.6 apply to all of 18.2.2.2.5

18.2.2.2.5.2 *

Door-locking arrangements shall be permitted where patient special needs require specialized protective measures for their safety, provided that all of the following criteria are met:

- ~~(1) Staff can readily unlock doors at all times in accordance with 18.2.2.2.6.~~
- ~~(2) A total (complete) smoke detection system is provided throughout the locked space in accordance with 9.6.2.9, or locked doors can be remotely unlocked at an approved, constantly attended location within the locked space.~~
- ~~(13) The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with 18.3.5.1, and the locks release by activation of waterflow in the automatic sprinkler system.~~
- ~~(24) The locks are electrical locks that fail safely so as to release upon loss of power to the device.~~
- ~~(35) The locks release by independent activation of each one of the following:~~
 - ~~(a) A total (complete) smoke detection system that is provided throughout the locked unit in accordance with 9.6.2.9. Activation of the smoke detection system required by 18.2.2.2.5.2(2)~~
 - ~~(b) Locked doors can be remotely unlocked at an approved, constantly attended location within the locked unit. Waterflow in the automatic sprinkler system required by 18.2.2.2.5.2(3)~~
- ~~(46) Hardware for new electric lock installations is listed in accordance with UL 294, Access Control System Units.~~

Commented [AG2]: This is a redundant reference as the provisions of 18.2.2.2.6 apply to all of 18.2.2.2.5

Commented [AG3]: This consolidates the sprinkler unlocking to a single line item

Commented [AG4]: Clarifying that the release is intended to be controlled from inside the unit that needs to be secured rather than considering a "space" that egresses into the locked unit as a locked "space"

18.2.2.2.6

Doors that are located in the means of egress and are permitted to be locked under other provisions of 18.2.2.2.5 shall comply with both of the following:

- (1) Provisions shall be made for the rapid removal of occupants by means of one of the following:
 - (a) Remote control of locks from within the locked ~~smoke compartment~~ unit
 - (b) Keying of all locks to keys carried by staff at all times
 - (c) Other such reliable means available to the staff at all times
- (2) Only one locking device shall be permitted on each door.

Commented [AG5]: These requirements apply 18.2.2.2.5.1, and 18.2.2.2.5.2 as they are subsections of 18.2.2.2.5.

**Public Comment No. 88-NFPA 101-2022 [Section No. 18.2.2.2.6]****18.2.2.2.6**

Doors that are located in the means of egress and are permitted to be locked under ~~other~~ provisions of 18.2.2.2.5 shall comply with both of the following:

(1) Provisions shall be made for the rapid removal of occupants by means of one of the following:

(2) Remote control of locks from within the locked

~~smoke compartment~~

(a) unit.

(b) Keying of all locks to keys carried by staff at all times

(c) Other such reliable means available to the staff at all times

(3) Only one locking device shall be permitted on each door.

Statement of Problem and Substantiation for Public Comment

See PC # 87-NFPA 101-2022 for details. Change prompted from committee response to PI # 62-NFPA 101-2021

Committee response indicated change of wording resulted in unintended change requiring releasing mechanism to be "within the locked smoke compartment" rather than "within the locked space." This was an inadvertent change, however it raises a point that these requirements should be worded the same. Often times these locking arrangements are used to lock doors into and out of units. The previous requirement stated the remote release device was required "within the locked space." If egress is required in both directions, this would result in two releasing mechanisms being required. The change to "within the secured unit" (as proposed by Public Comment # 88-NFPA 101-2022) indicates what the code intends: that the staff within the secured unit are responsible for choosing if/when to remotely unlock the doors. An adjacent unit should not be required to unlock the doors out of a secured unit, which is what would technically be required for doors secured in both directions.

In addition, the word "other" should be removed as this appears to be a reference for when these code requirements fell under the same subsection. Now that they are separate sections, the word "other" is no longer needed

**Public Comment No. 155-NFPA 101-2022 [Section No. 18.2.2.2.10]****18.2.2.2.10**

Stairs that serve an occupiable story that is more than 75 ft (23 m) above the level of fire department vehicle access shall comply with the re-entry provisions of 7.2.1.5.7.

(1) For fire alarm systems, only automatic activation of the fire alarm system shall trigger automatic release of stair enclosure re-entry.

Statement of Problem and Substantiation for Public Comment

Reference PI 233. Healthcare occupancies have a balance between security and life safety. Ultimately life safety trumps security; however, manual means of bypassing the security protocol for re-entry should not be an option. In the event of a stolen baby the criminal could easily pull the fire alarm and re-enter on a different floor.

**Public Comment No. 127-NFPA 101-2022 [New Section after 18.2.5.7.4]****18.2.5.8 Interlocked-Door Vestibule**

An interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress.

Additional Proposed Changes

<u>File Name</u>	<u>Description</u>	<u>Approved</u>
NFPA_101_Special_Locking_Arrangements_Interlocked_Door_Vestibule_Public_Comments_20200520.pdf	NFPA 101 2024 public comments re: interlocked door vestibule.	

Statement of Problem and Substantiation for Public Comment

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 19, 20, 21, 36, 37, 38, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

The criteria in proposed section 7.2.1.6.5 (via separate public comment) were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

John Woestman, BHMA

Black underscored text is original proposed revisions.
Red or blue formatted text are potential revisions for 2nd draft consideration.

Interlocked-Door Vestibule.

A compartment provided with doors in series where only one of the doors in series is openable at a time.

Reason:

This proposed definition is modeled after the definition of “sally port”, and along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 21, 36, 37, 38, 39, 40, and 42, offers the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

Chapter 7 Mean of Egress

7.2.1.6.5 Interlocked-Door Vestibule

Where permitted in chapters 11 through 43 with low- and ordinary-hazard contents, an interlocked-door vestibule shall be permitted in a the means of egress where there are provisions for continuous and unobstructed travel through the interlocked-door vestibule during an emergency egress condition.

Interlocked-door vestibules shall comply with all of the following:

1. The building shall be protected by an approved supervised automatic sprinkler system in accordance with Section 9.7.
2. The area served by the interlocked-door vestibule shall be protected by an approved supervised automatic fire detection system in accordance with Section 9.6 and shall utilize smoke detectors on each side of the interlocked doors.
3. An override switch, which disables the interlocks of the doors of the interlocked-door vestibule for not less than 30 seconds, shall be provided on the egress side of each door of the interlocked-door vestibule. The override switch may be omitted by approval of the Authority Having Jurisdiction.

Commented [WJ1]: Public Input No. 341-NFPA 101-2021

Commented [JW2]: Public Comment No. 126-NFPA 101-2022

Commented [WJ3]: Public Input No. 343-NFPA 101-2021

Commented [JW4]: Public Comment No. 125-NFPA 101-2022

4. The override switches shall be within 48 in. (1220 mm) of door and between 34 in. (865 mm) and 48 in. (1220 mm) above the floor.
5. Signage shall be provided at each override switch describing its operation.
6. Upon loss of power to the interlock function of the doors of the interlocked-door vestibule, the interlock function shall be disabled.
7. The interlocks of the doors of the interlocked-door vestibule shall deactivate by activation of the fire alarm when initiated by the automatic fire detection system or the automatic sprinkler system.
8. The egress path shall not pass through more than one interlocked-door vestibule.
9. The fire department with responsibility for responding to a building that contains an interlocked-door vestibule shall be notified of the presence of the interlocked-door vestibule.
10. Where permitted by the authority having jurisdiction, interlocked-door vestibules shall be permitted to serve high-hazard content areas.
11. Door electrical locking hardware for new installations shall be listed in accordance with UL 294, Access Control System Units, or UL 1034, Burglary-Resistant Locking Mechanisms.

Reason:

This proposal, along with complementary proposals in Chapters 18, 19, 20, 21, 36, 37, 38, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

An occupant egressing through an interlocked-door vestibule would be delayed at the second door in series if the first door in series is not in a closed position, and vice-versa.

The proposed criteria were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Potential Annex Note:

Outside of detention and correctional facilities, the commercial building equivalent of sally ports – interlocked-door vestibules - are utilized for security reasons (i.e. money handling rooms; and in health care), occupant protection, clinical needs of the patients, environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Interlocked-door vestibules are as the name implies: a vestibule with interlocked-doors. The door into the vestibule is interlocked with the door leading out of the vestibule such that only one of the doors can be open at a given time.

Requirement 3: an example of where interlock override switches may not be desired is where an interlocked-door vestibule is utilized to deter theft, such as a high-end precious gem business.

Visual indicators may be desirable on the egress side of each door to indicate when the door is in the locked status and when in the unlocked status. Visual indicators may be desirable in occupancies where some of the occupants are likely unfamiliar with interlocked-door vestibule, such as mercantile occupancies, or some health care occupancies.

These provisions for interlocked-door vestibules cannot address all potential uses and applications.

Chapter 18 New Health Care Occupancies

18.2.5.8 Interlocked-Door Vestibule

An interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress.

Reason:

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 19, 20, 21, 36, 37, 38, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

The criteria in proposed section 7.2.1.6.5 (via separate public comment) were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

The criteria is proposed section 7.2.1.6.5 (via separate public comment) were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Chapter 36 New Mercantile Occupancies

36.2.5.12 Interlocked-Door Vestibule

An interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress where doors are not required to swing in the direction of egress travel.

Reason:

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 21, 37, 38, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

For this occupancy, this proposal suggests an interlocked-door vestibule should be permitted only where the occupant load of the area served does not require doors to swing in the direction of egress travel.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

Chapter 42 Storage Occupancies

42.2.5.1 Interlocked-Door Vestibule

An interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress.

Reason:

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 21, 36, 37, 38, 39, and 40, offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Commented [WJ27]: Public Input No. 359-NFPA 101-2021

Commented [JW28]: Public Comment No. 136-NFPA 101-2022

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

The criteria in proposed section 7.2.1.6.5 (via separate public comment) were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Public Comment No. 213-NFPA 101-2022 [New Section after 18.3.2.1.3]

18.3.2.1.4

Rooms used as sterile cores supporting operating room and anesthetizing areas are not considered hazardous areas if separated from the corridor or nonsleeping patient care suite by corridor wall in accordance with 18.3.6 and shall be equipped with self-closing or automatic-closing doors.

Statement of Problem and Substantiation for Public Comment

In essence, this is to accept CI 6726, but ensure room doors either self or automatically close, to ensure a fire is contained to the sterile core. These rooms are essential to the OR setting and infection control is paramount such that the doors that are needed to contain a fire need to be equipped with closing devices in lieu of latching hardware.

Resolution: SR-6645-NFPA 101-2022

Statement: The revision incorporates the concept of sterile cores from CI-6726 as modified and ensures room doors either self or automatically close to ensure a fire is contained to the sterile core. These rooms are essential to the OR setting and infection control is paramount such that the doors that are needed to contain a fire need to be equipped with closing devices in lieu of latching hardware.

Public Comment No. 93-NFPA 101-2022 [Section No. 18.3.2.5.3]

18.3.2.5.3*

Within a smoke compartment, where residential or commercial cooking equipment is used to prepare meals for 30 or fewer persons, one cooking facility shall be permitted to be open to the corridor, provided that all of the following conditions are met:

- (1) The portion of the health care facility served by the cooking facility is limited to 30 beds and is separated from other portions of the health care facility by a smoke barrier constructed in accordance with 18.3.7.3, 18.3.7.6, and 18.3.7.8.
- (2) The cooktop or range is equipped with a range hood of a width at least equal to the width of the cooking surface, with grease baffles or other grease-collecting and clean-out capability.
- (3)* The hood systems have a minimum airflow of 500 cfm (14,000 L/min).
- (4) The hood systems that are not ducted to the exterior additionally have a charcoal filter to remove smoke and odor.
- (5) The cooktop or range complies with all of the following:
 - (6) The cooktop or range is protected with a fire suppression system listed in accordance with UL 300, *Fire Testing of Fire Extinguishing Systems for Protection of Commercial Cooking Equipment*, or is tested and meets all requirements of UL 300A, *Extinguishing System Units for Residential Range Top Cooking Surfaces*, in accordance with the applicable testing document's scope.
 - (7) A manual release of the extinguishing system is provided in accordance with Section 10.5 of NFPA 96.
 - (8) An interlock is provided to turn off all sources of fuel and electrical power to the cooktop or range when the suppression system is activated.
- (9)* The use of solid fuel for cooking is prohibited.
- (10) Deep-fat frying is prohibited
- (11) Portable fire extinguishers in accordance with NFPA 96 are located in all kitchen areas.
- (12) A switch meeting all of the following is provided:
 - (13) A locked switch, or a switch located in a restricted location, is provided within the cooking facility that deactivates the cooktop or range.
 - (14) The switch is used to deactivate the cooktop or range whenever the kitchen is not under staff supervision.
 - (15) The switch is on a timer, not exceeding a 120-minute capacity, that automatically deactivates the cooktop or range, independent of staff action.
- (16) Procedures for the use, inspection, testing, and maintenance of the cooking equipment are in accordance with Chapter 11 of NFPA 96 and the manufacturer's instructions are followed.
- (17) Not less than two AC-powered photoelectric smoke alarms with battery backup, interconnected in accordance with 9.6.2.10.4, and equipped with a silence feature are located not closer than 20 ft (6.1 m) and not further than 25 ft (7.6 m) from the cooktop or range.
- (18) The smoke alarms required by 18.3.2.5.3(11) are permitted to be located outside the kitchen area where such placement is necessary for compliance with the 20 ft (7.6 m) minimum distance criterion.
- (19) A single system smoke detector is permitted to be installed in lieu of the smoke alarms required in 18.3.2.5.3(11) provided the following criteria are met:
 - (20) The detector is located not closer than 20 ft (6.1 m) and not further than 25 ft (7.6 m) from the cooktop or range.
 - (21) The detector is permitted to initiate a local audible alarm signal only.
 - (22) The detector is not required to initiate a buildingwide occupant notification signal.
 - (23) The detector is not required to notify emergency forces.
 - (24) The local audible signal initiated by the detector is permitted to be silenced and reset by a button on the detector or by a switch installed within 10 ft (3.0 m) of the system smoke detector.
- (25) System smoke detectors that are required to be installed in corridors or spaces open to the corridor by other sections of this chapter are not used to meet the requirements of 18.3.2.5.3(11) and are located not closer than 25 ft (7.6 m) to the cooktop or range.
- (26) Carbon monoxide detectors shall be installed in accordance with 18.3.4.6.2(1).

Statement of Problem and Substantiation for Public Comment

This language, adding carbon monoxide detectors to this chapter, was developed by the Task Group on Carbon Monoxide Detection.

Resolution: The proposed revision is not necessary. The current requirement is clear. The committee intends for the required sprinkler system to be electrically supervised in accordance with 9.7.2.

**Public Comment No. 137-NFPA 101-2022 [Sections****18.3.6.3.5, 18.3.6.3.6, 18.3.6.3.7, 18.3.6.3.8]****Sections 18.3.6.3.5, 18.3.6.3.6, 18.3.6.3.7, 18.3.6.3.8****18.3.6.3.5**

Doors shall be self-latching and provided with positive latching hardware, except as permitted in 18.3.6.3.6, 18.3.6.3.7, or 18.3.6.3.8.

18.3.6.3.6

Doors to toilet rooms, bathrooms, shower rooms, sink closets, and similar auxiliary spaces that do not contain flammable or combustible materials shall not be required to meet the latching requirements of 18.3.6.3.5.

18.3.6.3.7

Powered doors that comply with the requirements of 7.2.1.9 shall not be required to meet the latching requirements of 18.3.6.3.5, provided that all of the following criteria are met:

- (1) The door is equipped with a means for keeping the door closed that is acceptable to the authority having jurisdiction.
- (2) The device used is capable of keeping the door fully closed if a force of 5 lbf (22 N) is applied at the latch edge of a swinging door and applied in any direction to a sliding or folding door, whether or not power is applied.
- (3) Where door leaves are operated by power by any automatic mechanism, the automatic opening of the doors shall cease to function upon operation of approved smoke detectors installed in accordance with the provisions of *NFPA 72* for door release service.

18.3.6.3.8*

Latching arrangements that do not provide positive latching in the normal mode shall be permitted to be used provided that, in a fire emergency, the door becomes positively latched by means of an automatic fail-safe device that is activated by an automatic fire detector. [80:6.4.4.4.3]

18.3.6.3.8.1*

Doors with latching arrangements complying with 18.3.6.3.8 shall be self-closing doors complying with 18.3.6.3.8.2 or automatic-closing doors complying with 18.3.6.3.8.3.

18.3.6.3.8.2*

Self-closing doors shall swing easily and freely and shall be equipped with a closing device to cause the door to close each time it is opened. The closing mechanism shall not have a hold-open feature.

18.3.6.3.8.3*

Automatic-closing doors shall be arranged to close automatically by means of a closing device which causes the door to close, and a separate, labeled, fail-safe door holder / release device that is activated by an actuation device and is installed in accordance with NFPA 80 Section 4.7.

18.3.6.3.9

Corridor doors utilizing an inactive leaf shall have automatic flush bolts on the inactive leaf to provide positive latching.

A.18.3.6.3.8

Corridor doors in health care facilities have long been required to have positive latching hardware.

An alternative to the positive latching hardware requirement, introduced in NFPA 101-2024, based on the provisions of NFPA 80 Section 6.4.4.4.3 and NFPA 105 Section 6.3.6.4.2, is equivalently applicable to doors not required to comply with NFPA 80 and to doors not required to comply with NFPA 105.

The alternative is an automatic fail-safe device that positively latches the door when activated by an automatic fire detector. This alternative is permitted if the doors are also either self-closing or automatic-closing – to ensure the door moves to a closed position upon activation of an automatic fire detector to become positively latched. This alternative is an option on doors required to comply with NFPA 80 as well as doors not required to comply with NFPA 80 (doors not required to be fire-rated).

The provisions of 18.3.6.3.8 are directly from NFPA 80-2022 Section 6.4.4.4.3.

A.18.3.6.3.8.1

For a door to become positively latched by means of a fail-safe device activated by an automatic fire detector, the door would need to be either self-closing or automatic-closing.

A.18.3.6.3.8.2

The self-closing requirements are from NFPA 80 Section 7.1.4.2, but without the NFPA 80 requirement to latch when closed.

A.18.3.6.3.8.3

The automatic-closing requirements are from NFPA 80 Sections 7.1.4.3 and 7.1.4.2.1, but without the requirement to latch upon closure, and without the option for fusible links.

Additional Proposed Changes

<u>File Name</u>	<u>Description</u>	<u>Approved</u>
2024_NFPA_101_Positive_Latching_Potential_Revisions_20220520.pdf	NFPA 101 2024 public comments re: positive latching NFPA 80 alternative.	

Statement of Problem and Substantiation for Public Comment

On corridor doors in health care facilities, as an acceptable alternative to doors provided with positive latching hardware is to become positively latched in a fire emergency. The option to become positively latched in a fire emergency is included in NFPA 80 and NFPA 105.

Our BHMA members are being asked if it is possible to apply the provisions of NFPA 80-2019 Section 6.4.4.3.3 / NFPA 80-2022 Section 6.4.4.4.3, or NFPA 105 Section 6.3.6.4.2, on corridor doors not required to comply with NFPA 80 (nor

NFPA 105). This proposal assumes that if it's acceptable to apply the provisions of NFPA 80 Section 6.4.4.3.3 to doors required to comply with NFPA 80 (doors required to be fire-rated), then it should also be acceptable to apply these same provisions to doors not required to comply with NFPA 80 (doors not required to be fire-rated). Ditto for NFPA 105.

The additional requirement for use of the automatic fail-safe devices is the doors are also required to be either self-closing or automatic-closing. This is to ensure the door moves to a closed position upon activation of an automatic fire detector and becomes positively latched.

The original Public Input No. 272-NFPA 101-2021 was resolved (disapproved) during the First Draft technical committee meeting, stating: The proposed revision might be better suited as a Ch. 8 requirement. There is also concern that the provision might permit a fusible link to serve as the required fire detection device.

This public comment does not propose revisions in Chapter 8 because this proposal addresses requirements for doors in new construction specifically identified as not required to comply with NFPA 80. It seems that proposing in Chapter 8 revisions as in this proposal would be out of place as Chapter 8 addresses building elements required to comply with explicit requirements, such as NFPA 80. It may be noted Chapter 8 includes several provisions (i.e. exceptions) for existing doors regarding opening protectives, but includes no similar provisions for new construction.

This public comment addresses the fusible link concern with the provisions proposed in 18.3.6.3.5.4 by not including fusible links as an option for activating automatic-closing doors.

Committee Action: Rejected but see related SR
Resolution: SR-6651-NFPA 101-2022
Statement: The revision incorporates the concept proposed by PC-137, as modified, and allows doors to become self-latching upon detection of smoke in the vicinity of the door as permitted by NFPA 80 for fire doors.

NFPA 101

Chapter 18 New Health Care Occupancies

18.3.6.3 * Corridor Doors.

18.3.6.3.1 *

Doors, including doors or panels to nurse servers and pass-through openings, protecting corridor openings shall be constructed to resist the passage of smoke, and the following also shall apply:

1. Compliance with NFPA 80 shall not be required.
2. For other than doors protecting pass-through openings, a clearance between the bottom of the door and the floor covering not exceeding 1 in. (25 mm) shall be permitted.
3. For doors protecting pass-through openings, a clearance between the bottom of the door and the sill not exceeding $\frac{1}{8}$ in. (3 mm) shall be permitted.
4. Doors to toilet rooms, bathrooms, shower rooms, sink closets, and similar auxiliary spaces that do not contain flammable or combustible material shall not be required to be constructed to resist the passage of smoke.

18.3.6.3.2 Reserved.

18.3.6.3.3 Reserved.

18.3.6.3.4 Reserved.

18.3.6.3.5

Doors shall be self-latching and provided with positive latching hardware, except as permitted in 18.3.6.3.6, 18.3.6.3.7, or 18.3.6.3.8.

18.3.6.3.6

Doors to toilet rooms, bathrooms, shower rooms, sink closets, and similar auxiliary spaces that do not contain flammable or combustible materials shall not be required to meet the latching requirements of 18.3.6.3.5.

18.3.6.3.7

Powered doors that comply with the requirements of 7.2.1.9 shall not be required to meet the latching requirements of 18.3.6.3.5, provided that all of the following criteria are met:

1. The door is equipped with a means for keeping the door closed that is acceptable to the authority having jurisdiction.
2. The device used is capable of keeping the door fully closed if a force of 5 lbf (22 N) is applied at the latch edge of a swinging door and applied in any direction to a sliding or folding door, whether or not power is applied.
3. Where door leaves are operated by power by any automatic mechanism, the automatic opening of the doors shall cease to function upon operation of approved smoke detectors installed in accordance with the provisions of *NFPA 72* for door release service.

18.3.6.3.8*

Latching arrangements that do not provide positive latching in the normal mode shall be permitted to be used provided that, in a fire emergency, the door becomes positively latched by means of an automatic fail-safe device that is activated by an automatic fire detector. [80:6.4.4.4.3]

18.3.6.3.8.1*

Commented [WJ1]: Original proposal, not shown, was Public Input No. 272-NFPA 101-2021. A revised proposal, to be submitted via Public Comment, is shown here.

Commented [JW2]: Language copied directly from NFPA 80-2022 6.4.4.4.3

Commented [JW3]: For a door to become positively latched (by means of a fail-safe device activated by an automatic fire detector) the door must also be either self-closing or automatic-closing.

Doors with latching arrangements complying with 18.3.6.3.8 shall be self-closing doors complying with 18.3.6.3.8.2 or automatic-closing doors complying with 18.3.6.3.8.3.

18.3.6.3.8.2*

Self-closing doors shall swing easily and freely and shall be equipped with a closing device to cause the door to close each time it is opened. The closing mechanism shall not have a hold-open feature.

Commented [JW4]: Text from self-closing requirements in NFPA 80 Section 7.1.4.2, but deleted NFPA 80 requirement to latch when closed.

18.3.6.3.8.3*

Automatic-closing doors shall be arranged to close automatically by means of a closing device which causes the door to close, and a separate, labeled, fail-safe door holder / release device that is activated by an actuation device and is installed in accordance with NFPA 80 Section 4.7.

Commented [JW5]: Text from automatic-closing requirements in NFPA 80 Section 7.1.4.3 and 7.1.4.2.1, but doesn't include requirement to latch upon closure nor option for fusible links.

18.3.6.3.89

Corridor doors utilizing an inactive leaf shall have automatic flush bolts on the inactive leaf to provide positive latching.

Reason: On corridor doors in health care facilities, as an acceptable alternative to doors provided with positive latching hardware is to become positively latched in a fire emergency. The option to become positively latched in a fire emergency is included in NFPA 80 and NFPA 105.

Our BHMA members are being asked if it is possible to apply the provisions of NFPA 80-2019 Section 6.4.4.3.3 / NFPA 80-2022 Section 6.4.4.4.3, or NFPA 105 Section 6.3.6.4.2, on corridor doors not required to comply with NFPA 80 (nor NFPA 105). This proposal assumes that if it's acceptable to apply the provisions of NFPA 80 Section 6.4.4.3.3 to doors required to comply with NFPA 80 (doors required to be fire-rated), then it should also be acceptable to apply these same provisions to doors not required to comply with NFPA 80 (doors not required to be fire-rated). Ditto for NFPA 105.

The additional requirement for use of the automatic fail-safe devices is the doors are also required to be either self-closing or automatic-closing. This is to ensure the door moves to a closed position upon activation of an automatic fire detector and becomes positively latched.

The original Public Input No. 272-NFPA 101-2021 was resolved (disapproved) during the First Draft technical committee meeting, stating: The proposed revision might be better suited as a Ch. 8 requirement. There is also concern that the provision might permit a fusible link to serve as the required fire detection device.

This public comment does not propose revisions in Chapter 8 because this proposal addresses requirements for doors in new construction specifically identified as not required to comply with NFPA 80. It seems that proposing in Chapter 8 revisions as in this proposal would be out of place as Chapter 8 addresses building elements required to comply with explicit requirements, such as NFPA 80. It may be noted Chapter 8 includes several provisions (i.e. exceptions) for existing doors regarding opening protectives, but includes no similar provisions for new construction.

This public comment addresses the fusible link concern with the provisions proposed in 18.3.6.3.5.4 by not including fusible links as an option for activating automatic-closing doors.

A.18.3.6.3.8

Corridor doors in health care facilities have long been required to have positive latching hardware. An alternative to the positive latching hardware requirement, introduced in NFPA 101-2024, based on the provisions of NFPA 80 Section 6.4.4.4.3 and NFPA 105 Section 6.3.6.4.2, is equivalently applicable to doors not required to comply with NFPA 80 and to doors not required to comply with NFPA 105.

Commented [WJ6]: Original proposal was Public Input No. 272-NFPA 101-2021. This public comment text has been revised from that PI.

The alternative is an automatic fail-safe device that positively latches the door when activated by an automatic fire detector. This alternative is permitted if the doors are also either self-closing or automatic-closing – to ensure the door moves to a closed position upon activation of an automatic fire detector to become positively latched. This alternative is an option on doors required to comply with NFPA 80 as well as doors not required to comply with NFPA 80 (doors not required to be fire-rated).

The provisions of 18.3.6.3.8 are directly from NFPA 80-2022 Section 6.4.4.4.3.

A.18.3.6.3.8.1

For a door to become positively latched by means of a fail-safe device activated by an automatic fire detector, the door would need to be either self-closing or automatic-closing.

A.18.3.6.3.8.2

The self-closing requirements are from NFPA 80 Section 7.1.4.2, but without the NFPA 80 requirement to latch when closed.

A.18.3.6.3.8.3

The automatic-closing requirements are from NFPA 80 Sections 7.1.4.3 and 7.1.4.2.1, but without the requirement to latch upon closure, and without the option for fusible links.

Reason: Proposing Annex A materials to complement new proposed revisions / section 18.3.6.3.8.

Chapter 19 Existing Health Care Occupancies

19.3.6.3 * Corridor Doors.

19.3.6.3.1 *

Doors, including doors or panels to nurse servers and pass-through openings, protecting corridor openings in other than required enclosures of vertical openings, exits, or hazardous areas shall be doors constructed to resist the passage of smoke and shall be constructed of materials such as the following:

1. 1³/₄ in. thick, solid-bonded wood core
2. Material that resists fire for a minimum of 20 minutes.

19.3.6.3.2

The requirements of 19.3.6.3.1 shall not apply where otherwise permitted by either of the following:

1. Doors to toilet rooms, bathrooms, shower rooms, sink closets, and similar auxiliary spaces that do not contain flammable or combustible materials shall not be required to comply with 19.3.6.3.1.
2. In smoke compartments protected throughout by an approved, supervised automatic sprinkler system in accordance with 19.3.5.7, the door construction materials requirements of 19.3.6.3.1 shall not be mandatory, but the doors shall be constructed to resist the passage of smoke.

19.3.6.3.3

Compliance with NFPA 80 shall not be required.

19.3.6.3.4

A clearance between the bottom of the door and the floor covering not exceeding 1 in. (25 mm) shall be permitted for corridor doors.

Commented [WJ7]: Text included for visibility. Corridor doors in existing health care occupancies not required to be positive latching. Thus, no changes proposed in Chapter 19, but potential revision in Annex A.

19.3.6.3.5 *

Doors shall be provided with a means for keeping the door closed, and the following requirements also shall apply:

1. The device used shall be capable of keeping the door fully closed if a force of 5 lbf (22 N) is applied at the latch edge of the door.
2. Roller latches shall be prohibited on corridor doors in buildings not fully protected by an approved automatic sprinkler system in accordance with 19.3.5.7.

Annex A Explanatory Material

A.19.3.6.3.5

While it is recognized that closed doors serve to maintain tenable conditions in a corridor and adjacent patient rooms, such doors, which, under normal or fire conditions, are self-closing, might create a special hazard for the personal safety of a room occupant. Such closed doors might present a problem of delay in discovery, confining fire products beyond tenable conditions.

Because it is critical for responding staff members to be able to immediately identify the specific room involved, it is recommended that approved automatic smoke detection that is interconnected with the building fire alarm be considered for rooms having doors equipped with closing devices. Such detection is permitted to be located at any approved point within the room. When activated, the detector is required to provide a warning that indicates the specific room of involvement by activation of a fire alarm annunciator, nurse call system, or any other device acceptable to the authority having jurisdiction.

In existing buildings, use of the following options reasonably ensures that patient room doors will be closed and remain closed during a fire:

1. Doors should have **positive latches**, ~~or as an alternative, the doors shall in a fire emergency become positively latched by means of an automatic fail-safe device that is activated by an automatic fire detector provided the doors are also self-closing or automatic-closing (see 18.3.6.3.8).~~ ~~and a~~
1. A suitable program that trains staff to close the doors in an emergency should be established.
- 2.
3. It is the intent of the Code that no new installations of roller **latches** be permitted; however, repair or replacement of roller **latches** is not considered a new installation.
4. Doors protecting openings to patient sleeping or treatment rooms, or spaces having a similar combustible loading, might be held closed using a closer exerting a closing force of not less than 5 lbf (22 N) on the door **latch** stile.

Reason: Revising Annex A materials to recognize the alternative proposed in 18.3.6.3.5 and 18.3.6.3.8.

NFPA 5000-2021

Chapter 19 Health Care Occupancies

19.3.6.3 * Corridor Doors.

19.3.6.3.1 *

Doors, including doors or panels to nurse servers and pass-through openings, protecting corridor openings shall be constructed to resist the passage of smoke and the following also shall apply:

- (1) Compliance with NFPA 80 shall not be required.

Commented [WJ8]: Public Input No. 273-NFPA 101-2021

- (2) For other than doors protecting pass-through openings, a clearance between the bottom of the door and the floor covering not exceeding 1 in. (25 mm) shall be permitted for corridor doors.
- (3) For doors protecting pass-through openings, a clearance between the bottom of the door and the sill not exceeding $\frac{1}{8}$ in. (3 mm) shall be permitted.
- (4) The requirements of [19.3.6.3.1](#) shall not apply to doors to toilet rooms, bathrooms, shower rooms, sink closets, and similar auxiliary spaces that do not contain flammable or combustible materials.

19.3.6.3.2

Doors shall be self-latching and provided with **positive latching** hardware except as permitted in [19.3.6.3.3](#), [19.3.6.3.4](#), or [19.3.6.3.5](#).

19.3.6.3.3

Doors to toilet rooms, bathrooms, shower rooms, sink closets, and similar auxiliary spaces that do not contain flammable or combustible materials shall not be required to meet the latching requirements of 19.3.6.3.2.

19.3.6.3.4

Powered doors that comply with the requirements of 11.2.1.9 shall not be required to meet the latching requirements of 19.3.6.3.2, provided that all of the following criteria are met:

- (1) The door is equipped with a means for keeping the door closed that is acceptable to the AHJ.
- (2) The device used is capable of keeping the door fully closed if a force of 5 lbf (22 N) is applied at the latch edge of a swinging door and applied in any direction to a sliding or folding door, whether or not power is applied.
- (3) Where door leaves are operated by power by any automatic mechanism, the automatic opening of the doors shall cease to function upon operation of approved smoke detectors installed in accordance with the provisions of NFPA 72 for door release service.

19.3.6.3.5*

Latching arrangements that do not provide positive latching in the normal mode shall be permitted to be used provided that, in a fire emergency, the door becomes positively latched by means of an automatic fail-safe device that is activated by an automatic fire detector. [\[80:6.4.4.4.3\]](#)

Commented [JW9]: Language copied directly from NFPA 80-2022 6.4.4.4.3

19.3.6.3.5.1*

Doors with latching arrangements complying with [19.3.6.3.5](#) shall be self-closing doors complying with [19.3.6.3.5.2](#) or automatic-closing doors complying with [19.3.6.3.5.3](#).

Commented [JW10]: For a door to become positively latched (by means of a fail-safe device activated by an automatic fire detector) the door must also be either self-closing or automatic-closing.

19.3.6.3.5.2*

Self-closing doors shall swing easily and freely and shall be equipped with a closing device to cause the door to close each time it is opened. The closing mechanism shall not have a hold-open feature.

Commented [JW11]: Text from self-closing requirements in NFPA 80 Section 7.1.4.2, but deleted NFPA 80 requirement to latch when closed.

19.3.6.3.5.3*

Automatic-closing doors shall be arranged to close automatically by means of a closing device which causes the door to close, and a separate, labeled, fail-safe door holder / release device that is activated by an actuation device and is installed in accordance with NFPA 80 Section 4.7.

Commented [JW12]: Text from automatic-closing requirements in NFPA 80 Sections 7.1.4.3 and 7.1.4.2.1, but deleted requirement to latch upon closure, and didn't include option for fusible links.

19.3.6.3.5.6

Corridor doors utilizing an inactive leaf shall have automatic flush bolts on the inactive leaf to provide **positive latching**.

Reason: On corridor doors in health care facilities, as an acceptable alternative to doors provided with positive latching hardware is to become positively latched in a fire emergency. The option to become positively latched in a fire emergency is included in NFPA 80 and NFPA 105.

Our BHMA members are being asked if it is possible to apply the provisions of NFPA 80-2019 Section 6.4.4.3.3 / NFPA 80-2022 Section 6.4.4.4.3, or NFPA 105 Section 6.3.6.4.2, on corridor doors not required to comply with NFPA 80 (nor NFPA 105). This proposal assumes that if it's acceptable to apply the provisions of NFPA 80 Section 6.4.4.3.3 to doors required to comply with NFPA 80 (doors required to be fire-rated), then it should also be acceptable to apply these same provisions to doors not required to comply with NFPA 80 (doors not required to be fire-rated). Ditto for NFPA 105.

The additional requirement for use of the automatic fail-safe devices is the doors are also required to be either self-closing or automatic-closing. This is to ensure the door moves to a closed position upon activation of an automatic fire detector and becomes positively latched.

The original Public Input No. 272-NFPA 101-2021 was resolved (disapproved) during the First Draft technical committee meeting, stating: The proposed revision might be better suited as a Ch. 8 requirement. There is also concern that the provision might permit a fusible link to serve as the required fire detection device.

This public comment for NFPA 5000 is consistent with the public comment for Chapter 18 of NFPA 101.

A.19.3.6.3.5

Corridor doors in health care facilities have long been required to have positive latching hardware. An alternative to the positive latching hardware requirement, introduced in NFPA 101-2024, based on the provisions of NFPA 80 Section 6.4.4.4.3 and NFPA 105 Section 6.3.6.4.2, is equivalently applicable to doors not required to comply with NFPA 80 and to doors not required to comply with NFPA 105.

The alternative is an automatic fail-safe device that positively latches the door when activated by an automatic fire detector. This alternative is permitted if the doors are also either self-closing or automatic-closing – to ensure the door moves to a closed position upon activation of an automatic fire detector to become positively latched. This alternative is an option on doors required to comply with NFPA 80 as well as doors not required to comply with NFPA 80 (doors not required to be fire-rated).

The provisions of 19.3.6.3.5 are directly from NFPA 80-2022 Section 6.4.4.4.3.

A.19.3.6.3.5.1

For a door to become positively latched by means of a fail-safe device activated by an automatic fire detector, the door would need to be either self-closing or automatic-closing.

A.19.3.6.3.5.2

The self-closing requirements are from NFPA 80 Section 7.1.4.2, but without the NFPA 80 requirement to latch when closed.

A.19.3.6.3.5.3

The automatic-closing requirements are from NFPA 80 Sections 7.1.4.3 and 7.1.4.2.1, but without the requirement to latch upon closure, and without the option for fusible links.

Reason: Proposing Annex A materials to complement new proposed revisions / section 19.3.6.3.5.

For reference: Text Permitting Positive Latching via Fail-Safe Electric Latch (not part of proposal)

NFPA 80-2019

6.4.4.3.3

Latching arrangements that do not provide positive latching in the normal mode shall be permitted to be used provided that, in a fire emergency, the door becomes positively latched by means of an automatic fail-safe device that is activated by an automatic fire detector. (See Section [4.7](#).)

NFPA 80-2022

6.4.4.4.3

Latching arrangements that do not provide positive latching in the normal mode shall be permitted to be used provided that, in a fire emergency, the door becomes positively latched by means of an automatic fail-safe device that is activated by an automatic fire detector. (See Section [4.7](#).)

NFPA 105-2019

6.3.6.4.2

Latching arrangements that do not provide positive latching in the normal mode shall be permitted to be used provided that, in a fire emergency, the door becomes positively latched by means of an automatic fail-safe device that is activated by an automatic fire detector. [80:6.4.4.3.3]

NFPA 105-2022

6.3.6.4.2

Latching arrangements that do not provide positive latching in the normal mode shall be permitted to be used provided that, in a fire emergency, the door becomes positively latched by means of an automatic fail-safe device that is activated by an automatic fire detector. [80:6.4.4.4.3]

**Public Comment No. 29-NFPA 101-2022 [Section No. 18.3.6.4.2]****18.3.6.4.2**

Doors and walls to toilet rooms, bathrooms, shower rooms, sink closets, and similar auxiliary spaces that do not contain flammable or combustible materials shall be permitted to have ventilating louvers and door undercuts.

Public Comment No. 92-NFPA 101-2022 [New Section after 18.4.5.8]

18.3.4.6 Carbon Monoxide Detection Systems

18.3.4.6.1 Carbon monoxide detection systems, where required by 18.3.4.6.2, shall be in accordance with 9.12.

18.3.4.6.2 Carbon monoxide detection systems shall be provided in the following locations:

- (1) Carbon monoxide detectors shall be installed on the ceilings of rooms containing permanently installed fuel-burning appliances, including fireplaces.
- (2) Carbon monoxide detectors shall be installed within 36 in (910 mm) . of . the first supply air register from a permanently installed, fuel-burning HVAC system.

Statement of Problem and Substantiation for Public Comment

This language, adding carbon monoxide detectors to this chapter, was developed by the Task Group on Carbon Monoxide Detection.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: [SR-6647-NFPA 101-2022](#)
Statement: The revision adds requirements for CO detection developed by the Task Group on CO Detection for Health Care Occupancies based on a review of loss data, incidents, and national requirements provided by a literature review conducted by the Fire Protection Research Foundation.

Public Comment No. 223-NFPA 101-2022 [New Section after 18.7.5]

18.7.6 Modular Rooms.

18.7.6.1

Modular rooms installed in indoor locations shall comply with Section 10.7.

18.7.6.2*

Where provided in areas covered by an occupant notification system, the audible and visible signals shall extend into the interior of the modular room.

A.18.7.6.2

Extending the audible and visible signals into the interior does not necessarily mean additional devices need to be installed. Where occupant notification systems installed to serve the area where the modular booth is to be located provide the required audible and visible signals within the modular booth additional devices are not necessary. If the occupant notification systems installed to serve the area where the modular booth is to be located do not provide the required audible and visible signals, then additional devices would be required to be installed within the modular booth.

Statement of Problem and Substantiation for Public Comment

The Committee Statement for the resolution of Public Input No. 303 stated that the committee was unclear how these would be defined. FR-6555 added a new definition of modular room. The committee statement also wanted to address fire sprinkler protection. FR-6583 adds requirements into Chapter 10 to cover modular rooms. The new Section 10.7.3 requires modular rooms to be listed to UL 962, Household and Commercial Furnishings. UL 962 contains requirements for modular booths to provide for fire sprinkler protection where installed in areas that are provided with automatic fire sprinkler protection. Additionally, this public comment simplifies the intent of Public Input No. 303 that where modular rooms are installed in areas covered by an occupant notification system the audible and visible signals must extend into the interior of the modular room. This public comment uses similar language to that approved with FR-6632 that created a new Section 36.4.4.12, 36.4.4.12.1 and 36.4.4.12.2. A new Annex section was added to clarify that extending the audible and visible signals into the interior of the modular does not necessary require the installation of a device in the interior of the modular room.

**Public Comment No. 238-NFPA 101-2022 [Section No. 19.1.3.11]****19.1.3.11 –**

~~Any area with a hazard of contents classified higher than that of the health care occupancy and located in the same building shall be protected as required by 19.3.2.~~

Statement of Problem and Substantiation for Public Comment

There is no need for this requirement. If a space is in an occupancy other than a healthcare occupancy and it is in the same building that contains the healthcare occupancy, the occupancy separation requirements of Chapter 6 that mandate a two hour fire resistance separation is more than adequate and this chapter should not be requiring a fire rated enclosure for a space in an occupancy that is outside of the healthcare occupancy that is already properly separated. If there is no two hour fire resistant separation between the healthcare occupancy and the other occupancies, then the hazardous area requirements of NFPA 101, 18/19.3.2 already apply. This requirement is more often missed than applied during design because designers don't refer to the healthcare occupancy requirements in Chapter 18/19 when designing spaces to the requirements of other occupancies within the same building that might contain a healthcare occupancy.

For existing buildings that contain healthcare occupancies, this mandates that the healthcare occupancy hazardous area protection requirements apply to all occupancies even when two hour separation exists between the occupancies. While this has been in the code for a long time, a storage room in an existing business occupancy in a building that is separated by two hour fire rated construction from a healthcare occupancy in the same building should not be identified as a deficiency based on a requirement in the healthcare occupancy chapter.

Committee Statement

Committee Action: Rejected but held
Resolution: The proposed revision is deemed to be new material and will be held for the next revision cycle.

Public Comment No. 122-NFPA 101-2022 [Section No. 19.2.2.2.5.2]

19.2.2.2.5.2*

Door-locking arrangements shall be permitted where patient special needs require specialized protective measures for their safety, provided that all of the following are met:

- (1) Staff can readily unlock doors at all times in accordance with 19.2.2.2.6.
- (2) A total (complete) smoke detection system is provided throughout the locked space in accordance with 9.6.2.9, or locked doors can be remotely unlocked at an approved, constantly attended location within the locked space.
- (3) The smoke compartment containing the secured area, all adjacent smoke compartments, and all smoke compartments leading to the required exits from the secured area are protected throughout by an approved, supervised automatic sprinkler system in accordance with 19.3.5.7.
- (4) The locks are electrical locks that fail safely so as to release upon loss of power to the device.
- (5) The locks release by independent activation of each of the following:
 - (6) Activation of the smoke detection system required by 19.2.2.2.5.2(2)
 - (7) Waterflow in the automatic sprinkler system required by 19.2.2.2.5.2(3)
- (8)* ~~Door electrical~~ Door electro-mechanical or electromagnetic locking hardware for new ~~electric lock~~ installations ~~is listed for the purpose~~ shall be listed in accordance with UL 294, Access Control System Units or UL 1034, Burglary-Resistant Electric Locking Mechanisms .

Statement of Problem and Substantiation for Public Comment

Because of implications to life safety with electrical locking systems potentially affecting egress on these doors in the means of egress, it is prudent to require listing of door electrical locking hardware used in these applications. Requiring listing to either UL 294 or to UL 1034 appropriately revises this important listing requirement to help assure the electrical locking hardware performs as intended for these life-safety applications.

The Life Safety Code, in chapters 18 and 19, first required this electrical door hardware to be listed to UL 294 in the 2018 edition of NFPA 101.

UL 294 and 1034 address efficacy and safety considerations for door access control applications (ingress control) to assure the door hardware would perform as intended and expected. Typically, access control systems incorporating card readers, keypads, iris scanners, etc. are tested and listed to UL 294. Additionally, delayed egress electrical locking systems, sensor-release electrical locking systems, and certain types of door hardware release electrical locking systems are all typically tested and listed to UL 294. On the other hand, components such as electromagnetic locks, electric dead bolts, electric strikes, and other door electrically operated locking mechanisms are typically listed to UL 1034. UL 294 and UL 1034 are collateral standards that complement each other.

These examples illustrate that many of the same systems and components used to control access (ingress) to a space are also used for egress-side electrical locking systems. Considering that egress-side electrical locking systems have life safety implications, NFPA 101 was enhanced (in 2009) to require listing of electrical locking hardware to UL 294. In hindsight, what's proposed here – meeting a mandatory listing requirement with the collateral listing to UL 1034 – should have been the language included in NFPA 101 in the earlier editions.

In addition to the option to list to UL 1034, this proposal brings consistency in the text where UL 294 (and UL 1034) are referenced in NFPA 101. The additions of Annex A text complement the revisions to the mandatory language of these special locking arrangements.

The revisions of the Annex A text complement the revisions to 19.2.2.2.5.2(6)

PI_-_Task_Group_-_1922252.docx

Clarification language for 19.2.2.2.5.2.

LSC_19.2.2.2.5.2_3_Diagram.pdf

Related to the new language in Item #2 with regards to the requirement for sprinkler protection for the smoke compartment, adjacent smoke compartments and all smoke compartments leading to the requires exists. A task group member submitted a drawing that may be helpful to illustrate this requirement and could possibly be used as handbook material. I have attached that drawing for your review.

Statement of Problem and Substantiation for Public Comment

As a result of FR-6737 (deleting existing language) and FR-6732 (adding new language), the Task Group felt that 19.2.2.2.5.2 was confusing and proposed a revised re-organization of the section to read as follows. There was some previous email discussion related to the new language in Item #2 with regards to the requirement for sprinkler protection for the smoke compartment, adjacent smoke compartments and all smoke compartments leading to the requires exists. A Task Group member submitted a drawing that may be helpful to illustrate this requirement and could possibly be used as handbook material.

**Public Comment No. 128-NFPA 101-2022 [New Section after 19.2.5.7.4]****19.2.5.8 Interlocked-Door Vestibule**

An interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress.

Statement of Problem and Substantiation for Public Comment

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 18, 20, 21, 36, 37, 38, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

The criteria is proposed section 7.2.1.6.5 (via separate public comment) were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Public Comment No. 215-NFPA 101-2022 [New Section after 19.3.2.1.5]

19.3.2.1.6

Rooms used as sterile cores supporting operating room and anesthetizing areas are not considered hazardous areas if separated from the corridor or nonsleeping patient care suite by corridor walls in accordance with 19.3.6 and shall be equipped with self-closing or automatic-closing doors.

Statement of Problem and Substantiation for Public Comment

In essence, this is to accept CI 6726 per another public comment but also add it for existing occupancies, Same justification as for new occupancies adding self or automatically closing room doors to ensure a fire is contained to the sterile core. These rooms are essential to the OR setting and infection control is paramount such that the doors that are needed to contain a fire need to be equipped with closing devices in lieu of latching hardware.

Resolution: SR-6646-NFPA 101-2022

Statement: The revision incorporates the concept of sterile cores from CI-6726 as modified and ensures room doors either self or automatically close to ensure a fire is contained to the sterile core. These rooms are essential to the OR setting and infection control is paramount such that the doors that are needed to contain a fire need to be equipped with closing devices in lieu of latching hardware.

Public Comment No. 98-NFPA 101-2022 [Section No. 19.3.2.5.3]

19.3.2.5.3*

Within a smoke compartment, where residential or commercial cooking equipment is used to prepare meals for 30 or fewer persons, one cooking facility shall be permitted to be open to the corridor, provided that all of the following conditions are met:

- (1) The portion of the health care facility served by the cooking facility is limited to 30 beds and is separated from other portions of the health care facility by a smoke barrier constructed in accordance with 19.3.7.3, 19.3.7.6, and 19.3.7.8.
- (2) The cooktop or range is equipped with a range hood of a width at least equal to the width of the cooking surface, with grease baffles or other grease-collecting and clean-out capability.
- (3)* The hood systems have a minimum airflow of 500 cfm (14,000 L/min).
- (4) The hood systems that are not ducted to the exterior additionally have a charcoal filter to remove smoke and odor.
- (5) The cooktop or range complies with all of the following:
 - (6) The cooktop or range is protected with a fire suppression system listed in accordance with UL 300, *Fire Testing of Fire Extinguishing Systems for Protection of Commercial Cooking Equipment*, or is tested and meets all requirements of UL 300A, *Extinguishing System Units for Residential Range Top Cooking Surfaces*, in accordance with the applicable testing document's scope.
 - (7) A manual release of the extinguishing system is provided in accordance with Section 10.5 of NFPA 96.
 - (8) An interlock is provided to turn off all sources of fuel and electrical power to the cooktop or range when the suppression system is activated.
- (9)* The use of solid fuel for cooking is prohibited.
- (10) Deep-fat frying is prohibited.
- (11) Portable fire extinguishers in accordance with NFPA 96 are located in all kitchen areas.
- (12) A switch meeting all of the following is provided:
 - (13) A locked switch, or a switch located in a restricted location, is provided within the cooking facility that deactivates the cooktop or range.
 - (14) The switch is used to deactivate the cooktop or range whenever the kitchen is not under staff supervision.
 - (15) The switch is on a timer, not exceeding a 120-minute capacity, that automatically deactivates the cooktop or range, independent of staff action.
- (16) Procedures for the use, inspection, testing, and maintenance of the cooking equipment are in accordance with Chapter 11 of NFPA 96 and the manufacturer's instructions are followed.
- (17) Not less than two AC-powered photoelectric smoke alarms with battery backup, interconnected in accordance with 9.6.2.10.4, and equipped with a silence feature are located not closer than 20 ft (6.1 m) and not further than 25 ft (7.6 m) from the cooktop or range.
- (18) The smoke alarms required by 19.3.2.5.3(11) are permitted to be located outside the kitchen area where such placement is necessary for compliance with the 20 ft (7.6 m) minimum distance criterion.
- (19) A single system smoke detector is permitted to be installed in lieu of the smoke alarms required in 19.3.2.5.3(11) provided the following criteria are met:
 - (20) The detector is located not closer than 20 ft (6.1 m) and not further than 25 ft (7.6 m) from the cooktop or range.
 - (21) The detector is permitted to initiate a local audible alarm signal only.
 - (22) The detector is not required to initiate a building-wide occupant notification signal.
 - (23) The detector is not required to notify the emergency forces.
 - (24) The local audible signal initiated by the detector is permitted to be silenced and reset by a button on the detector or by a switch installed within 10 ft (3.0 m) of the system smoke detector.
- (25) System smoke detectors that are required to be installed in corridors or spaces open to the corridor by other sections of this chapter are not used to meet the requirements of 19.3.2.5.3(11) and are located not closer than 25 ft (7.6 m) to the cooktop or range.
- (26) The smoke compartment is protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.
- (27) Carbon monoxide detectors shall be installed in accordance with 19.3.4.6.2(1).

Statement of Problem and Substantiation for Public Comment

This language, adding carbon monoxide detectors to this chapter, was developed by the Task Group on Carbon Monoxide Detection.

Committee Statement

Committee Action: Rejected

Resolution: No technical justification was provided to require the installation of CO detection in existing buildings. If new fuel-fired equipment is added to an existing health care occupancy, or there is a change of occupancy classification, Ch. 43 should address the need for CO detection in those instances. The proposed referenced paragraph does not exist via the rejection of PC-96.

Public Comment No. 96-NFPA 101-2022 [New Section after 19.3.4.5.2]

19.3.4.6 Carbon Monoxide Detection Systems

19.3.4.6.1 Carbon monoxide detection systems, where required by 19.3.4.6.2, shall be in accordance with 9.12.

19.3.4.6.2 Carbon monoxide detection systems shall be provided in the following locations:

(1) Carbon monoxide detectors shall be installed on the ceilings of rooms containing permanently installed fuel-burning appliances, including fireplaces.

(2) Carbon monoxide detectors shall be installed within 36 in (910 mm) . of the first supply air register from a permanently installed, fuel-burning HVAC system..

19.3.4.6.3 For existing fire alarm systems with a fire alarm control unit that does not support temporal 4 notification or the monitoring of carbon monoxide detectors due to older technology, stand-alone carbon monoxide alarms shall be permitted to be used.

Statement of Problem and Substantiation for Public Comment

This language, adding carbon monoxide detectors to this chapter, was developed by the Task Group on Carbon Monoxide Detection.

Public Comment No. 224-NFPA 101-2022 [New Section after 19.7.5]

19.7.6 Modular Rooms

19.7.6.1

Modular rooms installed in indoor locations shall comply with Section 10.7.

19.7.6.2*

Where provided in areas covered by an occupant notification system, the audible and visible signals shall extend into the interior of the modular room.

A.19.7.6.2

Extending the audible and visible signals into the interior does not necessarily mean additional devices need to be installed. Where occupant notification systems installed to serve the area where the modular booth is to be located provide the required audible and visible signals within the modular booth additional devices are not necessary. If the occupant notification systems installed to serve the area where the modular booth is to be located do not provide the required audible and visible signals, then additional devices would be required to be installed within the modular booth.

Statement of Problem and Substantiation for Public Comment

The Committee Statement for the resolution of Public Input No. 304 stated that the committee was unclear how these would be defined. FR-6555 added a new definition of modular room. The committee statement also wanted to address fire sprinkler protection. FR-6583 adds requirements into Chapter 10 to cover modular rooms. The new Section 10.7.3 requires modular rooms to be listed to UL 962, Household and Commercial Furnishings. UL 962 contains requirements for modular booths to provide for fire sprinkler protection where installed in areas that are provided with automatic fire sprinkler protection. Additionally, this public comment simplifies the intent of Public Input No. 304 that where modular rooms are installed in areas covered by an occupant notification system the audible and visible signals must extend into the interior of the modular room. This public comment uses similar language to that approved with FR-6632 that created a new Section 36.4.4.12, 36.4.4.12.1 and 36.4.4.12.2. A new Annex section was added to clarify that extending the audible and visible signals into the interior of the modular does not necessary require the installation of a device in the interior of the modular room.

**Public Comment No. 129-NFPA 101-2022 [New Section after 20.2.5.3.2]****20.2.5.4 Interlocked-Door Vestibule**

An interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress.

Statement of Problem and Substantiation for Public Comment

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 21, 36, 37, 38, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

The criteria is proposed section 7.2.1.6.5 (via separate public comment) were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-6649-NFPA 101-2022
Statement: This language, adding carbon monoxide detectors to this chapter, was developed by the Task Group on Carbon Monoxide Detection. The requirement for CO detection adjacent to attached garages is not included because it is not typically applicable to these occupancies. Garages are regulated by other standards, which address ventilation, etc.

Public Comment No. 170-NFPA 101-2022 [New Section after 20.3.4.4]

20.3.4.5 Carbon Monoxide Detection

20.3.4.5.1 New ambulatory health care occupancies shall be provided with carbon monoxide detection and warning equipment in accordance with Section 9.12 in the locations specified as follows:

- (1) On the ceilings of rooms containing permanently installed fuel-burning appliances or fuel-burning fireplaces
- (2) Centrally located within occupiable spaces served by the first supply air register from permanently installed fuel-burning HVAC systems
- (3)* Centrally located within occupiable spaces adjacent to an attached garage

A.20.3.4.5.1(3) The intent is to require CO detectors in occupiable spaces immediately adjacent, vertically or horizontally, to attached garages, regardless of the presence of openings between the garage and the adjacent occupiable spaces. Other occupiable spaces that are not adjacent to the attached garage do not require CO detectors.

20.3.4.5.2 Carbon monoxide detectors as specified in 20.3.4.5.1 shall not be required in the following locations:

- (1) Garages
- (2) Occupiable spaces with attached garages that are open parking structures as defined in 3.3.282.8.4
- (3) Occupiable spaces with attached garages that are mechanically ventilated in accordance with the mechanical code

Statement of Problem and Substantiation for Public Comment

New ambulatory health care occupancies currently lack requirements for CO detection in buildings with known CO hazards, including fuel-burning appliances. The addition of these requirements will ensure the safety of patients, visitors and staff in the event of high level CO release within the building.

This public comment is submitted in support of committee action taken in the first revision phase to develop CO detection requirements for new ambulatory health care occupancies. The resubmission of the requirement currently in place in Chapter 12 is submitted for example purposes only.

The committee noted that “no data was submitted specific to losses in ambulatory health care facilities.” A CO source in any building that is not monitored by installed CO detection devices is a life safety hazard to occupants. With regard to installation cost, primary consideration must be given to the unique nature of CO exposure and the inability of occupants to sense when they are being exposed. To avoid injury and death, there is no safe alternative to installed CO detection devices.

“The lack of an operating alarm can be seen in several of these case studies. Carbon monoxide is colorless and odorless. Its early onset symptoms are not unique or severe, which leads to mistaking them for something else or thinking there is not a serious problem. These symptoms can quickly escalate to severe symptoms, which usually revolves around the victim becoming unconscious. People do not self-rescue when they are able, because they do not realize that they should. If someone does realize there is problem, it is most likely too late. This common sequence combined with CO’s toxicity, and a general negligence, makes CO a very dangerous problem that can happen almost anywhere. Detection is the only safeguard against this problem.”

Public Comment No. 171-NFPA 101-2022 [New Section after 21.3.4.4]

21.3.4.5 Carbon Monoxide Detection

21.3.4.5.1 Existing ambulatory health care occupancies shall be provided with carbon monoxide detection and warning equipment in accordance with Section 9.12 in the locations specified as follows:

- (1) On the ceilings of rooms containing permanently installed fuel-burning appliances or fuel-burning fireplaces
- (2) Centrally located within occupiable spaces served by the first supply air register from permanently installed fuel-burning HVAC systems
- (3)* Centrally located within occupiable spaces adjacent to an attached garage

A.21.3.4.5.1(3) The intent is to require CO detectors in occupiable spaces immediately adjacent, vertically or horizontally, to attached garages, regardless of the presence of openings between the garage and the adjacent occupiable spaces. Other occupiable spaces that are not adjacent to the attached garage do not require CO detectors.

21.3.4.5.2 Carbon monoxide detectors as specified in 21.3.4.5.1 shall not be required in the following locations:

- (1) Garages
- (2) Occupiable spaces with attached garages that are open parking structures as defined in 3.3.282.8.4
- (3) Occupiable spaces with attached garages that are mechanically ventilated in accordance with the mechanical code

Statement of Problem and Substantiation for Public Comment

Existing ambulatory health care occupancies currently lack requirements for CO detection in buildings with known CO hazards, including fuel-burning appliances. The addition of these requirements will ensure the safety of patients, visitors and staff in the event of high level CO release within the building.

This public comment is submitted in support of committee action taken in the first revision phase to develop CO detection requirements for existing ambulatory health care occupancies. The resubmission of the requirement currently in place in Chapter 12 is resubmitted for example purposes only.

The committee noted that “no data was submitted specific to losses in ambulatory health care facilities.” A CO source in any building that is not monitored by installed CO detection devices is a life safety hazard to occupants. With regard to installation cost, primary consideration must be given to the unique nature of CO exposure and the inability of occupants to sense when they are being exposed. To avoid injury and death, there is no safe alternative to installed CO detection devices.

Existing buildings arguably carry the highest risk of exposure due to aging gas appliances and exhaust systems. A recent case:

“Vermont’s largest hospital...In late 2019, air circulation problems shut down five operating rooms at the Fanny Allen campus, which conducted about 30 outpatient surgeries a day. Carbon monoxide was found in the ventilation system, causing dizziness and nausea in staff. A similar issue in the building’s inpatient rehab area displaced 14 patients. After months of investigations, a brief attempt to reopen the OR and inpatient rehab unit and yet another poisoning incident in November 2020...”

<https://vtdigger.org/2021/09/12/states-largest-hospital-uvmmc-asks-for-204-million-increase/?fbclid=IwAR0DwLA172VRHeh78mjBlu9FkFeLre-mYskLvBlwi5xTG002P4Pf0p4QNYM>

“The lack of an operating alarm can be seen in several of these case studies. Carbon monoxide is colorless and odorless. Its early onset symptoms are not unique or severe, which leads to mistaking them for something else or thinking there is not a serious problem. These symptoms can quickly escalate to severe symptoms, which usually revolves around the victim becoming unconscious. People do not self-rescue when they are able, because they do not realize that they should. If someone does realize there is problem, it is most likely too late. This common sequence combined with CO’s toxicity, and a general negligence, makes CO a very dangerous problem that can happen almost anywhere. Detection is the only safeguard against this problem.”

City:

State:

Zip:

Submittal Date: Fri May 27 18:53:58 EDT 2022

Committee: SAF-HEA

Committee Statement

Committee Action: Rejected

Resolution: The limited incident data submitted does not warrant a retroactive requirement for CO detection in all existing facilities. The committee is aware that interested parties are exploring research opportunities to collect additional data. The CO task group is being retained for the next revision cycle.

**Public Comment No. 226-NFPA 101-2022 [New Section after 21.7.5]****21.7.6 Modular Rooms.****21.7.6.1**

Modular rooms installed in indoor locations shall comply with Section 10.7.

21.7.6.2*

Where provided in areas covered by an occupant notification system, the audible and visible signals shall extend into the interior of the modular room.

A.21.7.6.2

Extending the audible and visible signals into the interior does not necessarily mean additional devices need to be installed. Where occupant notification systems installed to serve the area where the modular booth is to be located provide the required audible and visible signals within the modular booth additional devices are not necessary. If the occupant notification systems installed to serve the area where the modular booth is to be located do not provide the required audible and visible signals, then additional devices would be required to be installed within the modular booth.

Statement of Problem and Substantiation for Public Comment

The Committee Statement for the resolution of Public Input No. 307 stated that the committee was unclear how these would be defined. FR-6555 added a new definition of modular room. The committee statement also wanted to address fire sprinkler protection. FR-6583 adds requirements into Chapter 10 to cover modular rooms. The new Section 10.7.3 requires modular rooms to be listed to UL 962, Household and Commercial Furnishings. UL 962 contains requirements for modular booths to provide for fire sprinkler protection where installed in areas that are provided with automatic fire sprinkler protection. Additionally, this public comment simplifies the intent of Public Input No. 307 that where modular rooms are installed in areas covered by an occupant notification system the audible and visible signals must extend into the interior of the modular room. This public comment uses similar language to that approved with FR-6632 that created a new Section 36.4.4.12, 36.4.4.12.1 and 36.4.4.12.2. A new Annex section was added to clarify that extending the audible and visible signals into the interior of the modular does not necessary require the installation of a device in the interior of the modular room.

**Public Comment No. 200-NFPA 101-2022 [Section No. A.18.2.2.2.5.2]****A.18.2.2.2.5.2**

Pediatric units, maternity units, and emergency departments are examples of areas where patients might have special needs that justify door locking. Door locking arrangements should be permitted to reduce the risk of abduction of infants and children who are patients. The requirements of this section apply even if a door is normally unlocked and only locks when a patient is within proximity of the door.

Statement of Problem and Substantiation for Public Comment

The purpose of the proposed new annex language is to provide clarity that the provisions of this section apply to infant abduction system locking even when the door is normally unlocked.

Resolution: SR-6655-NFPA 101-2022
Statement: The revision was developed by a task group on health care door locking to recognize alternative means of providing security where patient special needs require specialized protective measures for their safety.

Public Comment No. 41-NFPA 101-2022 [Section No. A.18.2.5.7.2.1(B)]

A.18.2.5.7.2.1(B)

Supervision of sleeping suites is accomplished by direct supervision by staff, smoke detection, or a combination of direct supervision and smoke detection. The following three options are available for meeting the supervision requirements for patient sleeping suites having an area not exceeding 7500 ft² (700 m²):

- (1) Direct supervision of all sleeping rooms by staff from a normally attended location within the suite [in accordance with 18.2.5.7.2.1(B)(1)(a)]
- (2) Supervision of those sleeping rooms that can be directly supervised [in accordance with 18.2.5.7.2.1(B)(1)(a)] and smoke detection provided in the sleeping rooms that cannot be directly supervised [in accordance with 18.2.5.7.2.1(B)(1)(b)] as depicted in Figure A.18.2.5.7.2.1(B)(a)
- (3) Total (complete) coverage smoke detection throughout the sleeping suite [in accordance with 18.2.5.7.2.1(B)(2)] as depicted in Figure A.18.2.5.7.2.1(B)(b)

Where the option for total (complete) coverage smoke detection is used, the provision of 9.6.2.9 requires detectors in all occupiable areas that are suitable for smoke detector operation. For example, an area subject to shower steam would not require a smoke detector.

For patient sleeping suites having an area greater than 7500 ft² (700 m²), both direct supervision by staff and total (complete) coverage smoke detection throughout the sleeping suite are required [in accordance with 18.2.5.7.2.3(C)] as depicted in Figure A.18.2.5.7.2.1(B)(c).

The interior partitions or walls might extend full height to the ceiling, provided that they do not obscure visual supervision of the suite. Where they do obscure visual supervision, see 18.2.5.7.2.1(B)(2).

Figure A.18.2.5.7.2.1(B)(a) All Sleeping Rooms Provided Either with Direct Supervision by Staff or Smoke Detection.

Figure A.18.2.5.7.2.1(B)(b) Supervision Provided by Total (Complete) Smoke Detection Throughout the Sleeping Suite.

Figure A.18.2.5.7.2.1(B)(c) For Suites >7500 ft² (>700 m²), All Sleeping Rooms Must Be Provided with Direct Supervision by Staff and Total (Complete) Smoke Detection Installed Throughout the Sleeping Suite.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-6659-NFPA 101-2022
Statement: The revision was developed by a task group on health care door locking to recognize alternative means of providing security where patient special needs require specialized protective measures for their safety.

Public Comment No. 42-NFPA 101-2022 [Section No. A.19.2.5.7.2.1(B)]

A.19.2.5.7.2.1(B)

Supervision of existing sleeping suites is accomplished by direct supervision by staff, automatic smoke detection, or a combination of direct supervision and smoke detection. The following three options are available for meeting the supervision requirements for patient sleeping suites having an area not exceeding 5000 ft² (460 m²):

- (1) Direct supervision of all sleeping rooms by staff from a normally attended location within the suite [in accordance with 19.2.5.7.2.1(B)(1)]
- (2) Supervision of those sleeping rooms that can be directly supervised [in accordance with 19.2.5.7.2.1(B)(1)] and automatic smoke detection provided in the sleeping rooms that cannot be directly supervised [in accordance with 19.2.5.7.2.1(B)(2)] as depicted in Figure A.19.2.5.7.2.1(B)(a)
- (3) Total (complete) coverage automatic smoke detection throughout the sleeping suite [in accordance with 19.2.5.7.2.1(B)(2)] as depicted in Figure A.19.2.5.7.2.1(B)(b)

Where the option for total (complete) coverage automatic smoke detection is used, the provision of 9.6.2.9 requires detectors in all occupiable areas that are suitable for smoke detector operation. For example, an area subject to shower steam would not require a smoke detector.

For patient sleeping suites having an area greater than 5000 ft² (460 m²) but not greater than 7500 ft² (700 m²), sprinkler protection is required throughout the suite and the supervision requirements of 19.2.5.7.2.1 also apply. Such protection might take the form of standard-response sprinklers in accordance with 19.3.5.7 or quick-response sprinklers in accordance with 19.3.5.8. Where standard-response sprinklers are used in accordance with 19.3.5.7, the suite must be protected by total (complete) automatic smoke detection [in accordance with 19.2.5.7.2.3(B)(1)] as depicted in Figure A.19.2.5.7.2.1(B)(c).

For patient sleeping suites having an area greater than 7500 ft² (700 m²), the suite must be protected by quick-response sprinklers in accordance with 19.3.5.8, direct supervision of all sleeping rooms must be provided by staff, and total (complete) coverage automatic smoke detection must be provided throughout the sleeping suite [in accordance with 19.2.5.7.2.3(C)] as depicted in Figure A.19.2.5.7.2.1(B)(d).

The interior partitions or walls might extend full height to the ceiling, provided that they do not obscure visual supervision of the suite. Where they do obscure visual supervision, see 19.2.5.7.2.1(B)(1)(2).

Figure A.19.2.5.7.2.1(B)(a) All Sleeping Rooms Provided Either with Direct Supervision by Staff or Smoke Detection.

Figure A.19.2.5.7.2.1(B)(b) Supervision Provided by Total (Complete) Smoke Detection Throughout the Sleeping Suite.

Figure A.19.2.5.7.2.1(B)(c) For Suites $>5000 \text{ ft}^2$ ($>460 \text{ m}^2$) and $\leq 7500 \text{ ft}^2$ ($\leq 700 \text{ m}^2$) Protected by Standard Response Sprinklers, Total (Complete) Smoke Detection Required Throughout the Sleeping Suite.

Figure A.19.2.5.7.2.1(B)(d) For Suites $>7500 \text{ ft}^2$ ($>700 \text{ m}^2$), All Sleeping Rooms Must Be Provided with Direct Supervision by Staff and Total (Complete) Smoke Detection Installed Throughout the Sleeping Suite.

Committee Statement

Committee Action: Rejected
Resolution: The proposed corresponding base requirement was rejected.

**Public Comment No. 138-NFPA 101-2022 [Section No. A.19.3.6.3.5]****A.19.3.6.3.5**

While it is recognized that closed doors serve to maintain tenable conditions in a corridor and adjacent patient rooms, such doors, which, under normal or fire conditions, are self-closing, might create a special hazard for the personal safety of a room occupant. Such closed doors might present a problem of delay in discovery, confining fire products beyond tenable conditions.

Because it is critical for responding staff members to be able to immediately identify the specific room involved, it is recommended that approved automatic smoke detection that is interconnected with the building fire alarm be considered for rooms having doors equipped with closing devices. Such detection is permitted to be located at any approved point within the room. When activated, the detector is required to provide a warning that indicates the specific room of involvement by activation of a fire alarm annunciator, nurse call system, or any other device acceptable to the authority having jurisdiction.

In existing buildings, use of the following options reasonably ensures that patient room doors will be closed and remain closed during a fire:

- (1) Doors should have positive latches, ~~and a~~ or as an alternative, the doors shall in a fire emergency become positively latched by means of an automatic fail-safe device that is activated by an automatic fire detector provided the doors are also self-closing or automatic-closing (see 18.3.6.3.8).
- (2) A suitable program that trains staff to close the doors in an emergency should be established.
- (3) It is the intent of the *Code* that no new installations of roller latches be permitted; however, repair or replacement of roller latches is not considered a new installation.
- (4) Doors protecting openings to patient sleeping or treatment rooms, or spaces having a similar combustible loading, might be held closed using a closer exerting a closing force of not less than 5 lbf (22 N) on the door latch stile.

NFPA 101

Chapter 18 New Health Care Occupancies

18.3.6.3 * Corridor Doors.

18.3.6.3.1 *

Doors, including doors or panels to nurse servers and pass-through openings, protecting corridor openings shall be constructed to resist the passage of smoke, and the following also shall apply:

1. Compliance with NFPA 80 shall not be required.
2. For other than doors protecting pass-through openings, a clearance between the bottom of the door and the floor covering not exceeding 1 in. (25 mm) shall be permitted.
3. For doors protecting pass-through openings, a clearance between the bottom of the door and the sill not exceeding $\frac{1}{8}$ in. (3 mm) shall be permitted.
4. Doors to toilet rooms, bathrooms, shower rooms, sink closets, and similar auxiliary spaces that do not contain flammable or combustible material shall not be required to be constructed to resist the passage of smoke.

18.3.6.3.2 Reserved.

18.3.6.3.3 Reserved.

18.3.6.3.4 Reserved.

18.3.6.3.5

Doors shall be self-latching and provided with positive latching hardware, except as permitted in 18.3.6.3.6, 18.3.6.3.7, or 18.3.6.3.8.

18.3.6.3.6

Doors to toilet rooms, bathrooms, shower rooms, sink closets, and similar auxiliary spaces that do not contain flammable or combustible materials shall not be required to meet the latching requirements of 18.3.6.3.5.

18.3.6.3.7

Powered doors that comply with the requirements of 7.2.1.9 shall not be required to meet the latching requirements of 18.3.6.3.5, provided that all of the following criteria are met:

1. The door is equipped with a means for keeping the door closed that is acceptable to the authority having jurisdiction.
2. The device used is capable of keeping the door fully closed if a force of 5 lbf (22 N) is applied at the latch edge of a swinging door and applied in any direction to a sliding or folding door, whether or not power is applied.
3. Where door leaves are operated by power by any automatic mechanism, the automatic opening of the doors shall cease to function upon operation of approved smoke detectors installed in accordance with the provisions of *NFPA 72* for door release service.

18.3.6.3.8*

Latching arrangements that do not provide positive latching in the normal mode shall be permitted to be used provided that, in a fire emergency, the door becomes positively latched by means of an automatic fail-safe device that is activated by an automatic fire detector. [80:6.4.4.4.3]

18.3.6.3.8.1*

Commented [WJ1]: Original proposal, not shown, was Public Input No. 272-NFPA 101-2021. A revised proposal, to be submitted via Public Comment, is shown here.

Commented [JW2]: Language copied directly from NFPA 80-2022 6.4.4.4.3

Commented [JW3]: For a door to become positively latched (by means of a fail-safe device activated by an automatic fire detector) the door must also be either self-closing or automatic-closing.

Doors with latching arrangements complying with 18.3.6.3.8 shall be self-closing doors complying with 18.3.6.3.8.2 or automatic-closing doors complying with 18.3.6.3.8.3.

18.3.6.3.8.2*

Self-closing doors shall swing easily and freely and shall be equipped with a closing device to cause the door to close each time it is opened. The closing mechanism shall not have a hold-open feature.

Commented [JW4]: Text from self-closing requirements in NFPA 80 Section 7.1.4.2, but deleted NFPA 80 requirement to latch when closed.

18.3.6.3.8.3*

Automatic-closing doors shall be arranged to close automatically by means of a closing device which causes the door to close, and a separate, labeled, fail-safe door holder / release device that is activated by an actuation device and is installed in accordance with NFPA 80 Section 4.7.

Commented [JW5]: Text from automatic-closing requirements in NFPA 80 Section 7.1.4.3 and 7.1.4.2.1, but doesn't include requirement to latch upon closure nor option for fusible links.

18.3.6.3.89

Corridor doors utilizing an inactive leaf shall have automatic flush bolts on the inactive leaf to provide positive latching.

Reason: On corridor doors in health care facilities, as an acceptable alternative to doors provided with positive latching hardware is to become positively latched in a fire emergency. The option to become positively latched in a fire emergency is included in NFPA 80 and NFPA 105.

Our BHMA members are being asked if it is possible to apply the provisions of NFPA 80-2019 Section 6.4.4.3.3 / NFPA 80-2022 Section 6.4.4.4.3, or NFPA 105 Section 6.3.6.4.2, on corridor doors not required to comply with NFPA 80 (nor NFPA 105). This proposal assumes that if it's acceptable to apply the provisions of NFPA 80 Section 6.4.4.3.3 to doors required to comply with NFPA 80 (doors required to be fire-rated), then it should also be acceptable to apply these same provisions to doors not required to comply with NFPA 80 (doors not required to be fire-rated). Ditto for NFPA 105.

The additional requirement for use of the automatic fail-safe devices is the doors are also required to be either self-closing or automatic-closing. This is to ensure the door moves to a closed position upon activation of an automatic fire detector and becomes positively latched.

The original Public Input No. 272-NFPA 101-2021 was resolved (disapproved) during the First Draft technical committee meeting, stating: The proposed revision might be better suited as a Ch. 8 requirement. There is also concern that the provision might permit a fusible link to serve as the required fire detection device.

This public comment does not propose revisions in Chapter 8 because this proposal addresses requirements for doors in new construction specifically identified as not required to comply with NFPA 80. It seems that proposing in Chapter 8 revisions as in this proposal would be out of place as Chapter 8 addresses building elements required to comply with explicit requirements, such as NFPA 80. It may be noted Chapter 8 includes several provisions (i.e. exceptions) for existing doors regarding opening protectives, but includes no similar provisions for new construction.

This public comment addresses the fusible link concern with the provisions proposed in 18.3.6.3.5.4 by not including fusible links as an option for activating automatic-closing doors.

A.18.3.6.3.8

Corridor doors in health care facilities have long been required to have positive latching hardware. An alternative to the positive latching hardware requirement, introduced in NFPA 101-2024, based on the provisions of NFPA 80 Section 6.4.4.4.3 and NFPA 105 Section 6.3.6.4.2, is equivalently applicable to doors not required to comply with NFPA 80 and to doors not required to comply with NFPA 105.

Commented [WJ6]: Original proposal was Public Input No. 272-NFPA 101-2021. This public comment text has been revised from that PI.

The alternative is an automatic fail-safe device that positively latches the door when activated by an automatic fire detector. This alternative is permitted if the doors are also either self-closing or automatic-closing – to ensure the door moves to a closed position upon activation of an automatic fire detector to become positively latched. This alternative is an option on doors required to comply with NFPA 80 as well as doors not required to comply with NFPA 80 (doors not required to be fire-rated).

The provisions of 18.3.6.3.8 are directly from NFPA 80-2022 Section 6.4.4.4.3.

A.18.3.6.3.8.1

For a door to become positively latched by means of a fail-safe device activated by an automatic fire detector, the door would need to be either self-closing or automatic-closing.

A.18.3.6.3.8.2

The self-closing requirements are from NFPA 80 Section 7.1.4.2, but without the NFPA 80 requirement to latch when closed.

A.18.3.6.3.8.3

The automatic-closing requirements are from NFPA 80 Sections 7.1.4.3 and 7.1.4.2.1, but without the requirement to latch upon closure, and without the option for fusible links.

Reason: Proposing Annex A materials to complement new proposed revisions / section 18.3.6.3.8.

Chapter 19 Existing Health Care Occupancies

19.3.6.3 * Corridor Doors.

19.3.6.3.1 *

Doors, including doors or panels to nurse servers and pass-through openings, protecting corridor openings in other than required enclosures of vertical openings, exits, or hazardous areas shall be doors constructed to resist the passage of smoke and shall be constructed of materials such as the following:

1. 1³/₄ in. thick, solid-bonded wood core
2. Material that resists fire for a minimum of 20 minutes.

19.3.6.3.2

The requirements of 19.3.6.3.1 shall not apply where otherwise permitted by either of the following:

1. Doors to toilet rooms, bathrooms, shower rooms, sink closets, and similar auxiliary spaces that do not contain flammable or combustible materials shall not be required to comply with 19.3.6.3.1.
2. In smoke compartments protected throughout by an approved, supervised automatic sprinkler system in accordance with 19.3.5.7, the door construction materials requirements of 19.3.6.3.1 shall not be mandatory, but the doors shall be constructed to resist the passage of smoke.

19.3.6.3.3

Compliance with NFPA 80 shall not be required.

19.3.6.3.4

A clearance between the bottom of the door and the floor covering not exceeding 1 in. (25 mm) shall be permitted for corridor doors.

Commented [WJ7]: Text included for visibility. Corridor doors in existing health care occupancies not required to be positive latching. Thus, no changes proposed in Chapter 19, but potential revision in Annex A.

19.3.6.3.5 *

Doors shall be provided with a means for keeping the door closed, and the following requirements also shall apply:

1. The device used shall be capable of keeping the door fully closed if a force of 5 lbf (22 N) is applied at the latch edge of the door.
2. Roller latches shall be prohibited on corridor doors in buildings not fully protected by an approved automatic sprinkler system in accordance with 19.3.5.7.

Annex A Explanatory Material

A.19.3.6.3.5

While it is recognized that closed doors serve to maintain tenable conditions in a corridor and adjacent patient rooms, such doors, which, under normal or fire conditions, are self-closing, might create a special hazard for the personal safety of a room occupant. Such closed doors might present a problem of delay in discovery, confining fire products beyond tenable conditions.

Because it is critical for responding staff members to be able to immediately identify the specific room involved, it is recommended that approved automatic smoke detection that is interconnected with the building fire alarm be considered for rooms having doors equipped with closing devices. Such detection is permitted to be located at any approved point within the room. When activated, the detector is required to provide a warning that indicates the specific room of involvement by activation of a fire alarm annunciator, nurse call system, or any other device acceptable to the authority having jurisdiction.

In existing buildings, use of the following options reasonably ensures that patient room doors will be closed and remain closed during a fire:

1. Doors should have **positive latches**, ~~or as an alternative, the doors shall in a fire emergency become positively latched by means of an automatic fail-safe device that is activated by an automatic fire detector provided the doors are also self-closing or automatic-closing (see 18.3.6.3.8).~~ ~~and a~~
1. A suitable program that trains staff to close the doors in an emergency should be established.
- 2.
3. It is the intent of the Code that no new installations of roller **latches** be permitted; however, repair or replacement of roller **latches** is not considered a new installation.
4. Doors protecting openings to patient sleeping or treatment rooms, or spaces having a similar combustible loading, might be held closed using a closer exerting a closing force of not less than 5 lbf (22 N) on the door **latch** stile.

Reason: Revising Annex A materials to recognize the alternative proposed in 18.3.6.3.5 and 18.3.6.3.8.

NFPA 5000-2021

Chapter 19 Health Care Occupancies

19.3.6.3 * Corridor Doors.

19.3.6.3.1 *

Doors, including doors or panels to nurse servers and pass-through openings, protecting corridor openings shall be constructed to resist the passage of smoke and the following also shall apply:

- (1) Compliance with NFPA 80 shall not be required.

Commented [WJ8]: Public Input No. 273-NFPA 101-2021

- (2) For other than doors protecting pass-through openings, a clearance between the bottom of the door and the floor covering not exceeding 1 in. (25 mm) shall be permitted for corridor doors.
- (3) For doors protecting pass-through openings, a clearance between the bottom of the door and the sill not exceeding $\frac{1}{8}$ in. (3 mm) shall be permitted.
- (4) The requirements of [19.3.6.3.1](#) shall not apply to doors to toilet rooms, bathrooms, shower rooms, sink closets, and similar auxiliary spaces that do not contain flammable or combustible materials.

19.3.6.3.2

Doors shall be self-latching and provided with **positive latching** hardware except as permitted in [19.3.6.3.3](#), [19.3.6.3.4](#), or [19.3.6.3.5](#).

19.3.6.3.3

Doors to toilet rooms, bathrooms, shower rooms, sink closets, and similar auxiliary spaces that do not contain flammable or combustible materials shall not be required to meet the latching requirements of 19.3.6.3.2.

19.3.6.3.4

Powered doors that comply with the requirements of 11.2.1.9 shall not be required to meet the latching requirements of 19.3.6.3.2, provided that all of the following criteria are met:

- (1) The door is equipped with a means for keeping the door closed that is acceptable to the AHJ.
- (2) The device used is capable of keeping the door fully closed if a force of 5 lbf (22 N) is applied at the latch edge of a swinging door and applied in any direction to a sliding or folding door, whether or not power is applied.
- (3) Where door leaves are operated by power by any automatic mechanism, the automatic opening of the doors shall cease to function upon operation of approved smoke detectors installed in accordance with the provisions of *NFPA 72* for door release service.

19.3.6.3.5*

Latching arrangements that do not provide positive latching in the normal mode shall be permitted to be used provided that, in a fire emergency, the door becomes positively latched by means of an automatic fail-safe device that is activated by an automatic fire detector. [\[80:6.4.4.4.3\]](#)

Commented [JW9]: Language copied directly from NFPA 80-2022 6.4.4.4.3

19.3.6.3.5.1*

Doors with latching arrangements complying with [19.3.6.3.5](#) shall be self-closing doors complying with [19.3.6.3.5.2](#) or automatic-closing doors complying with [19.3.6.3.5.3](#).

Commented [JW10]: For a door to become positively latched (by means of a fail-safe device activated by an automatic fire detector) the door must also be either self-closing or automatic-closing.

19.3.6.3.5.2*

Self-closing doors shall swing easily and freely and shall be equipped with a closing device to cause the door to close each time it is opened. The closing mechanism shall not have a hold-open feature.

Commented [JW11]: Text from self-closing requirements in NFPA 80 Section 7.1.4.2, but deleted NFPA 80 requirement to latch when closed.

19.3.6.3.5.3*

Automatic-closing doors shall be arranged to close automatically by means of a closing device which causes the door to close, and a separate, labeled, fail-safe door holder / release device that is activated by an actuation device and is installed in accordance with NFPA 80 Section 4.7.

Commented [JW12]: Text from automatic-closing requirements in NFPA 80 Sections 7.1.4.3 and 7.1.4.2.1, but deleted requirement to latch upon closure, and didn't include option for fusible links.

19.3.6.3.5.6

Corridor doors utilizing an inactive leaf shall have automatic flush bolts on the inactive leaf to provide **positive latching**.

Reason: On corridor doors in health care facilities, as an acceptable alternative to doors provided with positive latching hardware is to become positively latched in a fire emergency. The option to become positively latched in a fire emergency is included in NFPA 80 and NFPA 105.

Our BHMA members are being asked if it is possible to apply the provisions of NFPA 80-2019 Section 6.4.4.3.3 / NFPA 80-2022 Section 6.4.4.4.3, or NFPA 105 Section 6.3.6.4.2, on corridor doors not required to comply with NFPA 80 (nor NFPA 105). This proposal assumes that if it's acceptable to apply the provisions of NFPA 80 Section 6.4.4.3.3 to doors required to comply with NFPA 80 (doors required to be fire-rated), then it should also be acceptable to apply these same provisions to doors not required to comply with NFPA 80 (doors not required to be fire-rated). Ditto for NFPA 105.

The additional requirement for use of the automatic fail-safe devices is the doors are also required to be either self-closing or automatic-closing. This is to ensure the door moves to a closed position upon activation of an automatic fire detector and becomes positively latched.

The original Public Input No. 272-NFPA 101-2021 was resolved (disapproved) during the First Draft technical committee meeting, stating: The proposed revision might be better suited as a Ch. 8 requirement. There is also concern that the provision might permit a fusible link to serve as the required fire detection device.

This public comment for NFPA 5000 is consistent with the public comment for Chapter 18 of NFPA 101.

A.19.3.6.3.5

Corridor doors in health care facilities have long been required to have positive latching hardware. An alternative to the positive latching hardware requirement, introduced in NFPA 101-2024, based on the provisions of NFPA 80 Section 6.4.4.4.3 and NFPA 105 Section 6.3.6.4.2, is equivalently applicable to doors not required to comply with NFPA 80 and to doors not required to comply with NFPA 105.

The alternative is an automatic fail-safe device that positively latches the door when activated by an automatic fire detector. This alternative is permitted if the doors are also either self-closing or automatic-closing – to ensure the door moves to a closed position upon activation of an automatic fire detector to become positively latched. This alternative is an option on doors required to comply with NFPA 80 as well as doors not required to comply with NFPA 80 (doors not required to be fire-rated).

The provisions of 19.3.6.3.5 are directly from NFPA 80-2022 Section 6.4.4.4.3.

A.19.3.6.3.5.1

For a door to become positively latched by means of a fail-safe device activated by an automatic fire detector, the door would need to be either self-closing or automatic-closing.

A.19.3.6.3.5.2

The self-closing requirements are from NFPA 80 Section 7.1.4.2, but without the NFPA 80 requirement to latch when closed.

A.19.3.6.3.5.3

The automatic-closing requirements are from NFPA 80 Sections 7.1.4.3 and 7.1.4.2.1, but without the requirement to latch upon closure, and without the option for fusible links.

Reason: Proposing Annex A materials to complement new proposed revisions / section 19.3.6.3.5.

For reference: Text Permitting Positive Latching via Fail-Safe Electric Latch (not part of proposal)

NFPA 80-2019

6.4.4.3.3

Latching arrangements that do not provide positive latching in the normal mode shall be permitted to be used provided that, in a fire emergency, the door becomes positively latched by means of an automatic fail-safe device that is activated by an automatic fire detector. (See Section [4.7](#).)

NFPA 80-2022

6.4.4.4.3

Latching arrangements that do not provide positive latching in the normal mode shall be permitted to be used provided that, in a fire emergency, the door becomes positively latched by means of an automatic fail-safe device that is activated by an automatic fire detector. (See Section [4.7](#).)

NFPA 105-2019

6.3.6.4.2

Latching arrangements that do not provide positive latching in the normal mode shall be permitted to be used provided that, in a fire emergency, the door becomes positively latched by means of an automatic fail-safe device that is activated by an automatic fire detector. [80:6.4.4.3.3]

NFPA 105-2022

6.3.6.4.2

Latching arrangements that do not provide positive latching in the normal mode shall be permitted to be used provided that, in a fire emergency, the door becomes positively latched by means of an automatic fail-safe device that is activated by an automatic fire detector. [80:6.4.4.4.3]

Committee: SAF-HEA

Committee Statement

Committee Action: Rejected but see related SR

Resolution: [SR-6652-NFPA 101-2022](#)

Statement: The revision recognizes the alternative means of positive latching provided in 18.3.6.3.6.

Public Comment No. 102-NFPA 101-2022 [New Section after A.20.3.4.3.1.2]

A.20.3.4.5.1

The required location of carbon monoxide detectors is intended to be found in the scoping document, NFPA 101, under 20.3.4.5.2. The locations indicated in NFPA 72 17.12.1 are intended to be superseded by the NFPA 101 requirements.

Statement of Problem and Substantiation for Public Comment

This language, adding carbon monoxide detectors to this chapter, was developed by the Task Group on Carbon Monoxide Detection.

TO: Technical Committee on Health Care Occupancies

FROM: Jenny Depew, *Committee Administrator*

DATE: November 8, 2022

SUBJECT: NFPA 101® Second Draft TC FINAL Ballot Results (A2023)

According to the final ballot results, all ballot items received the necessary affirmative votes to pass ballot.

27 **Members Eligible to Vote**

4 **Members Not Returned** (*Carson, Cummings, Harmeyer, Pethe*)

The attached report shows the number of affirmative, negative, and abstaining votes as well as the explanation of the vote for **each** revision.

To pass ballot, **each** revision requires: (1) a simple majority of those eligible to vote and (2) an affirmative vote of $\frac{2}{3}$ of ballots returned. See Sections 3.3.4.3.(c) and 4.3.10.1 of the ***Regulations Governing the Development of NFPA Standards***.

Second Revision No. 6670-NFPA 101-2022 [Detail]

18.2.2.2.5*

Door-locking arrangements shall be permitted in accordance with either 18.2.2.2.5.1 or 18.2.2.2.5.2.

A.18.2.2.2.5

The requirements for these permitted locking systems also apply to doors that are locked or that are typically unlocked and that lock upon approach of a patient.

Submitter Information Verification

Committee: SAF-HEA

Submittal Date: Tue Aug 30 12:36:11 EDT 2022

Committee Statement

Committee Statement: The revision clarifies that the 18.2.2.2.5 locking arrangements also apply to systems on doors that are normally unlocked, but that lock upon approach of a patient.

Response Message: SR-6670-NFPA 101-2022

Prediger, G. Brian

In review of the two solutions (.5.3) and (.5.4), the draft revision would permit the omission of smoke detection devices for areas with remote locking arrangements (.5.4). I don't believe that was the intent of the committee upon review of this draft. Also since I intend to vote negative on sections .5.3. in Chapters 18 and 19, .5.3 seems to imply multiple locking arrangements could be permitted versus .5.4. Recommend SAF-HEA revise the intent and subsequent text of xx.2.2.2.5.2 through .5.4 to provide clarity of concept as the intent of the code change is appropriate.

Second Revision No. 6656-NFPA 101-2022 [New Section after 18.2.2.5.2]

18.2.2.2.5.4

Door-locking arrangements in accordance with 18.2.2.2.5.2 shall be permitted where all of the following requirements are met:

- (1)* Doors can be remotely unlocked from within the locked area at an approved, normally attended location.

A.18.2.2.2.5.4(1) _

A location such as a nurse station is considered normally attended if it is an area steadily used by staff throughout the period the area contains patients and where, at a given time within that period, staff will generally be present. Uninterrupted physical staff presence at the location for the entire period is not required for the location to be normally attended.

- (2) Only one locking device is provided on each door.

- (3)* The smoke compartment containing the locked area, all adjacent smoke compartments on the floor, and all smoke compartments leading to the required exits from the locked area are protected throughout by an approved, supervised automatic sprinkler system in accordance with 18.3.5.1 .

A.18.2.2.2.5.4(3) _

The intent of this section is to ensure that for a given smoke compartment containing door-locking arrangements, all adjacent smoke compartments on the same floor, as well as those smoke compartments containing the means of egress from the secured area to the exits from the smoke compartment containing the locked area required by 18.2.4.4 , be protected throughout by an approved, supervised automatic sprinkler system.

- (4) The locks are electrical locks that fail safely to release upon loss of power to the device.
- (5) The locks release by activation of the automatic sprinkler system required by 18.2.2.2.5.4(3) .
- (6)* Door electrical locking hardware for new electric lock installations is listed for the purpose.

A.18.2.2.2.5.4(6) _

UL 294, *Access Control System Units* , and UL 1034, *Burglary-Resistant Electric Locking Mechanisms* , are two standards that provide criteria for listed door-locking hardware. The electrical locking hardware might be a component of an electrical locking system, or the electrical locking hardware might be a device with an individual listing.

Submitter Information Verification

Committee: SAF-HEA

Submittal Date: Thu Aug 25 14:55:55 EDT 2022

Committee Statement

Committee Statement: The revision was developed by a task group on health care door locking to recognize alternative means of providing security where patient special needs require specialized protective measures for their safety. The reference to UL standards in the annex provides guidance on selecting electrical locking hardware. The new A.18.2.2.5.4(3) responds to the correlating committee request for clarification on how to determine which compartments provide access to the required exits from the locked area.

Bush, Kenneth E.

The new 18.2.2.2.5.4 (3) is not enforceable. Either all smoke compartments on that floor should be protected by automatic sprinkler protection, or more specific wording proposed to clearly the required path of travel from the locked smoke compartment to identifiable exits.

Prediger, G. Brian

See SR-6655 comment.

Widdekind, Michael D.

All smoke compartments serving the means of egress shall be protected throughout by an approved, supervised sprinkler system. This should not be an issue for new as an approved, supervised automatic sprinkler system is required throughout all spaces.

Second Revision No. 6657-NFPA 101-2022 [Section No. 18.2.2.2.5.2]

18.2.2.2.5.3

Door-locking arrangements in accordance with 18.2.2.2.5.2 shall be permitted where ~~patient special needs require specialized protective measures for their safety, provided that~~ all of the following criteria requirements are met:

- (1) A ~~total (complete)~~ smoke detection system is provided throughout the locked ~~space area~~ in accordance with 9.6.2.9, ~~or locked doors can be remotely unlocked at an approved, constantly attended location within the locked space~~.
- (2) Staff can readily unlock doors at all times in accordance with 18.2.2.2.6.
- (3)* The smoke compartment containing the ~~secured locked~~ area, all adjacent smoke compartments on the floor, and all smoke compartments leading to the required exits from the ~~secured locked~~ area are protected throughout by an approved, supervised automatic sprinkler system in accordance with 18.3.5.1.

A.18.2.2.2.5.3(3)

The intent of this section is to ensure that for a given smoke compartment containing door-locking arrangements, all adjacent smoke compartments on the same floor, as well as those smoke compartments containing the means of egress from the secured area to the exits from the smoke compartment containing the locked area required by 18.2.4.4, be protected throughout by an approved, supervised automatic sprinkler system.

- (4) The locks are electrical locks that fail safely ~~so as~~ to release upon loss of power to the device.
- (5) The locks release by ~~independent~~ activation of ~~each of the following~~ smoke detection system required by 18.2.2.2.5.3(1).

~~Activation of the smoke detection system required by 18.2.2.2.5.3(1)~~

~~Waterflow in the automatic sprinkler system required by 18.2.2.2.5.3(3)~~

- (6) ~~Waterflow~~ The locks release by waterflow in the automatic sprinkler system required by 18.2.2.2.5.3(3)
- (7)* Door electrical locking hardware for new electric lock installations is listed for the purpose.

A.18.2.2.2.5.3(7)

UL 294, *Access Control System Units*, and UL 1034, *Burglary-Resistant Electric Locking Mechanisms*, are two standards that provide criteria for listed door-locking hardware. The electrical locking hardware might be a component of an electrical locking system, or the electrical locking hardware might be a device with an individual listing.

A.18.2.2.2.5.3

~~Pediatric units, maternity units, and emergency departments are examples of areas where patients might have special needs that justify door locking. Door locking arrangements should be permitted to reduce the risk of abduction of infants and children who are patients.~~

Second Revision No. 6633-NFPA 101-2022 [Section No. 18.2.2.2.10]

18.2.2.2.10

Stairs that serve an occupiable story that is more than 75 ft (23 m) above the level of fire department vehicle access shall comply with the re-entry provisions of 7.2.1.5.7 as modified by 18.2.2.2.11.

18.2.2.2.11

The activation of manual fire alarm boxes shall not be required to unlock stair doors for re-entry.

Submitter Information Verification

Committee: SAF-HEA

Submittal Date: Thu Aug 18 14:46:13 EDT 2022

Committee Statement

Committee Statement: Healthcare occupancies have a balance between security and life safety. Ultimately life safety trumps security; however, manual means of bypassing the security protocol for re-entry should not be required. In the event of a stolen baby the criminal could easily pull the fire alarm and re-enter on a different floor.

Second Revision No. 6668-NFPA 101-2022 [Section No. 18.2.2.5.2]

18.2.2.5.2

The total number of exits and total egress capacity of the other exits (stairs, ramps, doors leading outside the building) shall not be reduced below one-third of that required for the entire area of the building.

Submitter Information Verification

Committee: SAF-HEA

Submittal Date: Fri Aug 26 16:23:48 EDT 2022

Committee Statement

Committee Statement: The revision is based on CI-6748. Prior to the 1997 edition of the Code, the Ch. 7 (then Ch. 5) horizontal exit criteria referred to substituting for required capacity and was silent on number of means of egress. In the 1997 edition, the Ch. 7 criteria was revised to include substituting for the required number of exits, but the health care chapters were not revised and continued to reference capacity only. Nothing in the technical committee documentation for the 1997 edition indicates the health care requirements were intended to be further revised. Based on the current language, every compartment formed by horizontal exits in health care occupancies must be provided with exits, other than horizontal exits, that accommodate at least 1/3 the required egress capacity and at least 1/2 of the required number of exits. The revision brings the health care horizontal exit criteria into alignment with Ch. 7.

Second Revision No. 6667-NFPA 101-2022 [Section No. 18.2.5.7.2.3(C)]

(C)*

Patient care sleeping suites greater than 7500 ft² (700 m²) gross floor area and not exceeding 10,000 ft² (930 m²) gross floor area shall be permitted where both of the following are provided in the suite:

- (1)* Direct visual supervision in accordance with 18.2.5.7.2.1(B)(1)
- (2) Total (complete) coverage automatic smoke detection in accordance with 9.6.2.9 and 18.3.4

A.18.2.5.7.2.3(C)

Direct supervision and total (complete) coverage smoke detection throughout the sleeping suite is depicted in Figure A.18.2.5.7.2.3(C).

Where a total (complete) coverage smoke detection is required by this Code, the provision of 9.6.2.9 requires detectors in all occupiable areas that are suitable for smoke detector operation. For example, an area subject to shower steam would not require a smoke detector, nor is smoke detection required in areas not subject to occupancy, such as closets, spaces above the ceiling, and the like.

Figure A.18.2.5.7.2.3(C) For Suites >7500 ft² (>700 m²), All Sleeping Rooms Must Be Provided with Direct Supervision by Staff and Total (Complete) Smoke Detection Installed Throughout the Sleeping Suite.

Submitter Information Verification

Committee: SAF-HEA

Submittal Date: Fri Aug 26 15:11:59 EDT 2022

Committee Statement

Committee Statement: The revision responds to CCN-41 and relocates former Fig. A.18.2.5.7.2.1(B)(c) as a new Fig. A.18.2.5.7.2.3(C).

Koffel, William E.

In response to Pete Larrimer's ballot comment, I would recommend that the one side of the room in question be changed to a glass partition. With respect to the privacy curtain issue, it should be noted that the diagram shows a solid wall between the smoke detector in the circulating space the room. Whereas the diagram is not to scale, one cannot easily determine if the smoke detector in the circulating space provides adequate protection with the solid wall between the detector and the space.

Larrimer, Peter A.

The drawing in Figure A.18.2.5.7.2.3(C) shows a smoke detector in one of the four patient rooms that have cubicle curtains with an open mesh top, while the other three rooms so not have a smoke detector shown inside the room. The smoke detector should be deleted from the one room that shows a smoke detector within to clarify that it is not needed and to be consistent with the other three patient rooms.

Widdekind, Michael D.

Affirmative with no Comment

Second Revision No. 6645-NFPA 101-2022 [Section No. 18.3.2.1.3]

18.3.2.1.3

The following areas shall be considered hazardous areas and shall be protected by smoke partitions in accordance with Section 8.4:

- (1) Laboratories employing flammable or combustible materials in quantities less than those that would be considered a severe hazard
- (2) Storage rooms larger than 50 ft² (4.6 m²) but not exceeding 100 ft² (9.3 m²) and storing combustible material
- (3)* Rooms used as sterile cores supporting operating rooms and anesthetizing areas unless all of the following conditions are met:
 - (a) Walls shall meet the requirements of 18.3.6.2 .
 - (b) Doors that separate the sterile core from the operating room or anesthetizing areas shall be equipped with self-closing or automatic-closing devices.
 - (c) Doors that separate the sterile core from the operating room or anesthetizing areas shall not be required to be equipped with latching devices.
 - (d) Egress shall be permitted from accessory spaces through the room.

A.18.3.2.1.3(3)

Sterile core rooms have a specific purpose in supporting OR functions. Equipment and items located in these rooms are intended to be staged for the daily activities of the OR. Positive latching should not be installed on doors that are intended to facilitate access into and out of the ORs by staff to limit the spread of infection.

Submitter Information Verification

Committee: SAF-HEA

Submittal Date: Fri Aug 19 14:47:08 EDT 2022

Committee Statement

Committee Statement: The revision incorporates the concept of sterile cores from CI-6726 as modified and ensures room doors either self or automatically close to ensure a fire is contained to the sterile core. These rooms are essential to the OR setting and infection control is paramount such that the doors that are needed to contain a fire need to be equipped with closing devices in lieu of latching hardware.

With the amount of equipment and supplies required to be accessible in the sterile core, sterile cores are hazardous areas and should remain as such.

Second Revision No. 6635-NFPA 101-2022 [Section No. 18.3.2.5.3]

18.3.2.5.3*

Within a smoke compartment, where residential or commercial cooking equipment is used to prepare meals for 30 or fewer persons, one cooking facility shall be permitted to be open to the corridor, provided that all of the following conditions are met:

- (1) The portion of the health care facility served by the cooking facility is limited to 30 beds and is separated from other portions of the health care facility by a smoke barrier constructed in accordance with 18.3.7.3, 18.3.7.6, and 18.3.7.8.
- (2) The cooktop or range is equipped with a range hood of a width at least equal to the width of the cooking surface, with grease baffles or other grease-collecting and clean-out capability.
- (3)* The hood systems have a minimum airflow of 500 cfm (14,000 L/min).
- (4) The hood systems that are not ducted to the exterior additionally have a charcoal filter to remove smoke and odor.
- (5) The cooktop or range complies with all of the following:
 - (a) The cooktop or range is protected with a fire suppression system listed in accordance with UL 300, *Fire Testing of Fire Extinguishing Systems for Protection of Commercial Cooking Equipment*, or is tested and meets all requirements of UL 300A, *Extinguishing System Units for Residential Range Top Cooking Surfaces*, in accordance with the applicable testing document's scope.
 - (b) A manual release of the extinguishing system is provided in accordance with Section 10.5 of NFPA 96.
 - (c) An interlock is provided to turn off all sources of fuel and electrical power to the cooktop or range when the suppression system is activated.
- (6)* The use of solid fuel for cooking is prohibited.
- (7) Deep-fat frying is prohibited
- (8) Portable fire extinguishers in accordance with NFPA 96 are located in all kitchen areas.
- (9)* A switch meeting all of the following is provided:
 - (a) A locked switch, or a switch located in a restricted location, is provided within the cooking facility that deactivates the cooktop or range.
 - (b) The switch is used to deactivate the cooktop or range whenever the kitchen is not under staff supervision.
 - (c) The switch is on a timer, not exceeding a 120-minute capacity, that automatically deactivates the cooktop or range, independent of staff action.
- (10) Procedures for the use, inspection, testing, and maintenance of the cooking equipment are in accordance with Chapter 11 of NFPA 96 and the manufacturer's instructions are followed.
- (11)* Not less than two AC-powered photoelectric smoke alarms with battery backup, interconnected in accordance with 9.6.2.10.4, and equipped with a silence feature are located not closer than 20 ft (6.1 m) and not further than 25 ft (7.6 m) from the cooktop or range.
- (12)* The smoke alarms required by 18.3.2.5.3(11) are permitted to be located outside the kitchen area where such placement is necessary for compliance with the 20 ft (7.6 m) minimum distance criterion.
- (13)* A single system smoke detector is permitted to be installed in lieu of the smoke alarms required in 18.3.2.5.3(11) provided the following criteria are met:
 - (a) The detector is located not closer than 20 ft (6.1 m) and not further than 25 ft (7.6 m) from the cooktop or range.
 - (b) The detector is permitted to initiate a local audible alarm signal only.
 - (c) The detector is not required to initiate a building-wide occupant notification signal.
 - (d) The detector is not required to notify emergency forces.

- (e) The local audible signal initiated by the detector is permitted to be silenced and reset by a button on the detector or by a switch installed within 10 ft (3.0 m) of the system smoke detector.
- (14) System smoke detectors that are required to be installed in corridors or spaces open to the corridor by other sections of this chapter are not used to meet the requirements of 18.3.2.5.3(11) and are located not closer than 25 ft (7.6 m) to the cooktop or range.
- (15) Carbon monoxide detectors are installed in accordance with 18.3.4.6.2(1).

Second Revision No. 6647-NFPA 101-2022 [New Section after 18.3.4.5]

18.3.4.6 Carbon Monoxide Detection.

18.3.4.6.1*

Carbon monoxide detection, where required by 18.3.4.6.2(1), shall be in accordance with Section 9.12.

A.18.3.4.6.1

The required location of carbon monoxide detectors is intended to be found in the scoping document, NFPA 101, under 18.3.4.6.2. The locations indicated in NFPA 72 are intended to be superseded by the NFPA 101 requirements.

18.3.4.6.2

Carbon monoxide detection shall be provided in the following locations:

- (1) Carbon monoxide detectors shall be installed on the ceilings of rooms containing permanently installed fuel-burning appliances, including fireplaces.
- (2) Carbon monoxide detectors shall be installed within 36 in. (910 mm) of the first supply air register from a permanently installed, fuel-burning HVAC system.

Submitter Information Verification

Committee: SAF-HEA

Submittal Date: Fri Aug 19 15:06:16 EDT 2022

Committee Statement

Committee Statement: The revision adds requirements for CO detection developed by the Task Group on CO Detection for Health Care Occupancies based on a review of loss data, incidents, and national requirements provided by a literature review conducted by the Fire Protection Research Foundation.

Bush, Kenneth E.

Both sides of a door opening must be kept clear in order to permit the operation and use of the door. However, there is no control on the placement of such materials against the walls of these rooms. The presence of combustibles directly adjacent to vented openings into egress corridors, which would now be permitted by this change, presents an unacceptable hazard by permitting the spread of smoke, heat, and other products of combustion directly into the means of egress

Widdekind, Michael D.

Louvers and door undercuts will permit more smoke to enter the corridor from a trash container fire originating in any of these rooms.

Second Revision No. 6639-NFPA 101-2022 [Section No. 18.4.3.2]

18.4.3.2

Smokeproof enclosures in accordance with 11.8.2.3 shall not be required in buildings ~~sprinkler~~ protected throughout by an approved, supervised automatic sprinkler system in accordance with 18.3.5.

Second Revision No. 6659-NFPA 101-2022 [New Section after 19.2.2.2.5.1]

19.2.2.2.5.2*

Door-locking arrangements shall be permitted where patient special needs require specialized protective measures for their safety in accordance with 19.2.2.2.5.3 or 19.2.2.2.5.4 .

A.19.2.2.2.5.2

Pediatric units, maternity units, and emergency departments are examples of areas where patients might have special needs that justify door locking. Door-locking arrangements should be permitted to reduce the risk of abduction of infants and children who are patients.

Submitter Information Verification

Second Revision No. 6660-NFPA 101-2022 [New Section after 19.2.2.2.5.2]

19.2.2.2.5.4

Door-locking arrangements in accordance with 19.2.2.2.5.2 shall be permitted where all of the following requirements are met:

- (1)* Doors can be remotely unlocked from within the locked area at an approved, normally attended location.

A.19.2.2.2.5.4(1) _

A location such as a nurse station is considered normally attended if it is an area steadily used by staff throughout the period the area contains patients and where, at a given time within that period, staff will generally be present. Uninterrupted physical staff presence at the location for the entire period is not required for the location to be normally attended.

- (2) Only one locking device is provided on each door.

- (3)* The smoke compartment containing the locked area, all adjacent smoke compartments on the floor, and all smoke compartments leading to the required exits from the locked area are protected throughout by an approved, supervised automatic sprinkler system in accordance with 19.3.5.7 .

A.19.2.2.2.5.4(3) _

The intent of this section is to ensure that for a given smoke compartment containing door-locking arrangements, all adjacent smoke compartments on the same floor, as well as those smoke compartments containing the means of egress from the secured area to the exits from the smoke compartment containing the locked area required by 19.2.4.4 , be protected throughout by an approved, supervised automatic sprinkler system.

- (4) The locks are electrical locks that fail safely to release upon loss of power to the device.
- (5) The locks release by activation of the automatic sprinkler system required by 19.2.2.2.5.4(3) .
- (6)* Door electrical locking hardware for new electric lock installations is listed for the purpose.

A.19.2.2.2.5.4(6) _

UL 294, *Access Control System Units* , and UL 1034, *Burglary-Resistant Electric Locking Mechanisms* , are two standards that provide criteria for listed door-locking hardware. The electrical locking hardware might be a component of an electrical locking system, or the electrical locking hardware might be a device with an individual listing.

Submitter Information Verification

Committee: SAF-HEA

Submittal Date: Thu Aug 25 15:39:49 EDT 2022

Committee Statement

Committee Statement: The revision was developed by a task group on health care door locking to recognize alternative means of providing security where patient special needs require specialized protective measures for their safety. The reference to UL standards in the annex provides guidance on selecting electrical locking hardware. The new A.19.2.2.5.4(3) responds to the correlating committee request for clarification on how to determine which compartments provide access to the required exits from the locked area.

The new 19.2.2.2.5.4 (3) is not enforceable. Either all smoke compartments on that floor should be protected by automatic sprinkler protection, or more specific wording proposed to clearly the required path of travel from the locked smoke compartment to identifiable exits.

Prediger, G. Brian

See SR-6655 comment.

Widdekind, Michael D.

All smoke compartments serving the means of egress shall be protected throughout by an approved, supervised automatic sprinkler system.

Second Revision No. 6661-NFPA 101-2022 [Section No. 19.2.2.2.5.2]

19.2.2.2.5.3

Door-locking arrangements in accordance with 19.2.2.2.5.2 shall be permitted where ~~patient special needs require specialized protective measures for their safety, provided that~~ all of the following requirements are met:

- (1) A ~~total (complete)~~ smoke detection system is provided throughout the locked ~~space area~~ in accordance with 9.6.2.9, ~~or locked doors can be remotely unlocked at an approved, constantly attended location within the locked space~~.
- (2) Staff can readily unlock doors at all times in accordance with 19.2.2.2.6.
- (3)* The smoke compartment containing the ~~secured locked~~ area, all adjacent smoke compartments on the floor, and all smoke compartments leading to the required exits from the ~~secured locked~~ area are protected throughout by an approved, supervised automatic sprinkler system in accordance with 19.3.5.7.

A.19.2.2.2.5.3(3)

The intent of this section is to ensure that for a given smoke compartment containing door-locking arrangements, all adjacent smoke compartments on the same floor, as well as those smoke compartments containing the means of egress from the secured area to the exits from the smoke compartment containing the locked area required by 19.2.4.4, be protected throughout by an approved, supervised automatic sprinkler system.

- (4) The locks are electrical locks that fail safely ~~so as~~ to release upon loss of power to the device.
- (5) The locks release by ~~independent~~ activation of ~~each of the following:~~ the smoke detection system required by 19.2.2.2.5.3(1).

~~Activation of the smoke detection system required by 19.2.2.2.5.4(2)~~

~~Waterflow in the automatic sprinkler system required by 19.2.2.2.5.4(3)~~

- (6) ~~Waterflow~~ The locks release by waterflow in the automatic sprinkler system required by 19.2.2.2.5.3(3).
- (7)* Door electrical locking hardware for new electric lock installations is listed for the purpose.

A.19.2.2.2.5.3

~~Pediatric units, maternity units, and emergency departments are examples of areas where patients might have special needs that justify door locking. Door locking arrangements should be permitted to reduce the risk of abduction of infants and children who are patients.~~

Widdekind, Michael D.

All smoke compartments serving the means of egress shall be protected throughout by an approved, supervised automatic sprinkler system.

Second Revision No. 6669-NFPA 101-2022 [Section No. 19.2.2.5.2]

19.2.2.5.2

The total number of exits and total egress capacity of the other exits (stairs, ramps, doors leading outside the building) shall not be reduced below one-third of that required for the entire area of the building.

Submitter Information Verification

Committee: SAF-HEA

Submittal Date: Fri Aug 26 16:26:52 EDT 2022

Committee Statement

Committee Statement: The revision is based on CI-6760. Prior to the 1997 edition of the Code, the Ch. 7 (then Ch. 5) horizontal exit criteria referred to substituting for required capacity and was silent on number of means of egress. In the 1997 edition, the Ch. 7 criteria was revised to include substituting for the required number of exits, but the health care chapters were not revised and continued to reference capacity only. Nothing in the technical committee documentation for the 1997 edition indicates the health care requirements were intended to be further revised. Based on the current language, every compartment formed by horizontal exits in health care occupancies must be provided with exits, other than horizontal exits, that accommodate at least 1/3 the required egress capacity and at least 1/2 of the required number of exits. The revision brings the health care horizontal exit criteria into alignment with Ch. 7.

Second Revision No. 6666-NFPA 101-2022 [Section No. 19.2.5.7.2.3]

19.2.5.7.2.3 Patient Care Sleeping Suite Maximum Size.

(A)

Patient care sleeping suites shall not exceed 5000 ft² (460 m²) gross floor area, unless otherwise provided in 19.2.5.7.2.3(B) or 19.2.5.7.2.3(C).

(B)*

Patient care sleeping suites shall not exceed 7500 ft² (700 m²) gross floor area where the suite is protected throughout by one of the following:

- (1) Approved electrically supervised sprinkler system in accordance with 19.3.5.7 and total (complete) coverage automatic smoke detection in accordance with 9.6.2.9 and 19.3.4
- (2) Approved electrically supervised sprinkler system protection complying with 19.3.5.8

A.19.2.5.7.2.3(B)

For patient sleeping suites having an area greater than 5000 ft² (460 m²) but not greater than 7500 ft² (700 m²), sprinkler protection is required throughout the suite and the supervision requirements of 19.2.5.7.2.1 also apply. Such protection might take the form of standard-response sprinklers in accordance with 19.3.5.7 or quick-response sprinklers in accordance with 19.3.5.8. Where standard-response sprinklers are used in accordance with 19.3.5.7, the suite must be protected by total (complete) automatic smoke detection [in accordance with 19.2.5.7.2.3(B)(1)] as depicted in Figure A.19.2.5.7.2.3(B).

Figure A.19.2.5.7.2.3(B) For Suites >5000 ft² (>460 m²) and ≤7500 ft² (≤700 m²) Protected by Standard Response Sprinklers, Total (Complete) Smoke Detection Required Throughout the Sleeping Suite.

(C)*

Patient care sleeping suites greater than 7500 ft² (700 m²) gross floor area; and not exceeding 10,000 ft² (930 m²) gross floor area; shall be permitted where all of the following are provided in the suite:

- (1)* Direct visual supervision in accordance with 19.2.5.7.2.1(B)(1)

A.19.2.5.7.2.3(C)(1)

The alternative of 19.2.5.7.2.1(B)(2)(1)(b) is not to be applied, since 19.2.5.7.2.3(C)(2) requires total coverage automatic smoke detection for the suite that exceeds 7500 ft² (700 m²) but does not exceed 10,000 ft² (930 m²).

- (2) Total (complete) coverage automatic smoke detection in accordance with 9.6.2.9 and 19.3.4
- (3) Approved electrically supervised sprinkler system protection complying with 19.3.5.8

A.19.2.5.7.2.3(C)

For patient sleeping suites having an area greater than 7500 ft² (700 m²), the suite must be protected by quick-response sprinklers in accordance with 19.3.5.8, direct supervision of all sleeping rooms must be provided by staff, and total (complete) coverage automatic smoke detection must be provided throughout the sleeping suite [in accordance with 19.2.5.7.2.3(C)] as depicted in Figure A.19.2.5.7.2.3(C).

Figure A.19.2.5.7.2.3(C) For Suites >7500 ft² (>700 m²), All Sleeping Rooms Must Be Provided with Direct Supervision by Staff and Total (Complete) Smoke Detection Installed Throughout the Sleeping Suite.

Koffel, William E.

In response to Pete Larrimer's ballot comment on SR-6667 (not this SR), I would recommend that the one side of the room in question be changed to a glass partition in Figure 19.2.5.2.7.3(C). With respect to the privacy curtain issue, it should be noted that the diagram shows a solid wall between the smoke detector in the circulating space the room. Whereas the diagram is not to scale, one cannot easily determine if the smoke detector in the circulating space provides adequate protection with the solid wall between the detector and the space.

Larrimer, Peter A.

The "Cubicle curtains w/open mesh top" designation should be removed from Figure A.19.2.5.7.2.3(B) since it is not used on the drawing.

Widdekind, Michael D.

Affirmative with no Comment

**Second Revision No. 6646-NFPA 101-2022 [Section No. 19.3.2.1.5]****19.3.2.1.5**

Hazardous areas shall include, but shall not be restricted to, the following:

- (1) Boiler and fuel-fired heater rooms
- (2) Central/bulk laundries larger than 100 ft² (9.3 m²)
- (3) Paint shops
- (4) Repair shops
- (5) Rooms with soiled linen in volume exceeding 64 gal (242 L)
- (6) Rooms with collected trash in volume exceeding 64 gal (242 L)
- (7) Rooms or spaces larger than 50 ft² (4.6 m²), including repair shops, used for storage of combustible supplies and equipment in quantities deemed hazardous by the authority having jurisdiction
- (8) Laboratories employing flammable or combustible materials in quantities less than those that would be considered a severe hazard
- (9)* Rooms used as sterile cores supporting operating rooms and anesthetizing areas unless all of the following conditions are met:
 - (a) Sterile core rooms shall be protected by an automatic extinguishing system in accordance with 9.7.1 .
 - (b) Walls shall meet the requirements of 19.3.6.3.2 .
 - (c) Doors that separate the sterile core from the operating room or anesthetizing areas shall be equipped with self-closing or automatic-closing devices.
 - (d) Doors that separate the sterile core from the operating room or anesthetizing areas shall not be required to be equipped with latching devices.
 - (e) Egress shall be permitted from accessory spaces through the room.

A.19.3.2.1.5(9)

Sterile core rooms have a specific purpose in supporting OR functions. Equipment and items located in these rooms are intended to be staged for the daily activities of the OR. Positive latching should not be installed on doors that are intended to facilitate access into and out of the ORs by staff to limit the spread of infection.

Submitter Information Verification

Committee: SAF-HEA

Submittal Date: Fri Aug 19 14:54:51 EDT 2022

Committee Statement

Committee Statement: The revision incorporates the concept of sterile cores from CI-6726 as modified and ensures room doors either self or automatically close to ensure a fire is contained to the sterile core. These rooms are essential to the OR setting and infection control is

paramount such that the doors that are needed to contain a fire need to be equipped with closing devices in lieu of latching hardware.

Prasad, Ajay V.

The proposed change assumes that equipment and items located in these rooms are intended to be staged but this is not stated as a requirement. The mandatory code text could cause enforcement issues. This new subsection does not send the reader back to the storage room provisions if items are within the space beyond "staging" which is also not described. Item 3 does not require compliance with Section 8.10. Reference to the corridor wall requirements of 19.3.6.3.2 is problematic as the corridor wall provisions require positive latching doors. If the sterile core is hazardous (i.e., doesn't meet Item 3), 19.3.2.1.2 requires smoke partitions in accordance with Section 8.10. Section 8.10 requires closers but not positive latching doors. What spaces are considered as accessory? Are control rooms or equipment rooms considered accessory? Is it the intent of item d to allow egress from the operating or anesthetizing room through the sterile core? The annex statement does not address this.

Widdekind, Michael D.

With the amount of equipment and supplies required to be accessible in the sterile core, sterile cores are hazardous areas and should remain as such.

Bush, Kenneth E.

Both sides of a door opening must be kept clear in order to permit the operation and use of the door. However, there is no control on the placement of such materials against the walls of these rooms. The presence of combustibles directly adjacent to vented openings into egress corridors, which would now be permitted by this change, presents an unacceptable hazard by permitting the spread of smoke, heat, and other products of combustion directly into the means of egress.

Widdekind, Michael D.

Louvers and door undercuts will permit more smoke to enter the corridor from a trash container fire originating in any of these rooms.

Second Revision No. 6662-NFPA 101-2022 [Section No. 19.7.9.2]

19.7.9.2

The Any alternative or interim means of egress from any area that remains occupied by building occupants required to be established in buildings or portions of buildings during construction, repair, or improvements alterations, or additions for building occupants other than construction workers shall be inspected daily for compliance with 7.1.10.1.

Second Revision No. 6649-NFPA 101-2022 [New Section after 20.3.4.4]

20.3.4.5 Carbon Monoxide Detection.

20.3.4.5.1*

Carbon monoxide detection, where required by 20.3.4.5.2, shall be in accordance with Section 9.12.

A.20.3.4.5.1

The required location of carbon monoxide detectors is intended to be found in the scoping document, NFPA 101, under 20.3.4.5.2. The locations indicated in NFPA 72 are intended to be superseded by the NFPA 101 requirements.

20.3.4.5.2

Carbon monoxide detection shall be provided in the following locations:

- (1) Carbon monoxide detectors shall be installed on the ceilings of rooms containing permanently installed fuel-burning appliances, including fireplaces.
- (2) Carbon monoxide detectors shall be installed within 36 in. (910 mm) of the first supply air register from a permanently installed, fuel-burning HVAC system.

Second Revision No. 6663-NFPA 101-2022 [Section No. A.18.2.5.7.2.1(B)]

A.18.2.5.7.2.1(B) 

Supervision of sleeping suites is accomplished by direct supervision by staff, smoke detection, or a combination of direct supervision and smoke detection. The following ~~three~~ two options are available for meeting the supervision requirements for patient sleeping suites having an area not exceeding 7500 ft² (700 m²):

- (1) Direct supervision of all sleeping rooms by staff from a normally attended location within the suite [in accordance with 18.2.5.7.2.1(B)(1)(a)]
- (2) Supervision of those sleeping rooms that can be directly supervised [in accordance with 18.2.5.7.2.1(B)(1)(a)] and smoke detection provided in the sleeping rooms that cannot be directly supervised [in accordance with 18.2.5.7.2.1(B)(1)(b)] as depicted in Figure A.18.2.5.7.2.1(B)

~~Total (complete) coverage smoke detection throughout the sleeping suite [in accordance with 18.2.5.7.2.1(B)(2)] as depicted in Figure A.18.2.5.7.2.1(B)(b)~~

~~Where the option for total (complete) coverage smoke detection is used, the provision of 9.6.2.9 requires detectors in all occupiable areas that are suitable for smoke detector operation. For example, an area subject to shower steam would not require a smoke detector.~~

~~For patient sleeping suites having an area greater than 7500 ft² (700 m²), both direct supervision by staff and total (complete) coverage smoke detection throughout the sleeping suite are required [in accordance with 18.2.5.7.2.3(G)] as depicted in Figure A.18.2.5.7.2.1(B)(c) :~~

The interior partitions or walls might extend full height to the ceiling, provided that they do not obscure visual supervision of the suite. Where they do obscure visual supervision, see 18.2.5.7.2.1(B)(2).

Figure A.18.2.5.7.2.1(B) All Sleeping Rooms Provided with Either ~~with~~ Direct Supervision by Staff or Smoke Detection.

Figure A.18.2.5.7.2.1(B)(b) ~~Supervision Provided by Total (Complete) Smoke Detection Throughout the Sleeping Suite.~~

Figure A.18.2.5.7.2.1(B)(c) For Suites >7500 ft² (>700 m²), All Sleeping Rooms Must Be Provided with Direct Supervision by Staff and Total (Complete) Smoke Detection Installed Throughout the Sleeping Suite.

Second Revision No. 6652-NFPA 101-2022 [Section No. A.19.3.6.3.5]

A.19.3.6.3.5

While it is recognized that closed doors serve to maintain tenable conditions in a corridor and adjacent patient rooms, such doors, which, under normal or fire conditions, are self-closing, might create a special hazard for the personal safety of a room occupant. Such closed doors might present a problem of delay in discovery, confining fire products beyond tenable conditions.

Because it is critical for responding staff members to be able to immediately identify the specific room involved, it is recommended that approved automatic smoke detection that is interconnected with the building fire alarm be considered for rooms having doors equipped with closing devices. Such detection is permitted to be located at any approved point within the room. When activated, the detector is required to provide a warning that indicates the specific room of involvement by activation of a fire alarm annunciator, nurse call system, or any other device acceptable to the authority having jurisdiction.

In existing buildings, use of the following options reasonably ensures that patient room doors will be closed and remain closed during a fire:

- (1) Doors should have positive latches, ~~and a~~ or as an alternative, the doors in a fire emergency become positively latched upon activation of an automatic smoke detector, provided the doors are also self-closing or automatic-closing. (see 18.3.6.3.6).
- (2) A suitable program that trains staff to close the doors in an emergency should be established.
- (3) It is the intent of the *Code* that no new installations of roller latches be permitted; however, repair or replacement of roller latches is not considered a new installation.
- (4) Doors protecting openings to patient sleeping or treatment rooms, or spaces having a similar combustible loading, might be held closed using a closer exerting a closing force of not less than 5 lbf (22 N) on the door latch stile.

**Public Comment No. 143-NFPA 101-2022 [New Section after 11.1.8]****11.1.9****Alcohol-Based-Hand-Rub Dispensers**

The installation and maintenance of alcohol-based hand-rub dispensers and the storage of alcohol-based hand rub solutions in accordance with 8.7.3.3 shall be permitted.

Statement of Problem and Substantiation for Public Comment

To address the TC concerns the section number has been modified to reflect the correct desired section number for this change and provide guidance for storage and use of alcohol based hand sanitizer with a pointer to section 8.7.3.3 that was not addressed in this chapter previously.

This is a necessary change because, our current health situation with the latest viral outbreak has led to an increased need to install alcohol based hand sanitizer within many different types of occupancies and high-rise buildings have special risk factors associated with them and are often mixed-use occupancies. Adding this pointer is consistent with the actions taken in First Draft by other NFPA 101 TC's to provide uniformity throughout the standard by including a pointer to the requirements related to ABHR dispensers and storage of ABHR replacement solutions that are found in Section 8.7.3.3 of this code

All new tent fabric shall comply with the requirements of Chapter 16 of NFPA 701 .

Submitter Information Verification

Committee: SAF-IND

Submittal Date: Wed Aug 11 08:57:29 EDT 2021

Committee Statement and Meeting Notes

Committee This will ensure that all newly installed tent fabrics have been tested to Chapter 16 of 701.

Statement: The PI was revised to make it applicable to only new fabric, so that it is not a

retroactive requirement.

Chapter 16 of NFPA 701, which addresses weathering requirements, is an optional section. However, it is important that the code contains a requirement that the fabrics have been assessed for weathering, to ensure that any flame retardant treatment is not easily washed away.

The committee also created CI-6686 and CI-6704 to consider and solicit public input on adding these requirements for other new fabric structures, including temporary and permanent membrane structures.

**Public Comment No. 135-NFPA 101-2022 [New Section after 40.2.5.3.2]****40.2.5.4 Interlocked-Door Vestibule**

In other than high-hazard occupancies, an interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress.

Additional Proposed Changes

<u>File Name</u>	<u>Description</u>	<u>Approved</u>
NFPA_101_Special_Locking_Arrangements_Interlocked_Door_Vestibule_Public_Comments_20200520.pdf	NFPA 101 2024 public comments re: interlocked door vestibule.	

Statement of Problem and Substantiation for Public Comment

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 21, 36, 37, 38, 39, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

For this occupancy, the proposal suggests interlocked-door vestibules would not be permitted in high-hazard industrial occupancies – the committee is encouraged to revise as appropriate.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

The criteria in proposed section 7.2.1.6.5 (via separate public comment) were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

John Woestman, BHMA

Black underscored text is original proposed revisions.
Red or blue formatted text are potential revisions for 2nd draft consideration.

Interlocked-Door Vestibule.

A compartment provided with doors in series where only one of the doors in series is openable at a time.

Reason:

This proposed definition is modeled after the definition of “sally port”, and along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 21, 36, 37, 38, 39, 40, and 42, offers the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

Chapter 7 Mean of Egress

7.2.1.6.5 Interlocked-Door Vestibule

Where permitted in chapters 11 through 43 with low- and ordinary-hazard contents, an interlocked-door vestibule shall be permitted in a the means of egress where there are provisions for continuous and unobstructed travel through the interlocked-door vestibule during an emergency egress condition.

Interlocked-door vestibules shall comply with all of the following:

1. The building shall be protected by an approved supervised automatic sprinkler system in accordance with Section 9.7.
2. The area served by the interlocked-door vestibule shall be protected by an approved supervised automatic fire detection system in accordance with Section 9.6 and shall utilize smoke detectors on each side of the interlocked doors.
3. An override switch, which disables the interlocks of the doors of the interlocked-door vestibule for not less than 30 seconds, shall be provided on the egress side of each door of the interlocked-door vestibule. The override switch may be omitted by approval of the Authority Having Jurisdiction.

Commented [WJ1]: Public Input No. 341-NFPA 101-2021

Commented [JW2]: Public Comment No. 126-NFPA 101-2022

Commented [WJ3]: Public Input No. 343-NFPA 101-2021

Commented [JW4]: Public Comment No. 125-NFPA 101-2022

4. The override switches shall be within 48 in. (1220 mm) of door and between 34 in. (865 mm) and 48 in. (1220 mm) above the floor.
5. Signage shall be provided at each override switch describing its operation.
6. Upon loss of power to the interlock function of the doors of the interlocked-door vestibule, the interlock function shall be disabled.
7. The interlocks of the doors of the interlocked-door vestibule shall deactivate by activation of the fire alarm when initiated by the automatic fire detection system or the automatic sprinkler system.
8. The egress path shall not pass through more than one interlocked-door vestibule.
9. The fire department with responsibility for responding to a building that contains an interlocked-door vestibule shall be notified of the presence of the interlocked-door vestibule.
10. Where permitted by the authority having jurisdiction, interlocked-door vestibules shall be permitted to serve high-hazard content areas.
11. Door electrical locking hardware for new installations shall be listed in accordance with UL 294, Access Control System Units, or UL 1034, Burglary-Resistant Locking Mechanisms.

Reason:

This proposal, along with complementary proposals in Chapters 18, 19, 20, 21, 36, 37, 38, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

An occupant egressing through an interlocked-door vestibule would be delayed at the second door in series if the first door in series is not in a closed position, and vice-versa.

The proposed criteria were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Potential Annex Note:

Outside of detention and correctional facilities, the commercial building equivalent of sally ports – interlocked-door vestibules - are utilized for security reasons (i.e. money handling rooms; and in health care), occupant protection, clinical needs of the patients, environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Interlocked-door vestibules are as the name implies: a vestibule with interlocked-doors. The door into the vestibule is interlocked with the door leading out of the vestibule such that only one of the doors can be open at a given time.

Requirement 3: an example of where interlock override switches may not be desired is where an interlocked-door vestibule is utilized to deter theft, such as a high-end precious gem business.

Visual indicators may be desirable on the egress side of each door to indicate when the door is in the locked status and when in the unlocked status. Visual indicators may be desirable in occupancies where some of the occupants are likely unfamiliar with interlocked-door vestibule, such as mercantile occupancies, or some health care occupancies.

These provisions for interlocked-door vestibules cannot address all potential uses and applications.

Chapter 18 New Health Care Occupancies

18.2.5.8 Interlocked-Door Vestibule

An interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress.

Reason:

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 19, 20, 21, 36, 37, 38, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

The criteria in proposed section 7.2.1.6.5 (via separate public comment) were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Chapter 21 Existing Ambulatory Health Care Occupancies

21.2.5.4 Interlocked-Door Vestibule

Commented [WJ11]: Public Input No. 350-NFPA 101-2021

Commented [JW12]: Public Comment No. 130-NFPA 101-2022

An interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress.

Reason:

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 36, 37, 38, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

The criteria is proposed section 7.2.1.6.5 (via separate public comment) were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Chapter 36 New Mercantile Occupancies

36.2.5.12 Interlocked-Door Vestibule

An interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress
where doors are not required to swing in the direction of egress travel.

Reason:

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 21, 37, 38, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

For this occupancy, this proposal suggests an interlocked-door vestibule should be permitted only where the occupant load of the area served does not require doors to swing in the direction of egress travel.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

Commented [WJ13]: Public Input No. 352-NFPA 101-2021

Commented [JW24]: Revisions to address TC reasons for resolution.

Chapter 40 Industrial Occupancies

40.2.5.4 Interlocked-Door Vestibule

In other than high-hazard occupancies, an interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress.

Reason:

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 21, 36, 37, 38, 39, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

For this occupancy, the proposal suggests interlocked-door vestibules would not be permitted in high-hazard industrial occupancies – the committee is encouraged to revise as appropriate.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

The criteria in proposed section 7.2.1.6.5 (via separate public comment) were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Commented [WJ25]: Public Input No. 358-NFPA 101-2021

Commented [JW26]: Public Comment No. 135-NFPA 101-2022

Chapter 42 Storage Occupancies

42.2.5.1 Interlocked-Door Vestibule

An interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress.

Reason:

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 21, 36, 37, 38, 39, and 40, offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Commented [WJ27]: Public Input No. 359-NFPA 101-2021

Commented [JW28]: Public Comment No. 136-NFPA 101-2022

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

The criteria in proposed section 7.2.1.6.5 (via separate public comment) were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Public Comment No. 198-NFPA 101-2022 [New Section after 40.3.4.3.4]

40.3.4.4 Carbon Monoxide Detection

40.3.4.4.1 New and existing industrial occupancies shall be provided with carbon monoxide detection and warning equipment in accordance with Section 9.12 in the locations specified as follows:

- (1) On the ceilings of rooms containing permanently installed fuel-burning appliances or fuel-burning fireplaces
- (2) Centrally located within occupiable spaces served by the first supply air register from permanently installed fuel-burning HVAC systems
- (3)* Centrally located within occupiable spaces adjacent to an attached garage

A.40.3.4.4.1(3) The intent is to require CO detectors in occupiable spaces immediately adjacent, vertically or horizontally, to attached garages, regardless of the presence of openings between the garage and the adjacent occupiable spaces. Other occupiable spaces that are not adjacent to the attached garage do not require CO detectors.

40.3.4.4.2 Carbon monoxide detectors as specified in 40.3.4.4.1 shall not be required in the following locations:

- (1) Garages
- (2) Occupiable spaces with attached garages that are open parking structures as defined in 3.3.282.8.4
- (3) Occupiable spaces with attached garages that are mechanically ventilated in accordance with the mechanical code

Statement of Problem and Substantiation for Public Comment

New and existing industrial occupancies currently lack requirements for CO detection in buildings with known CO hazards, including fuel-burning appliances. A CO source in any building that is not monitored by installed CO detection devices is a life safety hazard to occupants. Existing buildings arguably pose a higher risk of exposure due to aging gas appliances and ventilation systems. High level CO exposure carries the immediate risk of permanent brain injury and death. The addition of a requirement for CO detection for these occupancies will prevent deaths and injuries to occupants in the event of high level CO release within the building.

This public comment is submitted in support of committee action taken in the first revision phase to develop CO detection requirements for this occupancy chapter. The resubmission of the requirement that is currently in place for Chapter 12 is for example purpose only. If this proposed example is not considered adequate, the committee is urged to develop what it considers to be an adequate requirement. Similar action was taken by other 101 committees who created first revisions, committee input, or formed task groups to create CO detection requirements within their respective chapters (see page 7 of the Correlating Committee First Draft Meeting Minutes https://www.nfpa.org/assets/files/AboutTheCodes/101/101_A2023_SAF_AAC_FD_Minutes_1_22.pdf)

Please act to prevent further delay in getting this critical baseline life safety requirement in place to protect occupants of new and existing industrial occupancies.

“The lack of an operating alarm can be seen in several of these case studies. Carbon monoxide is colorless and odorless. Its early onset symptoms are not unique or severe, which leads to mistaking them for something else or thinking there is not a serious problem. These symptoms can quickly escalate to severe symptoms, which usually revolves around the victim becoming unconscious. People do not self-rescue when they are able, because they do not realize that they should. If someone does realize there is problem, it is most likely too late. This common sequence combined with CO’s toxicity, and a general negligence, makes CO a very dangerous problem that can happen almost anywhere. Detection is the only safeguard against this problem.”

Committee Statement

Committee Action: Rejected
Resolution: The location of CO detectors should be in accordance with NFPA 72. Additionally, is not clear what is meant by "centrally located".

Public Comment No. 110-NFPA 101-2022 [Section No. 40.3.5]

40.3.5 Extinguishment Requirements.

Where installed, new automatic sprinkler systems shall be in accordance with 9.7.1 and electrically supervised in accordance with 9.7.2.

Statement of Problem and Substantiation for Public Comment

Industrial and storage buildings are often built with special purpose exceptions. Building codes and the life safety code allow height and area exceptions because operations and processes often dictates construction that is unconventional. Storage and warehousing are allowed unlimited areas because they have fire sprinkler systems installed throughout. Often, these increases were allowed due to fire sprinkler systems.

Requiring electrical supervision for all initiating devices (tamper and waterflow) would not require full fire alarm systems to be installed for industrial and storage buildings. Only dedicated function systems are installed as is currently for waterflow switches.

Committee Statement

Committee Action: Rejected but see related SR
Resolution: SR-6613-NFPA 101-2022
Statement: The committee agrees that where sprinklers systems are installed voluntarily, such as for property protection, that there should be no difference from such an installation to where they are required or mandatory in other provisions in order to ensure fire and life safety.

Public Comment No. 194-NFPA 101-2022 [Section No. 40.3.5]

40.3.5 Extinguishment Requirements.

40.3.5.1 Where installed, automatic sprinkler systems shall be in accordance with 9.7.1.

40.3.5.2 Portable fire extinguishers shall be provided in accordance with Section 9.9.

Statement of Problem and Substantiation for Public Comment

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Under the Scope of the Life Safety Code, Subsection 1.1.2 entitled, "Danger to Life from Fire," the Code states the following: "The Code addresses those construction, protection, and occupancy features necessary to minimize danger to life from the effects of fire, including smoke, heat, and toxic gases created during a fire." Further, it states in Subsection 1.1.4 entitled, "Other Fire-Related Considerations," the following: "The Code addresses other considerations that are essential to life safety in recognition of the fact that life safety is more than a matter of egress. The Code also addresses protective features and systems, building services, operating features, maintenance activities, and other provisions in recognition of the fact that achieving an acceptable degree of life safety depends on additional safeguards to provide adequate egress time or protection for people exposed to fire."

Studies of building fires indicate that occupants typically exhibit altruistic behavior toward others. Human response to a threatening situation might follow one of a variety of behaviors. Individuals might choose to investigate, sound an alarm, assist with rescue, seek help, or flee. Such actions constitute normal behavior, even when taken collectively. Most people avoid direct contact with a fire while undertaking another action.

There is a fundamental discrepancy between official/policy assumptions and the public in relation to priorities in the event of a fire. Government and professionals focus on avoiding injuries and see that as the sole aspiration, in the pursuit of which everything else is secondary. In contrast, the public have a wide and largely unrecognized range of priorities when encountering a fire, based on their individual circumstances. These include: the avoidance of embarrassment/inconvenience; mitigating the impact of damage to the property, e.g. avoiding the risk of being unable to remain in their place of business; and their concern for the wellbeing of other people. Each are invested by different aspirations in the fire safety ecosystem.

A desire to achieve their self-appointed tasks is a strong motivation for the public's behavior when encountering a fire. For most, this will involve an active response of on average five actions, although for some it will be as many as 11. This includes investigating the initial cues and tackling the fire, often using improvised means. They are usually successful in doing so, with 70% to 80% of fires dealt with by the public without requiring professional assistance. It is important to note that in doing so, they are willingly acting against official advice and are not being coerced into this. The evidence shows the public to be effective and capable in tackling fires, even in the absence of any professional support, or often without specialized equipment. This is supported by the pioneering studies of the public experience of dwelling fires undertaken by Bryan (1977) and Wood (1972) in the USA and UK, respectively. Their studies supported by their findings that the public did undertake a range of self-appointed tasks including investigating and tackling fires. Recent studies have confirmed similar findings and these behaviors appear consistent over time.

The evidence further identifies that the public is willing and will accept minor consequences in their pursuit of achieving personal humanistic priorities and instinct. Concern for people, pets and possessions are strong and established drivers of behavior in the event of a fire. Therefore, this should be no surprise to see it as an influential feature of most individual's response to a fire.

2013 NFPA Report: "U.S. Experience with Sprinklers" reports that there were 48,460 reported structure fires annually in buildings equipped with sprinkler systems between 2007-2011, and 40,440 (83 percent) never grew large enough to activate the system. Based on this report alone, it's clear that people are reacting to small fires and extinguishing them

prior to sprinkler activation. Limiting a fire to the smallest area within a building is a sensible aspiration.

A 2003 UK survey found that across all categories of location, extinguishers were successful in extinguishing 79.9% of fires. Note: Private houses accounted for only 3.3% of extinguisher use. It reported that 58.6% were operated by trained staff, 36.4% were operated by untrained staff and in 5% of incidents, this was unknown.

Data from the National Association of Fire Equipment Distributors (NAFED) provides even more robust validation of the influence of fire extinguishers as used by 'ordinary civilians. Their research and data indicate, "Of 13,221 fire incidents reported, portable fire extinguishers successfully extinguished 12,505 fires (95%)." (NAFED 2010: 2) The combined results of the 34 years of data are based on the performance of 32,756 fire extinguishers used on 13,453 incidents.

Fortunately, most people encountering a fire will avoid any injury or will be exposed to a low, and often considered risk of a minor injury at worst. This is not a matter of luck but due to a combination of their own abilities and to the low level of risk presented by most fires individuals would choose to fight at the incipient stage. A 2015 study identified that there was a disconnect between the fire service/government and the public in terms of what they referred to as 'risk tolerance'. This was most evident in attitude to injuries. Official policy seems to place avoidance of any injury as its highest priority and assumes this to also be the public's main motivation and enough to dictate any response to the discovery of a fire. However, the same study found that almost all those who incurred a minor injury accepted it as a reasonable cost in relation to pursuing or achieving their personal priorities. Further, they stated, in hindsight, they would do the same again.

It should be noted that numerous every day and discretionary activities carry similar or higher levels of risk to those resulting from using an extinguisher. Do-It-Yourself and sport for example are frequently responsible for injuries or even fatalities. In response, the government and industry seek to help make products safer or provide advice. This is preferred to denying people the option to participate in either activity by withdrawing public access to tools or sports equipment. The benefits achieved by the public using extinguishers are significant, given the potential for a fire to otherwise lead to detrimental and life-changing outcomes. A low and calculated level of personal risk willingly accepted by an individual tackling a fire can avoid, or reduce, a much higher risk to others should they ignore the fire and allow it to develop. Where current guidance discourages the provision of extinguishers in public spaces, this policy is neither supported by the evidence or justifiable through a consensus from the public. Rather it is imposed on them and is inconsistent with other approaches to public health.

The fire service's response time to structure fires has increased significantly over the past 25 years for several reasons like traffic, infrastructures, and lately staffing. Hence, the ability for the early interventions of the public are likely to be the most significant determinant of the outcome of a fire event. Most people do respond appropriately, and the literature confirms that they do not panic. Typically, most people are at risk of a minor injury at worst, due to the low risk from the fire and their own ability to assess and act in accordance with the situation.

A significant amount of data has been collected to support the requirement for portable extinguishers, including: WPI/EKU Study: "Ordinary People and the Effective Operation of Fire Extinguishers", which clearly showed that the vast majority of people who have never used an extinguisher can operate one safely and effectively. This willingness of the public to accept minor injuries to protect individuals, the facility or their personal property is supported by literature and data and shows these to be well established behaviors which policy makers need to work with, rather than against. Reflecting official policy, national and local fire safety messaging has, for some time, urged the public, on discovering a fire in the home, to "Get out, stay out", "Don't put yourself at risk" and "Leave it to the professionals." This paternalistic messaging confirms the government policy makers and fire services' belief that a professional response is the only intervention capable of safely tackling fires. Again, this starkly contrasts with the reality that between 70% and 80% of dwelling fires are tackled effectively and at low risk, by the public. The policy also fails to accord with the public who have been shown to be tolerant, or accepting, of the incurrence of minor injuries in pursuit of their personal priorities.

Surveys from the National Association of Fire Equipment Distributors (NAFED) in America reveals the same trend of public firefighting, with even higher percentages not needing the fire service. "In both the 1979 and 1985 surveys, the fire department was only called for 13% of the reported fires. In the 1996 survey, the fire department was called in 24% of the reported fires. However, in the 2010 survey the number dropped to 17% of the time'. And 'These results are not unique to NAFED surveys. A 1978 publication by the U.S. Department of Commerce stated that about 90% of fires in households are not reported, based on their survey of 33,000 fires." (NAFED, 2010: 9)

The public are likely to encounter a fire that is relatively small and often contained to the item first ignited. They are often the ones present when fire starts. In summary, there is a significant difference between official assumptions/guidance and actual public behavior. However, the government and FRS seek to deter this behavior, and, in singularly promoting there, "Get out" message," and remove the simple yet potential life saving devices in sprinklered buildings.

A recent study also showed that the public do not just get out, with 49% never leaving the property during the fire. While this may surprise or concern many professionals, it is likely to be explained by a difference between the fire as perceived by professionals and the lived experience of the public. There is nothing to suggest that the public routinely take unnecessary risks. A more likely explanation is that the fire was small and not sufficiently well-developed to pose an imminent injury or life threat. As such, they were able to remain in the premises safely and relatively comfortably, which is supported by the evidence in relation to the majority of fires not spreading beyond the item first ignited or the room of origin. Inclement weather or other factors may also make remaining in the premises a safer or more comfortable option. Fires, like other emergencies, must also be understood in human terms.

The concept of trading off portable extinguishers in sprinklered buildings has been largely abandoned by fire protection principles. NFPA 10 states in subsection 5.1.2, "The selection of extinguishers shall be independent of whether the building is equipped with automatic sprinklers, standpipe and hose, or other fixed protection equipment." Other codes, and other occupancy chapters have abandoned this concept in recognition of the fact that portable extinguishers are a valuable, cost-effective layer of fire protection, and are intended for a different purpose than sprinklers. Recognition of the valuable role of extinguishers came from a 2003 report which concluded, 'Fire extinguishers are designed to prevent relatively minor incidents becoming major conflagrations.' It is, of course, difficult to prove how many and which fires would have developed to pose a serious risk if not tackled and contained early on. Events such as the Grenfell fire are a reminder of the consequences when this happens.

The National Fire Codes of both NFPA and the ICC require portable fire extinguishers in all occupancy classes including storage which addresses property protection and property loss as well as, the safety of the building occupants. Fire safety is grounded in the engineering discipline which brings many strengths to codes requirements, but it is insufficient, and fire safety effectiveness is limited by ignoring the social sciences of human behavior. It is important to appreciate that while different to official assumptions and desire for evacuation, research shows the public's priorities to be rational and appropriate. The public's experience of fire is vastly different to that of the professionals involved in the planning for and responding to fire.

Official policy and attitudes of the Technical Committee are most singularly directed at avoiding the risk when the public encounters a fire. This is well meaning but the research has shown that this DOES NOT I REPEAT DOES NOT align with the public's attitude or the ability of the general public. The belief that 'undesirable' behavior can be changed by advice, campaigns or other measures has been shown to be inaccurate. The paternalistic approach by which government and the building safety regulatory sector seek to change human behavior by removing proven and effective appliances such as portable fire extinguishers is WRONG. However, the building safety regulatory sector continue this approach despite the evidence that public behaviors are safe, effective, and largely unaltered by current guidance and campaigns rather than providing appropriate safety devices for use by the public. A portable fire extinguisher is an effective item of fire protection which allows for small fires to be tackled by the occupants of a building and saves 100s of thousands of dollars in property loss.

Concerns have been indicted regarding the requirement for training. Training in the use of extinguishers is an important issue and one in which opinion appears more influential than the evidence. Whether purchased for a private dwelling or provided through regulatory processes, there is no mandatory requirement for training to use an extinguisher, and studies do not reveal training to be a requirement for their safe or effective use. In fact, the available data and studies demonstrate the opposite to be the case.

The Technical Committee should also note that portable fire extinguishers are designed for the novice user. Although, training is recommended for proper use and technique and is wide available through a variety of resources including at online training; there are no specified training requirements even under OSHA unless that is an assigned duty employee by the employer. The proposed requirement is intended as a provision for layered fire protection for the general public and employees for general safety.

Although there is limited data available related to extinguisher use since the removal of portable fire extinguishers in the NIFRS data field, there is little to no data supporting the removal of portable fire extinguishers and sole reliance on building fire sprinkler systems. Limiting a fire to the smallest area within a building is a sensible aspiration.

Cost has been another point of contention. A study by Richard Bukowski in 2014, the life cycle cost of portable fire extinguishers was determined to be between one and a half and four cents per foot annually; if coverage could be maximized to that allowable by code, the cost drops to between a half cent and one cent per foot annually. It's unlikely that any other layer of fire protection is so cost-effective.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Committee Statement

Committee Action: Rejected
Resolution: Requirements for portable fire extinguishers should not be in NFPA 101 as they are not life safety equipment, but should be in building and fire codes. Additionally, this PC does not include any requirements for training of staff on the use of portable fire extinguishers.

Public Comment No. 195-NFPA 101-2022 [Section No. 40.3.5]

40.3.5 Extinguishment Requirements.

40.3.5.1 Where installed, automatic sprinkler systems shall be in accordance with 9.7.1.

40.3.5.2 Portable fire extinguishers shall be provided in accordance with Section 9.9, unless permitted by the following:

- (1) Portable fire extinguishers shall be permitted to be located in staff locations only.
- (2) Access to portable fire extinguishers shall be permitted to be locked.

Statement of Problem and Substantiation for Public Comment

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Under the Scope of the Life Safety Code, Subsection 1.1.2 entitled, "Danger to Life from Fire," the Code states the following: "The Code addresses those construction, protection, and occupancy features necessary to minimize danger to life from the effects of fire, including smoke, heat, and toxic gases created during a fire." Further, it states in Subsection 1.1.4 entitled, "Other Fire-Related Considerations," the following: "The Code addresses other considerations that are essential to life safety in recognition of the fact that life safety is more than a matter of egress. The Code also addresses protective features and systems, building services, operating features, maintenance activities, and other provisions in recognition of the fact that achieving an acceptable degree of life safety depends on additional safeguards to provide adequate egress time or protection for people exposed to fire."

Studies of building fires indicate that occupants typically exhibit altruistic behavior toward others. Human response to a threatening situation might follow one of a variety of behaviors. Individuals might choose to investigate, sound an alarm, assist with rescue, seek help, or flee. Such actions constitute normal behavior, even when taken collectively. Most people avoid direct contact with a fire while undertaking another action.

There is a fundamental discrepancy between official/policy assumptions and the public in relation to priorities in the event of a fire. Government and professionals focus on avoiding injuries and see that as the sole aspiration, in the pursuit of which everything else is secondary. In contrast, the public have a wide and largely unrecognized range of priorities when encountering a fire, based on their individual circumstances. These include: the avoidance of embarrassment/inconvenience; mitigating the impact of damage to the property, e.g. avoiding the risk of being unable to remain in their place of business; and their concern for the wellbeing of other people. Each are invested by different aspirations in the fire safety ecosystem.

A desire to achieve their self-appointed tasks is a strong motivation for the public's behavior when encountering a fire. For most, this will involve an active response of on average five actions, although for some it will be as many as 11. This includes investigating the initial cues and tackling the fire, often using improvised means. They are usually successful in doing so, with 70% to 80% of fires dealt with by the public without requiring professional assistance. It is important to note that in doing so, they are willingly acting against official advice and are not being coerced into this. The evidence shows the public to be effective and capable in tackling fires, even in the absence of any professional support, or often without specialized equipment. This is supported by the pioneering studies of the public experience of dwelling fires undertaken by Bryan (1977) and Wood (1972) in the USA and UK, respectively. Their studies supported by their findings that the public did undertake a range of self-appointed tasks including investigating and tackling fires. Recent studies have confirmed similar findings and these behaviors appear consistent over time.

The evidence further identifies that the public is willing and will accept minor consequences in their pursuit of achieving personal humanistic priorities and instinct. Concern for people, pets and possessions are strong and established drivers of behavior in the event of a fire. Therefore, this should be no surprise to see it as an influential feature of most individual's response to a fire.

2013 NFPA Report: "U.S. Experience with Sprinklers" reports that there were 48,460 reported structure fires annually in buildings equipped with sprinkler systems between 2007-2011, and 40,440 (83 percent) never grew large enough to activate the system. Based on this report alone, it's clear that people are reacting to small fires and extinguishing them prior to sprinkler activation. Limiting a fire to the smallest area within a building is a sensible aspiration.

A 2003 UK survey found that across all categories of location, extinguishers were successful in extinguishing 79.9% of fires. Note: Private houses accounted for only 3.3% of extinguisher use. It reported that 58.6% were operated by trained staff, 36.4% were operated by untrained staff and in 5% of incidents, this was unknown.

Data from the National Association of Fire Equipment Distributors (NAFED) provides even more robust validation of the influence of fire extinguishers as used by 'ordinary civilians. Their research and data indicate, "Of 13,221 fire incidents reported, portable fire extinguishers successfully extinguished 12,505 fires (95%)." (NAFED 2010: 2) The combined results of the 34 years of data are based on the performance of 32,756 fire extinguishers used on 13,453 incidents.

Fortunately, most people encountering a fire will avoid any injury or will be exposed to a low, and often considered risk of a minor injury at worst. Submittal Date: Sat May 28 18:45:21 EDT 2022
Committee: SAF-IND

Committee Statement

Committee Action: Rejected
Resolution: Requirements for portable fire extinguishers should not be in NFPA 101 as they are not life safety equipment, but should be in building and fire codes. Additionally, this PC does not include any requirements for training of staff on the use of portable fire extinguishers. Portable fire extinguishers are for use in the incipient phase of a fire. Locating portable fire extinguishers in industrial occupancies with high hazard contents at a distance away from the high hazard contents could pose a life safety hazard for personnel attempting to use the fire extinguisher.

**Public Comment No. 231-NFPA 101-2022 [New Section after 40.7.2]****TITLE OF NEW CONTENT****40.7.3 Modular Rooms****40.7.3.1**

Modular rooms installed in indoor locations shall comply with Section 10.7.

40.7.3.2*

Where provided in areas covered by an occupant notification system, the audible and visible signals shall extend into the interior of the modular room.

A.40.7.3.2

Extending the audible and visible signals into the interior does not necessarily mean additional devices need to be installed. Where occupant notification systems installed to serve the area where the modular booth is to be located provide the required audible and visible signals within the modular booth additional devices are not necessary. If the occupant notification systems installed to serve the area where the modular booth is to be located do not provide the required audible and visible signals, then additional devices would be required to be installed within the modular booth.

Statement of Problem and Substantiation for Public Comment

: The Committee Statement for the resolution of Public Input No. 313 stated that the committee was unclear if this proposed requirement applied to modular rooms that were being manufactured in the industrial occupancy. The requirements in this PC are intended to apply to modular rooms that are installed in an industrial facility such as a lactation booth, private office, or conference room. This public comment simplifies the intent of Public Input No. 313 that where modular rooms are installed in areas covered by an occupant notification system the audible and visible signals must extend into the interior of the modular room. This public comment uses similar language to that approved with FR-6632 that created a new Section 36.4.4.12, 36.4.4.12.1 and 36.4.4.12.2. A new Annex section was added to clarify that extending the audible and visible signals into the interior of the modular does not necessary require the installation of a device in the interior of the modular room.

Committee: SAF-IND

Committee Statement

Committee Action: Rejected

Resolution: This public comment does not address industrial processes occurring within modular rooms. The use of modular rooms for industrial processes introduces potential life safety hazards which are not addressed by the public comment not have been reviewed by the technical committee. The use of these spaces for office space or other uses can be addressed by utilizing the provisions for the applicable occupancy.

**Public Comment No. 136-NFPA 101-2022 [New Section after 42.2.5]****42.2.5.1 Interlocked-Door Vestibule**

An interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress.

Statement of Problem and Substantiation for Public Comment

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 21, 36, 37, 38, 39, and 40, offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

The criteria in proposed section 7.2.1.6.5 (via separate public comment) were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Public Comment No. 196-NFPA 101-2022 [Section No. 42.3.5]

42.3.5 Extinguishment Requirements.- (Reserved)

Portable fire extinguishers shall be provided in accordance with Section 9.9

Statement of Problem and Substantiation for Public Comment

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Under the Scope of the Life Safety Code, Subsection 1.1.2 entitled, "Danger to Life from Fire," the Code states the following: "The Code addresses those construction, protection, and occupancy features necessary to minimize danger to life from the effects of fire, including smoke, heat, and toxic gases created during a fire." Further, it states in Subsection 1.1.4 entitled, "Other Fire-Related Considerations," the following: "The Code addresses other considerations that are essential to life safety in recognition of the fact that life safety is more than a matter of egress. The Code also addresses protective features and systems, building services, operating features, maintenance activities, and other provisions in recognition of the fact that achieving an acceptable degree of life safety depends on additional safeguards to provide adequate egress time or protection for people exposed to fire."

Studies of building fires indicate that occupants typically exhibit altruistic behavior toward others. Human response to a threatening situation might follow one of a variety of behaviors. Individuals might choose to investigate, sound an alarm, assist with rescue, seek help, or flee. Such actions constitute normal behavior, even when taken collectively. Most people avoid direct contact with a fire while undertaking another action.

There is a fundamental discrepancy between official/policy assumptions and the public in relation to priorities in the event of a fire. Government and professionals focus on avoiding injuries and see that as the sole aspiration, in the pursuit of which everything else is secondary. In contrast, the public have a wide and largely unrecognized range of priorities when encountering a fire, based on their individual circumstances. These include: the avoidance of embarrassment/inconvenience; mitigating the impact of damage to the property, e.g. avoiding the risk of being unable to remain in their place of business; and their concern for the wellbeing of other people. Each are invested by different aspirations in the fire safety ecosystem.

A desire to achieve their self-appointed tasks is a strong motivation for the public's behavior when encountering a fire. For most, this will involve an active response of on average five actions, although for some it will be as many as 11. This includes investigating the initial cues and tackling the fire, often using improvised means. They are usually successful in doing so, with 70% to 80% of fires dealt with by the public without requiring professional assistance. It is important to note that in doing so, they are willingly acting against official advice and are not being coerced into this. The evidence shows the public to be effective and capable in tackling fires, even in the absence of any professional support, or often without specialized equipment. This is supported by the pioneering studies of the public experience of dwelling fires undertaken by Bryan (1977) and Wood (1972) in the USA and UK, respectively. Their studies supported by their findings that the public did undertake a range of self-appointed tasks including investigating and tackling fires. Recent studies have confirmed similar findings and these behaviors appear consistent over time.

The evidence further identifies that the public is willing and will accept minor consequences in their pursuit of achieving personal humanistic priorities and instinct. Concern for people, pets and possessions are strong and established drivers of behavior in the event of a fire. Therefore, this should be no surprise to see it as an influential feature of most individual's response to a fire.

2013 NFPA Report: "U.S. Experience with Sprinklers" reports that there were 48,460 reported structure fires annually in buildings equipped with sprinkler systems between 2007-2011, and 40,440 (83 percent) never grew large enough to activate the system. Based on this report alone, it's clear that people are reacting to small fires and extinguishing them prior to sprinkler activation. Limiting a fire to the smallest area within a building is a sensible aspiration.

A 2003 UK survey found that across all categories of location, extinguishers were successful in extinguishing 79.9% of fires. Note: Private houses accounted for only 3.3% of extinguisher use. It reported that 58.6% were operated by trained staff, 36.4% were operated by untrained staff and in 5% of incidents, this was unknown.

Data from the National Association of Fire Equipment Distributors (NAFED) provides even more robust validation of the influence of fire extinguishers as used by 'ordinary civilians'. Their research and data indicate, "Of 13,221 fire incidents reported, portable fire extinguishers successfully extinguished 12,505 fires (95%)." (NAFED 2010: 2) The combined results of the 34 years of data are based on the performance of 32,756 fire extinguishers used on 13,453 incidents.

Fortunately, most people encountering a fire will avoid any injury or will be exposed to a low, and often considered risk of a minor injury at worst. This is not a matter of luck but due to a combination of their own abilities and to the low level of risk presented by most fires individuals would choose to fight at the incipient stage. A 2015 study identified that there was a disconnect between the fire service/government and the public in terms of what they referred to as 'risk tolerance'. This was most evident in attitude to injuries. Official policy seems to place avoidance of any injury as its highest priority and assumes this to also be the public's main motivation and enough to dictate any response to the discovery of a fire. However, the same study found that almost all those who incurred a minor injury accepted it as a reasonable cost in relation to pursuing or achieving their personal priorities. Further, they stated, in hindsight, they would do the same again.

It should be noted that numerous every day and discretionary activities carry similar or higher levels of risk to those resulting from using an extinguisher. Do-It-Yourself and sport for example are frequently responsible for injuries or even fatalities. In response, the government and industry seek to help make products safer or provide advice. This is preferred to denying people the option to participate in either activity by withdrawing public access to tools or sports equipment. The benefits achieved by the public using extinguishers are significant, given the potential for a fire to otherwise lead to detrimental and life-changing outcomes. A low and calculated level of personal risk willingly accepted by an individual tackling a fire can avoid, or reduce, a much higher risk to others should they ignore the fire and allow it to develop. Where current guidance discourages the provision of extinguishers in public spaces, this policy is neither supported by the evidence or justifiable through a consensus from the public. Rather it is imposed on them and is inconsistent with other approaches to public health.

The fire service's response time to structure fires has increased significantly over the past 25 years for several reasons like traffic, infrastructures, and lately staffing. Hence, the ability for the early interventions of the public are likely to be the most significant determinant of the outcome of a fire event. Most people do respond appropriately, and the literature confirms that they do not panic. Typically, most people are at risk of a minor injury at worst, due to the low risk from the fire and their own ability to assess and act in accordance with the situation.

A significant amount of data has been collected to support the requirement for portable extinguishers, including: WPI/EKU Study: "Ordinary People and the Effective Operation of Fire Extinguishers", which clearly showed that the vast majority of people who have never used an extinguisher can operate one safely and effectively. This willingness of the public to accept minor injuries to protect individuals, the facility or their personal property is supported by literature and data and shows these to be well established behaviors which policy makers need to work with, rather than against. Reflecting official policy, national and local fire safety messaging has, for some time, urged the public, on discovering a fire in the home, to "Get out, stay out", "Don't put yourself at risk" and "Leave it to the professionals." This paternalistic messaging confirms the government policy makers and fire services' belief that a professional response is the only intervention capable of safely tackling fires. Again, this starkly contrasts with the reality that between 70% and 80% of dwelling fires are tackled effectively and at low risk, by the public. The policy also fails to accord with the public who have been shown to be tolerant, or accepting, of the incurrence of minor injuries in pursuit of their personal priorities.

Surveys from the National Association of Fire Equipment Distributors (NAFED) in America reveals the same trend of public firefighting, with even higher percentages not needing the fire service. "In both the 1979 and 1985 surveys, the fire department was only called for 13% of the reported fires. In the 1996 survey, the fire department was called in 24% of the reported fires. However, in the 2010 survey the number dropped to 17% of the time". And "These results are not unique to NAFED surveys. A 1978 publication by the U.S. Department of Commerce stated that about 90% of fires in households are not reported, based on their survey of 33,000 fires." (NAFED, 2010: 9)

The public are likely to encounter a fire that is relatively small and often contained to the item first ignited. They are often the ones present when fire starts. In summary, there is a significant difference between official assumptions/guidance and actual public behavior. However, the government and FRS seek to deter this behavior, and, in singularly promoting there, "Get out" message," and remove the simple yet potential life saving devices in sprinklered buildings.

A recent study also showed that the public do not just get out, with 49% never leaving the property during the fire. While this may surprise or concern many professionals, it is likely to be explained by a difference between the fire as perceived by professionals and the lived experience of the public. There is nothing to suggest that the public routinely take unnecessary risks. A more likely explanation is that the fire was small and not sufficiently well-developed to pose an imminent injury or life threat. As such, they were able to remain in the premises safely and relatively comfortably, which is supported by the evidence in relation to the majority of fires not spreading beyond the item first ignited or the room of origin. Inclement weather or other factors may also make remaining in the premises a safer or more comfortable option. Fires, like other emergencies, must also be understood in human terms.

The concept of trading off portable extinguishers in sprinklered buildings has been largely abandoned by fire protection

principles. NFPA 10 states in subsection 5.1.2, "The selection of extinguishers shall be independent of whether the building is equipped with automatic sprinklers, standpipe and hose, or other fixed protection equipment." Other codes, and other occupancy chapters have abandoned this concept in recognition of the fact that portable extinguishers are a valuable, cost-effective layer of fire protection, and are intended for a different purpose than sprinklers. Recognition of the valuable role of extinguishers came from a 2003 report which concluded, 'Fire extinguishers are designed to prevent relatively minor incidents becoming major conflagrations.' It is, of course, difficult to prove how many and which fires would have developed to pose a serious risk if not tackled and contained early on. Events such as the Grenfell fire are a reminder of the consequences when this happens.

The National Fire Codes of both NFPA and the ICC require portable fire extinguishers in all occupancy classes including storage which addresses property protection and property loss as well as, the safety of the building occupants. Fire safety is grounded in the engineering discipline which brings many strengths to codes requirements, but it is insufficient, and fire safety effectiveness is limited by ignoring the social sciences of human behavior. It is important to appreciate that while different to official assumptions and desire for evacuation, research shows the public's priorities to be rational and appropriate. The public's experience of fire is vastly different to that of the professionals involved in the planning for and responding to fire.

Official policy and attitudes of the Technical Committee are most singularly directed at avoiding the risk when the public encounters a fire. This is well meaning but the research has shown that this DOES NOT I REPEAT DOES NOT align with the public's attitude or the ability of the general public. The belief that 'undesirable' behavior can be changed by advice, campaigns or other measures has been shown to be inaccurate. The paternalistic approach by which government and the building safety regulatory sector seek to change human behavior by removing proven and effective appliances such as portable fire extinguishers is WRONG. However, the building safety regulatory sector continue this approach despite the evidence that public behaviors are safe, effective, and largely unaltered by current guidance and campaigns rather than providing appropriate safety devices for use by the public. A portable fire extinguisher is an effective item of fire protection which allows for small fires to be tackled by the occupants of a building and saves 100s of thousands of dollars in property loss.

Concerns have been indicted regarding the requirement for training. Training in the use of extinguishers is an important issue and one in which opinion appears more influential than the evidence. Whether purchased for a private dwelling or provided through regulatory processes, there is no mandatory requirement for training to use an extinguisher, and studies do not reveal training to be a requirement for their safe or effective use. In fact, the available data and studies demonstrate the opposite to be the case.

The Technical Committee should also note that portable fire extinguishers are designed for the novice user. Although, training is recommended for proper use and technique and is wide available through a variety of resources including at online training; there are no specified training requirements even under OSHA unless that is an assigned duty employee by the employer. The proposed requirement is intended as a provision for layered fire protection for the general public and employees for general safety.

Although there is limited data available related to extinguisher use since the removal of portable fire extinguishers in the NIFRS data field, there is little to no data supporting the removal of portable fire extinguishers and sole reliance on building fire sprinkler systems. Limiting a fire to the smallest area within a building is a sensible aspiration.

Cost has been another point of contention. A study by Richard Bukowski in 2014, the life cycle cost of portable fire extinguishers was determined to be between one and a half and four cents per foot annually; if coverage could be maximized to that allowable by code, the cost drops to between a half cent and one cent per foot annually. It's unlikely that any other layer of fire protection is so cost-effective.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Additionally, this PC does not include any requirements for training of staff on the use of portable fire extinguishers.

Public Comment No. 167-NFPA 101-2022 [Section No. 42.8.3.5]

42.8.3.5 Extinguishing Requirements.- (Reserved) -

Automatic sprinkler systems shall be installed in all new parking structures.

Statement of Problem and Substantiation for Public Comment

This is to align with a change that was published in the 2023 edition of NFPA 88A, Section 6.4.1. The committee additionally clarified this only applies to new parking structures, as the scope of NFPA 88A is not retroactive to existing parking structures.

NFPA 101 (2024) Extracts to NFPA 88A (2023)

~~3.3.28 Assisted Mechanical Type Parking Structure.~~

~~See 3.3.293.8.1, Parking Structure, Assisted Mechanical Type.~~

~~3.3.32 Automated Type Parking Structure.~~

~~See 3.3.293.8.2, Parking Structure, Automated Type.~~

3.3.130 Fully Automated Parking System.

See 3.3.294.1.

3.3.187 Mechanical Parking System.

See 3.3.294.2.

~~3.3.291293.8*~~ Parking Structure.

A building, structure, or portion thereof used for the parking, storage, or both, of motor vehicles. [88A, [20192023](#)] (SAF-IND)

~~A.3.3.291293.8~~ Parking Structure.

A parking structure is permitted to be enclosed or open, use ramps, and use mechanical control push-button-type elevators to transfer vehicles from one floor to another. Motor vehicles are permitted to be parked by the driver or an attendant or are permitted to be parked mechanically by automated facilities. Where automated-type parking is provided, the operator of those facilities is permitted either to remain at the entry level or to travel to another level. Motor fuel is permitted to be dispensed, and motor vehicles are permitted to be serviced in a parking structure in accordance with NFPA 30A. [88A, [20192023](#)]

~~3.3.291.8.1 Parking Structure, Assisted Mechanical Type.~~

~~A parking structure that uses lifts or other mechanical devices to transport vehicles to the floors of a parking structure, where the vehicles are then parked by a person. [88A, 2019] (SAF-IND)~~

~~3.3.291.8.2 Parking Structure, Automated Type.~~

~~A parking structure that uses computer controlled machines to store and retrieve vehicles, without drivers, in multi-level storage racks with no floors. [88A, 2019] (SAF-IND)~~

~~3.3.291293.8.3~~ Parking Structure, Enclosed.

Any parking structure that is not an open parking structure. [88A, [20192023](#)] (SAF-IND)

~~3.3.291293.8.4~~ Parking Structure, Open.

A parking structure that meets the requirements of 42.8.1.3. [[88A, 2023](#)] (SAF-IND)

~~3.3.291293.8.5~~ Parking Structure, Ramp Type.

A parking structure that utilizes sloped floors for vertical vehicle circulation. [88A, 20192023] (SAF-IND)

3.3.294 Parking Systems.

3.3.294.1 Fully Automated Parking System.

An unoccupied, vehicle storage and retrieval system that transports vehicles in X (i.e., horizontal right to left), Y (i.e., forward and backward), and Z (i.e., up and down) directions.

3.3.294.2 Mechanical Parking System.

A parking system that stores and retrieves vehicles on a platform, and that transports vehicles horizontally and vertically to an available parking location within the parking system.

42.8.1.1* Application.

The provisions of 42.8.1 through 42.8.5.4 shall apply to parking structures of the closed or open type, above or below grade plane, but shall not apply to ~~assisted-mechanical type or automated-type~~ parking facilities utilizing fully automated parking systems or mechanical parking systems that are not occupied by customers. The requirements of Sections 42.1 through 42.7 shall not apply.

42.8.1.3 Opening Requirements for Open Parking Structures.

Open parking structures shall comply with 42.8.1.3.1 through 42.8.1.3.5.

42.8.1.3.1

For natural ventilation purposes, the exterior sides of the structure shall have uniformly distributed openings on two or more sides. [88A:~~5.5.1~~5.6.1]

42.8.1.3.2

The area of such openings in exterior walls on a level shall be not less than 20 percent of the total perimeter wall area of each level. [88A:~~5.5.2~~5.6.2]

42.8.1.3.3

The aggregate length (i.e., total of widths) of the openings considered to be providing natural ventilation shall be not less than 40 percent of the perimeter of the level. [88A:~~5.5.3~~5.6.3]

42.8.1.3.4

Where the required openings are uniformly distributed over two opposing sides of the building, 42.8.1.3.3 shall not apply. [88A:~~5.5.4~~5.6.4]

42.8.1.3.5

Interior wall lines and column lines shall be at least 20 percent open, with openings uniformly distributed to provide ventilation. [88A:~~5.5.5~~5.6.7]

42.8.3.1.1 Vertical Openings in Enclosed Parking Structures.

42.8.3.1.1.1

Unless otherwise provided in 42.8.3.1.1.3, 42.8.3.1.1.4, or 42.8.3.1.1.5, vertical openings through floors in enclosed parking structures four stories or more in height shall be enclosed with walls or partitions having a fire resistance rating of not less than 2 hours [determined in accordance with ASTM E119, Standard Test Methods for Fire Tests of Building Construction and Materials, or UL 263, Fire Tests of Building Construction and Materials](#). [~~88A:5.4.3~~5.5.3]

42.8.3.1.1.2

Unless otherwise provided in 42.8.3.1.1.3, 42.8.3.1.1.4, or 42.8.3.1.1.5, vertical openings through floors in enclosed parking structures less than four stories in height shall be enclosed with walls or partitions having a fire resistance rating of not less than 1 hour [determined in accordance with ASTM E119, Standard Test Methods for Fire Tests of Building Construction and Materials, or UL 263, Fire Tests of Building Construction and Materials](#). [~~88A:5.4.4~~5.5.4]

42.8.3.1.1.3

Ramps in enclosed parking structures shall not be required to be enclosed in accordance with 42.8.3.1.1.1 or 42.8.3.1.1.2 where the parking structure is protected throughout by an approved, automatic sprinkler system. [~~88A:5.4.5~~5.5.5]

42.8.3.1.1.4

Ramps in enclosed parking structures shall not be required to be enclosed in accordance with 42.8.3.1.1.1 or 42.8.3.1.1.2 where the parking structure is protected throughout by an approved, supervised, automatic fire detection system and a mechanical ventilation system in accordance with 6.3.1 of NFPA 88A. [~~88A:5.4.6~~5.5.6]

42.8.3.1.1.5

Openings in the floor assembly between an enclosed parking structure and an open parking structure, except exit openings, shall not be required to be enclosed where the enclosed parking structure is protected in accordance with 42.8.3.1.1.3 or 42.8.3.1.1.4. [~~88A:5.4.7~~5.5.7]

42.8.3.1.2

Unprotected vertical openings through floors in open parking structures shall be permitted. [~~88A:5.4.8~~5.5.8]

3.3.~~483~~184.2.2 Physical Hazard Material.

A chemical or substance classified as a ~~combustible liquid~~, explosive, flammable cryogen, flammable gas, ~~flammable liquid~~, flammable solid, ~~ignitable (flammable or combustible) liquid~~, organic peroxide, oxidizer, oxidizing cryogen, pyrophoric, unstable (reactive), or water-reactive material. [400, ~~2019~~2022] (SAF-IND)

3.3.~~483~~184.3 Hazardous Material.

A chemical or substance that is classified as a physical hazard material or a health hazard material, whether the chemical or substance is in usable or waste condition. [400, ~~2019~~2022] (SAF-IND)

3.3.~~483~~184.7.1 Highly Toxic Material.

A material that produces a lethal dose or lethal concentration that falls within any of the following categories: (1) a chemical that has a median lethal dose (LD₅₀) of 50 mg/kg or less of body weight when administered orally to albino rats weighing between 200 g and 300 g each; (2) a chemical that has a median lethal dose (LD₅₀) of 200 mg/kg or less of body weight when administered by continuous contact for 24 hours, or less if death occurs within 24 hours, with the bare skin of albino rabbits weighing between 2 kg and 3 kg each or albino rats weighing 200 g to 300 g each; (3) a chemical that has a median lethal concentration (LC₅₀) in air of 200 parts per million by volume or less of gas or vapor, or 2 mg/L or less of mist, fume, or dust, when administered by continuous inhalation for 1 hour, or less if death occurs within 1 hour, to albino rats weighing between 200 g and 300 g each. [400, ~~2019~~2022] (SAF-IND)

Second Revision No. 6571-NFPA 101-2022 [Section No. 3.3.183.2.1]

3.3.184.2.1 Health Hazard Material.

A chemical or substance classified as a toxic, highly toxic, or corrosive material in accordance with definitions set forth in this code. [~~5000~~ 400, 2021 2022] (SAF-IND)

Second Revision No. 6612-NFPA 101-2022 [Section No. 11.11.2.2]

11.11.2.2

~~All new~~ Prior to first use, all tent fabric shall comply with the requirements of Chapter 16 of NFPA 701.

Submitter Information Verification

Committee: SAF-IND

Submittal Date: Mon Aug 15 13:07:33 EDT 2022

Committee Statement

Committee Statement: This change is to clarify to the correlating committee what is considered new fabric.

In response to the correlating committee about the applicability of Chapter 16 of NFPA 701: Chapter 16 of NFPA 701 addresses the weathering requirements for tent fabrics. Chapter 16 of NFPA 701 is an optional section, however, it is important that NFPA 101 contains requirements that the fabrics have been assessed for weathering, to ensure that any flame retardant treatment is not easily washed away.

Public Comment No. 72-NFPA 101-2022 [Section No. 10.3.3.2.2]

10.3.3.2.2

The mattress shall have a mass loss not exceeding 15 percent when tested in accordance with the fire test in ~~Appendix~~ Annex A3 of ASTM F1085, *Standard Specification for Mattress and Box Springs for Use in Berths in Marine Vessels*.

Statement of Problem and Substantiation for Public Comment

There is a typo in this section. The test method being referenced is contained in Annex A3 and not in Appendix A3 of ASTM F1085. ASTM F1085 does not have an appendix and Annex A3 is the section that contains the fire test for mattresses referenced in this section.

PI186 updates the date of ASTM F1085 and that provides the needed link to the public inputs.

Committee: SAF-INT

Committee Statement

Committee Action: Rejected but see related SR

Resolution: [SR-6564-NFPA 101-2022](#)

Statement: This public comment is in response to the affirmative with comment by a committee member on FR 6659. The test in section 10.2 of ASTM F1870 is the same test as in Annex A3 of ASTM F1085, referenced in section 10.3.3.2.2. The annex of ASTM F1085 provides more detailed instructions than ASTM F1870.

The technical committee dealing with detention occupancies created FR 6659 with a similar annex section to A.22.4.5.13.2.

This revision also corrects a typo in section 10.3.3.2.2 in that the relevant test is contained in Annex A3 of ASTM F1085 and not in Appendix A3 (which does not exist).

Public Comment No. 79-NFPA 101-2022 [Section No. 10.3.3.2.2]

10.3.3.2.2— *

The mattress shall have a mass loss not exceeding 15 percent when tested in accordance with the fire test in ~~Appendix~~ Annex A3 of ASTM F1085, *Standard Specification for Mattress and Box Springs for Use in Berths in Marine Vessels*.

A.10.3.3.2.2

The fire test in Annex A3 of ASTM F1085 (*Standard Specification for Mattress and Box Springs for Use in Berths in Marine Vessels*) is known as the Michigan "Roll Up" test and it is the same test described briefly in Section 10 (on Tests and Specifications Designed for Detention and Correction Facilities) of ASTM F1870 (Standard Guide for Selection of Fire Test Methods for the Assessment of Upholstered Furnishings in Detention and Correctional Facilities).

Statement of Problem and Substantiation for Public Comment

This public comment is in response to the affirmative with comment by committee member Derek Duval on FR 6659. Note that, as the committee on detention occupancies noted, the test in section 10.2 of ASTM F1870 is the same test as in Annex A3 of ASTM F1085, referenced in section 10.3.3.2.2. The annex of ASTM F1085 provides more detailed instructions than ASTM F1870. The technical committee dealing with detention occupancies created FR 6659 so that the annex section will read as shown below. Committee member Derek Duval considered that some further clarification was warranted.

A.22.4.5.13.2 Open referenced numbered section

Mattresses used in detention and correctional facilities should be evaluated with regard to the fire hazards of the environment. The potential for vandalism and excessive wear and tear also should be taken into account when evaluating the fire performance of the mattress. ASTM F1870, Standard Guide for Selection of Fire Test Methods for the Assessment of Upholstered Furnishings in Detention and Correctional Facilities, provides guidance for this purpose, in Section 10, entitled "Tests and Specifications Designed for Detention and Correction Facilities". One of the tests contained in that section is similar to the test in Annex A3 of ASTM F1085, contained in Section 10.3.3.2.2 of this Code. ASTM F1870 also includes guidance on alternate fire test methods that can be used to assess whether a mattress, or mattress cushioning, meets the requirements of 10.3.3.2 by simply melting and flowing away from the flame.

Separately, this public comment also corrects the typo in section 10.3.3.2.2 in that the relevant test is contained in Annex A3 of ASTM F1085 and not in Appendix A3 (which does not exist). This is also addressed in a separate public comment.

Public Comment No. 9-NFPA 101-2022 [Section No. 10.6]

10.6 Inflatable Amusement Devices.

10.6.1 General.

Inflatable amusement devices installed in the interior or exterior of occupancies other than private residences shall comply with Section 10.6.

10.6.2 Construction.

Inflatable amusement devices shall be constructed in accordance with the manufacturer's instructions and the requirements of ASTM F2374, *Standard Practice for Design, Manufacture, Operation, and Maintenance of Inflatable Amusement Devices*.

10.6.3 Materials of Construction.

The inflatable amusement devices shall be constructed of noncombustible materials or of materials meeting the flame propagation criteria of Test Method 2 of NFPA 701.

10.6.3.1

One of the following shall serve as evidence that the fabric materials have the required flame propagation performance in accordance with NFPA 701:

- (1) The authority having jurisdiction shall require a certificate or other evidence of acceptance by an organization acceptable to the authority having jurisdiction.
- (2) The authority having jurisdiction shall require a report of tests made by other inspection authorities or organizations acceptable to the authority having jurisdiction.

10.6.4 Electrical Equipment.

Electrical equipment associated with the inflatable amusement device shall comply with the applicable provisions of *NFPA 70*.

10.6.5 Portable Generators.

Portable generators associated with the inflatable amusement device shall comply with the applicable provisions of *NFPA 37*.

10.6.6 Fire Extinguishers.

If a portable generator is associated with the inflatable amusement device, it shall be accompanied by an approved portable fire extinguisher.

Committee Statement and Meeting Notes

Committee Statement: Inflatable amusement devices (also known as bounce houses) are typically constructed and maintained in accordance with ASTM F2374, a standard practice issued by ASTM committee F24. There are two major concerns typically with such devices: fire safety and anchoring. ASTM F2374 addresses primarily the issue of anchoring as well as all other critical design, construction, and maintenance issues. the proposed language addresses the issue of fire safety of the materials of construction of the device (which are often similar as the ones that are used for tents, which are required, in section 11.11.2 to meet the flame propagation performance of NFPA 701, test method 2) as well as of associated electrical wiring and, potentially, portable generators.

Note that the scope of NFPA 37 clarifies that it applies also to portable equipment, as long as it is in use for at least a week.

Response FR-6582-NFPA 101-2021

Message:

Committee Notes:

<u>Date</u>	<u>Submitted By</u>	
Jul 27, 2021	Stephen Ganoe	Add a reference to ASTM F2374 into chapter 2, section 2.3.6, ASTM F2374, Standard Practice for Design, Manufacture, Operation, and Maintenance of Inflatable Amusement Devices, 2021.
		Add a reference to NFPA 37, Standard for the Installation and Use of Stationary Combustion Engines and Gas Turbines, 2021. into chapter 2, on NFPA referenced documents.

Public Comment No. 10-NFPA 101-2022 [Section No. 10.7]

10.7* Modular Rooms and Sleep Pods.

10.7.1* General.

Modular rooms and sleep pods provided in indoor locations shall comply with 10.7.1 through 10.7.4 and other applicable requirements in the *Code*.

10.7.2 Dimensions.

10.7.2.1

The maximum dimensions of modular rooms and sleep pods shall comply with the following:

- (1) Modular rooms: 100 ft² (9.3 m²) or less in floor area and 8 ft (2438 mm) or less in height
- (2) Sleep pods: 36 ft² (3.3 m²) or less in floor area, 8 ft (2438 mm) or less in height, and 4 ft (1219 mm) or less in width

10.7.2.2

Modular rooms and sleep pods exceeding the dimensions in 10.6.1 shall comply with all applicable requirements in this *Code* and the applicable building code.

10.7.3 Listing.

Modular rooms and sleep pods shall be listed and labeled in accordance with UL 962, *Household and Commercial Furnishings*, and installed in accordance with the listing and the manufacturer's instructions.

10.7.4* Interior Finish.

Modular rooms and sleep pods shall comply with the interior finish requirements in Section 10.2 as follows and be marked as having met the requirements:

- (1) Interior wall and ceiling finish materials, other than cellular or foamed plastic materials, shall comply with 10.2.3.
- (2) Interior wall and ceiling finish cellular or foamed plastic materials shall comply with 10.2.4.3.
- (3) For modular rooms and sleep pods with integrated floors, the interior floor finish materials shall comply with 10.7.4(1) or 10.7.4(2), as appropriate.

10.7.5 Locations.

Modular rooms and sleep pods shall only be installed in approved locations and shall not obstruct required means of egress.

Additional Proposed Changes

**First Revision No. 6583-NFPA 101-2021 [New Section after 10.5.5]****10.7*** Modular Rooms and Sleep Pods.**A.10.7**

Modular rooms such as lactation stations and other small privacy enclosures, including sleep pods, are showing up in an increasing number of indoor locations. These include airports, convention centers, business, and government buildings. These are typically factory-built products that are required to be listed to UL 962, *Household and Commercial Furnishings*, rather than being constructed as a structure in accordance with the local building code.

10.7.1* General.

Modular rooms and sleep pods provided in indoor locations shall comply with 10.7.1 through 10.7.4 and other applicable requirements in the *Code*.

A.10.7.1

The maximum size limits in 10.7.2.1 are designed to delineate factory build products that can be listed, versus larger size units that should comply with all applicable building code requirements, including structural design. These products are intended to comply with Section 10.7 and other applicable sections of the *Code*. This includes complying with requirements such as obstructions of automatic sprinkler system flow, not impacting means of egress requirements, and other criteria.

10.7.2 Dimensions.**10.7.2.1**

The maximum dimensions of modular rooms and sleep pods shall comply with the following:

- (1) Modular rooms: 100 ft² (9.3 m²) or less in floor area and 8 ft (2438 mm) or less in height
- (2) Sleep pods: 36 ft² (3.3 m²) or less in floor area, 8 ft (2438 mm) or less in height, and 4 ft (1219 mm) or less in width

10.7.2.2

Modular rooms and sleep pods exceeding the dimensions in 10.6.1 shall comply with all applicable requirements in this *Code* and the applicable building code.

10.7.3 Listing.

Modular rooms and sleep pods shall be listed and labeled in accordance with UL 962, *Household and Commercial Furnishings*, and installed in accordance with the listing and the manufacturer's instructions.

10.7.4* Interior Finish.

Modular rooms and sleep pods shall comply with the interior finish requirements in Section 10.2 as follows and be marked as having met the requirements:

- (1) Interior wall and ceiling finish materials, other than cellular or foamed plastic materials, shall comply with 10.2.3 .
- (2) Interior wall and ceiling finish cellular or foamed plastic materials shall comply with 10.2.4.3 .
- (3) For modular rooms and sleep pods with integrated floors, the interior floor finish materials shall comply with 10.7.4 (1) or 10.7.4 (2), as appropriate.

A.10.7.4

Because modular rooms and sleep pods are factory built products, it might not be easy for the authority having jurisdiction to determine if the materials used in the products comply with applicable Chapter 10 interior finish and foamed plastic requirements. As part of the UL 962, Household and Commercial Furnishings , listing the ratings specified will be marked on the modular rooms and sleep pods, simplifying compliance for the specifier, occupant, and authority having jurisdiction.

10.7.5 Locations.

Modular rooms and sleep pods shall only be installed in approved locations and shall not obstruct required means of egress.

Submitter Information Verification

Committee: SAF-INT

Submittal Date: Tue Jul 27 08:04:25 EDT 2021

Committee Statement and Meeting Notes

Committee Statement: Modular rooms and sleep pods are becoming increasingly popular, and are showing up in a variety of different occupancies. The new text provides a means for AHJs to approve these installations and allow the use of these prefabricated structures. This also allows modular rooms and sleep pods to be treated as products that can be installed in a building, and not as building construction, while not losing applicable code requirements.

TO: Technical Committee on Interior Finish and Contents

FROM: Jenny Depew, *Committee Administrator*

DATE: November 8, 2022

SUBJECT: NFPA 101® Second Draft TC FINAL Ballot Results (A2023)

According to the final ballot results, all ballot items received the necessary affirmative votes to pass ballot.

15 **Members Eligible to Vote**

3 **Members Not Returned** (*Daugherty, Newman, Sloan*)

The attached report shows the number of affirmative, negative, and abstaining votes as well as the explanation of the vote for **each** revision.

To pass ballot, **each** revision requires: (1) a simple majority of those eligible to vote and (2) an affirmative vote of $\frac{2}{3}$ of ballots returned. See Sections 3.3.4.3.(c) and 4.3.10.1 of the ***Regulations Governing the Development of NFPA Standards***.

Second Revision No. 6568-NFPA 101-2022 [Detail]

Revise A.10.7 to replace "showing up" with "being installed" and changing "business" to "businesses" as follows:

A.10.7

Modular rooms such as lactation stations and other small privacy enclosures, including sleep pods, are ~~showing up~~being installed in an increasing number of indoor locations. These include airports, convention centers, businesses, and government buildings. These are typically factory-built products that are required to be listed to UL 962, *Household and Commercial Furnishings*, rather than being constructed as a structure in accordance with the local building code.

Second Revision No. 6564-NFPA 101-2022 [Section No. 10.3.3.2.2]

10.3.3.2.2*

The mattress shall have a mass loss not exceeding 15 percent when tested in accordance with the fire test in ~~Appendix Annex~~ A3 of ASTM F1085, *Standard Specification for Mattress and Box Springs for Use in Berths in Marine Vessels*.

A.10.3.3.2.2

The fire test in Annex A3 of ASTM F1085, *Standard Specification for Mattress and Box Springs for Use in Berths in Marine Vessels*, is known as the Michigan Roll-up Test, and it is the same test described briefly in Section 10 (on Tests and Specifications Designed for Detention and Correction Facilities) of ASTM F1870, *Standard Guide for Selection of Fire Test Methods for the Assessment of Upholstered Furnishings in Detention and Correctional Facilities*.

Submitter Information Verification

Committee: SAF-INT

Submittal Date: Wed Jul 20 12:38:21 EDT 2022

Committee Statement

Committee Statement: This public comment is in response to the affirmative with comment by a committee member on FR 6659. The test in section 10.2 of ASTM F1870 is the same test as in Annex A3 of ASTM F1085, referenced in section 10.3.3.2.2. The annex of ASTM F1085 provides more detailed instructions than ASTM F1870.

The technical committee dealing with detention occupancies created FR 6659 with a similar annex section to A.22.4.5.13.2.

This revision also corrects a typo in section 10.3.3.2.2 in that the relevant test is contained in Annex A3 of ASTM F1085 and not in Appendix A3 (which does not exist).

Public Comment No. 126-NFPA 101-2022 [New Section after 3.3.164.2]

Interlocked-Door Vestibule.

A compartment provided with doors in series where only one of the doors in series is openable at a time.

Statement of Problem and Substantiation for Public Comment

This proposed definition is modeled after the definition of “sally port”, and along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 21, 36, 37, 38, 39, 40, and 42, offers the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

**Public Comment No. 5-NFPA 101-2022 [Section No. 7.1.5.1]****7.1.5.1**

Means of egress shall be designed and maintained to provide headroom in accordance with other sections of this *Code*, and such headroom shall be not less than 7 ft 6 in. (2285 mm). Projections from the ceiling shall provide headroom of not less than 6 ft 8 in. (2030 mm), with a tolerance of $-3/4$ in. (-19 mm), above the finished floor, unless otherwise specified by any of the following:

- (1) In existing buildings, the ceiling height shall be not less than 7 ft (2135 mm) from the floor, with projections from the ceiling not less than 6 ft 8 in. (2030 mm), with a tolerance of $-3/4$ in. (-19 mm), nominal above the floor.
- (2) Headroom in industrial equipment access areas as provided in 40.2.5.3 shall be permitted.

Statement of Problem and Substantiation for Public Comment

NOTE: The following CC Note No. 3 appeared in the First Draft Report on First Revision No. 6529, and is also related to Public Input No. 231.

Reconsider the action on FR-6529. The specification of a precise tolerance might be more restrictive than the existing nominal dimension. If tolerance is retained, consider deleting "nominal."

First Revision No. 6529-NFPA 101-2021 [Section No. 7.1.5.1]

7.1.5.1

Means of egress shall be designed and maintained to provide headroom in accordance with other sections of this *Code*, and such headroom shall be not less than 7 ft 6 in. (2285 mm). Projections from the ceiling shall provide headroom of not less than 6 ft 8 in. (2030 mm), with a tolerance of $-\frac{3}{4}$ in. (-19 mm), above the finished floor, unless otherwise specified by any of the following:

- (1) In existing buildings, the ceiling height shall be not less than 7 ft (2135 mm) from the floor, with projections from the ceiling not less than 6 ft 8 in. (2030 mm), with a tolerance of $-\frac{3}{4}$ in. (-19 mm), nominal above the floor.
- (2) Headroom in industrial equipment access areas as provided in 40.2.5.3 shall be permitted.

Public Comment No. 114-NFPA 101-2022 [Section No. 7.2.1.5.7]

7.2.1.5.7* Stair Enclosure Re-entry.

Every door assembly in a stair enclosure serving more than four stories, unless permitted by 7.2.1.5.7.2, shall meet one of the following conditions:

- (1) Re-entry from the stair enclosure to the interior of the building shall be provided.
- (2) An automatic release shall be provided that meets all of the following:
 - (a) The automatic release shall unlock all stair enclosure door assemblies to allow re-entry.
 - (b) The automatic release shall be actuated with the initiation of the building fire alarm system.
 - (c)* ~~Door electrical~~ electro-mechanical or electromagnetic locking hardware for new installations shall be listed in accordance with UL 294, *Access Control System Units*, or UL 1034, *Burglary-Resistant Electric Locking Mechanisms*.
- (3) Selected re-entry shall be provided in accordance with 7.2.1.5.7.1.

7.2.1.5.7.1

Door assemblies on stair enclosures shall be permitted to be equipped with hardware that prevents re-entry into the interior of the building, provided that all of the following criteria are met:

- (1) There shall be not less than two levels where it is possible to leave the stair enclosure to access another exit.
- (2) There shall be not more than four stories intervening between stories where it is possible to leave the stair enclosure to access another exit.
- (3) Re-entry shall be possible on the top story or next-to-top story served by the stair enclosure, and such story shall allow access to another exit.
- (4) Door assemblies allowing re-entry shall be identified as such on the stair side of the door leaf.
- (5) Door assemblies not allowing re-entry shall be provided with a sign on the stair side indicating the location of the nearest door opening, in each direction of travel, that allows re-entry or exit.

7.2.1.5.7.2

The requirements of 7.2.1.5.7, except as provided in 7.2.1.5.7.3, shall not apply to the following:

- (1) Existing installations in buildings that are not high-rise buildings as permitted in Chapters 11 through 43
- (2) Existing installations in high-rise buildings as permitted in Chapters 11 through 43 where the occupancy is within a building protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7
- (3) Existing approved stairwell re-entry installations as permitted by Chapters 11 through 43
- (4) Stair enclosures serving a building permitted to have a single exit in accordance with Chapters 11 through 43
- (5) Stair enclosures in health care occupancies where otherwise provided in Chapter 18
- (6) Stair enclosures in detention and correctional occupancies where otherwise provided in Chapter 22

7.2.1.5.7.3

When the provisions of 7.2.1.5.7.2 are used, signage on the stair door leaves shall be required as follows:

- (1) Door assemblies allowing re-entry shall be identified as such on the stair side of the door leaf.
- (2) Door assemblies not allowing re-entry shall be provided with a sign on the stair side indicating the location of the nearest door opening, in each direction of travel, that allows re-entry or exit.

Additional Proposed Changes

<u>File Name</u>	<u>Description</u>	<u>Approved</u>
2024_NFPA_101_UL_294_and_UL_1034_Public_Comments_20220520.pdf	NFPA 101 2024 add UL 1034 as an option where door hardware is required to be listed to UL 294.	

Statement of Problem and Substantiation for Public Comment

The proposed revisions help clarify the door electrical locking hardware that is required to be listed for these electrical locking applications. In addition of adding the option to list to UL 1034 included in the First Revision, this proposal brings consistency in the text where UL 294 and UL 1034 are referenced in NFPA 101. The additions of the Annex A text complement the revisions to the mandatory language of these special locking arrangements.

Because of implications to life safety with electrical locking systems potentially affecting egress on doors in the means of egress, it is prudent to require listing of door electrical locking hardware used in these applications. Listing to either UL 294 or to UL 1034 appropriately revises this important listing requirement to help assure the electrical locking hardware performs as intended for this life-safety application.

The Life Safety Code first required door hardware to be listed to UL 294 in the 2009 edition of NFPA 101. This section of NFPA 101, Stair Enclosure Re-entry, first required listing of door locking hardware to UL 294 with the 2021 edition of NFPA 101.

UL 294 and 1034 address efficacy and safety considerations for door access control applications (ingress control) to help assure the door hardware and access control solutions would perform as intended and expected. Typically, access control systems incorporating card readers, keypads, iris scanners, etc. are tested and listed to UL 294. Additionally, delayed egress electrical locking systems, sensor-release electrical locking systems, and certain types of door hardware release electrical locking systems are all typically tested and listed to UL 294. On the other hand, components such as electromagnetic locks, electric dead bolts, electric strikes, and other door electrically operated locking mechanisms are typically listed to UL 1034. UL 294 and UL 1034 are collateral standards that complement each other.

These examples illustrate that some of the same systems and components used to control access (ingress) to a space are also used for egress-side electrical locking systems. Considering that egress-side electrical locking systems have life safety implications, NFPA 101 was enhanced (in 2009) to require listing of electrical locking hardware to UL 294. In hindsight, the collateral listing to UL 1034 should have been the language included in NFPA 101 in the earlier editions.

Committee Statement

Committee Action: Rejected but see related SR

Resolution: [SR-6546-NFPA 101-2022](#)

Statement: The revision accepts the recommendations in PC-114 and PC-115. It is noted that the PCs were accepted by the technical committee at its meeting; however, the revisions must be processed as Reject but See Related SR-6546 in order to keep the revised annex language associated with the base paragraph. The net result is identical to the intended action. Note that the first sentence of A.7.2.1.5.7(2)(c) is existing language and is erroneously displayed as new underlined text. The substantiations for PC-114 and PC-115 follow.

PC-114: The proposed revisions help clarify the door electrical locking hardware that is required to be listed for these electrical locking applications. In addition of adding the option to list to UL 1034 included in the First Revision, this proposal brings consistency in the text where UL 294 and UL 1034 are referenced in NFPA 101. The additions of the Annex A text complement the revisions to the mandatory language of these special locking arrangements.

Because of implications to life safety with electrical locking systems potentially affecting egress on doors in the means of egress, it is prudent to require listing of door electrical locking hardware used in these applications. Listing to either UL 294 or to UL 1034 appropriately revises this important listing requirement to help assure the electrical locking hardware performs as intended for this life-safety application.

The Life Safety Code first required door hardware to be listed to UL 294 in the 2009 edition of NFPA 101. This section of NFPA 101, Stair Enclosure Re-entry, first required listing of door locking hardware to UL 294 with the 2021 edition of NFPA 101.

UL 294 and 1034 address efficacy and safety considerations for door access control applications (ingress control) to help assure the door hardware and access control solutions would perform as intended and expected. Typically, access control systems incorporating card readers, keypads, iris scanners, etc. are tested and listed to UL 294. Additionally, delayed egress electrical locking systems, sensor-release electrical locking systems, and certain types of door hardware release electrical locking systems are all typically tested and listed to UL 294. UL 294 and UL 1034 are collateral standards that complement each other.

These examples illustrate that some of the same systems and components used to control access (ingress) to a space are also used for egress-side electrical locking systems. Considering that egress-side electrical locking systems have life safety implications, NFPA 101 was enhanced (in 2009) to require listing of electrical locking hardware to UL 294. In hindsight, the collateral listing to UL 1034 should have been the language included in NFPA 101 in the earlier editions.

PC-115: The additions of the Annex A text complement the revisions to the mandatory language of these special locking arrangements.

2021 / 2024 NFPA 101 UL 294 and UL 1034

Revised 20, 2022

BHMA, John Woestman

Proposed public comment revisions are based on NFPA 101 language as revised, or not, per the First Draft Report.

Chapter 2 Referenced Publications

UL 294, Access Control System Units, 2018.

UL 1034, *Burglary-Resistant Electric Locking Mechanisms*, 2011, revised 2020

Commented [WJ1]: Public Input No. 277-NFPA 101-2021

The approved First Revision is the **highlighted** text. No revisions needed for public comment.

Chapter 7 Means of Egress

7.2.1.5.7 * Stair Enclosure Re-entry.

Every door assembly in a stair enclosure serving more than four stories, unless permitted by 7.2.1.5.7.2, shall meet one of the following conditions:

1. Re-entry from the stair enclosure to the interior of the building shall be provided.
2. An automatic release shall be provided that meets all of the following:
 - a) The automatic release shall unlock all stair enclosure door assemblies to allow re-entry.
 - b) The automatic release shall be actuated with the initiation of the building fire alarm system.
 - c) *Door **electrical** ~~electro-mechanical or electromagnetic~~ locking hardware for new installations shall be listed in accordance with UL 294, *Access Control System Units* or UL 1034, *Burglary-Resistant Electric Locking Mechanisms*.
3. Selected re-entry shall be provided in accordance with 7.2.1.5.7.1.

Commented [WJ2]: Public Input No. 278-NFPA 101-2021

The approved First Revision is with the **highlighted** text with potential further revisions via public comment.

Commented [JW3]: PC 114

A.7.2.1.5.7(2)(c)

The electrical locking hardware may be a component of an electrical locking system (e.g. access control system) or the electrical locking hardware may be a device with an individual listing. **Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.**

Commented [WJ4]: Public Input No. 278-NFPA 101-2021

The approved First Revision is the **highlighted** text. No revisions via public comment needed.

Commented [JW5]: PC 115

Reason:

The proposed revisions help clarify the door electrical locking hardware that is required to be listed for these electrical locking applications. In addition of adding the option to list to UL 1034 included in the First Revision, this proposal brings consistency in the text where UL 294 and UL 1034 are referenced in NFPA 101. The additions of the Annex A text complement the revisions to the mandatory language of these special locking arrangements.

Because of implications to life safety with electrical locking systems potentially affecting egress on doors in the means of egress, it is prudent to require listing of door electrical locking hardware used in these applications. Listing to either UL 294 or to UL 1034 appropriately revises this important listing requirement to help assure the electrical locking hardware performs as intended for this life-safety application.

The Life Safety Code first required door hardware to be listed to UL 294 in the 2009 edition of NFPA 101. This section of NFPA 101, Stair Enclosure Re-entry, first required listing of door locking hardware to UL 294 with the 2021 edition of NFPA 101.

UL 294 and 1034 address efficacy and safety considerations for door access control applications (ingress control) to help assure the door hardware and access control solutions would perform as intended and expected. Typically, access control systems incorporating card readers, keypads, iris scanners, etc. are tested and listed to UL 294. Additionally, delayed egress electrical locking systems, sensor-release electrical locking systems, and certain types of door hardware release electrical locking systems are all typically tested and listed to UL 294. On the other hand, components such as electromagnetic locks, electric dead bolts, electric strikes, and other door electrically operated locking mechanisms are typically listed to UL 1034. UL 294 and UL 1034 are collateral standards that complement each other.

These examples illustrate that some of the same systems and components used to control access (ingress) to a space are also used for egress-side electrical locking systems. Considering that egress-side electrical locking systems have life safety implications, NFPA 101 was enhanced (in 2009) to require listing of electrical locking hardware to UL 294. In hindsight, the collateral listing to UL 1034 should have been the language included in NFPA 101 in the earlier editions.

7.2.1.6* Special Locking Arrangements.

7.2.1.6.1 * Delayed-Egress Electrical Locking Systems.

7.2.1.6.1.1

Approved, delayed-egress electrical locking systems shall be permitted to be installed on door assemblies serving low- and ordinary-hazard contents in buildings protected throughout by an approved, supervised automatic fire detection system in accordance with Section 9.6 or an approved, supervised automatic sprinkler system in accordance with Section 9.7, and where permitted in Chapters 11 through 43, provided that all of the following criteria are met:

1. The delay of the delayed-egress electrical locking system shall deactivate allowing unobstructed egress upon actuation of one of the following:
 - a) Approved, supervised automatic sprinkler system in accordance with Section 9.7
 - b) Not more than one heat detector of an approved, supervised automatic fire detection system in accordance with Section 9.6
 - c) Not more than two smoke detectors of an approved, supervised automatic fire detection system in accordance with Section 9.6
2. The delay of the delayed-egress electrical locking system shall deactivate allowing unobstructed egress upon loss of power controlling the lock or locking mechanism.
3. *An irreversible process shall release the electrical lock in the direction of egress within 15 seconds, or 30 seconds where approved by the authority having jurisdiction, upon application of a force to the release device required in 7.2.1.5.3 under all of the following conditions:
 - a) The force shall not be required to exceed 15 lbf (67 N).
 - b) The force shall not be required to be continuously applied for more than 3 seconds.
 - c) The initiation of the release process shall activate an audible signal in the vicinity of the door opening.
 - d) Once the electrical lock has been released by the application of force to the releasing device, rearming the delay electronics shall be by manual means only.

Commented [WJ6]: Public Input No. 279-NFPA 101-2021

Commented [JW7]: PC 116 is the mandatory text (Chapter 7). Separate PC for the Annex revisions.

4. *A readily visible, durable sign that conforms to the visual characters requirements of ICC A117.1, *Accessible and Usable Buildings and Facilities*, shall be located on the door leaf adjacent to the release device in the direction of egress, and shall read as follows:
 - a) PUSH UNTIL ALARM SOUNDS, DOOR CAN BE OPENED IN 15 SECONDS, for doors that swing in the direction of egress travel
 - b) PULL UNTIL ALARM SOUNDS, DOOR CAN BE OPENED IN 15 SECONDS, for doors that swing against the direction of egress travel
5. The egress side of doors equipped with delayed-egress electrical locking systems shall be provided with emergency lighting in accordance with Section 7.9.
6. ~~*Door electro-mechanical or electromagnetic locking hardware~~ for new installations shall be listed in accordance with UL 294, *Access Control System Units* or UL 1034, *Burglary-Resistant Electric Locking Mechanisms*.

A.7.2.1.6.1.1(6)

The electrical locking hardware may be a component of an electrical locking system, or the electrical locking hardware may be a device with an individual listing. Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

Commented [JW8]: PC 117

7.2.1.6.2 * Sensor-Release of Electrical Locking Systems.

7.2.1.6.2.1

Where permitted in Chapters 11 through 43, door assemblies in the means of egress shall be permitted to be equipped with sensor-release electrical locking system hardware provided that all of the following criteria are met:

1. A sensor shall be provided on the egress side, arranged to electrically unlock the door leaf in the direction of egress upon detection of an approaching occupant.
2. Door leaves shall automatically electrically unlock in the direction of egress upon loss of power to the sensor or to the part of the locking system that electrically locks the door leaves.
3. Door locks shall be arranged to electrically unlock in the direction of egress from a manual release device complying with all of the following criteria:
 - a) The manual release device shall be located on the egress side, 40 in. to 48 in. (1015 mm to 1220 mm) vertically above the floor, and within 60 in. (1525 mm) of the secured door openings, except as otherwise permitted by 7.2.1.6.2(3)(c).
 - b) The requirement of 7.2.1.6.2(3)(a) to locate the manual release device within 60 in. (1525 mm) of the secured door opening shall not apply to previously approved existing installations.
 - c) The manual release device shall be readily accessible and clearly identified by a sign that reads as follows: PUSH TO EXIT.
 - d) When operated, the manual release device shall result in direct interruption of power to the electrical lock — independent of the locking system electronics — and the lock shall remain unlocked for not less than 30 seconds.
4. Activation of the building fire-protective signaling system, if provided, shall automatically electrically unlock the door leaves in the direction of egress, and the door leaves shall remain electrically unlocked until the fire-protective signaling system has been manually reset.
5. The activation of manual fire alarm boxes that activate the building fire-protective signaling system specified in 7.2.1.6.2(4) shall not be required to unlock the door leaves.
6. Activation of the building automatic sprinkler or fire detection system, if provided, shall automatically electrically unlock the door leaves in the direction of egress, and the door leaves shall remain electrically unlocked until the fire-protective signaling system has been manually reset.

7. The egress side of sensor-release electrically locked egress doors, other than existing sensor-release electrically locked egress doors, shall be provided with emergency lighting in accordance with Section 7.9.
8. ~~*Door electro-mechanical or electromagnetic locking. Hardware~~ for new installations shall be listed in accordance with UL 294, *Access Control System Units* or UL 1034, *Burglary-Resistant Electric Locking Mechanisms*.

A.7.2.1.6.2.1(8)

The electrical locking hardware may be a component of an electrical locking system, or the electrical locking hardware may be a device with an individual listing. Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

Commented [JW9]: PC 118

7.2.1.6.3 Door Hardware Release of Electrically Locked Egress Door Assemblies.

7.2.1.6.3.1

Door assemblies in the means of egress shall be permitted to be equipped with approved electrical locking systems released by the operation of door hardware provided that all of the following conditions are met:

1. The hardware for egress-side occupant release of the electrical lock is affixed to the door leaf.
2. The hardware has an obvious method of operation that is readily operated in the direction of egress under all lighting conditions.
3. The hardware is capable of being operated with one hand in the direction of egress.
4. Operation of the hardware directly and immediately interrupts the power supply to the electric lock to unlock the door assembly in the direction of egress.
5. *Loss of power to the listed releasing hardware automatically unlocks the door assembly in the direction of egress.
6. ~~*Door electro-mechanical or electromagnetic locking. Hardware~~ for new installations ~~is shall be~~ listed in accordance with UL 294, *Access Control System Units* or UL 1034, *Burglary-Resistant Electric Locking Mechanisms*.

A.7.2.1.6.3.1(6)

The electrical locking hardware may be a component of an electrical locking system, or the electrical locking hardware may be a device with an individual listing. Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

Commented [JW10]: PC 119

7.2.1.6.4 * Elevator Lobby Exit Access Door Assemblies Locking.

7.2.1.6.4.1

Where permitted in Chapters 11 through 43, door assemblies separating the elevator lobby from the exit access required by 7.4.1.6.1 shall be permitted to be electrically locked, provided that all the following criteria are met:

1. ~~*The Door electro-mechanical or electromagnetic~~ locking hardware ~~is shall be~~ listed in accordance with UL 294, *Access Control System Units* or UL 1034, *Burglary-Resistant Locking Mechanisms*.
2. The building is protected throughout by a fire alarm system in accordance with Section 9.6.
3. The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.
4. Waterflow in the sprinkler system required by 7.2.1.6.4.1 is arranged to initiate the building fire alarm system.
5. The elevator lobby is protected by an approved, supervised smoke detection system in accordance with Section 9.6.
6. Detection of smoke by the detection system required by 7.2.1.6.4.1 is arranged to initiate the building fire alarm system and notify building occupants.

7. Initiation of the building fire alarm system by other than manual fire alarm boxes unlocks the electrical locks on the elevator lobby door assembly.
8. Loss of power to the elevator lobby electrical lock system unlocks the electrical locks on the elevator lobby door assemblies.
9. Once unlocked, the elevator lobby door assemblies remain electrically unlocked until the building fire alarm system has been manually reset.
10. Where the elevator lobby door assemblies remain mechanically latched after being electrically unlocked, latch-releasing hardware in accordance with 7.2.1.5.3 is affixed to the door leaves.
11. A two-way communication system is provided for communication between the elevator lobby and a central control point that is constantly staffed.
12. The central control point staff required by 7.2.1.6.4 is capable, trained, and authorized to provide emergency assistance.

A.7.2.1.6.4.1(1)

The electrical locking hardware may be a component of an electrical locking system, or the electrical locking hardware may be a device with an individual listing. Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

Commented [JW11]: PC 120

Reason:

Because of implications to life safety with electrical locking systems potentially affecting egress on doors in the means of egress, it is prudent to require listing of door electrical locking hardware used in these special locking arrangements. Listing to either UL 294 or to UL 1034 appropriately revises this important listing requirement to help assure the electrical locking hardware performs as intended for these life-safety applications.

The Life Safety Code first required door hardware to be listed to UL 294 in the 2009 edition of NFPA 101 on elevator lobby exit access door assemblies. Special locking arrangements included the UL 294 listing requirement with the 2012 and 2018 editions of NFPA 101.

UL 294 and 1034 address efficacy and safety considerations for door access control applications (ingress control) to assure the door hardware and access control solutions would perform as intended and expected. Typically, access control systems incorporating card readers, keypads, iris scanners, etc. are tested and listed to UL 294. Additionally, delayed egress electrical locking systems, sensor-release electrical locking systems, and certain types of door hardware release electrical locking systems are all typically tested and listed to UL 294. On the other hand, components such as electromagnetic locks, electric dead bolts, electric strikes, and other door electrically operated locking mechanisms are typically listed to UL 1034. UL 294 and UL 1034 are collateral standards that complement each other.

These examples illustrate that many of the same systems and components used to control access (ingress) to a space are also used for egress-side electrical locking systems. Considering that egress-side electrical locking systems have life safety implications, NFPA 101 was enhanced (in 2009) to require listing of electrical locking hardware to UL 294. In hindsight, what's proposed here – the collateral listing to UL 1034 – should have been the language included in NFPA 101 in the earlier editions.

In addition to the option to list to UL 1034, this proposal brings consistency in the text where UL 294 (and UL 1034) are referenced in NFPA 101. The additions of Annex A text complement the revisions to the mandatory language of these special locking arrangements.

Chapter 18 New Health Care Occupancies

18.2.2.2.5

Door-locking arrangements shall be permitted in accordance with either 18.2.2.2.5.1 or 18.2.2.2.5.2.

18.2.2.2.5.1 *

Door-locking arrangements shall be permitted where the clinical needs of patients require specialized security measures or where patients pose a security threat, provided that staff can readily unlock doors at all times in accordance with 18.2.2.2.6.

18.2.2.2.5.2 *

Door-locking arrangements shall be permitted where patient special needs require specialized protective measures for their safety, provided that all of the following criteria are met:

1. Staff can readily unlock doors at all times in accordance with 18.2.2.2.6.
2. A total (complete) smoke detection system is provided throughout the locked space in accordance with 9.6.2.9, or locked doors can be remotely unlocked at an approved, constantly attended location within the locked space.
3. *The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with 18.3.5.1.
4. The locks are electrical locks that fail safely so as to release upon loss of power to the device.
5. The locks release by independent activation of each of the following:
 - a) Activation of the smoke detection system required by 18.2.2.2.5.2(2)
 - b) Waterflow in the automatic sprinkler system required by 18.2.2.2.5.2(3)

6. *Door electrical locking hardware for new electric lock installations is listed for the purpose: *Door electro-mechanical or electromagnetic locking hardware for new installations shall be listed in accordance with UL 294, Access Control System Units or UL 1034, Burglary-Resistant Electric Locking Mechanisms.

A. 18.2.2.2.5.2(6)

~~UL 294, Access Control System Units, and UL 1034, Burglary-Resistant Electric Locking Mechanisms, are two standards that provide criteria for listed door-locking hardware. The electrical locking hardware might be a component of an electrical locking system or the electrical locking hardware might be a device with an individual listing. Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.~~

Reason:

~~Because of implications to life safety with electrical locking systems potentially affecting egress on these doors in the means of egress, it is prudent to require listing of door electrical locking hardware used in these applications. Requiring listing to either UL 294 or to UL 1034 appropriately revises this important listing requirement to help assure the electrical locking hardware performs as intended for these life-safety applications.~~

~~The Life Safety Code, in chapters 18 and 19, first required this electrical door hardware to be listed to UL 294 in the 2018 edition of NFPA 101.~~

~~UL 294 and 1034 address efficacy and safety considerations for door access control applications (ingress control) to assure the door hardware would perform as intended and expected. Typically, access control systems incorporating card readers, keypads, iris scanners, etc. are tested and listed to UL 294. Additionally, delayed egress electrical locking systems, sensor-release electrical locking systems, and certain types of door hardware release electrical locking systems are all typically tested and listed to UL 294. On the other hand, components such as electromagnetic locks, electric dead bolts, electric strikes,~~

The approved First Revision is the highlighted text.

Commented [JW13]: PC 121

Commented [JW14]: PC 123

and other door electrically operated locking mechanisms are typically listed to UL 1034. UL 294 and UL 1034 are collateral standards that complement each other.

These examples illustrate that many of the same systems and components used to control access (ingress) to a space are also used for egress-side electrical locking systems. Considering that egress-side electrical locking systems have life safety implications, NFPA 101 was enhanced (in 2009) to require listing of electrical locking hardware to UL 294. In hindsight, what's proposed here – meeting a mandatory listing requirement with the collateral listing to UL 1034 – should have been the language included in NFPA 101 in the earlier editions.

In addition to the option to list to UL 1034, this proposal brings consistency in the text where UL 294 (and UL 1034) are referenced in NFPA 101. The additions of Annex A text complement the revisions to the mandatory language of these special locking arrangements.

The revisions of the Annex A text complement the revisions to 18.2.2.2.5.2(6)

Chapter 19 Existing Health Care Occupancies

19.2.2.2.5

Door-locking arrangements shall be permitted in accordance with either 19.2.2.2.5.1 or 19.2.2.2.5.2.

19.2.2.2.5.1 *

Door-locking arrangements shall be permitted where the clinical needs of patients require specialized security measures or where patients pose a security threat, provided that staff can readily unlock doors at all times in accordance with 19.2.2.2.6.

19.2.2.2.5.2 *

Door-locking arrangements shall be permitted where patient special needs require specialized protective measures for their safety, provided that all of the following are met:

1. Staff can readily unlock doors at all times in accordance with 19.2.2.2.6.
2. A total (complete) smoke detection system is provided throughout the locked space in accordance with 9.6.2.9, or locked doors can be remotely unlocked at an approved, constantly attended location within the locked space.
3. *The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with 19.3.5.7.
4. The locks are electrical locks that fail safely so as to release upon loss of power to the device.
5. The locks release by independent activation of each of the following:
 1. Activation of the smoke detection system required by 19.2.2.2.5.2(2)
 2. Waterflow in the automatic sprinkler system required by 19.2.2.2.5.2(3)

6. *Door electrical locking hardware for new electric lock installations is listed for the purpose. *Door electro-mechanical or electromagnetic locking hardware for new installations shall be listed in accordance with UL 294, Access Control System Units or UL 1034, Burglary-Resistant Electric Locking Mechanisms.

A. 19.2.2.2.5.2(6)

UL 294, Access Control System Units, and UL 1034, Burglary-Resistant Electric Locking Mechanisms, are two standards that provide criteria for listed door locking hardware. The electrical locking hardware might be a component of an electrical locking system or the electrical locking hardware might be a device with an individual listing. Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

Commented [WJ15]: Public Input No. 283- NFPA 101-2021

The approved First Revision is the highlighted text.

Commented [JW16]: PC 122

Commented [JW17]: PC 124

Reason:

Because of implications to life safety with electrical locking systems potentially affecting egress on these doors in the means of egress, it is prudent to require listing of door electrical locking hardware used in these applications. Requiring listing to either UL 294 or to UL 1034 appropriately revises this important listing requirement to help assure the electrical locking hardware performs as intended for these life-safety applications.

The Life Safety Code, in chapters 18 and 19, first required this electrical door hardware to be listed to UL 294 in the 2018 edition of NFPA 101.

UL 294 and 1034 address efficacy and safety considerations for door access control applications (ingress control) to assure the door hardware would perform as intended and expected. Typically, access control systems incorporating card readers, keypads, iris scanners, etc. are tested and listed to UL 294. Additionally, delayed egress electrical locking systems, sensor-release electrical locking systems, and certain types of door hardware release electrical locking systems are all typically tested and listed to UL 294. On the other hand, components such as electromagnetic locks, electric dead bolts, electric strikes, and other door electrically operated locking mechanisms are typically listed to UL 1034. UL 294 and UL 1034 are collateral standards that complement each other.

These examples illustrate that many of the same systems and components used to control access (ingress) to a space are also used for egress-side electrical locking systems. Considering that egress-side electrical locking systems have life safety implications, NFPA 101 was enhanced (in 2009) to require listing of electrical locking hardware to UL 294. In hindsight, what's proposed here – meeting a mandatory listing requirement with the collateral listing to UL 1034 – should have been the language included in NFPA 101 in the earlier editions.

In addition to the option to list to UL 1034, this proposal brings consistency in the text where UL 294 (and UL 1034) are referenced in NFPA 101. The additions of Annex A text complement the revisions to the mandatory language of these special locking arrangements.

The revisions of the Annex A text complement the revisions to 19.2.2.2.5.2(6).

Public Comment No. 154-NFPA 101-2022 [Section No. 7.2.1.5.7]

7.2.1.5.7* Stair Enclosure Re-entry.

Every door assembly in a stair enclosure serving more than four stories, unless permitted by 7.2.1.5.7.2, shall meet one of the following conditions:

- (1) Re-entry from the stair enclosure to the interior of the building shall be provided.
- (2) An automatic release shall be provided that meets all of the following:
 - (a) The automatic release shall unlock all stair enclosure door assemblies to allow re-entry.
 - (b) The automatic release shall be actuated with the automatic initiation of the building fire alarm system.
 - (c)* Door electrical locking hardware for new installations shall be listed in accordance with UL 294, *Access Control System Units*, or UL 1034, *Burglary-Resistant Locking Mechanisms*.
- (3) Selected re-entry shall be provided in accordance with 7.2.1.5.7.1.

7.2.1.5.7.1

Door assemblies on stair enclosures shall be permitted to be equipped with hardware that prevents re-entry into the interior of the building, provided that all of the following criteria are met:

- (1) There shall be not less than two levels where it is possible to leave the stair enclosure to access another exit.
- (2) There shall be not more than four stories intervening between stories where it is possible to leave the stair enclosure to access another exit.
- (3) Re-entry shall be possible on the top story or next-to-top story served by the stair enclosure, and such story shall allow access to another exit.
- (4) Door assemblies allowing re-entry shall be identified as such on the stair side of the door leaf.
- (5) Door assemblies not allowing re-entry shall be provided with a sign on the stair side indicating the location of the nearest door opening, in each direction of travel, that allows re-entry or exit.

7.2.1.5.7.2

The requirements of 7.2.1.5.7, except as provided in 7.2.1.5.7.3, shall not apply to the following:

- (1) Existing installations in buildings that are not high-rise buildings as permitted in Chapters 11 through 43
- (2) Existing installations in high-rise buildings as permitted in Chapters 11 through 43 where the occupancy is within a building protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7
- (3) Existing approved stairwell re-entry installations as permitted by Chapters 11 through 43
- (4) Stair enclosures serving a building permitted to have a single exit in accordance with Chapters 11 through 43
- (5) Stair enclosures in health care occupancies where otherwise provided in Chapter 18
- (6) Stair enclosures in detention and correctional occupancies where otherwise provided in Chapter 22

7.2.1.5.7.3

When the provisions of 7.2.1.5.7.2 are used, signage on the stair door leaves shall be required as follows:

- (1) Door assemblies allowing re-entry shall be identified as such on the stair side of the door leaf.
- (2) Door assemblies not allowing re-entry shall be provided with a sign on the stair side indicating the location of the nearest door opening, in each direction of travel, that allows re-entry or exit.

Statement of Problem and Substantiation for Public Comment

As indicated in the response to PI 233, this applies to new healthcare facilities per 18.2.2.2.10. Manual means of activating fire alarm should not activate re-entry protocols of stairwell doors.

Committee Statement

Committee Action: Rejected

Resolution: The issue applies to specific occupancies, such as health care. As submitted, the revision would apply to all occupancies. Where this applies to a specific occupancy, it should be addressed by the applicable occupancy committee.

Public Comment No. 202-NFPA 101-2022 [Section No. 7.2.1.5.7 [Excluding any Sub-Sections]]

Every door assembly in a stair enclosure serving more than four stories, unless permitted by 7.2.1.5.7.2, shall meet one of the following conditions:

- (1) Re-entry from the stair enclosure to the interior of the building shall be provided.
- (2) An automatic release shall be provided that meets all of the following:
 - (a) The automatic release shall unlock all stair enclosure door assemblies to allow re-entry.
 - (b) The automatic release shall be actuated with the initiation of the building fire alarm system. Activation of manual fire alarm boxes that activate the building fire alarm system shall not be required to unlock the stair doors.
 - (c)* Door electrical locking hardware for new installations shall be listed in accordance with UL 294, *Access Control System Units*, or UL 1034, *Burglary-Resistant Locking Mechanisms*.
- (3) Selected re-entry shall be provided in accordance with 7.2.1.5.7.1.

Statement of Problem and Substantiation for Public Comment

This language in this PC would increase the security provided by re-entry provisions for all occupancies. The provisions of this section preventing re-entry to the interior of the building from a stair can be defeated by simply activating a manual fire alarm box which is not very secure. Both delayed egress electrical locking (7.2.1.6.1.1(1)) and sensor-release electrical locking (7.2.1.6.2(4)) do not require activation of a manual fire alarm box to release the locking mechanism on the door. The same allowance should be provided for stair re-entry.

Committee Statement

Committee Action: Rejected

Resolution: The issue addressed by the public comment is not the same as that of delayed egress and other special locking arrangements because in those cases, the manual fire alarm box is on the secure side of the door. In the case of stair re-entry, the manual fire alarm box is not located within the stair. In some buildings, a manual fire alarm box might be the only means available to activate the alarm. Each occupancy chapter can modify these core chapter requirements based on their security needs. The correlating committee is currently evaluating to what extent security provisions should be included in the code.

**Public Comment No. 116-NFPA 101-2022 [Section No. 7.2.1.6]****7.2.1.6* Special Locking Arrangements.****7.2.1.6.1* Delayed-Egress Electrical Locking Systems.****7.2.1.6.1.1**

Approved, delayed-egress electrical locking systems shall be permitted to be installed on door assemblies serving low- and ordinary-hazard contents in buildings protected throughout by an approved, supervised automatic fire detection system in accordance with Section 9.6 or an approved, supervised automatic sprinkler system in accordance with Section 9.7, and where permitted in Chapters 11 through 43, provided that all of the following criteria are met:

- (1) The delay of the delayed-egress electrical locking system shall deactivate allowing unobstructed egress upon actuation of one of the following:
 - (2) Approved, supervised automatic sprinkler system in accordance with Section 9.7
 - (3) Not more than one heat detector of an approved, supervised automatic fire detection system in accordance with Section 9.6
 - (4) Not more than two smoke detectors of an approved, supervised automatic fire detection system in accordance with Section 9.6
- (5) The delay of the delayed-egress electrical locking system shall deactivate allowing unobstructed egress upon loss of power controlling the lock or locking mechanism.
- (6)* An irreversible process shall release the electrical lock in the direction of egress within 15 seconds, or 30 seconds where approved by the authority having jurisdiction, upon application of a force to the release device required in 7.2.1.5.3 under all of the following conditions:
 - (7) The force shall not be required to exceed 15 lbf (67 N).
 - (8) The force shall not be required to be continuously applied for more than 3 seconds.
 - (9) The initiation of the release process shall activate an audible signal in the vicinity of the door opening.
 - (10) Once the electrical lock has been released by the application of force to the releasing device, rearming the delay electronics shall be by manual means only.
- (11)* A readily visible, durable sign that conforms to the visual characters requirements of ICC A117.1, *Accessible and Usable Buildings and Facilities*, shall be located on the door leaf adjacent to the release device in the direction of egress, and shall read as follows:
 - (12) PUSH UNTIL ALARM SOUNDS, DOOR CAN BE OPENED IN 15 SECONDS, for doors that swing in the direction of egress travel
 - (13) PULL UNTIL ALARM SOUNDS, DOOR CAN BE OPENED IN 15 SECONDS, for doors that swing against the direction of egress travel
- (14) The egress side of doors equipped with delayed-egress electrical locking systems shall be provided with emergency lighting in accordance with Section 7.9.
- (15) ~~Hardware~~ Door electro-mechanical or electromagnetic locking hardware for new installations shall be listed in accordance with UL 294, *Access Control System Units* Units or UL 1034, *Burglary-Resistant Electric Locking Mechanisms*.

7.2.1.6.1.2

The provisions of 7.2.1.6.2 for sensor-release of electrical locking systems and 7.2.1.6.3 for door hardware release of electrically locked egress door assemblies shall not apply to door assemblies with delayed-egress electrical locking systems.

7.2.1.6.2* Sensor-Release of Electrical Locking Systems.

7.2.1.6.2.1

Where permitted in Chapters 11 through 43, door assemblies in the means of egress shall be permitted to be equipped with sensor-release electrical locking system hardware provided that all of the following criteria are met:

- (1) A sensor shall be provided on the egress side, arranged to electrically unlock the door leaf in the direction of egress upon detection of an approaching occupant.
- (2) Door leaves shall automatically electrically unlock in the direction of egress upon loss of power to the sensor or to the part of the locking system that electrically locks the door leaves.
- (3) Door locks shall be arranged to electrically unlock in the direction of egress from a manual release device complying with all of the following criteria:
 - (4) The manual release device shall be located on the egress side, 40 in. to 48 in. (1015 mm to 1220 mm) vertically above the floor, and within 60 in. (1525 mm) of the secured door openings, except as otherwise permitted by 7.2.1.6.2.1 (3)(b).
 - (5) The requirement of 7.2.1.6.2.1 (3)(a) to locate the manual release device within 60 in. (1525 mm) of the secured door opening shall not apply to previously approved existing installations.
 - (6) The manual release device shall be readily accessible and clearly identified by a sign that reads as follows: PUSH TO EXIT.
 - (7) When operated, the manual release device shall result in direct interruption of power to the electrical lock — independent of the locking system electronics — and the lock shall remain unlocked for not less than 30 seconds.
- (8) Activation of the building fire-protective signaling system, if provided, shall automatically electrically unlock the door leaves in the direction of egress, and the door leaves shall remain electrically unlocked until the fire-protective signaling system has been manually reset.
- (9) The activation of manual fire alarm boxes that activate the building fire-protective signaling system specified in 7.2.1.6.2.1(4) shall not be required to unlock the door leaves.
- (10) Activation of the building automatic sprinkler or fire detection system, if provided, shall automatically electrically unlock the door leaves in the direction of egress, and the door leaves shall remain electrically unlocked until the fire-protective signaling system has been manually reset.
- (11) The egress side of sensor-release electrically locked egress doors, other than existing sensor-release electrically locked egress doors, shall be provided with emergency lighting in accordance with Section 7.9.
- (12) ~~Hardware for Door electro-mechanical or electromagnetic locking hardware for~~ new installations shall be listed in accordance with UL 294, *Access Control System Units* or UL 1034, *Burglary-Resistant Electric Locking Mechanisms*.

7.2.1.6.2.2

The provisions of 7.2.1.6.1 for delayed-egress electrical locking systems and 7.2.1.6.3 for door hardware release of electrically locked egress door assemblies shall not apply to door assemblies with sensor-release of electrical locking systems.

7.2.1.6.3 Door Hardware Release of Electrically Locked Egress Door Assemblies.**7.2.1.6.3.1**

Door assemblies in the means of egress shall be permitted to be equipped with approved electrical locking systems released by the operation of door hardware provided that all of the following conditions are met:

- (1) The hardware for egress-side occupant release of the electrical lock is affixed to the door leaf.
- (2) The hardware has an obvious method of operation that is readily operated in the direction of egress under all lighting conditions.
- (3) The hardware is capable of being operated with one hand in the direction of egress.
- (4) Operation of the hardware directly and immediately interrupts the power supply to the electric lock to unlock the door assembly in the direction of egress.
- (5)* Loss of power to the listed releasing hardware automatically unlocks the door assembly in the direction of egress.
- (6) ~~Hardware~~ Door electro-mechanical or electromagnetic locking hardware for new installations ~~is~~ shall be listed in accordance with UL 294, *Access Control System Units* or UL 1034, *Burglary-Resistant Electric Locking Mechanisms*.

7.2.1.6.3.2

The provisions of 7.2.1.6.1 for delayed-egress electrical locking systems and the provisions of 7.2.1.6.2 for sensor-release of electrical locking systems shall not apply to door assemblies with door hardware release of electrically locked egress doors.

7.2.1.6.4* Elevator Lobby Exit Access Door Assemblies Locking.**7.2.1.6.4.1**

Where permitted in Chapters 11 through 43, door assemblies separating the elevator lobby from the exit access required by 7.4.1.6.1 shall be permitted to be electrically locked, provided that all the following criteria are met:

- (1) ~~The electrical~~ Door electro-mechanical or electromagnetic locking hardware is- shall be listed in accordance with UL 294, *Access Control System Units* or UL 1034, *Burglary-Resistant Electric Locking Mechanisms*.
- (2) The building is protected throughout by a fire alarm system in accordance with Section 9.6.
- (3) The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.
- (4) Waterflow in the sprinkler system required by 7.2.1.6.4.1 is arranged to initiate the building fire alarm system.
- (5) The elevator lobby is protected by an approved, supervised smoke detection system in accordance with Section 9.6.
- (6) Detection of smoke by the detection system required by 7.2.1.6.4.1 is arranged to initiate the building fire alarm system and notify building occupants.
- (7) Initiation of the building fire alarm system by other than manual fire alarm boxes unlocks the electrical locks on the elevator lobby door assembly.
- (8) Loss of power to the elevator lobby electrical lock system unlocks the electrical locks on the elevator lobby door assemblies.
- (9) Once unlocked, the elevator lobby door assemblies remain electrically unlocked until the building fire alarm system has been manually reset.
- (10) Where the elevator lobby door assemblies remain mechanically latched after being electrically unlocked, latch-releasing hardware in accordance with 7.2.1.5.3 is affixed to the door leaves.
- (11) A two-way communication system is provided for communication between the elevator lobby and a central control point that is constantly staffed.
- (12) The central control point staff required by 7.2.1.6.4.1(11) is capable, trained, and authorized to provide emergency assistance.

7.2.1.6.4.2

Elevator lobby exit access doors equipped with electrical locking systems shall not be required to comply with 7.2.1.6.1, 7.2.1.6.2, or 7.2.1.6.3.

Additional Proposed Changes

<u>File Name</u>	<u>Description</u>	<u>Approved</u>
2024_NFPA_101_UL_294_and_UL_1034_Public_Comments_20220520.pdf	NFPA 101 2024 add UL 1034 as an option where door hardware is required to be listed to UL 294.	

Statement of Problem and Substantiation for Public Comment

Because of implications to life safety with electrical locking systems potentially affecting egress on doors in the means of egress, it is prudent to require listing of door electrical locking hardware used in these special locking arrangements. Listing to either UL 294 or to UL 1034 appropriately revises this important listing requirement to help assure the electrical locking hardware performs as intended for these life-safety applications.

The Life Safety Code first required door hardware to be listed to UL 294 in the 2009 edition of NFPA 101 on elevator lobby exit access door assemblies. Special locking arrangements included the UL 294 listing requirement with the 2012 and 2018 editions of NFPA 101.

UL 294 and 1034 address efficacy and safety considerations for door access control applications (ingress control) to assure the door hardware and access control solutions would perform as intended and expected. Typically, access control systems incorporating card readers, keypads, iris scanners, etc. are tested and listed to UL 294. Additionally, delayed egress electrical locking systems, sensor-release electrical locking systems, and certain types of door hardware release electrical locking systems are all typically tested and listed to UL 294. On the other hand, components such as

electromagnetic locks, electric dead bolts, electric strikes, and other door electrically operated locking mechanisms are typically listed to UL 1034. UL 294 and UL 1034 are collateral standards that complement each other.

These examples illustrate that many of the same systems and components used to control access (ingress) to a space are also used for egress-side electrical locking systems. Considering that egress-side electrical locking systems have life safety implications, NFPA 101 was enhanced (in 2009) to require listing of electrical locking hardware to UL 294. In hindsight, what's proposed here – the collateral listing to UL 1034 – should have been the language included in NFPA 101 in the earlier editions.

In addition to the option to list to UL 1034, this proposal brings consistency in the text where UL 294 (and UL 1034) are referenced in NFPA 101. The additions of Annex A text complement the revisions to the mandatory language of these special locking arrangements.

Committee Statement

Committee Action: Rejected but see related SR

Resolution: [SR-6547-NFPA 101-2022](#)

Statement: The revision accepts the recommendations in PC-116, PC-117, PC-118, PC-119, and PC-120. It is noted that the PCs were accepted by the technical committee at its meeting; however, they must be processed as Reject but See Related SR-6547 to associate the new annex language with the base requirements. The net result is identical to that intended by the committee. The substantiations for the noted PCs follow.

PC-116: Because of implications to life safety with electrical locking systems potentially affecting egress on doors in the means of egress, it is prudent to require listing of door electrical locking hardware used in these special locking arrangements. Listing to either UL 294 or to UL 1034 appropriately revises this important listing requirement to help assure the electrical locking hardware performs as intended for these life-safety applications.

The Life Safety Code first required door hardware to be listed to UL 294 in the 2009 edition of NFPA 101 on elevator lobby exit access door assemblies. Special locking arrangements included the UL 294 listing requirement with the 2012 and 2018 editions of NFPA 101.

UL 294 and 1034 address efficacy and safety considerations for door access control applications (ingress control) to assure the door hardware and access control solutions would perform as intended and expected. Typically, access control systems incorporating card readers, keypads, iris scanners, etc. are tested and listed to UL 294. Additionally, delayed egress electrical locking systems, sensor-release

electrical locking systems, and certain types of door hardware release electrical locking systems are all typically tested and listed to UL 294. On the other hand, components such as electromagnetic locks, electric dead bolts, electric strikes, and other door electrically operated locking mechanisms are typically listed to UL 1034. UL 294 and UL 1034 are collateral standards that complement each other.

These examples illustrate that many of the same systems and components used to control access (ingress) to a space are also used for egress-side electrical locking systems. Considering that egress-side electrical locking systems have life safety implications, NFPA 101 was enhanced (in 2009) to require listing of electrical locking hardware to UL 294. In hindsight, what's proposed here – the collateral listing to UL 1034 – should have been the language included in NFPA 101 in the earlier editions.

In addition to the option to list to UL 1034, this proposal brings consistency in the text where UL 294 (and UL 1034) are referenced in NFPA 101. The additions of Annex A text complement the revisions to the mandatory language of these special locking arrangements.

PC-117 through PC-120: The additions of Annex A text complement the revisions to the mandatory language of these special locking arrangements.

2021 / 2024 NFPA 101 UL 294 and UL 1034

Revised 20, 2022

BHMA, John Woestman

Proposed public comment revisions are based on NFPA 101 language as revised, or not, per the First Draft Report.

Chapter 2 Referenced Publications

UL 294, Access Control System Units, 2018.

UL 1034, *Burglary-Resistant Electric Locking Mechanisms*, 2011, revised 2020

Commented [WJ1]: Public Input No. 277-NFPA 101-2021

The approved First Revision is the highlighted text. No revisions needed for public comment.

Chapter 7 Means of Egress

7.2.1.5.7 * Stair Enclosure Re-entry.

Every door assembly in a stair enclosure serving more than four stories, unless permitted by 7.2.1.5.7.2, shall meet one of the following conditions:

1. Re-entry from the stair enclosure to the interior of the building shall be provided.
2. An automatic release shall be provided that meets all of the following:
 - a) The automatic release shall unlock all stair enclosure door assemblies to allow re-entry.
 - b) The automatic release shall be actuated with the initiation of the building fire alarm system.
 - c) *Door ~~electrical~~ **electro-mechanical or electromagnetic** locking hardware for new installations shall be listed in accordance with UL 294, *Access Control System Units* or UL 1034, *Burglary-Resistant Electric Locking Mechanisms*.
3. Selected re-entry shall be provided in accordance with 7.2.1.5.7.1.

Commented [WJ2]: Public Input No. 278-NFPA 101-2021

The approved First Revision is with the highlighted text with potential further revisions via public comment.

Commented [JW3]: PC 114

A.7.2.1.5.7(2)(c)

The electrical locking hardware may be a component of an electrical locking system (e.g. access control system) or the electrical locking hardware may be a device with an individual listing. Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

Commented [WJ4]: Public Input No. 278-NFPA 101-2021

The approved First Revision is the highlighted text. No revisions via public comment needed.

Commented [JW5]: PC 115

Reason:

The proposed revisions help clarify the door electrical locking hardware that is required to be listed for these electrical locking applications. In addition of adding the option to list to UL 1034 included in the First Revision, this proposal brings consistency in the text where UL 294 and UL 1034 are referenced in NFPA 101. The additions of the Annex A text complement the revisions to the mandatory language of these special locking arrangements.

Because of implications to life safety with electrical locking systems potentially affecting egress on doors in the means of egress, it is prudent to require listing of door electrical locking hardware used in these applications. Listing to either UL 294 or to UL 1034 appropriately revises this important listing requirement to help assure the electrical locking hardware performs as intended for this life-safety application.

The Life Safety Code first required door hardware to be listed to UL 294 in the 2009 edition of NFPA 101. This section of NFPA 101, Stair Enclosure Re-entry, first required listing of door locking hardware to UL 294 with the 2021 edition of NFPA 101.

UL 294 and 1034 address efficacy and safety considerations for door access control applications (ingress control) to help assure the door hardware and access control solutions would perform as intended and expected. Typically, access control systems incorporating card readers, keypads, iris scanners, etc. are tested and listed to UL 294. Additionally, delayed egress electrical locking systems, sensor-release electrical locking systems, and certain types of door hardware release electrical locking systems are all typically tested and listed to UL 294. On the other hand, components such as electromagnetic locks, electric dead bolts, electric strikes, and other door electrically operated locking mechanisms are typically listed to UL 1034. UL 294 and UL 1034 are collateral standards that complement each other.

These examples illustrate that some of the same systems and components used to control access (ingress) to a space are also used for egress-side electrical locking systems. Considering that egress-side electrical locking systems have life safety implications, NFPA 101 was enhanced (in 2009) to require listing of electrical locking hardware to UL 294. In hindsight, the collateral listing to UL 1034 should have been the language included in NFPA 101 in the earlier editions.

7.2.1.6* Special Locking Arrangements.

7.2.1.6.1 * Delayed-Egress Electrical Locking Systems.

7.2.1.6.1.1

Approved, delayed-egress electrical locking systems shall be permitted to be installed on door assemblies serving low- and ordinary-hazard contents in buildings protected throughout by an approved, supervised automatic fire detection system in accordance with Section 9.6 or an approved, supervised automatic sprinkler system in accordance with Section 9.7, and where permitted in Chapters 11 through 43, provided that all of the following criteria are met:

1. The delay of the delayed-egress electrical locking system shall deactivate allowing unobstructed egress upon actuation of one of the following:
 - a) Approved, supervised automatic sprinkler system in accordance with Section 9.7
 - b) Not more than one heat detector of an approved, supervised automatic fire detection system in accordance with Section 9.6
 - c) Not more than two smoke detectors of an approved, supervised automatic fire detection system in accordance with Section 9.6
2. The delay of the delayed-egress electrical locking system shall deactivate allowing unobstructed egress upon loss of power controlling the lock or locking mechanism.
3. *An irreversible process shall release the electrical lock in the direction of egress within 15 seconds, or 30 seconds where approved by the authority having jurisdiction, upon application of a force to the release device required in 7.2.1.5.3 under all of the following conditions:
 - a) The force shall not be required to exceed 15 lbf (67 N).
 - b) The force shall not be required to be continuously applied for more than 3 seconds.
 - c) The initiation of the release process shall activate an audible signal in the vicinity of the door opening.
 - d) Once the electrical lock has been released by the application of force to the releasing device, rearming the delay electronics shall be by manual means only.

Commented [WJ6]: Public Input No. 279-NFPA 101-2021

Commented [JW7]: PC 116 is the mandatory text (Chapter 7). Separate PC for the Annex revisions.

4. *A readily visible, durable sign that conforms to the visual characters requirements of ICC A117.1, *Accessible and Usable Buildings and Facilities*, shall be located on the door leaf adjacent to the release device in the direction of egress, and shall read as follows:
 - a) PUSH UNTIL ALARM SOUNDS, DOOR CAN BE OPENED IN 15 SECONDS, for doors that swing in the direction of egress travel
 - b) PULL UNTIL ALARM SOUNDS, DOOR CAN BE OPENED IN 15 SECONDS, for doors that swing against the direction of egress travel
5. The egress side of doors equipped with delayed-egress electrical locking systems shall be provided with emergency lighting in accordance with Section 7.9.
6. ~~*Door electro-mechanical or electromagnetic locking hardware~~ for new installations shall be listed in accordance with UL 294, *Access Control System Units* or UL 1034, *Burglary-Resistant Electric Locking Mechanisms*.

A.7.2.1.6.1.1(6)

The electrical locking hardware may be a component of an electrical locking system, or the electrical locking hardware may be a device with an individual listing. Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

Commented [JW8]: PC 117

7.2.1.6.2 * Sensor-Release of Electrical Locking Systems.

7.2.1.6.2.1

Where permitted in Chapters 11 through 43, door assemblies in the means of egress shall be permitted to be equipped with sensor-release electrical locking system hardware provided that all of the following criteria are met:

1. A sensor shall be provided on the egress side, arranged to electrically unlock the door leaf in the direction of egress upon detection of an approaching occupant.
2. Door leaves shall automatically electrically unlock in the direction of egress upon loss of power to the sensor or to the part of the locking system that electrically locks the door leaves.
3. Door locks shall be arranged to electrically unlock in the direction of egress from a manual release device complying with all of the following criteria:
 - a) The manual release device shall be located on the egress side, 40 in. to 48 in. (1015 mm to 1220 mm) vertically above the floor, and within 60 in. (1525 mm) of the secured door openings, except as otherwise permitted by 7.2.1.6.2(3)(c).
 - b) The requirement of 7.2.1.6.2(3)(a) to locate the manual release device within 60 in. (1525 mm) of the secured door opening shall not apply to previously approved existing installations.
 - c) The manual release device shall be readily accessible and clearly identified by a sign that reads as follows: PUSH TO EXIT.
 - d) When operated, the manual release device shall result in direct interruption of power to the electrical lock — independent of the locking system electronics — and the lock shall remain unlocked for not less than 30 seconds.
4. Activation of the building fire-protective signaling system, if provided, shall automatically electrically unlock the door leaves in the direction of egress, and the door leaves shall remain electrically unlocked until the fire-protective signaling system has been manually reset.
5. The activation of manual fire alarm boxes that activate the building fire-protective signaling system specified in 7.2.1.6.2(4) shall not be required to unlock the door leaves.
6. Activation of the building automatic sprinkler or fire detection system, if provided, shall automatically electrically unlock the door leaves in the direction of egress, and the door leaves shall remain electrically unlocked until the fire-protective signaling system has been manually reset.

7. The egress side of sensor-release electrically locked egress doors, other than existing sensor-release electrically locked egress doors, shall be provided with emergency lighting in accordance with Section 7.9.
8. ~~*Door electro-mechanical or electromagnetic locking. Hardware~~ for new installations shall be listed in accordance with UL 294, *Access Control System Units* or UL 1034, *Burglary-Resistant Electric Locking Mechanisms*.

A.7.2.1.6.2.1(8)

The electrical locking hardware may be a component of an electrical locking system, or the electrical locking hardware may be a device with an individual listing. Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

Commented [JW9]: PC 118

7.2.1.6.3 Door Hardware Release of Electrically Locked Egress Door Assemblies.

7.2.1.6.3.1

Door assemblies in the means of egress shall be permitted to be equipped with approved electrical locking systems released by the operation of door hardware provided that all of the following conditions are met:

1. The hardware for egress-side occupant release of the electrical lock is affixed to the door leaf.
2. The hardware has an obvious method of operation that is readily operated in the direction of egress under all lighting conditions.
3. The hardware is capable of being operated with one hand in the direction of egress.
4. Operation of the hardware directly and immediately interrupts the power supply to the electric lock to unlock the door assembly in the direction of egress.
5. *Loss of power to the listed releasing hardware automatically unlocks the door assembly in the direction of egress.
6. ~~*Door electro-mechanical or electromagnetic locking. Hardware~~ for new installations ~~is shall be~~ listed in accordance with UL 294, *Access Control System Units* or UL 1034, *Burglary-Resistant Electric Locking Mechanisms*.

A.7.2.1.6.3.1(6)

The electrical locking hardware may be a component of an electrical locking system, or the electrical locking hardware may be a device with an individual listing. Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

Commented [JW10]: PC 119

7.2.1.6.4 * Elevator Lobby Exit Access Door Assemblies Locking.

7.2.1.6.4.1

Where permitted in Chapters 11 through 43, door assemblies separating the elevator lobby from the exit access required by 7.4.1.6.1 shall be permitted to be electrically locked, provided that all the following criteria are met:

1. ~~*The Door electro-mechanical or electromagnetic~~ locking hardware ~~is shall be~~ listed in accordance with UL 294, *Access Control System Units* or UL 1034, *Burglary-Resistant Locking Mechanisms*.
2. The building is protected throughout by a fire alarm system in accordance with Section 9.6.
3. The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.
4. Waterflow in the sprinkler system required by 7.2.1.6.4.1 is arranged to initiate the building fire alarm system.
5. The elevator lobby is protected by an approved, supervised smoke detection system in accordance with Section 9.6.
6. Detection of smoke by the detection system required by 7.2.1.6.4.1 is arranged to initiate the building fire alarm system and notify building occupants.

7. Initiation of the building fire alarm system by other than manual fire alarm boxes unlocks the electrical locks on the elevator lobby door assembly.
8. Loss of power to the elevator lobby electrical lock system unlocks the electrical locks on the elevator lobby door assemblies.
9. Once unlocked, the elevator lobby door assemblies remain electrically unlocked until the building fire alarm system has been manually reset.
10. Where the elevator lobby door assemblies remain mechanically latched after being electrically unlocked, latch-releasing hardware in accordance with 7.2.1.5.3 is affixed to the door leaves.
11. A two-way communication system is provided for communication between the elevator lobby and a central control point that is constantly staffed.
12. The central control point staff required by 7.2.1.6.4 is capable, trained, and authorized to provide emergency assistance.

A.7.2.1.6.4.1(1)

The electrical locking hardware may be a component of an electrical locking system, or the electrical locking hardware may be a device with an individual listing. Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

Commented [JW11]: PC 120

Reason:

Because of implications to life safety with electrical locking systems potentially affecting egress on doors in the means of egress, it is prudent to require listing of door electrical locking hardware used in these special locking arrangements. Listing to either UL 294 or to UL 1034 appropriately revises this important listing requirement to help assure the electrical locking hardware performs as intended for these life-safety applications.

The Life Safety Code first required door hardware to be listed to UL 294 in the 2009 edition of NFPA 101 on elevator lobby exit access door assemblies. Special locking arrangements included the UL 294 listing requirement with the 2012 and 2018 editions of NFPA 101.

UL 294 and 1034 address efficacy and safety considerations for door access control applications (ingress control) to assure the door hardware and access control solutions would perform as intended and expected. Typically, access control systems incorporating card readers, keypads, iris scanners, etc. are tested and listed to UL 294. Additionally, delayed egress electrical locking systems, sensor-release electrical locking systems, and certain types of door hardware release electrical locking systems are all typically tested and listed to UL 294. On the other hand, components such as electromagnetic locks, electric dead bolts, electric strikes, and other door electrically operated locking mechanisms are typically listed to UL 1034. UL 294 and UL 1034 are collateral standards that complement each other.

These examples illustrate that many of the same systems and components used to control access (ingress) to a space are also used for egress-side electrical locking systems. Considering that egress-side electrical locking systems have life safety implications, NFPA 101 was enhanced (in 2009) to require listing of electrical locking hardware to UL 294. In hindsight, what's proposed here – the collateral listing to UL 1034 – should have been the language included in NFPA 101 in the earlier editions.

In addition to the option to list to UL 1034, this proposal brings consistency in the text where UL 294 (and UL 1034) are referenced in NFPA 101. The additions of Annex A text complement the revisions to the mandatory language of these special locking arrangements.

Chapter 18 New Health Care Occupancies

18.2.2.2.5

Door-locking arrangements shall be permitted in accordance with either 18.2.2.2.5.1 or 18.2.2.2.5.2.

18.2.2.2.5.1 *

Door-locking arrangements shall be permitted where the clinical needs of patients require specialized security measures or where patients pose a security threat, provided that staff can readily unlock doors at all times in accordance with 18.2.2.2.6.

18.2.2.2.5.2 *

Door-locking arrangements shall be permitted where patient special needs require specialized protective measures for their safety, provided that all of the following criteria are met:

1. Staff can readily unlock doors at all times in accordance with 18.2.2.2.6.
2. A total (complete) smoke detection system is provided throughout the locked space in accordance with 9.6.2.9, or locked doors can be remotely unlocked at an approved, constantly attended location within the locked space.
3. *The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with 18.3.5.1.
4. The locks are electrical locks that fail safely so as to release upon loss of power to the device.
5. The locks release by independent activation of each of the following:
 - a) Activation of the smoke detection system required by 18.2.2.2.5.2(2)
 - b) Waterflow in the automatic sprinkler system required by 18.2.2.2.5.2(3)

6. *Door electrical locking hardware for new electric lock installations is listed for the purpose: *Door electro-mechanical or electromagnetic locking hardware for new installations shall be listed in accordance with UL 294, Access Control System Units or UL 1034, Burglary-Resistant Electric Locking Mechanisms.

A. 18.2.2.2.5.2(6)

~~UL 294, Access Control System Units, and UL 1034, Burglary-Resistant Electric Locking Mechanisms, are two standards that provide criteria for listed door-locking hardware. The electrical locking hardware might be a component of an electrical locking system or the electrical locking hardware might be a device with an individual listing. Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.~~

Reason:

~~Because of implications to life safety with electrical locking systems potentially affecting egress on these doors in the means of egress, it is prudent to require listing of door electrical locking hardware used in these applications. Requiring listing to either UL 294 or to UL 1034 appropriately revises this important listing requirement to help assure the electrical locking hardware performs as intended for these life-safety applications.~~

~~The Life Safety Code, in chapters 18 and 19, first required this electrical door hardware to be listed to UL 294 in the 2018 edition of NFPA 101.~~

~~UL 294 and 1034 address efficacy and safety considerations for door access control applications (ingress control) to assure the door hardware would perform as intended and expected. Typically, access control systems incorporating card readers, keypads, iris scanners, etc. are tested and listed to UL 294. and other door electrically operated locking mechanisms are typically listed to UL 1034. UL 294 and UL 1034 are collateral standards that complement each other.

These examples illustrate that many of the same systems and components used to control access (ingress) to a space are also used for egress-side electrical locking systems. Considering that egress-side electrical locking systems have life safety implications, NFPA 101 was enhanced (in 2009) to require listing of electrical locking hardware to UL 294. In hindsight, what's proposed here – meeting a mandatory listing requirement with the collateral listing to UL 1034 – should have been the language included in NFPA 101 in the earlier editions.

In addition to the option to list to UL 1034, this proposal brings consistency in the text where UL 294 (and UL 1034) are referenced in NFPA 101. The additions of Annex A text complement the revisions to the mandatory language of these special locking arrangements.

The revisions of the Annex A text complement the revisions to 18.2.2.2.5.2(6)

Chapter 19 Existing Health Care Occupancies

19.2.2.2.5

Door-locking arrangements shall be permitted in accordance with either 19.2.2.2.5.1 or 19.2.2.2.5.2.

19.2.2.2.5.1 *

Door-locking arrangements shall be permitted where the clinical needs of patients require specialized security measures or where patients pose a security threat, provided that staff can readily unlock doors at all times in accordance with 19.2.2.2.6.

19.2.2.2.5.2 *

Door-locking arrangements shall be permitted where patient special needs require specialized protective measures for their safety, provided that all of the following are met:

1. Staff can readily unlock doors at all times in accordance with 19.2.2.2.6.
2. A total (complete) smoke detection system is provided throughout the locked space in accordance with 9.6.2.9, or locked doors can be remotely unlocked at an approved, constantly attended location within the locked space.
3. *The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with 19.3.5.7.
4. The locks are electrical locks that fail safely so as to release upon loss of power to the device.
5. The locks release by independent activation of each of the following:
 1. Activation of the smoke detection system required by 19.2.2.2.5.2(2)
 2. Waterflow in the automatic sprinkler system required by 19.2.2.2.5.2(3)

6. *Door electrical locking hardware for new electric lock installations is listed for the purpose. *Door electro-mechanical or electromagnetic locking hardware for new installations shall be listed in accordance with UL 294, Access Control System Units or UL 1034, Burglary-Resistant Electric Locking Mechanisms.

A. 19.2.2.2.5.2(6)

UL 294, Access Control System Units, and UL 1034, Burglary-Resistant Electric Locking Mechanisms, are two standards that provide criteria for listed door locking hardware. The electrical locking hardware might be a component of an electrical locking system or the electrical locking hardware might be a device with an individual listing. Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

Reason:

Because of implications to life safety with electrical locking systems potentially affecting egress on these doors in the means of egress, it is prudent to require listing of door electrical locking hardware used in these applications. Requiring listing to either UL 294 or to UL 1034 appropriately revises this important listing requirement to help assure the electrical locking hardware performs as intended for these life-safety applications.

The Life Safety Code, in chapters 18 and 19, first required this electrical door hardware to be listed to UL 294 in the 2018 edition of NFPA 101.

UL 294 and 1034 address efficacy and safety considerations for door access control applications (ingress control) to assure the door hardware would perform as intended and expected. Typically, access control systems incorporating card readers, keypads, iris scanners, etc. are tested and listed to UL 294. Additionally, delayed egress electrical locking systems, sensor-release electrical locking systems, and certain types of door hardware release electrical locking systems are all typically tested and listed to UL 294. On the other hand, components such as electromagnetic locks, electric dead bolts, electric strikes, and other door electrically operated locking mechanisms are typically listed to UL 1034. UL 294 and UL 1034 are collateral standards that complement each other.

These examples illustrate that many of the same systems and components used to control access (ingress) to a space are also used for egress-side electrical locking systems. Considering that egress-side electrical locking systems have life safety implications, NFPA 101 was enhanced (in 2009) to require listing of electrical locking hardware to UL 294. In hindsight, what's proposed here – meeting a mandatory listing requirement with the collateral listing to UL 1034 – should have been the language included in NFPA 101 in the earlier editions.

In addition to the option to list to UL 1034, this proposal brings consistency in the text where UL 294 (and UL 1034) are referenced in NFPA 101. The additions of Annex A text complement the revisions to the mandatory language of these special locking arrangements.

The revisions of the Annex A text complement the revisions to 19.2.2.2.5.2(6).

Public Comment No. 199-NFPA 101-2022 [Section No. 7.2.1.6.1.1]

7.2.1.6.1.1

Approved, delayed-egress electrical locking systems shall be permitted to be installed on door assemblies serving low- and ordinary-hazard

contents in buildings protected

contents where permitted in Chapters 11 through 43, provided that all of the following criteria are met:

(1) The building shall be protected by one of the following methods:

(a) The building shall be protected throughout by an approved supervised sprinkler system in accordance with Section 9.7.

(i) For existing buildings only the secured area and the required egress paths from the secured area to the exterior of the building shall be required to be protected by an approved supervised automatic sprinkler system in accordance with

Section 9.7 provided the secured area and the required egress paths from the secured area to the exterior of the building are separated from nonsprinklered portions of the building by a 2-hour fire barrier.

(b) The building shall be protected throughout by an approved

supervised automatic fire detection system in accordance with

Section

Section 9.6

or an approved, supervised automatic sprinkler system in accordance with Section 9.7, and where permitted in Chapters 11 through 43, provided that all of the following criteria are met:

(i) For existing buildings only the secured area and the required egress paths from the secured area to the exterior of the building shall be required to be protected by an approved supervised automatic fire detection system in accordance with

Section 9.6 provided the secured area and the required egress paths from the secured area to the exterior of the building are separated from the non-fire detected portions of the building by a 2-hour fire barrier.

(1) The delay of the delayed-egress electrical locking system shall deactivate allowing unobstructed egress upon actuation of one of the following:

(2) Approved, supervised automatic sprinkler system in accordance with Section 9.7

(3) Not more than one heat detector of an approved, supervised automatic fire detection system in accordance with Section 9.6

(4) Not more than two smoke detectors of an approved, supervised automatic fire detection system in accordance with Section 9.6

(5) The delay of the delayed-egress electrical locking system shall deactivate allowing unobstructed egress upon loss of power controlling the lock or locking mechanism.

(6)* An irreversible process shall release the electrical lock in the direction of egress within 15 seconds, or 30 seconds where approved by the authority having jurisdiction, upon application of a force to the release device required in 7.2.1.5.3 under all of the following conditions:

(7) The force shall not be required to exceed 15 lbf (67 N).

(8) The force shall not be required to be continuously applied for more than 3 seconds.

(9) The initiation of the release process shall activate an audible signal in the vicinity of the door opening.

(10) Once the electrical lock has been released by the application of force to the releasing device, rearming the delay electronics shall be by manual means only.

(11)* A readily visible, durable sign that conforms to the visual characters requirements of ICC A117.1, *Accessible and Usable Buildings and Facilities*, shall be located on the door leaf adjacent to the release device in the direction of egress, and shall read as follows:

(12) PUSH UNTIL ALARM SOUNDS, DOOR CAN BE OPENED IN 15 SECONDS, for doors that swing in the direction of egress travel

(13) PULL UNTIL ALARM SOUNDS, DOOR CAN BE OPENED IN 15 SECONDS, for doors that swing against the direction of egress travel

(14) The egress side of doors equipped with delayed-egress electrical locking systems shall be provided with emergency lighting in accordance with Section 7.9.

(15) Hardware for new installations shall be listed in accordance with UL 294, *Access Control System Units*.

Additional Proposed Changes

<u>File Name</u>	<u>Description</u>	<u>Approved</u>
7.2.1.6.1.1.docx	Changes provided in word file for clarity	

Statement of Problem and Substantiation for Public Comment

This PC was submitted to address the First Draft committee statement on PI 229 related to the lack of clarity of the terms “delayed egress path” and “secured compartment”, limiting the change to existing buildings and expanding the concept to include fire detection in addition to sprinkler protection.

Currently delayed egress locking is not permitted unless the building is completely sprinkler protected leaving only sensor-release electrical locking as the only security option. Sensor-release electrical locking is not always a feasible way of providing security due to the required motion sensor to unlock the door each time an occupant walks near the door. The new proposed text is similar to the exit discharge approach as detailed in Section 7.7.2 separating the non-protected portion of the egress by 2-hour construction. Provided the building occupants from the secure area and required egress paths to the building exterior are separated from non-protected areas by a 2-hour fire barrier, delayed egress should be permitted to be installed in existing buildings to provide security. Providing protection throughout an existing building is not always feasible in older buildings due to remediation of conditions such as asbestos.

Committee Statement

Committee Action: Rejected

Resolution: It is not clear what defines the egress paths from the secured area. Also the code does not generally refer to supervised automatic fire detection systems or non-fire detected portions of the building.

7.2.1.6.1.1 Approved, delayed-egress electrical locking system shall be permitted to be installed on door assemblies serving low- and ordinary-hazard contents ~~in buildings protected throughout by an approved, supervised automatic fire detection system in accordance with Section 9.6 or an approved, supervised automatic sprinkler system in accordance with Section 9.7, and~~ where permitted in Chapters 11 through 43, provided that all of the following criteria are met:

(1) The building shall be protected by one of the following methods:

- a. The building shall be protected throughout by an approved supervised sprinkler system in accordance with Section 9.7.
 - i. For existing buildings only the secured area and the required egress paths from the secured area to the exterior of the building shall be required to be protected by an approved supervised sprinkler system in accordance with Section 9.7 provided the secured area and required egress paths from the secured area to the exterior of the building are separated from nonsprinklered portions of the building by a 2-hour fire barrier.
- b. The building shall be protected throughout by an approved supervised automatic fire detection system in accordance with Section 9.6.
 - i. For existing buildings only the secured area and the required egress paths from the secured area to the exterior of the building shall be required to be protected by an approved supervised automatic fire detection system in accordance with Section 9.6 provided the secured area and required egress paths from the secured area to the exterior of the building are separated from non-fire detected portions of the building by a 2-hour fire barrier.

(12) The delay of the delayed-egress electrical locking system shall deactivate allowing unobstructed egress upon actuation of one of the following:

- (a) Approved, supervised automatic sprinkler system in accordance with Section 9.7
- (b) Not more than one heat detector of an approved, supervised automatic fire detection system in accordance with Section 9.6
- (c) Not more than two smoke detectors of an approved, supervised automatic fire detection system in accordance with Section 9.6

Public Comment No. 70-NFPA 101-2022 [Section No. 7.2.1.6.2.1]

7.2.1.6.2.1

—

* Where permitted in Chapters 11 through 43, door assemblies in the means of egress shall be permitted to be equipped with sensor-release electrical locking system hardware provided that all of the following criteria are met:

- (1) A sensor shall be provided on the egress side, arranged to electrically unlock the door leaf in the direction of egress upon detection of an approaching occupant.
- (2) Door leaves shall automatically electrically unlock in the direction of egress upon loss of power to the sensor or to the part of the locking system that electrically locks the door leaves.
- (3) Door locks shall be arranged to electrically unlock in the direction of egress from a manual release device or contactless sensor complying with all of the following criteria:
 - (a) The manual release device or contactless sensor shall be located on the egress side, 40 in. to 48 in. (1015 mm to 1220 mm) vertically above the floor, and within 60 in. (1525 mm)

1525 mm

1525 mm) of the secured door openings, except as otherwise permitted by 7.2.1.6.2.1 (3)(

b

c).

- (b) The requirement of 7.2.1.6.2.1 (3)(a) to locate the manual release device or contactless sensor within 60 in. (1525 mm) of the secured door opening shall not apply to previously approved existing installations.
- (c) The manual release device, where provided, shall be readily accessible and clearly identified by a sign that reads as follows: PUSH TO EXIT.
- (d)* The contactless sensor, where provided, shall be readily accessible and clearly identified by a sign that reads as follows: WAVE TO EXIT
- (e) When operated, the manual release device or contactless sensor shall result in direct interruption of power to the electrical lock — independent of the locking system electronics — and the lock shall remain unlocked for not less than 30 seconds.
- (f)* The contactless sensor referenced in 7.2.1.6.2.1(3) that is used to automatically unlock the doors in the direction of egress shall be independent of the sensor referenced in 7.2.1.6.2.1(1) and 7.2.1.6.1(2).
- (4) Activation of the building fire-protective signaling system, if provided, shall automatically electrically unlock the door leaves in the direction of egress, and the door leaves shall remain electrically unlocked until the fire-protective signaling system has been manually reset.
- (5) The activation of manual fire alarm boxes that activate the building fire-protective signaling system specified in 7.2.1.6.2.1 (4) shall not be required to unlock the door leaves.
- (6) Activation of the building automatic sprinkler or fire detection system, if provided, shall automatically electrically unlock the door leaves in the direction of egress, and the door leaves shall remain electrically unlocked until the fire-protective signaling system has been manually reset.
- (7) The egress side of sensor-release electrically locked egress doors, other than existing sensor-release electrically locked egress doors, shall be provided with emergency lighting in accordance with

Section-

Section 7.9 .

- (8) Hardware for new installations shall be listed in accordance with ANSI/ UL 294, Standard for Access Control System Units .

Statement of Problem and Substantiation for Public Comment

The use of contactless sensors to open doors is becoming more prevalent due to Covid and other concerns about the

spread of infection, especially in health care settings. Contactless sensors (e.g., “wave to open” devices) can perform similarly to manual “push to exit” devices and should therefore be permitted as a substitute for “push to exit” devices, but only if they are listed to UL 294 and only if they are configured to be independent of the (overhead motion) sensors used to unlock the door upon occupant approach such that a single failure can’t result in both types of sensors failing simultaneously.

To avoid confusion, annex material is added to discuss the differences between the existing (overhead motion) sensors used to unlock doors upon occupant approach and the proposed contactless sensors to unlock doors in the event the (overhead motion) sensors fail. Text is also included that clarifies that contactless sensors can currently be used, but only as a supplement to “push to exit” devices.

Resolution: The proposed revision is new material. The inclusion of common terminology would be advantageous during the next revision cycle.

**Public Comment No. 85-NFPA 101-2022 [Section No. 7.2.1.6.4.1]****7.2.1.6.4.1**

Where permitted in Chapters 11 through 43, door assemblies separating the elevator lobby from the exit access required by 7.4.1.6.1 shall be permitted to be electrically locked, provided that all the following criteria are met:

- (1) The electrical locking hardware is listed in accordance with UL 294, *Access Control System Units*.
- (2) The building is protected throughout by a fire alarm system in accordance with Section 9.6.
- (3) The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.
- (4) Waterflow in the sprinkler system required by 7.2.1.6.4.1 is arranged to initiate the building fire alarm system.
- (5) The elevator lobby is protected by an approved, supervised smoke detection system in accordance with Section 9.6.
- (6) Detection of smoke by the detection system required by 7.2.1.6.4.1 is arranged to initiate the building fire alarm system and notify building occupants.
- (7) Initiation of the building fire alarm system by other than manual fire alarm boxes unlocks the electrical locks on the elevator lobby door assembly.
- (8) Loss of power to the elevator lobby electrical lock system unlocks the electrical locks on the elevator lobby door assemblies.
- (9) Once unlocked, the elevator lobby door assemblies remain electrically unlocked until the building fire alarm system has been manually reset.
- (10) Where the elevator lobby door assemblies remain mechanically latched after being electrically unlocked, latch-releasing hardware in accordance with 7.2.1.5.3 is affixed to the door leaves.
- (11) A means for two-way communication ~~system~~ is provided ~~for communication~~ between the elevator lobby and a central control point that is constantly staffed.
- (12) The central control point staff required by 7.2.1.6.4.1(11) is capable, trained, and authorized to provide emergency assistance.

Statement of Problem and Substantiation for Public Comment

The intent of PI# 56-NFPA 101-2021 was to clarify what is desired by the code committee in the requirement for a two-way communication system. Because NFPA 101 does not define a "two-way communications system," it is left up to the interpretation of the designer to coordinate with the AHJ. This has lead to interpretation of enforcing requirements of NFPA 72 which does define a "two-way emergency communications system" and has specific requirements. If the intent is that any system that provides communication to and from the constantly attended location is acceptable, then revising the language as noted in the PC should convey this. If the committee's intent is to meet the requirements for NFPA 72, then a reference to NFPA 72 should be made and the wording should be revised to indicate a "two-way emergency communications system" is required.

Committee Statement

Committee Action:	Rejected
Resolution:	The term 'system' needs to be retained. The current language does not mandate compliance with NFPA 72.

Public Comment No. 125-NFPA 101-2022 [New Section after 7.2.1.6.4.2]

7.2.1.6.5 Interlocked-Door Vestibule

Where permitted in chapters 11 through 43 with low- and ordinary-hazard contents, an interlocked-door vestibule shall be permitted in a the means of egress where there are provisions for continuous and unobstructed travel through the interlocked-door vestibule during an emergency egress condition. Interlocked-door vestibules shall comply with all of the following:

1. The building shall be protected by an approved supervised automatic sprinkler system in accordance with Section 9.7.
2. The area served by the interlocked-door vestibule shall be protected by an approved supervised automatic fire detection system in accordance with Section 9.6 and shall utilize smoke detectors on each side of the interlocked doors.
3. An override switch, which disables the interlocks of the doors of the interlocked-door vestibule for not less than 30 seconds, shall be provided on the egress side of each door of the interlocked-door vestibule. The override switch may be omitted by approval of the Authority Having Jurisdiction.
4. The override switches shall be within 48 in. (1220 mm) of door and between 34 in. (865 mm) and 48 in. (1220 mm) above the floor.
5. Signage shall be provided at each override switch describing its operation.
6. Upon loss of power to the interlock function of the doors of the interlocked-door vestibule, the interlock function shall be disabled.
7. The interlocks of the doors of the interlocked-door vestibule shall deactivate by activation of the fire alarm when initiated by the automatic fire detection system or the automatic sprinkler system.
8. The egress path shall not pass through more than one interlocked-door vestibule.
9. The fire department with responsibility for responding to a building that contains an interlocked-door vestibule shall be notified of the presence of the interlocked-door vestibule.
10. Where permitted by the authority having jurisdiction, interlocked-door vestibules shall be permitted to serve high-hazard content areas.
11. Door electrical locking hardware for new installations shall be listed in accordance with UL 294, Access Control System Units, or UL 1034, Burglary-Resistant Locking Mechanisms.

Potential Annex Note:

Outside of detention and correctional facilities, the commercial building equivalent of sally ports – interlocked-door vestibules - are utilized for security reasons (i.e. money handling rooms; and in health care), occupant protection, clinical needs of the patients, environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Interlocked-door vestibules are as the name implies: a vestibule with interlocked-doors. The door into the vestibule is interlocked with the door leading out of the vestibule such that only one of the doors can be open at a given time.

Requirement 3: an example of where interlock override switches may not be desired is where an interlocked-door vestibule is utilized to deter theft, such as a high-end precious gem business.

Visual indicators may be desirable on the egress side of each door to indicate when the door is in the locked status and when in the unlocked status. Visual indicators may be desirable in occupancies where some of the occupants are likely unfamiliar with interlocked-door vestibule, such as mercantile occupancies, or some health care occupancies.

These provisions for interlocked-door vestibules cannot address all potential uses and applications.

Additional Proposed Changes

<u>File Name</u>	<u>Description</u>	<u>Approved</u>
NFPA_101_Special_Locking_Arrangements_Interlocked_Door_Vestibule_Public_Comments_20200520.pdf	NFPA 101 2024 public comments re: interlocked door vestibule.	

Statement of Problem and Substantiation for Public Comment

This proposal, along with complementary proposals in Chapters 18, 19, 20, 21, 36, 37, 38, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

An occupant egressing through an interlocked-door vestibule would be delayed at the second door in series if the first door in series is not in a closed position, and vise-versa.

The proposed criteria were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Committee Statement

Committee Rejected

Action:

Resolution: It is not clear how to define the area served by the interlocked door vestibule or the required locations of smoke detectors in item 2. No details are provided for the signage in item 5. There is concern about the potential for occupants to become trapped in the vestibule. The use of supervised detection system is unclear and inconsistent. It is also unclear under what conditions an AHJ would permit the omission of the manual interlock release or when to permit the arrangement for high hazard contents.

NFPA 101 Special Locking Arrangement – Interlocked-Door Vestibule – Informal Task Group
Public Comments for 2nd draft, Sept. 29, 2021 – revisions Oct. 1, 2021, further revisions Nov. 1, 2021,
Nov. 3, 2021, and May 4, 6, 9, & 20, 2022.

Black underscored text is original proposed revisions.
Red or blue formatted text are potential revisions for 2nd draft consideration.

Interlocked-Door Vestibule.

A compartment provided with doors in series where only one of the doors in series is openable at a time.

Reason:

This proposed definition is modeled after the definition of “sally port”, and along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 21, 36, 37, 38, 39, 40, and 42, offers the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

Chapter 7 Mean of Egress

7.2.1.6.5 Interlocked-Door Vestibule

Where permitted in chapters 11 through 43 with low- and ordinary-hazard contents, an interlocked-door vestibule shall be permitted in a the means of egress where there are provisions for continuous and unobstructed travel through the interlocked-door vestibule during an emergency egress condition.

Interlocked-door vestibules shall comply with all of the following:

1. The building shall be protected by an approved supervised automatic sprinkler system in accordance with Section 9.7.
2. The area served by the interlocked-door vestibule shall be protected by an approved supervised automatic fire detection system in accordance with Section 9.6 and shall utilize smoke detectors on each side of the interlocked doors.
3. An override switch, which disables the interlocks of the doors of the interlocked-door vestibule for not less than 30 seconds, shall be provided on the egress side of each door of the interlocked-door vestibule. The override switch may be omitted by approval of the Authority Having Jurisdiction.

Commented [WJ1]: Public Input No. 341-NFPA 101-2021

Commented [JW2]: Public Comment No. 126-NFPA 101-2022

Commented [WJ3]: Public Input No. 343-NFPA 101-2021

Commented [JW4]: Public Comment No. 125-NFPA 101-2022

4. The override switches shall be within 48 in. (1220 mm) of door and between 34 in. (865 mm) and 48 in. (1220 mm) above the floor.
5. Signage shall be provided at each override switch describing its operation.
6. Upon loss of power to the interlock function of the doors of the interlocked-door vestibule, the interlock function shall be disabled.
7. The interlocks of the doors of the interlocked-door vestibule shall deactivate by activation of the fire alarm when initiated by the automatic fire detection system or the automatic sprinkler system.
8. The egress path shall not pass through more than one interlocked-door vestibule.
9. The fire department with responsibility for responding to a building that contains an interlocked-door vestibule shall be notified of the presence of the interlocked-door vestibule.
10. Where permitted by the authority having jurisdiction, interlocked-door vestibules shall be permitted to serve high-hazard content areas.
11. Door electrical locking hardware for new installations shall be listed in accordance with UL 294, Access Control System Units, or UL 1034, Burglary-Resistant Locking Mechanisms.

Reason:

This proposal, along with complementary proposals in Chapters 18, 19, 20, 21, 36, 37, 38, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

An occupant egressing through an interlocked-door vestibule would be delayed at the second door in series if the first door in series is not in a closed position, and vice-versa.

The proposed criteria were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Potential Annex Note:

Outside of detention and correctional facilities, the commercial building equivalent of sally ports – interlocked-door vestibules - are utilized for security reasons (i.e. money handling rooms; and in health care), occupant protection, clinical needs of the patients, environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Interlocked-door vestibules are as the name implies: a vestibule with interlocked-doors. The door into the vestibule is interlocked with the door leading out of the vestibule such that only one of the doors can be open at a given time.

Requirement 3: an example of where interlock override switches may not be desired is where an interlocked-door vestibule is utilized to deter theft, such as a high-end precious gem business.

Visual indicators may be desirable on the egress side of each door to indicate when the door is in the locked status and when in the unlocked status. Visual indicators may be desirable in occupancies where some of the occupants are likely unfamiliar with interlocked-door vestibule, such as mercantile occupancies, or some health care occupancies.

These provisions for interlocked-door vestibules cannot address all potential uses and applications.

Chapter 18 New Health Care Occupancies

18.2.5.8 Interlocked-Door Vestibule

An interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress.

Reason:

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 19, 20, 21, 36, 37, 38, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

The criteria in proposed section 7.2.1.6.5 (via separate public comment) were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Chapter 21 Existing Ambulatory Health Care Occupancies

21.2.5.4 Interlocked-Door Vestibule

Commented [WJ11]: Public Input No. 350-NFPA 101-2021

Commented [JW12]: Public Comment No. 130-NFPA 101-2022

An interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress.

Reason:

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 36, 37, 38, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

The criteria is proposed section 7.2.1.6.5 (via separate public comment) were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Chapter 36 New Mercantile Occupancies

36.2.5.12 Interlocked-Door Vestibule

An interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress
where doors are not required to swing in the direction of egress travel.

Reason:

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 21, 37, 38, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

For this occupancy, this proposal suggests an interlocked-door vestibule should be permitted only where the occupant load of the area served does not require doors to swing in the direction of egress travel.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

Commented [WJ13]: Public Input No. 352-NFPA 101-2021

Commented [JW14]: Public Comment No. 131-NFPA 101-2022

Commented [JW15]: Revisions to address TC reasons for resolution.

The criteria is proposed section 7.2.1.6.5 (via separate public comment) were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Chapter 37 Existing Mercantile Occupancies

37.2.5.12 Interlocked-Door Vestibule

Where approved permitted by the authority having jurisdiction, aAn interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress where doors are not required to swing in the direction of egress travel.

Reason:

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 21, 36, 38, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

For this occupancy, this proposal suggests an interlocked-door vestibule should be permitted only where the occupant load of the area served does not require doors to swing in the direction of egress travel.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

The criteria is proposed section 7.2.1.6.5 (via separate public comment) were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Chapter 38 New Business Occupancies

38.2.5.4 Interlocked-Door Vestibule

Where approved permitted by the authority having jurisdiction, aAn interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress where doors are not required to swing in the direction of egress travel.

Reason:

Commented [WJ19]: Public Input No. 355-NFPA 101-2021

Commented [JW20]: Public Comment No. 133-NFPA 101-2022

Commented [JW21]: Revisions to address TC reasons for resolution.

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 21, 36, 37, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

For this occupancy, this proposal suggests an interlocked-door vestibule should be permitted only where the occupant load of the area served does not require doors to swing in the direction of egress travel.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

The criteria is proposed section 7.2.1.6.5 (via separate public comment) were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Chapter 39 Existing Business Occupancies

39.2.5.4 Interlocked-Door Vestibule

~~Where approved by the authority having jurisdiction, a~~ An interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress ~~where doors are not required to swing in the direction of egress travel.~~

Reason:

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 21, 36, 37, 38, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

For this occupancy, this proposal suggests an interlocked-door vestibule should be permitted only where the occupant load of the area served does not require doors to swing in the direction of egress travel.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

Commented [WJ22]: Public Input No. 356-NFPA 101-2021

Commented [JW23]: Public Comment No. 134-NFPA 101-2022

Commented [JW24]: Revisions to address TC reasons for resolution.

Chapter 40 Industrial Occupancies

40.2.5.4 Interlocked-Door Vestibule

In other than high-hazard occupancies, an interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress.

Reason:

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 21, 36, 37, 38, 39, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

For this occupancy, the proposal suggests interlocked-door vestibules would not be permitted in high-hazard industrial occupancies – the committee is encouraged to revise as appropriate.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

The criteria in proposed section 7.2.1.6.5 (via separate public comment) were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

First Revision No. 6536-NFPA 101-2021 [Section No. 7.2.3.3.2]

7.2.3.3.2

Where a vestibule is used as part of one of the design methods , it shall be within the 2-hour-rated enclosure and shall be considered part of the smokeproof enclosure.

Submitter Information Verification

Committee: SAF-MEA

Submittal Date: Fri Jul 09 15:38:42 EDT 2021

Committee Statement and Meeting Notes

Committee Statement: This section falls under the "general" requirements of the smokeproof enclosure section and needs to clarify that only when the vestibule is considered as part of the design method (design methods include: Natural Ventilation, Mechanical Ventilation, and Enclosure Pressurization) that it is to be included within the smokeproof enclosure. When using the enclosure pressurization method, a vestibule is not required (See Sec. 7.2.3.6). However, there are instances where based on the building function that a vestibule may be required to access the stairway. This section as currently written and if using the enclosure pressurization method would require that vestibule to be included as part of the smokeproof enclosure and subject to the pressurization requirements. This may not cause a big issue on many high-rise buildings, however, this is problematic in air traffic control towers that have a single stair and typically a shared vestibule between the single stairway and the elevator shaft. In this instance, the design of the system would be complicated if using the enclosure pressurization method that has to include a shared vestibule. While in this example another method could be utilized such as the mechanical ventilation method with vestibule, it could still be problematic with an elevator opening into the vestibule as well and code issues with elevators opening into exit enclosures. This revision is intended to clarify that if using the enclosure pressurization method and a vestibule is provided that it does not need considered part of the smokeproof enclosure unless it is part of the design method (i.e. the designer can decide if to include the vestibule as enclosure pressurization method which is common in California High Rise buildings).

**Public Comment No. 61-NFPA 101-2022 [Section No. 7.2.4.3.5]****7.2.4.3.5***

Fire barriers forming horizontal exits shall not be penetrated by ducts, unless one of the following criteria is met:

- (1) The ducts are existing penetrations protected by approved and listed fire dampers.
- (2) The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.
- (3) The duct penetrations are those permitted in detention and correctional occupancies as otherwise provided in Chapters 22 and 23 and are protected by combination fire- ~~dampers/smoke-leakage-rated~~ -smoke dampers that meet the smoke damper actuation requirements of 8.5.5.

Statement of Problem and Substantiation for Public Comment

SAF-AAC appointed a task group to review damper terminology throughout NFPA 101 based upon FR 6516 which modified the definitions for various dampers and made the change to extract the definitions from NFPA 90A. The purpose of this Public Comment, submitted on behalf of the Task Group, is to revise the language to be consistent with the defined terms in Chapter 3. It should be noted that the terms proposed are based upon the First Draft Report of NFPA 90A and not necessarily the definitions in Chapter 3 of the First Draft Report for NFPA 101. If NFPA 90A is revised during the Public Comment period it is the intent that these terms would be revised to be consistent with the defined terms being extracted from NFPA 90A.

It should be noted that although Koffel Associates is a consultant to AMCA International, the Public Comment is not identified as being submitted on behalf of AMCA International since the Public Comment was the result of the SAF-AAC Task Group.

Residential Use	-	-
Hotels and dormitories	200	18.6
Apartment buildings	200	18.6
Board and care, large	200	18.6
Storage Use	-	-
In storage occupancies	MP	MP
In mercantile occupancies	300	27.9
In other than storage and mercantile occupancies	500	46.5

MP: The occupant load is the maximum probable number of occupants present at any time.

^aAll factors are expressed in gross area unless marked "net."

^bSee A.7.3.1.2.

^cFor determining occupant load in mercantile occupancies where, due to differences in the finished ground level of streets on different sides, two or more floors directly accessible from streets (not including alleys or similar back streets) exist, each such floor is permitted to be considered a street floor. The occupant load factor is one person for each 40 ft² (3.7 m²) of gross floor area of sales space.

^dFor determining occupant load in mercantile occupancies with no street floor, as defined in 3.3.290, but with access directly from the street by stairs or escalators, the floor at the point of entrance to the mercantile occupancy is considered the street floor.

^eFor any food court or other assembly use areas located in the mall concourse that are not included as a portion of the gross leasable area of the mall structure, the occupant load is calculated based on the occupant load factor for that use as specified in Table 7.3.1.2. The remaining mall concourse area is not required to be assigned an occupant load.

^fThe portions of the mall concourse not used as gross leasable area are not required to be assessed an occupant load based on Table 7.3.1.2. However, means of egress from a mall concourse are required to be provided for an occupant load determined by dividing the gross leasable area of the mall building (not including anchor buildings) by the appropriate lowest whole number occupant load factor from Figure 7.3.1.2(a) or Figure 7.3.1.2(b).

Each individual tenant space is required to have means of egress to the outside or to the mall concourse based on occupant loads calculated by using the appropriate occupant load factor from Table 7.3.1.2.

Each individual anchor store is required to have means of egress independent of the mall concourse.

Figure 7.3.1.2(a) Mall Structure Occupant Load Factors (U.S. Customary Units).

Figure 7.3.1.2(b) Mall Structure Occupant Load Factors (SI Units).

Statement of Problem and Substantiation for Public Comment

I submitted the same proposal during the First Draft and it was ignored by the NFPA because it was determined to be in the scope of the Assembly Occupancy Committee and it was supposed to be acted on by that committee, but it was not. It is interesting that this same proposal was deemed to be within the scope of the Means of Egress Committee last cycle when it was rejected. Since this has been deemed to be in the scope of this committee at least once in the last few years, this comment is being submitted so that it can't be ignored again if the decision is made that this is in the scope of the Means of Egress Committee.

The Means of Egress committee stated in the previous cycle that their reason for their rejection was, "No data has been provided to substantiate the proposed revision." The Committee Statement is incorrect. The statement that I submitted in support of the proposed change was to account for people in wheelchairs and people who stand up in front of the room that do not have a seat. The egress system needs to account for these people as well as the people in fixed seats. The occupant load needs to include these people so that the egress capacity is actually adequate to handle them.

Does the committee doubt that people in wheelchairs use assembly occupancies with fixed seats without getting out of their wheelchairs? How does the egress system account for these people? Has the committee ever heard of the Americans with Disabilities Act (ADA)? Does the committee really need me to remind them that if people in wheelchairs are not counted in the occupant load that is used to determine egress capacity, these people can sue the NFPA under the ADA for being discriminated against?

Does the committee doubt that people stand in front of lecture halls, theaters, and other assembly spaces without using a seat? Do I really need to build a case that by only counting the seats in a fixed seating assembly occupancy, you are ignoring the people that are not in seats?

Asking specifically about the 10% number would have been appropriate. The committee never actually questioned this number, but I can share how it was obtained. The ADA Standards for Accessible Design require a certain number of spaces to be added to fixed seat assembly spaces based on the number of fixed seats. The requirements vary between 1% and 8% for spaces with more than 50 seats (meeting the definition of Assembly). Since the justification for this proposed change is more than just ADA acceptance (such as a professor standing up in front of a class), the 8% number was rounded up to 10% so that there would be one simple rule that would help everyone comply with the ADA and account for everyone who was reasonably going to be in the room.

Alternatively, the committee could refer to the ADA Standards For Accessible Design to figure out how many additional people they should add to the occupant load, but that would be more cumbersome for the user. The 10% number is reasonable, easy to calculate, and provides a number that helps everyone meet the ADA Standards for Accessible Design regardless of the number of seats.

Resolution: Occupant load factors are under the jurisdiction of the applicable occupancy committees. The proposed revision will be reviewed by the TC on Assembly Occupancies. If accepted, the revision will be moved to Table 7.3.1.2 by the correlating committee.

Public Comment No. 60-NFPA 101-2022 [Section No. 7.7.2]

Use text from CI-6545 (Note - what is submitted below is (or should be) an exact copy of the CI)

Proposal – Revise 7.7.2

–
as follows.

- (1) Add new 7.7.2(1)(c)
- (2) Move existing 7.7.2(3) to 7.7.2(4) (text unchanged)
- (3) Move existing 7.7.2(4) to 7.7.2(3) (text unchanged)

7.7.2 Exit Discharge Through Interior Building Areas.

– Exits shall be permitted to discharge through interior building areas, provided that all of the following are met:

~~(1) Not more than 50 percent of the required number of exit enclosures serving normally occupied areas of each floor, and not more than 50 percent of the exit enclosure capacity required for normally occupied areas of each floor, shall discharge through areas on any level of discharge, except as otherwise permitted by one of the following:~~

~~(a) One hundred percent of the exits shall be permitted to discharge through areas on any level of discharge in detention and correctional occupancies as otherwise provided in Chapters 22 and 23.~~

~~(b) In existing buildings, the 50 percent limit on egress capacity shall not apply if the 50 percent limit on the required number of exits is met.~~

~~**(c) Where the level of discharge is protected throughout by an approved automatic sprinkler system in accordance with Section 9.7 and vestibules or foyers meeting the requirements of 7.7.2(3)(b) are provided, not more than 75 percent of the required number of exit stairs serving normally occupied areas of each floor, and not more than 75 percent of the exit stair capacity required for normally occupied areas of each floor, shall discharge through such vestibules or foyers on any level of discharge.**~~

~~(2) Each level of discharge shall discharge directly outside at the finished ground level or discharge directly outside and provide access to the finished ground level by outside stairs or outside ramps.~~

~~(3) The interior exit discharge shall lead to a free and unobstructed way to the exterior of the building, and such way shall be readily apparent or shall be identifiable by exit signage from the point of discharge from the exit. [IE1] -~~

~~(3) The interior exit discharge shall be protected by one of the following methods:~~

~~(a) The level of discharge shall be protected throughout by an approved automatic sprinkler system in accordance with~~

Section-

Section 9.7, or the portion of the level of discharge used for interior exit discharge shall be protected by an approved automatic sprinkler system in accordance with

Section-

Section 9.7 and shall be separated from the nonsprinklered portion of the floor by fire barriers with a fire resistance rating

meeting the requirements for the enclosure of exits. (See 7.1.3.2.1.)

(b) The interior exit discharge area shall be in a vestibule or foyer that meets all of the following criteria:

i. The depth from the exterior of the building shall be not more than 10 ft (3050 mm), and the length shall be not more than 30 ft (9

4 m

1 m).

ii. The foyer shall be separated from the remainder of the level of discharge by fire barriers with a minimum 1-hour fire resistance rating, and existing installations of wired glass in steel frames shall be permitted to be

continued in use.

iii. The foyer shall serve only as means of egress and shall include an exit directly to the outside [JE2] .

(4) The interior exit discharge shall lead to a free and unobstructed way to the exterior of the building, and such way shall be readily apparent or shall be identifiable by exit signage from the point of discharge from the exit [JE3] .

(4) The interior exit discharge shall be protected by one of the following methods:

(a) The level of discharge shall be protected throughout by an approved automatic sprinkler system in accordance with Section 9.7, or the portion of the level of discharge used for interior exit discharge shall be protected by an approved automatic sprinkler system in accordance with Section 9.7 and shall be separated from the nonsprinklered portion of the floor by fire barriers with a fire resistance rating

meeting the requirements for the enclosure of exits. (See 7.1.3.2.1.)

(b) The interior exit discharge area shall be in a vestibule or foyer that meets all of the following criteria:

i. The depth from the exterior of the building shall be not more than 10 ft (3050 mm), and the length shall be not more than 30 ft (9.1 m).

ii. The foyer shall be separated from the remainder of the level of discharge by fire barriers with a minimum 1-hour fire resistance rating, and existing installations of wired glass in steel frames shall be permitted to be continued in use.

iii. The foyer shall serve only as means of egress and shall include an exit directly to the outside. [JE4] .

(5) The entire area on the level of discharge shall be separated from areas below by construction having a fire resistance rating not less than that required for the exit enclosure, unless otherwise provided in 7.7.2(6) .

(6) Levels below the level of discharge in an atrium shall be permitted to be open to the level of discharge where such level of discharge is protected in accordance with 8.6.7 .

Substantiation

The purpose of this proposal is to allow a new scenario to increase the number and capacity of exit stairs on the level of exit discharge from 50% to 75% under certain very specific conditions without reducing the level of safety currently provided by the Code.

Currently, 50% credit is given to stairs that discharge to building interiors in sprinklered buildings or stairs that discharge into compliant vestibules in non-sprinklered buildings. This revision would permit compliant vestibules (i.e., those that meet the three existing requirements for vestibules – 10' x 30', 1 hr enclosure, direct egress) additional credit in buildings where the level of exit discharge is completely sprinklered. Note: compliant vestibules already would meet 100% of the discharge requirements if installed in non-sprinklered buildings less than 4 stories in height (since they require 1 hr enclosures) or in existing sprinklered buildings (since 7.1.3.2.1(3) permits 1 hr exit enclosures). Reordering (3) and (4) better introduces interior exit discharge.

This concept was accepted by this committee during the 1st draft meeting last cycle and text inserted into the 1st draft of the 2021 Code, but was rightfully removed during the 2nd draft meeting because after subsequent review, the text as written created potential problems. This proposal addresses those problems and presents the concept again.

[JE1] (3) becomes (4)

[JE2] old (4) relocated to (3) text unchanged

[JE3] old (3) relocated to 4 as interior discharge is introduced in (3) text unchanged

[JE4] (4) becomes (3)

Statement of Problem and Substantiation for Public Comment

Justification from the original CI remains unchanged.

Committee Statement

Committee Action: Rejected but see related SR

Resolution: [SR-6552-NFPA 101-2022](#)

Statement: The revision accepts the recommendations in CI-6545, PC-60, and PC-89. The only technical change to the current language is the addition of item 7.7.2(1)(c). Existing 7.7.2(3) is moved to 7.7.2(4), and existing 7.7.2(4) is moved to 7.7.2(3) for clarity. The committee statement for CI-6545 follows:

The purpose of this committee input is to allow a new scenario to increase the number and capacity of exit stairs on the level of exit discharge from 50% to 75% under certain very specific conditions without reducing the level of safety currently provided by the Code.

Currently, 50% credit is given to stairs that discharge to building interiors in sprinklered buildings or stairs that discharge into compliant vestibules in non-sprinklered buildings. This revision would permit compliant vestibules (i.e., those that meet the three existing requirements for vestibules – 10' x 30', 1 hr enclosure, direct egress) additional credit in buildings where the level of exit discharge is completely sprinklered. Note: compliant vestibules already would meet 100% of the discharge requirements if installed in non-sprinklered buildings less than 4 stories in height (since they require 1 hr enclosures) or in existing sprinklered buildings (since 7.1.3.2.1(3) permits 1 hr exit enclosures). Reordering (3) and (4) better introduces interior exit discharge.

This concept was accepted by this committee during the 1st draft meeting last cycle and text inserted into the 1st draft of the 2021 Code, but was rightfully removed during the 2nd draft meeting because after subsequent review, the text as written created potential problems. This committee input addresses those problems and presents the concept again, and is intended to solicit public comments for further review at the second draft stage.

Public Comment No. 89-NFPA 101-2022 [Section No. 7.7.2]

7.7.2

Exit Discharge Through Interior Building Areas.

Exits shall be permitted to discharge through interior building areas, provided that all of the following are met:

- (1) Not more than 50 percent of the required number of exit enclosures serving normally occupied areas of each floor, and not more than 50 percent of the exit enclosure capacity required for normally occupied areas of each floor, shall discharge through areas on any level of discharge, except as otherwise permitted by one of the following:
 - (2) One hundred percent of the exits shall be permitted to discharge through areas on any level of discharge in detention and correctional occupancies as otherwise provided in Chapters 22 and 23.
 - (3) In existing buildings, the 50 percent limit on egress capacity shall not apply if the 50 percent limit on the required number of exits is met.
- (4) Each level of discharge shall discharge directly outside at the finished ground level or discharge directly outside and provide access to the finished ground level by outside stairs or outside ramps.
- (5) The interior exit discharge shall lead to a free and unobstructed way to the exterior of the building, and such way shall be readily apparent or shall be identifiable by exit signage from the point of discharge from the exit.
- (6) The interior exit discharge shall be protected by one of the following methods:
 - (7) The level of discharge shall be protected throughout by an approved automatic sprinkler system in accordance with Section 9.7, or the portion of the level of discharge used for interior exit discharge shall be protected by an approved automatic sprinkler system in accordance with Section 9.7 and shall be separated from the nonsprinklered portion of the floor by fire barriers with a fire resistance rating meeting the requirements for the enclosure of exits. (See 7.1.3.2.1.)
 - (8) The interior exit discharge area shall be in a vestibule or foyer that meets all of the following criteria:
 - (9) The depth from the exterior of the building shall be not more than 10 ft (3050 mm), and the length shall be not more than 30 ft (9.1 m).
 - (10) The foyer shall be separated from the remainder of the level of discharge by fire barriers with a minimum 1-hour fire resistance rating, and existing installations of wired glass in steel frames shall be permitted to be continued in use.
 - (11) The foyer shall serve only as means of egress and shall include an exit directly to the outside.
- (12) The entire area on the level of discharge shall be separated from areas below by construction having a fire resistance rating not less than that required for the exit enclosure, unless otherwise provided in 7.7.2(6).
- (13) Levels below the level of discharge in an atrium shall be permitted to be open to the level of discharge where such level of discharge is protected in accordance with 8.6.7.

Statement of Problem and Substantiation for Public Comment

"I wholly support this committee input. My facility has a very complex exiting arrangement where more than 50% of the exit stairs discharge within the interior on the level of exit discharge. I currently have a temporary equivalency that permits this arrangement, but because my facility is completely sprinklered, I would actually be code compliant if this change were made. Discharging into fire rated sprinklered vestibules has to be much safer than discharging onto the floor without any protection other than sprinklers."

**Public Comment No. 156-NFPA 101-2022 [Section No. 7.15.1]****7.15.1 General.****7.15.1.1***

Where passenger elevators for general public use are permitted to be used for occupant evacuation prior to Phase I Emergency Recall Operation mandated by the firefighters' emergency operation provisions of ASME A17.1/CSA B44, *Safety Code for Elevators and Escalators*, the elevator system shall also comply with this section, except as otherwise permitted by 7.15.1.2.

7.15.1.2

The provisions of Section 7.15 shall not apply where the limited or supervised use of elevators for evacuation is part of a formal or informal evacuation strategy, including the relocation or evacuation of patients in health care occupancies and ~~where the relocation or evacuation of occupants with disabilities in other occupancies occupants are unable to relocate or evacuate without assistance .~~

7.15.1.3*

The occupant evacuation elevators shall be in accordance with the occupant evacuation operation (OEO) requirements of ASME A17.1/CSA B44, *Safety Code for Elevators and Escalators*, and the building emergency action plan required by 7.15.3.1.

7.15.1.4

Occupant evacuation elevators in accordance with Section 7.15 shall not be permitted to satisfy requirements of this Code applicable to the following:

- (1) Number of means of egress
- (2) Capacity of means of egress
- (3) Arrangement of means of egress

Statement of Problem and Substantiation for Public Comment

The exceptions in the current 7.15.1.2 are for occupancies where the occupants are unable to evacuate without assistance or supervision. In many cases an occupant with a disability, such as use of a wheelchair, could evacuated using the occupant evacuation elevators without assistance. This proposal clarifies when 7.15 applies.

Committee: SAF-MEA

Committee Statement

Committee Action: Rejected

Resolution: The proposed revision does not clarify the intent of Sec. 7.15. This would create confusion and does not add anything to the Code. The use of "evacuate without assistance" could apply to detention and correctional occupancies and educational and day care occupancies.

Public Comment No. 158-NFPA 101-2022 [Section No. 7.15.6]

7.15.6 Elevator Installation.

7.15.6.1

Except as modified by 7.15.6.2 and 7.15.6.3, occupant evacuation elevators shall be installed in accordance with ASME A17.1/CSA B44, *Safety Code for Elevators and Escalators*, including the provisions for occupant evacuation operation, as required by 7.15.1.3.

7.15.6.2*

Shunt breakers shall not be installed on elevator systems used for occupant evacuation.

7.15.6.3

Occupant evacuation elevators shall be limited to electric passenger elevators that are located in noncombustible hoistways and for which the car enclosure materials meet the requirements of ASME A17.1/CSA B44, *Safety Code for Elevators and Escalators*.

Statement of Problem and Substantiation for Public Comment

NFPA 13 currently requires sprinklers to be installed in hydraulic elevator pit but A17.1 prohibits sprinklers in the hoistway, including the pit, for occupant evacuation elevators. Until NFPA 13 removes sprinklers from hydraulic pits, 11.14.6.3 needs to prevent a hydraulic elevator from being included as an occupant evacuation elevator.

Committee Statement

Committee Action: Accepted

Resolution: [SR-6541-NFPA 101-2022](#)

Statement: NFPA 13 currently requires sprinklers to be installed in hydraulic elevator pit but A17.1 prohibits sprinklers in the hoistway, including the pit, for occupant evacuation elevators. Until NFPA 13 removes sprinklers from hydraulic pits (11.14.6.3), NFPA 101 needs to prevent a hydraulic elevator from being included as an occupant evacuation elevator.

**Public Comment No. 159-NFPA 101-2022 [Section No. 7.15.8]****7.15.8** Electrical Power and Control Wiring.**7.15.8.1**

The following features associated with occupant evacuation elevators shall be supplied by both normal power and Type 60, Class 2, Level 1 standby power:

- (1) Elevator equipment
- (2) Ventilation and cooling equipment for elevator machine/control rooms and machinery/control spaces
- (3) Elevator car lighting

7.15.8.2

Wires or cables serving Phase II emergency in-car operation that are located outside elevator hoistways, machine/control rooms, and machinery/control spaces, and that provide normal power, standby power, control signals, communication with the cars, lighting, heating, air-conditioning, ventilation, and fire detecting systems to occupant evacuation elevators shall be protected by one of the following means, except as otherwise provided in 7.15.8.3:

- (1) The wiring shall utilize Type CI cable with a minimum 2-hour fire resistance rating.
- (2) The wiring shall be enclosed in a minimum 2-hour fire-resistance-rated construction.
- (3) The wiring shall be wiring that is approved as providing a 2-hour performance alternative.

7.15.8.3*

Control signaling wiring and cables that do not serve Phase II emergency in-car service shall not be required to be protected.

Statement of Problem and Substantiation for Public Comment

The intent of Occupant Evacuation Elevators (OEE) is to provide an additional means to evacuate even prior to firefighters' arrival on-site. Once firefighters take control, they will assess when OEE will not be available to assist in evacuating occupants. The protection of the wiring and cables is critical for firefighters' operation when they are using the elevators under Phase II emergency in-car operation.

Resolution: The provision is already addressed by 7.15.8.3.

**Public Comment No. 160-NFPA 101-2022 [Section No. 7.15.9]****7.15.9 Occupant Evacuation Shaft System.****7.15.9.1**

Occupant evacuation elevators, except those that service only an open parking garage, shall be provided with an occupant evacuation shaft system consisting of all of the following:

- (1) Elevator hoistway
- (2) Enclosed elevator lobby outside the bank or group of hoistway doors on each floor served by the elevators, with the exception that elevator lobbies not be required to be enclosed where located either on the street floor or level of exit discharge
- (3) Enclosed exit stair with doors to all floors, at and above grade level, served by the elevators

7.15.9.2* Elevator Lobby Size.**7.15.9.2.1**

Occupant evacuation elevator lobbies shall have minimum clear floor area, except as otherwise provided in 7.15.9.2.2, as follows:

- (1) The elevator lobby clear floor area shall accommodate, at 3 ft² (0.28 m²) per person, a minimum of 25 percent of the occupant load of the floor area served by the lobby.
- (2) The elevator lobby clear floor area also shall accommodate one wheelchair space of 30 in. × 48 in. (760 mm × 1220 mm) for each 50 persons, or portion thereof, of the occupant load of the floor area served by the lobby.

7.15.9.2.2

The size of lobbies serving multiple banks of elevators shall be exempt from the requirement of 7.15.9.2.1(1), provided that the area of such lobbies is approved on an individual basis and is consistent with the building's emergency action plan.

7.15.9.3

Access to the exit stair required by 7.15.9.1(3) shall be directly from the enclosed elevator lobby on each floor, except the floor that is at the lobby of the building .

7.15.9.4

The occupant evacuation shaft system shall be enclosed and separated from the remainder of the building by walls complying with the following:

- (1) The shaft system walls shall be smoke barriers in accordance with Section 8.5.
- (2) The shaft system walls separating the elevator lobby from the remainder of the building shall have a minimum 1-hour fire resistance rating and minimum ¾-hour fire-protection-rated opening protectives.
- (3) The shaft system walls separating the elevator hoistway from the remainder of the building shall have a minimum 2-hour fire resistance rating and minimum 1½-hour fire-protection-rated opening protectives.
- (4) The shaft system walls separating the enclosed exit stair from the remainder of the building shall have a minimum 2-hour fire resistance rating and minimum 1½-hour fire-protection-rated opening protectives.

7.15.9.5

Occupant evacuation shaft system enclosures shall be constructed to provide a minimum of classification Level 2 in accordance with ASTM C1629/C1629M, *Standard Classification for Abuse-Resistant Nondecorated Interior Gypsum Panel Products and Fiber-Reinforced Cement Panels*.

7.15.9.6*

An approved method to prevent water from infiltrating into the hoistway enclosure from the operation of the automatic sprinkler system outside the enclosed occupant evacuation elevator lobby shall be provided.

7.15.9.7

Occupant evacuation shaft system elevator lobby doors, other than doors to the hoistway, exit stair enclosure, control room, or control space, shall have all of the following features:

- (1) The doors shall have a fire protection rating of not less than ¾ hour.
- (2) The doors shall be smoke-leakage-rated assemblies in accordance with NFPA 105.
- (3) The doors shall have an automatic positioning bottom seal to resist the passage of water at floor level from outside the shaft system.

7.15.9.8

Occupant evacuation shaft system elevator lobby doors shall have the following features:

- (1) Each door, other than doors to the hoistway, exit stair enclosure, control room, or control space, shall be automatic-closing in accordance with 7.2.1.8.2, as modified by 7.15.9.8(2).
- (2) In addition to the automatic-closing means addressed by 7.2.1.8.2, the elevator lobby door on any floor shall also close in response to any alarm signal initiated on that floor.
- (3) Each door shall be provided with a vision panel arranged to allow people on either side of the door to view conditions on the other side of the door.

7.15.9.9

Each occupant evacuation shaft system exit stair enclosure door shall be provided with a vision panel arranged to allow people on either side of the door to view conditions on the other side of the door.

Statement of Problem and Substantiation for Public Comment

There is no need to have access to exit stairs in an open parking garage or in the lobby of the building that is at the exit discharge level.

Submittal Date: Fri May 20 16:25:39 EDT 2022
Committee: SAF-MEA

Committee Statement

Committee Action: Rejected but see related SR

Resolution: SR-6546-NFPA 101-2022

Statement: The revision accepts the recommendations in PC-114 and PC-115. It is noted that the PCs were accepted by the technical committee at its meeting; however, the revisions must be processed as Reject but See Related SR-6546 in order to keep the revised annex language associated with the base paragraph. The net result is identical to the intended action. Note that the first sentence of A.7.2.1.5.7(2)(c) is existing language and is erroneously displayed as new underlined text. The substantiations for PC-114 and PC-115 follow.

PC-114: The proposed revisions help clarify the door electrical locking hardware that is required to be listed for these electrical locking applications. In addition of adding the option to list to UL 1034 included in the First Revision, this proposal brings consistency in the text where UL 294 and UL 1034 are referenced in NFPA 101. The additions of the Annex A text complement the revisions to the mandatory language of these special locking arrangements.

Because of implications to life safety with electrical locking systems potentially affecting egress on doors in the means of egress, it is prudent to require listing of door electrical locking hardware used in these applications. Listing to either UL 294 or to UL 1034 appropriately revises this important listing requirement to help assure the electrical locking hardware performs as intended for this life-safety application.

The Life Safety Code first required door hardware to be listed to UL 294 in the 2009 edition of NFPA 101. This section of NFPA 101, Stair Enclosure Re-entry, first required listing of door locking hardware to UL

294 with the 2021 edition of NFPA 101.

UL 294 and 1034 address efficacy and safety considerations for door access control applications (ingress control) to help assure the door hardware and access control solutions would perform as intended and expected. Typically, access control systems incorporating card readers, keypads, iris scanners, etc. are tested and listed to UL 294. Additionally, delayed egress electrical locking systems, sensor-release electrical locking systems, and certain types of door hardware release electrical locking systems are all typically tested and listed to UL 294. On the other hand, components such as electromagnetic locks, electric dead bolts, electric strikes, and other door electrically operated locking mechanisms are typically listed to UL 1034. UL 294 and UL 1034 are collateral standards that complement each other.

These examples illustrate that some of the same systems and components used to control access (ingress) to a space are also used for egress-side electrical locking systems. Considering that egress-side electrical locking systems have life safety implications, NFPA 101 was enhanced (in 2009) to require listing of electrical locking hardware to UL 294. In hindsight, the collateral listing to UL 1034 should have been the language included in NFPA 101 in the earlier editions.

PC-115: The additions of the Annex A text complement the revisions to the mandatory language of these special locking arrangements.

Public Comment No. 117-NFPA 101-2022 [New Section after A.7.2.1.6.1.1(4)]

A.7.2.1.6.1.1(6)

The electrical locking hardware may be a component of an electrical locking system, or the electrical locking hardware may be a device with an individual listing. Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

Statement of Problem and Substantiation for Public Comment

The additions of Annex A text complement the revisions to the mandatory language of these special locking arrangements.

Committee Statement

Committee Action: Rejected but see related SR

Resolution: SR-6547-NFPA 101-2022

Statement: The revision accepts the recommendations in PC-116, PC-117, PC-118, PC-119, and PC-120. It is noted that the PCs were accepted by the technical committee at its meeting; however, they must be processed as Reject but See Related SR-6547 to associate the new annex language with the base requirements. The net result is identical to that intended by the committee. The substantiations for the noted PCs follow.

PC-116: Because of implications to life safety with electrical locking systems potentially affecting egress on doors in the means of egress, it is prudent to require listing of door electrical locking hardware used in these special locking arrangements. Listing to either UL 294 or to UL 1034 appropriately revises this important listing requirement to help assure the electrical locking hardware performs as intended for these life-safety applications.

The Life Safety Code first required door hardware to be listed to UL 294 in the 2009 edition of NFPA 101 on elevator lobby exit access door assemblies. Special locking arrangements included the UL 294 listing requirement with the 2012 and 2018 editions of NFPA 101.

UL 294 and 1034 address efficacy and safety considerations for door access control applications (ingress control) to assure the door hardware and access control solutions would perform as intended and expected. Typically, access control systems incorporating card readers, keypads, iris scanners, etc. are tested and listed to UL 294. Additionally, delayed egress electrical locking systems, sensor-release electrical locking systems, and certain types of door hardware release electrical locking systems are all typically tested and listed to UL 294. On the other hand, components such as electromagnetic locks,

electric dead bolts, electric strikes, and other door electrically operated locking mechanisms are typically listed to UL 1034. UL 294 and UL 1034 are collateral standards that complement each other.

These examples illustrate that many of the same systems and components used to control access (ingress) to a space are also used for egress-side electrical locking systems. Considering that egress-side electrical locking systems have life safety implications, NFPA 101 was enhanced (in 2009) to require listing of electrical locking hardware to UL 294. In hindsight, what's proposed here – the collateral listing to UL 1034 – should have been the language included in NFPA 101 in the earlier editions.

In addition to the option to list to UL 1034, this proposal brings consistency in the text where UL 294 (and UL 1034) are referenced in NFPA 101. The additions of Annex A text complement the revisions to the mandatory language of these special locking arrangements.

PC-117 through PC-120: The additions of Annex A text complement the revisions to the mandatory language of these special locking arrangements.

Public Comment No. 118-NFPA 101-2022 [New Section after A.7.2.1.6.2]

A.7.2.1.6.2.1(8)

The electrical locking hardware may be a component of an electrical locking system, or the electrical locking hardware may be a device with an individual listing. Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

Statement of Problem and Substantiation for Public Comment

The additions of Annex A text complement the revisions to the mandatory language of these special locking arrangements.

PC-116: Because of implications to life safety with electrical locking systems potentially affecting egress on doors in the means of egress, it is prudent to require listing of door electrical locking hardware used in these special locking arrangements. Listing to either UL 294 or to UL 1034 appropriately revises this important listing requirement to help assure the electrical locking hardware performs as intended for these life-safety applications.

The Life Safety Code first required door hardware to be listed to UL 294 in the 2009 edition of NFPA 101 on elevator lobby exit access door assemblies. Special locking arrangements included the UL 294 listing requirement with the 2012 and 2018 editions of NFPA 101.

UL 294 and 1034 address efficacy and safety considerations for door access control applications (ingress control) to assure the door hardware and access control solutions would perform as intended and expected. Typically, access control systems incorporating card readers, keypads, iris scanners, etc. are tested and listed to UL 294. Additionally, delayed egress electrical locking systems, sensor-release electrical locking systems, and certain types of door hardware release electrical locking systems are all typically tested and listed to UL 294. On the other hand, components such as electromagnetic locks,

electric dead bolts, electric strikes, and other door electrically operated locking mechanisms are typically listed to UL 1034. UL 294 and UL 1034 are collateral standards that complement each other.

These examples illustrate that many of the same systems and components used to control access (ingress) to a space are also used for egress-side electrical locking systems. Considering that egress-side electrical locking systems have life safety implications, NFPA 101 was enhanced (in 2009) to require listing of electrical locking hardware to UL 294. In hindsight, what's proposed here – the collateral listing to UL 1034 – should have been the language included in NFPA 101 in the earlier editions.

In addition to the option to list to UL 1034, this proposal brings consistency in the text where UL 294 (and UL 1034) are referenced in NFPA 101. The additions of Annex A text complement the revisions to the mandatory language of these special locking arrangements.

PC-117 through PC-120: The additions of Annex A text complement the revisions to the mandatory language of these special locking arrangements.

**Public Comment No. 71-NFPA 101-2022 [Section No. A.7.2.1.6.2]**A.7.2.1.6.2

Doors with a sensor-release electrical locking system are equipped with an electrical locking system that is released by a sensor activated by the normal motions of an occupant egressing through that door. The activation of the sensor to cause the electrical lock to release is usually by passive action by the occupant, such as walking to the door. A manual release device, such as a push-button switch that directly interrupts the power to the electrical lock, is required by item (3) as a backup. With most sensor-release electrical locking systems, the occupant might not notice the door is electrically locked in the direction of egress. Doors equipped with these locking systems provide unobstructed, immediate egress.

These provisions were previously titled "Access-Controlled Egress Door Assemblies" as these doors typically have some type of access control system, such as a key pad, card scanner, or fob scanner controlling access (ingress) into the building or space. Because access control systems can be installed on essentially any door, the previous title resulted in differing interpretations, applications, and enforcement of permitted locking systems, and they were retitled in the 2018 edition of the *Code*.

.1 The sensor referenced in 7.2.1.6.2.1(1) and 7.2.1.6.2.1(2) used to unlock the door upon occupant approach is typically mounted above the locked door in the direction of egress. The purpose of the contactless sensor referenced in 7.2.1.6.2.1(3) is to provide another manual option to the "PUSH TO EXIT" button that doesn't require physical contact and locate it within 60 inches of the door to unlock the doors in the event the sensor referenced in 7.2.1.6.1.2(1) and 7.2.1.6.2.1(2) fails.

A.7.2.1.6.2.1(3)(d). A wave-to-open sensor is an example of a contactless sensor.

A.7.2.1.6.2.1(3)(f). The contactless sensor needs to be independent of the sensor referenced in 7.2.1.6.2.1(1) and 7.2.1.6.2.1(2) in order to ensure both sensors can't fail simultaneously .

Statement of Problem and Substantiation for Public Comment

Add the text from the public comment to existing annex text as appropriate (i.e., do not delete any existing text, if that's what Terra View shows)

The use of contactless sensors to open doors is becoming more prevalent due to Covid and other concerns about the spread of infection, especially in health care settings. Contactless sensors (e.g., "wave to open" devices) can perform similarly to manual "push to exit" devices and should therefore be permitted as a substitute for "push to exit" devices, but only if they are listed to UL 294 and only if they are configured to be independent of the (overhead motion) sensors used to unlock the door upon occupant approach such that a single failure can't result in both types of sensors failing simultaneously.

To avoid confusion, annex material is added to discuss the differences between the existing (overhead motion) sensors used to unlock doors upon occupant approach and the proposed contactless sensors to unlock doors in the event the (overhead motion) sensors fail.

Committee Statement

Committee Action: Rejected but see related SR

Resolution: SR-6547-NFPA 101-2022

Statement: The revision accepts the recommendations in PC-116, PC-117, PC-118, PC-119, and PC-120. It is noted that the PCs were accepted by the technical committee at its meeting; however, they must be processed as Reject but See Related SR-6547 to associate the new annex language with the base requirements. The net result is identical to that intended by the committee. The substantiations for the noted PCs follow.

PC-116: Because of implications to life safety with electrical locking systems potentially affecting egress on doors in the means of egress, it is prudent to require listing of door electrical locking hardware used in these special locking arrangements. Listing to either UL 294 or to UL 1034 appropriately revises this important listing requirement to help assure the electrical locking hardware performs as intended for these life-safety applications.

The Life Safety Code first required door hardware to be listed to UL 294 in the 2009 edition of NFPA 101 on elevator lobby exit access door assemblies. Special locking arrangements included the UL 294 listing requirement with the 2012 and 2018 editions of NFPA 101.

UL 294 and 1034 address efficacy and safety considerations for door access control applications (ingress control) to assure the door hardware and access control solutions would perform as intended and expected. Typically, access control systems incorporating card readers, keypads, iris scanners, etc. are tested and listed to UL 294. Additionally, delayed egress electrical locking systems, sensor-release electrical locking systems, and certain types of door hardware release electrical locking systems are all typically tested and listed to UL 294. On the other hand, components such as electromagnetic locks,

electric dead bolts, electric strikes, and other door electrically operated locking mechanisms are typically listed to UL 1034. UL 294 and UL 1034 are collateral standards that complement each other.

These examples illustrate that many of the same systems and components used to control access (ingress) to a space are also used for egress-side electrical locking systems. DATE: November 8, 2022
SUBJECT: NFPA 101® Second Draft TC FINAL Ballot Results (A2023)

According to the final ballot results, all ballot items received the necessary affirmative votes to pass ballot.

33 **Members Eligible to Vote**
3 **Members Not Returned** (*Day, Frye, Ramseur*)

The attached report shows the number of affirmative, negative, and abstaining votes as well as the explanation of the vote for **each** revision.

To pass ballot, **each** revision requires: (1) a simple majority of those eligible to vote and (2) an affirmative vote of $\frac{2}{3}$ of ballots returned. See Sections 3.3.4.3.(c) and 4.3.10.1 of the ***Regulations Governing the Development of NFPA Standards***.

**Second Revision No. 6536-NFPA 101-2022 [Section No. 7.1.5.1]****7.1.5.1**

Means of egress shall be designed and maintained to provide headroom in accordance with other sections of this *Code*, and such headroom shall be not less than 7 ft 6 in. (2285 mm). Projections from the ceiling shall provide headroom of not less than 6 ft 8 in. (2030 mm), with a tolerance of $-\frac{3}{4}$ in. (-19 mm), above the finished floor, unless otherwise specified by any of the following:

- (1) In existing buildings, the ceiling height shall be not less than 7 ft (2135 mm) from the floor, with projections from the ceiling not less than 6 ft 8 in. (2030 mm), with a tolerance of $-\frac{3}{4}$ in. (-19 mm), ~~nominal~~ above the floor.
- (2) Headroom in industrial equipment access areas as provided in 40.2.5.3 shall be permitted.

I agree with the removal of the word "nominal"

Second Revision No. 6546-NFPA 101-2022 [Section No. 7.2.1.5.7 [Excluding any Sub-Sections]]

Every door assembly in a stair enclosure serving more than four stories, unless permitted by 7.2.1.5.7.2, shall meet one of the following conditions:

- (1) Re-entry from the stair enclosure to the interior of the building shall be provided.
- (2) An automatic release shall be provided that meets all of the following:
 - (a) The automatic release shall unlock all stair enclosure door assemblies to allow re-entry.
 - (b) The automatic release shall be actuated with the initiation of the building fire alarm system.
 - (c)* Door ~~electrical~~ electromechanical or electromagnetic locking hardware for new installations shall be listed in accordance with UL 294, *Access Control System Units*, or UL 1034, *Burglary-Resistant Electric Locking Mechanisms*.

A.7.2.1.5.7(2)(c)

The electrical locking hardware might be a component of an electrical locking system (e.g., an access control system), or the electrical locking hardware might be a device with an individual listing. Depending on the electrical locking hardware system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

- (3) Selected re-entry shall be provided in accordance with 7.2.1.5.7.1.

Submitter Information Verification

Committee: SAF-MEA

Submittal Date: Thu Jul 14 08:34:34 EDT 2022

Committee Statement

Committee Statement: The revision accepts the recommendations in PC-114 and PC-115. It is noted that the PCs were accepted by the technical committee at its meeting; however, the revisions must be processed as Reject but See Related SR-6546 in order to keep the revised annex language associated with the base paragraph. The net result is identical to the intended action. Note that the first sentence of A.7.2.1.5.7(2)(c) is existing language and is erroneously displayed as new underlined text. The substantiations for PC-114 and PC-115 follow.

PC-114: The proposed revisions help clarify the door electrical locking hardware that is required to be listed for these electrical locking applications. In addition of adding the option to list to UL 1034 included in the First Revision, this proposal brings consistency in the text where UL 294 and UL 1034 are referenced in NFPA 101. The additions of the Annex A text complement the revisions to the mandatory language of these special locking arrangements.

Because of implications to life safety with electrical locking systems potentially affecting egress on doors in the means of egress, it is prudent to require listing of door electrical

locking hardware used in these applications. Listing to either UL 294 or to UL 1034 appropriately revises this important listing requirement to help assure the electrical locking hardware performs as intended for this life-safety application.

The Life Safety Code first required door hardware to be listed to UL 294 in the 2009 edition of NFPA 101. This section of NFPA 101, Stair Enclosure Re-entry, first required listing of door locking hardware to UL 294 with the 2021 edition of NFPA 101.

UL 294 and 1034 address efficacy and safety considerations for door access control applications (ingress control) to help assure the door hardware and access control solutions would perform as intended and expected. Typically, access control systems incorporating card readers, keypads, iris scanners, etc. are tested and listed to UL 294. Additionally, delayed egress electrical locking systems, sensor-release electrical locking systems, and certain types of door hardware release electrical locking systems are all typically tested and listed to UL 294. On the other hand, components such as electromagnetic locks, electric dead bolts, electric strikes, and other door electrically operated locking mechanisms are typically listed to UL 1034. UL 294 and UL 1034 are collateral standards that complement each other.

These examples illustrate that some of the same systems and components used to control access (ingress) to a space are also used for egress-side electrical locking systems. Considering that egress-side electrical locking systems have life safety implications, NFPA 101 was enhanced (in 2009) to require listing of electrical locking hardware to UL 294. In hindsight, the collateral listing to UL 1034 should have been the language included in NFPA 101 in the earlier editions.

PC-115: The additions of the Annex A text complement the revisions to the mandatory language of these special locking arrangements.

I agree with the inclusion of UL 294 and 1034

Second Revision No. 6547-NFPA 101-2022 [Section No. 7.2.1.6]

7.2.1.6* Special Locking Arrangements.

7.2.1.6.1* Delayed-Egress Electrical Locking Systems.

7.2.1.6.1.1

Approved, delayed-egress electrical locking systems shall be permitted to be installed on door assemblies serving low- and ordinary-hazard contents in buildings protected throughout by an approved, supervised automatic fire detection system in accordance with Section 9.6 or an approved, supervised automatic sprinkler system in accordance with Section 9.7, and where permitted in Chapters 11 through 43, provided that all of the following criteria are met:

- (1) The delay of the delayed-egress electrical locking system shall deactivate allowing unobstructed egress upon actuation of one of the following:
 - (a) Approved, supervised automatic sprinkler system in accordance with Section 9.7
 - (b) Not more than one heat detector of an approved, supervised automatic fire detection system in accordance with Section 9.6
 - (c) Not more than two smoke detectors of an approved, supervised automatic fire detection system in accordance with Section 9.6
- (2) The delay of the delayed-egress electrical locking system shall deactivate allowing unobstructed egress upon loss of power controlling the lock or locking mechanism.
- (3)* An irreversible process shall release the electrical lock in the direction of egress within 15 seconds, or 30 seconds where approved by the authority having jurisdiction, upon application of a force to the release device required in 7.2.1.5.3 under all of the following conditions:
 - (a) The force shall not be required to exceed 15 lbf (67 N).
 - (b) The force shall not be required to be continuously applied for more than 3 seconds.
 - (c) The initiation of the release process shall activate an audible signal in the vicinity of the door opening.
 - (d) Once the electrical lock has been released by the application of force to the releasing device, rearming the delay electronics shall be by manual means only.
- (4)* A readily visible, durable sign that conforms to the visual characters requirements of ICC A117.1, *Accessible and Usable Buildings and Facilities*, shall be located on the door leaf adjacent to the release device in the direction of egress, and shall read as follows:
 - (a) PUSH UNTIL ALARM SOUNDS, DOOR CAN BE OPENED IN 15 SECONDS, for doors that swing in the direction of egress travel
 - (b) PULL UNTIL ALARM SOUNDS, DOOR CAN BE OPENED IN 15 SECONDS, for doors that swing against the direction of egress travel
- (5) The egress side of doors equipped with delayed-egress electrical locking systems shall be provided with emergency lighting in accordance with Section 7.9.
- (6)* Hardware Door electromechanical or electromagnetic locking hardware for new installations shall be listed in accordance with UL 294, *Access Control System Units*, or UL 1034, *Burglary-Resistant Electric Locking Mechanisms*.

A.7.2.1.6.1.1(6)

The electrical locking hardware might be a component of an electrical locking system, or it might be a device with an individual listing. Depending on the electrical locking system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

7.2.1.6.1.2

The provisions of 7.2.1.6.2 for sensor-release of electrical locking systems and 7.2.1.6.3 for door hardware release of electrically locked egress door assemblies shall not apply to door assemblies with delayed-egress electrical locking systems.

7.2.1.6.2* Sensor-Release of Electrical Locking Systems.

7.2.1.6.2.1

Where permitted in Chapters 11 through 43, door assemblies in the means of egress shall be permitted to be equipped with sensor-release electrical locking system hardware provided that all of the following criteria are met:

- (1) A sensor shall be provided on the egress side, arranged to electrically unlock the door leaf in the direction of egress upon detection of an approaching occupant.
- (2) Door leaves shall automatically electrically unlock in the direction of egress upon loss of power to the sensor or to the part of the locking system that electrically locks the door leaves.
- (3) Door locks shall be arranged to electrically unlock in the direction of egress from a manual release device complying with all of the following criteria:
 - (a) The manual release device shall be located on the egress side, 40 in. to 48 in. (1015 mm to 1220 mm) vertically above the floor, and within 60 in. (1525 mm) of the secured door openings, except as otherwise permitted by 7.2.1.6.2.1(3)(b).
 - (b) The requirement of 7.2.1.6.2.1(3)(a) to locate the manual release device within 60 in. (1525 mm) of the secured door opening shall not apply to previously approved existing installations.
 - (c) The manual release device shall be readily accessible and clearly identified by a sign that reads as follows: PUSH TO EXIT.
 - (d) When operated, the manual release device shall result in direct interruption of power to the electrical lock — independent of the locking system electronics — and the lock shall remain unlocked for not less than 30 seconds.
- (4) Activation of the building fire-protective signaling system, if provided, shall automatically electrically unlock the door leaves in the direction of egress, and the door leaves shall remain electrically unlocked until the fire-protective signaling system has been manually reset.
- (5) The activation of manual fire alarm boxes that activate the building fire-protective signaling system specified in 7.2.1.6.2.1(4) shall not be required to unlock the door leaves.
- (6) Activation of the building automatic sprinkler or fire detection system, if provided, shall automatically electrically unlock the door leaves in the direction of egress, and the door leaves shall remain electrically unlocked until the fire-protective signaling system has been manually reset.
- (7) The egress side of sensor-release electrically locked egress doors, other than existing sensor-release electrically locked egress doors, shall be provided with emergency lighting in accordance with Section 7.9.
- (8)* ~~Hardware~~ Door electromechanical or electromagnetic locking hardware for new installations shall be listed in accordance with UL 294, *Access Control System Units*, or UL 1034, *Burglary-Resistant Electric Locking Mechanisms*.

A.7.2.1.6.2.1(8)

The electrical locking hardware might be a component of an electrical locking system, or it might be a device with an individual listing. Depending on the electrical locking system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

7.2.1.6.2.2

The provisions of 7.2.1.6.1 for delayed-egress electrical locking systems and 7.2.1.6.3 for door hardware release of electrically locked egress door assemblies shall not apply to door assemblies with sensor-release of electrical locking systems.

7.2.1.6.3 Door Hardware Release of Electrically Locked Egress Door Assemblies.

7.2.1.6.3.1

Door assemblies in the means of egress shall be permitted to be equipped with approved electrical locking systems released by the operation of door hardware provided that all of the following conditions are met:

- (1) The hardware for egress-side occupant release of the electrical lock is affixed to the door leaf.
- (2) The hardware has an obvious method of operation that is readily operated in the direction of egress under all lighting conditions.
- (3) The hardware is capable of being operated with one hand in the direction of egress.
- (4) Operation of the hardware directly and immediately interrupts the power supply to the electric lock to unlock the door assembly in the direction of egress.
- (5)* Loss of power to the listed releasing hardware automatically unlocks the door assembly in the direction of egress.
- (6)* Hardware Door electromechanical or electromagnetic locking hardware for new installations is listed in accordance with UL 294, *Access Control System Units*, or UL 1034, *Burglary-Resistant Electric Locking Mechanisms*.

A.7.2.1.6.3.1(6).

The electrical locking hardware might be a component of an electrical locking system, or it might be a device with an individual listing. Depending on the electrical locking system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

7.2.1.6.3.2

The provisions of 7.2.1.6.1 for delayed-egress electrical locking systems and the provisions of 7.2.1.6.2 for sensor-release of electrical locking systems shall not apply to door assemblies with door hardware release of electrically locked egress doors.

7.2.1.6.4* Elevator Lobby Exit Access Door Assemblies Locking.

7.2.1.6.4.1

Where permitted in Chapters 11 through 43, door assemblies separating the elevator lobby from the exit access required by 7.4.1.6.1 shall be permitted to be electrically locked, provided that all the following criteria are met:

- (1)* ~~The electrical~~ Door electromechanical or electromagnetic locking hardware is listed in accordance with UL 294, *Access Control System Units*, or UL 1034, *Burglary-Resistant Electric Locking Mechanisms*.

A.7.2.1.6.4.1(1)

The electrical locking hardware might be a component of an electrical locking system, or it might be a device with an individual listing. Depending on the electrical locking system or component, either UL 294 or UL 1034 is the pertinent standard for the required listing.

- (2) The building is protected throughout by a fire alarm system in accordance with Section 9.6.
- (3) The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.
- (4) Waterflow in the sprinkler system required by 7.2.1.6.4.1 is arranged to initiate the building fire alarm system.
- (5) The elevator lobby is protected by an approved, supervised smoke detection system in accordance with Section 9.6.
- (6) Detection of smoke by the detection system required by 7.2.1.6.4.1 is arranged to initiate the building fire alarm system and notify building occupants.
- (7) Initiation of the building fire alarm system by other than manual fire alarm boxes unlocks the electrical locks on the elevator lobby door assembly.
- (8) Loss of power to the elevator lobby electrical lock system unlocks the electrical locks on the elevator lobby door assemblies.
- (9) Once unlocked, the elevator lobby door assemblies remain electrically unlocked until the building fire alarm system has been manually reset.
- (10) Where the elevator lobby door assemblies remain mechanically latched after being electrically unlocked, latch-releasing hardware in accordance with 7.2.1.5.3 is affixed to the door leaves.
- (11) A two-way communication system is provided for communication between the elevator lobby and a central control point that is constantly staffed.
- (12) The central control point staff required by 7.2.1.6.4.1(11) is capable, trained, and authorized to provide emergency assistance.

7.2.1.6.4.2

Elevator lobby exit access doors equipped with electrical locking systems shall not be required to comply with 7.2.1.6.1, 7.2.1.6.2, or 7.2.1.6.3.

Submitter Information Verification

Committee: SAF-MEA

Submittal Date: Thu Jul 14 09:37:18 EDT 2022

Committee Statement

Committee The revision accepts the recommendations in PC-116, PC-117, PC-118, PC-119, and PC-

Statement: 120. It is noted that the PCs were accepted by the technical committee at its meeting; however, they must be processed as Reject but See Related SR-6547 to associate the new annex language with the base requirements. The net result is identical to that intended by the committee. The substantiations for the noted PCs follow.

PC-116: Because of implications to life safety with electrical locking systems potentially affecting egress on doors in the means of egress, it is prudent to require listing of door electrical locking hardware used in these special locking arrangements. Listing to either UL 294 or to UL 1034 appropriately revises this important listing requirement to help assure the electrical locking hardware performs as intended for these life-safety applications.

The Life Safety Code first required door hardware to be listed to UL 294 in the 2009 edition of NFPA 101 on elevator lobby exit access door assemblies. Special locking arrangements included the UL 294 listing requirement with the 2012 and 2018 editions of NFPA 101.

UL 294 and 1034 address efficacy and safety considerations for door access control applications (ingress control) to assure the door hardware and access control solutions would perform as intended and expected. Typically, access control systems incorporating card readers, keypads, iris scanners, etc. are tested and listed to UL 294. Additionally, delayed egress electrical locking systems, sensor-release electrical locking systems, and certain types of door hardware release electrical locking systems are all typically tested and listed to UL 294. On the other hand, components such as electromagnetic locks, electric dead bolts, electric strikes, and other door electrically operated locking mechanisms are typically listed to UL 1034. UL 294 and UL 1034 are collateral standards that complement each other.

These examples illustrate that many of the same systems and components used to control access (ingress) to a space are also used for egress-side electrical locking systems. Considering that egress-side electrical locking systems have life safety implications, NFPA 101 was enhanced (in 2009) to require listing of electrical locking hardware to UL 294. In hindsight, what's proposed here – the collateral listing to UL 1034 – should have been the language included in NFPA 101 in the earlier editions.

In addition to the option to list to UL 1034, this proposal brings consistency in the text where UL 294 (and UL 1034) are referenced in NFPA 101. The additions of Annex A text complement the revisions to the mandatory language of these special locking arrangements.

PC-117 through PC-120: The additions of Annex A text complement the revisions to the mandatory language of these special locking arrangements.

Second Revision No. 6548-NFPA 101-2022 [Section No. 7.2.1.12]

7.2.1.12 Door Openings in Folding Partitions.

Where permanently mounted folding or movable partitions divide a room into smaller spaces, a swinging door leaf or open doorway shall be provided as an exit access from each such space, unless otherwise specified in 7.2.1.12.1 ~~and~~ or 7.2.1.12.2.

7.2.1.12.1

A door leaf or opening in the folding partition shall not be required, provided that all of the following criteria are met:

- (1) The subdivided space is ~~not~~ used by not more than 20 persons at any time.
- (2) The use of the space is under adult supervision.
- (3) The partitions are arranged so that they do not extend across any aisle or corridor used as an exit access to the required exits from the story.
- (4) The partitions conform to the interior finish and other requirements of this *Code*.
- (5) The partitions are of an approved type, have a simple method of release, and are capable of being opened quickly and easily by experienced persons in case of emergency.

7.2.1.12.2

~~Where a subdivided space is provided with not less than two means of egress, the swinging door leaf or opening in the folding partition specified in 7.2.1.12 shall not be required, and one such means of egress shall be permitted to be equipped with a horizontal sliding door assembly complying with 7.2.1.13 where each space on both sides of the folding partition is provided with compliant means of egress without requiring travel through the folding partition.~~

Second Revision No. 6539-NFPA 101-2022 [Section No. 7.2.4.3.5]

7.2.4.3.5*

Fire barriers forming horizontal exits shall not be penetrated by ducts, unless one of the following criteria is met:

- (1) The ducts are existing penetrations protected by approved and listed fire dampers.
- (2) The building is protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7.
- (3) The duct penetrations are those permitted in detention and correctional occupancies as otherwise provided in Chapters 22 and 23 and are protected by combination fire dampers/smoke-leakage-rated ~~smoke~~ dampers that meet the smoke damper actuation requirements of 8.5.5.

Submitter Information Verification

Committee: SAF-MEA

Submittal Date: Wed Jul 13 13:55:47 EDT 2022

Committee Statement

Committee Statement: SAF-AAC appointed a task group to review damper terminology throughout NFPA 101 based upon FR 6516 which modified the definitions for various dampers and made the change to extract the definitions from NFPA 90A. The purpose of this Public Comment, submitted on behalf of the Task Group, is to revise the language to be consistent with the defined terms in Chapter 3. It should be noted that the terms proposed are based upon the First Draft Report of NFPA 90A and not necessarily the definitions in Chapter 3 of the First Draft Report for NFPA 101. If NFPA 90A is revised during the Public Comment period it is the intent that these terms would be revised to be consistent with the defined terms being extracted from NFPA 90A.

Second Revision No. 6556-NFPA 101-2022 [New Section after 7.2.12.2.5]

7.2.12.2.6

Newly installed two-way communication systems shall be listed in accordance with UL 2525, Standard for Two-Way Emergency Communications Systems for Rescue Assistance , and installed in accordance with NFPA 72 .

Submitter Information Verification

Committee: SAF-MEA

Submittal Date: Thu Jul 14 14:57:22 EDT 2022

Committee Statement

Committee Statement: The revision incorporates the recommendations of PI-217 and CI-6515, the substantiations for which follow.

PI-217: This Public Input seeks to require two-way communication systems to comply with the applicable product listing standard and the installation standard. Two-way communication systems are intended to allow occupants in need of assistance to evacuate a building to areas of safety. These systems must work correctly when they are needed in an emergency condition.

UL 2525 is a new Product Standard for products intended to be used in combination with other devices to form a rescue assistance two-way emergency communication system. NFPA 72 within Chapter 24 has the requirements for installation of these systems including main panels, remote panels, remote call stations, pathway integrity and backup power.

CI-6515: This committee input seeks to require newly installed two-way communication systems to comply with the applicable product listing standard. Two-way communication systems are intended to allow occupants in need of assistance to evacuate a building to areas of safety. These systems must work correctly when they are needed in an emergency condition. UL 2525 is a new Product Standard for products intended to be used in combination with other devices to form a rescue assistance two-way emergency communication system. The CI is intended to solicit public comments and give the committee the opportunity to review the new product standard.

Affirmative with Comment

Brackett, Joshua

I agree with the CI's intent to solicit public comments and give the committee the opportunity to review the new UL 2525 product standard.

Negative with Comment

Elvove, Joshua W.

NFPA 72 requirements are too stringent for 2-way communication systems and therefore not cost effective (e.g., survivability requirements). UL 2525 requirements should be sufficient. Two-way communications systems aren't connected to the fire alarm system, hence installers are not typically fire alarm contractors who are familiar NFPA 72 requirements and there's no need for them to do so, since NFPA 72 isn't warranted.

Frable, David W.

My objection with this proposed new section is only with the addition of the requirement that the installation of the two-way communication system must be installed in accordance with NFPA 72. Requiring only that the two-way communication systems being listed to UL 2525 should be sufficient at this time. Please note, the requirements for installing a two-way communication system in an area of refuge has been a requirement in NFPA 101 for over 25 years. Over this timeframe, it has never been the intent of the TC on Means of Egress to require "pathway survivability requirements" for these two-way communications systems. As proposed, newly installed area of refuge two-way communication systems would be required to meet the same "pathway survivability requirements" as required for the notification and communication circuits for the operation of a building's emergency communication system. This seems excessive and not cost effective since the area of refuge two-way communication system is a stand-alone system and is not connected to the building's fire alarm or emergency communication system. Also, these two-way communication systems are typically not installed by fire alarm system contractors. In addition, the "pathway survivability requirements" for area of refuge two-way communication systems in NFPA 72 are relatively new and are based only on the building's method of evacuation (e.g., total evacuation strategy and selective (relocation) strategy) and the fire resistance rated construction of the building and not a process to characterize the likelihood, vulnerability, and magnitude of a fire incident (including probabilities and potential consequences) occurring within the specific building. Lastly, no fire incident data has been provided to the TC on Means of Egress identifying any fire incidents within a building that affected the communication circuit cabling for the area of refuge two-way communication system, causing it to fail and not work correctly during an emergency.

Tilton, Kelly R.

Based on the comments provided, I agree Mr. Frable and Mr. Elvove. There has been no historical data provided to the TC on Means of Egress indicating the current method for two-way communication installation is insufficient, causing it to fail or not work correctly during an emergency. Two-way communication systems are not connected to the building fire alarm system and are not typically installed by fire alarm contractors. Often two-way communication is achieved by standard phone lines. The proposed section would cause unnecessary and reoccurring excessive costs.

Second Revision No. 6552-NFPA 101-2022 [Section No. 7.7.2]

7.7.2 Exit Discharge Through Interior Building Areas.

Exits shall be permitted to discharge through interior building areas, provided that all of the following are met:

- (1) Not more than 50 percent of the required number of exit enclosures serving normally occupied areas of each floor, and not more than 50 percent of the exit enclosure capacity required for normally occupied areas of each floor, shall discharge through areas on any level of discharge, except as otherwise permitted by one of the following:
 - (a) One hundred percent of the exits shall be permitted to discharge through areas on any level of discharge in detention and correctional occupancies as otherwise provided in Chapters 22 and 23.
 - (b) In existing buildings, the 50 percent limit on egress capacity shall not apply if the 50 percent limit on the required number of exits is met.
 - (c) Not more than 75 percent of the required number and capacity of exit stairs serving normally occupied areas of each floor shall be permitted to discharge through vestibules or foyers on any level of discharge where the level of discharge is protected throughout by an approved automatic sprinkler system in accordance with Section 9.7, and such vestibules or foyers meet the requirements of 7.7.2(3)(b).
- (2) Each level of discharge shall discharge directly outside at the finished ground level or discharge directly outside and provide access to the finished ground level by outside stairs or outside ramps.
- (3) The interior exit discharge shall be protected by one of the following methods:
 - (a) The level of discharge shall be protected throughout by an approved automatic sprinkler system in accordance with Section 9.7, or the portion of the level of discharge used for interior exit discharge shall be protected by an approved automatic sprinkler system in accordance with Section 9.7 and shall be separated from the nonsprinklered portion of the floor by fire barriers with a fire resistance rating meeting the requirements for the enclosure of exits. (See 7.1.3.2.1.)
 - (b) The interior exit discharge area shall be in a vestibule or foyer that meets all of the following criteria:
 - i. The depth from the exterior of the building shall be not more than 10 ft (3050 mm), and the length shall be not more than 30 ft (9.1 m).
 - ii. The foyer shall be separated from the remainder of the level of discharge by fire barriers with a minimum 1-hour fire resistance rating, and existing installations of wired glass in steel frames shall be permitted to be continued in use.
 - iii. The foyer shall serve only as means of egress and shall include an exit directly to the outside.
- (4) The interior exit discharge shall lead to a free and unobstructed way to the exterior of the building, and such way shall be readily apparent or shall be identifiable by exit signage from the point of discharge from the exit.
- (5) The entire area on the level of discharge shall be separated from areas below by construction having a fire resistance rating not less than that required for the exit enclosure, unless otherwise provided in 7.7.2(6).
- (6) Levels below the level of discharge in an atrium shall be permitted to be open to the level of discharge where such level of discharge is protected in accordance with 8.6.7.

Submitter Information Verification

Committee: SAF-MEA

Submittal Date: Thu Jul 14 13:16:00 EDT 2022

Committee Statement

Committee Statement: The revision accepts the recommendations in CI-6545, PC-60, and PC-89. The only technical change to the current language is the addition of item 7.7.2(1)(c). Existing 7.7.2(3) is moved to 7.7.2(4), and existing 7.7.2(4) is moved to 7.7.2(3) for clarity. The committee statement for CI-6545 follows:

The purpose of this committee input is to allow a new scenario to increase the number and capacity of exit stairs on the level of exit discharge from 50% to 75% under certain very specific conditions without reducing the level of safety currently provided by the Code.

Currently, 50% credit is given to stairs that discharge to building interiors in sprinklered buildings or stairs that discharge into compliant vestibules in non-sprinklered buildings. This revision would permit compliant vestibules (i.e., those that meet the three existing requirements for vestibules – 10' x 30', 1 hr enclosure, direct egress) additional credit in buildings where the level of exit discharge is completely sprinklered. Note: compliant vestibules already would meet 100% of the discharge requirements if installed in non-sprinklered buildings less than 4 stories in height (since they require 1 hr enclosures) or in existing sprinklered buildings (since 7.1.3.2.1(3) permits 1 hr exit enclosures). Reordering (3) and (4) better introduces interior exit discharge.

This concept was accepted by this committee during the 1st draft meeting last cycle and text inserted into the 1st draft of the 2021 Code, but was rightfully removed during the 2nd draft meeting because after subsequent review, the text as written created potential problems. This committee input addresses those problems and presents the concept again, and is intended to solicit public comments for further review at the second draft stage.

Second Revision No. 6541-NFPA 101-2022 [Section No. 7.15.6]

7.15.6 Elevator Installation.

7.15.6.1

Except as modified by 7.15.6.2 and 7.15.6.3, occupant evacuation elevators shall be installed in accordance with ASME A17.1/CSA B44, *Safety Code for Elevators and Escalators*, including the provisions for occupant evacuation operation, as required by 7.15.1.3.

7.15.6.2*

Shunt breakers shall not be installed on elevator systems used for occupant evacuation.

7.15.6.3

Occupant evacuation elevators shall be limited to electric passenger elevators that are located in noncombustible hoistways and for which the car enclosure materials meet the requirements of ASME A17.1/CSA B44, *Safety Code for Elevators and Escalators*.

Submitter Information Verification

Committee: SAF-MEA

Submittal Date: Wed Jul 13 14:44:17 EDT 2022

Committee Statement

Committee Statement: NFPA 13 currently requires sprinklers to be installed in hydraulic elevator pit but A17.1 prohibits sprinklers in the hoistway, including the pit, for occupant evacuation elevators. Until NFPA 13 removes sprinklers from hydraulic pits (11.14.6.3), NFPA 101 needs to prevent a hydraulic elevator from being included as an occupant evacuation elevator.

Brackett, Joshua

I think this is too limiting and outside the scope of Chapter 7. There are many hydraulic elevators in use today that are used for occupant evacuation. Shunt trip only occurs in certain circumstances. Egress during emergency situations where the elevator has shunted will occur via stairs. Further, elevator installation and inspection are state specific. Not all states have adopted and follow ASME 17.1.

Crowley, Michael A.

The use of hydraulic elevators was never planned in the development of Occupant Evacuation Elevators. This change may have unintended consequences.

Second Revision No. 6542-NFPA 101-2022 [Section No. 7.15.9]

7.15.9 Occupant Evacuation Shaft System.

7.15.9.1

Occupant evacuation elevators, except those that service only an open parking garage, shall be provided with an occupant evacuation shaft system consisting of all of the following:

- (1) Elevator hoistway
- (2) Enclosed elevator lobby outside the bank or group of hoistway doors on each floor served by the elevators, ~~with the exception~~ except that elevator lobbies are not ~~be~~ required to be enclosed where located either on the street floor or on the level of exit discharge
- (3) Enclosed exit stair with doors to all floors, at and above grade level, served by the elevators

7.15.9.2* Elevator Lobby Size.

7.15.9.2.1

Occupant evacuation elevator lobbies shall have minimum clear floor area, except as otherwise provided in 7.15.9.2.2, as follows:

- (1) The elevator lobby clear floor area shall accommodate, at 3 ft² (0.28 m²) per person, a minimum of 25 percent of the occupant load of the floor area served by the lobby.
- (2) The elevator lobby clear floor area also shall accommodate one wheelchair space of 30 in. × 48 in. (760 mm × 1220 mm) for each 50 persons, or portion thereof, of the occupant load of the floor area served by the lobby.

7.15.9.2.2

The size of lobbies serving multiple banks of elevators shall be exempt from the requirement of 7.15.9.2.1(1), provided that the area of such lobbies is approved on an individual basis and is consistent with the building's emergency action plan.

7.15.9.3

Access to the exit stair required by 7.15.9.1(3) shall be directly from the enclosed elevator lobby on each floor, except the floor that is at the lobby of the building.

7.15.9.4

The occupant evacuation shaft system shall be enclosed and separated from the remainder of the building by walls complying with the following:

- (1) The shaft system walls shall be smoke barriers in accordance with Section 8.5.
- (2) The shaft system walls separating the elevator lobby from the remainder of the building shall have a minimum 1-hour fire resistance rating and minimum ¾-hour fire-protection-rated opening protectives.
- (3) The shaft system walls separating the elevator hoistway from the remainder of the building shall have a minimum 2-hour fire resistance rating and minimum 1½-hour fire-protection-rated opening protectives.
- (4) The shaft system walls separating the enclosed exit stair from the remainder of the building shall have a minimum 2-hour fire resistance rating and minimum 1½-hour fire-protection-rated opening protectives.

7.15.9.5

Occupant evacuation shaft system enclosures shall be constructed to provide a minimum of classification Level 2 in accordance with ASTM C1629/C1629M, *Standard Classification for Abuse-Resistant Nondecorated Interior Gypsum Panel Products and Fiber-Reinforced Cement Panels*.

7.15.9.6*

An approved method to prevent water from infiltrating into the hoistway enclosure from the operation of the automatic sprinkler system outside the enclosed occupant evacuation elevator lobby shall be provided.

7.15.9.7

Occupant evacuation shaft system elevator lobby doors, other than doors to the hoistway, exit stair enclosure, control room, or control space, shall have all of the following features:

- (1) The doors shall have a fire protection rating of not less than $\frac{3}{4}$ hour.
- (2) The doors shall be smoke-leakage-rated assemblies in accordance with NFPA 105.
- (3) The doors shall have an automatic positioning bottom seal to resist the passage of water at floor level from outside the shaft system.

7.15.9.8

Occupant evacuation shaft system elevator lobby doors shall have the following features:

- (1) Each door, other than doors to the hoistway, exit stair enclosure, control room, or control space, shall be automatic-closing in accordance with 7.2.1.8.2, as modified by 7.15.9.8(2).
- (2) In addition to the automatic-closing means addressed by 7.2.1.8.2, the elevator lobby door on any floor shall also close in response to any alarm signal initiated on that floor.
- (3) Each door shall be provided with a vision panel arranged to allow people on either side of the door to view conditions on the other side of the door.

7.15.9.9

Each occupant evacuation shaft system exit stair enclosure door shall be provided with a vision panel arranged to allow people on either side of the door to view conditions on the other side of the door.

The use of Occupant Evacuation elevators was never planned for parking garages over 420 feet in height This change may have unintended consequences.

Hoskins, Bryan Lawrence

Occupant evacuation elevators were never intended for open parking garages, so the exception could lead to unintended consequences.

Committee Comment No. 6589-NFPA 101-2022 [Section No. 36.4.6]

This was a Second Revision that has been modified or deleted as the result of Second Correlating Revision:

36.4.6 Alcohol-Based Hand-Rub Dispensers.

36.4.6.1

The installation and maintenance of alcohol-based hand-rub dispensers and the storage of alcohol-based hand-rub solutions in accordance with 8.7.3.3 shall be permitted.

36.4.6.2

The requirements of 36.4.6.1 shall not apply to individual personal use ABHR containers with a nominal volume not exceeding 16 ounces (0.5 L).

Submitter Information Verification

Committee: SAF-MER

Submittal Date: Fri Aug 05 13:29:05 EDT 2022

Committee Statement

Committee Statement: The new language clarifies that individual personal use ABHR containers not greater than a nominal volume of 16 oz (0.5 L) are not subject to the provisions of 8.7.3.3. This action varies slightly from that proposed by the FIR Committee in that the container size limitation is cited as “a nominal volume not exceed than a 16 ounces (0.5L)” as opposed to the proposed action of the FIR Committee to exempt such containers that are “less than 16 ounces (0.5 L)”. Commonly available containers have a volume of 16.9 ounces (0.5 L). The proposed action here is intended to highlight a discrepancy between the current proposed language to be considered by the FIR Committee and that proposed here for consideration by the Correlating Committee.

Public Comment No. 131-NFPA 101-2022 [New Section after 36.2.5.11]

36.2.5.12 Interlocked-Door Vestibule

An interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress where doors are not required to swing in the direction of egress travel.

Additional Proposed Changes

<u>File Name</u>	<u>Description</u>	<u>Approved</u>
NFPA_101_Special_Locking_Arrangements_Interlocked_Door_Vestibule_Public_Comments_20200520.pdf	NFPA 101 2024 public comments re: interlocked door vestibule.	

Statement of Problem and Substantiation for Public Comment

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 21, 37, 38, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

For this occupancy, this proposal suggests an interlocked-door vestibule should be permitted only where the occupant load of the area served does not require doors to swing in the direction of egress travel.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

The criteria in proposed section 7.2.1.6.5 (via separate public comment) were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Committee Statement

Committee Action:	Rejected
Resolution:	The associated public comments 125 & 126 were rejected by MEA committee therefore there are no requirements in 7.2.1.6.5.

NFPA 101 Special Locking Arrangement – Interlocked-Door Vestibule – Informal Task Group
Public Comments for 2nd draft, Sept. 29, 2021 – revisions Oct. 1, 2021, further revisions Nov. 1, 2021,
Nov. 3, 2021, and May 4, 6, 9, & 20, 2022.
John Woestman, BHMA

Black underscored text is original proposed revisions.
Red or blue formatted text are potential revisions for 2nd draft consideration.

Interlocked-Door Vestibule.

A compartment provided with doors in series where only one of the doors in series is openable at a time.

Reason:

This proposed definition is modeled after the definition of “sally port”, and along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 21, 36, 37, 38, 39, 40, and 42, offers the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

Chapter 7 Mean of Egress

7.2.1.6.5 Interlocked-Door Vestibule

Where permitted in chapters 11 through 43 with low- and ordinary-hazard contents, an interlocked-door vestibule shall be permitted in a the means of egress where there are provisions for continuous and unobstructed travel through the interlocked-door vestibule during an emergency egress condition.

Interlocked-door vestibules shall comply with all of the following:

1. The building shall be protected by an approved supervised automatic sprinkler system in accordance with Section 9.7.
2. The area served by the interlocked-door vestibule shall be protected by an approved supervised automatic fire detection system in accordance with Section 9.6 and shall utilize smoke detectors on each side of the interlocked doors.
3. An override switch, which disables the interlocks of the doors of the interlocked-door vestibule for not less than 30 seconds, shall be provided on the egress side of each door of the interlocked-door vestibule. The override switch may be omitted by approval of the Authority Having Jurisdiction.

Commented [WJ1]: Public Input No. 341-NFPA 101-2021

Commented [JW2]: Public Comment No. 126-NFPA 101-2022

Commented [WJ3]: Public Input No. 343-NFPA 101-2021

Commented [JW4]: Public Comment No. 125-NFPA 101-2022

4. The override switches shall be within 48 in. (1220 mm) of door and between 34 in. (865 mm) and 48 in. (1220 mm) above the floor.
5. Signage shall be provided at each override switch describing its operation.
6. Upon loss of power to the interlock function of the doors of the interlocked-door vestibule, the interlock function shall be disabled.
7. The interlocks of the doors of the interlocked-door vestibule shall deactivate by activation of the fire alarm when initiated by the automatic fire detection system or the automatic sprinkler system.
8. The egress path shall not pass through more than one interlocked-door vestibule.
9. The fire department with responsibility for responding to a building that contains an interlocked-door vestibule shall be notified of the presence of the interlocked-door vestibule.
10. Where permitted by the authority having jurisdiction, interlocked-door vestibules shall be permitted to serve high-hazard content areas.
11. Door electrical locking hardware for new installations shall be listed in accordance with UL 294, Access Control System Units, or UL 1034, Burglary-Resistant Locking Mechanisms.

Reason:

This proposal, along with complementary proposals in Chapters 18, 19, 20, 21, 36, 37, 38, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

An occupant egressing through an interlocked-door vestibule would be delayed at the second door in series if the first door in series is not in a closed position, and vice-versa.

The proposed criteria were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Potential Annex Note:

Outside of detention and correctional facilities, the commercial building equivalent of sally ports – interlocked-door vestibules - are utilized for security reasons (i.e. money handling rooms; and in health care), occupant protection, clinical needs of the patients, environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Interlocked-door vestibules are as the name implies: a vestibule with interlocked-doors. The door into the vestibule is interlocked with the door leading out of the vestibule such that only one of the doors can be open at a given time.

Requirement 3: an example of where interlock override switches may not be desired is where an interlocked-door vestibule is utilized to deter theft, such as a high-end precious gem business.

Visual indicators may be desirable on the egress side of each door to indicate when the door is in the locked status and when in the unlocked status. Visual indicators may be desirable in occupancies where some of the occupants are likely unfamiliar with interlocked-door vestibule, such as mercantile occupancies, or some health care occupancies.

These provisions for interlocked-door vestibules cannot address all potential uses and applications.

Chapter 18 New Health Care Occupancies

18.2.5.8 Interlocked-Door Vestibule

An interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress.

Reason:

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 19, 20, 21, 36, 37, 38, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

The criteria in proposed section 7.2.1.6.5 (via separate public comment) were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Commented [WJ5]: Public Input No. 345-NFPA 101-2021

Commented [JW6]: Public Comment No. 127-NFPA 101-2022

Chapter 19 Existing Health Care Occupancies

19.2.5.8 Interlocked-Door Vestibule

An interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress.

Reason:

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 18, 20, 21, 36, 37, 38, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

Commented [WJ7]: Public Input No. 346-NFPA 101-2021

Commented [JW8]: Public Comment No. 128-NFPA 101-2022

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

The criteria is proposed section 7.2.1.6.5 (via separate public comment) were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Chapter 20 New Ambulatory Health Care Occupancies

20.2.5.4 Interlocked-Door Vestibule

An interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress.

Reason:

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 21, 36, 37, 38, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

Chapter 21 Existing Ambulatory Health Care Occupancies

21.2.5.4 Interlocked-Door Vestibule

Commented [WJ11]: Public Input No. 350-NFPA 101-2021

Commented [JW12]: Public Comment No. 130-NFPA 101-2022

An interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress.

Reason:

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 36, 37, 38, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

The criteria is proposed section 7.2.1.6.5 (via separate public comment) were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Chapter 36 New Mercantile Occupancies

36.2.5.12 Interlocked-Door Vestibule

An interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress where doors are not required to swing in the direction of egress travel.

Reason:

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 21, 37, 38, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

For this occupancy, this proposal suggests an interlocked-door vestibule should be permitted only where the occupant load of the area served does not require doors to swing in the direction of egress travel.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

Commented [WJ13]: Public Input No. 352-NFPA 101-2021

Commented [JW14]: Public Comment No. 131-NFPA 101-2022

Commented [JW15]: Revisions to address TC reasons for resolution.

The criteria is proposed section 7.2.1.6.5 (via separate public comment) were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Chapter 37 Existing Mercantile Occupancies

37.2.5.12 Interlocked-Door Vestibule

Where approved permitted by the authority having jurisdiction, aAn interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress where doors are not required to swing in the direction of egress travel.

Reason:

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 21, 36, 38, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Public Comment No. 176-NFPA 101-2022 [New Section after 36.3.4.3.2]

36.3.4.4 Carbon Monoxide Detection

36.3.4.4.1 New mercantile occupancies shall be provided with carbon monoxide detection and warning equipment in accordance with Section 9.12 in the locations specified as follows:

- (1) On the ceilings of rooms containing permanently installed fuel-burning appliances or fuel-burning fireplaces
- (2) Centrally located within occupiable spaces served by the first supply air register from permanently installed fuel-burning HVAC systems
- (3)* Centrally located within occupiable spaces adjacent to an attached garage

A.36.3.4.4.1(3) The intent is to require CO detectors in occupiable spaces immediately adjacent, vertically or horizontally, to attached garages, regardless of the presence of openings between the attached garage and the adjacent occupiable spaces. Other occupiable spaces that are not adjacent to the attached garage do not require CO detectors.

36.3.4.4.2 Carbon monoxide detectors as specified in 36.3.4.4.1 shall not be required in the following locations:

- (1) Garages
- (2) Occupiable spaces with attached garages that are open parking structures as defined in 3.3.282.8.4
- (3) Occupiable spaces with attached garages that are mechanically ventilated in accordance with the mechanical code

Statement of Problem and Substantiation for Public Comment

New mercantile occupancies currently lack requirements for CO detection in buildings with known CO hazards, including fuel-burning appliances. The addition of a requirement for CO detection for new mercantile occupancies will prevent deaths and injuries to occupants in the event of high level CO release within the building.

To clarify, the proposed revision being resubmitted is meant to serve as an example of what is currently required in the Life Safety Code. It is identical to the requirement that is currently in place for Chapter 12. If this proposed example is not considered adequate, the committee is urged to develop what it considers to be an adequate requirement. Similar action was taken by other 101 committees who created first revisions, committee input, or formed task groups to create CO detection requirements within their respective chapters (see page 7 of the Correlating Committee First Draft Meeting Minutes https://www.nfpa.org/assets/files/AboutTheCodes/101/101_A2023_SAF_AAC_FD_Minutes_1_22.pdf)

In response to the committee's request for "technical justification to demonstrate that this is a significant enough issue in Mercantile occupancies to warrant these changes": A CO source in any building that is not monitored by installed CO detection devices is a life safety hazard to occupants. High level CO exposure carries the immediate risk of permanent brain injury and death. Risk is associated with CO producing appliances and equipment, it is not specific to building type.

Further justification was provided in the substantiation statement for PI 211. Occupants are critically reliant on the building/business owner for their life safety, most of whom likely have no knowledge of the vital need for installed CO detection as there are not universal requirements for them to be knowledgeable about CO safety.

With regard to installation cost, primary consideration must be given to the unique nature of CO exposure and the inability of occupants to sense when they are being exposed. To avoid injury and death, there is no safe alternative to installed CO detection devices.

Please act to prevent further delay in getting this critical baseline requirement for life safety in place to protect occupants of new mercantile buildings.

"The lack of an operating alarm can be seen in several of these case studies. Carbon monoxide is colorless and odorless. Its early onset symptoms are not unique or severe, which leads to mistaking them for something else or thinking there is not a serious problem. These symptoms can quickly escalate to severe symptoms, which usually revolves around the victim becoming unconscious. People do not self-rescue when they are able, because they do not realize that they should. If someone does realize there is problem, it is most likely too late. This common sequence combined with CO's toxicity, and a general negligence, makes CO a very dangerous problem that can happen almost anywhere. Detection is the only safeguard against this problem."

Committee Statement

Committee Action: Rejected

Resolution: This public comment does not provide any new information from what was provided in the public input. Without further technical justification, the technical committee cannot approve this public comment. The need to provide CO detection in mercantile occupancies has not been provided. Technical justification pointing to the specific need (such as data on incidents, injuries, or fatalities) to provide CO detection in mercantile occupancies has not been provided. Additionally, the requirement for placement of CO detection devices does not address the specific spaces which can be found in a mercantile occupancy, such as large volume spaces, sales floors, big box retailers, storerooms, etc. For example, committee does not see the life safety benefit for a single CO detector to be "centrally located" in a large volume mercantile space, as would be required by the current text. Further clarification is needed for the locations of CO detection. The committee may consider action on CO requirements in mercantile occupancies based upon additional technical justification including Phase II of the Fire Protection Research Foundation report of CO detection. Additionally, the reference to "mechanical code," but does not provide any guidance on which document this specifically references.

**Public Comment No. 227-NFPA 101-2022 [Section No. 36.4.4.12.2]****36.4.4.12.2***

Where provided in areas covered by an occupant notification system, the audible and visible signals shall extend into the interior of the modular room.

A.36.4.4.12.2

Extending the audible and visible signals into the interior does not necessarily mean additional devices need to be installed. Where occupant notification systems installed to serve the area where the modular booth is to be located provide the required audible and visible signals within the modular booth additional devices are not necessary. If the occupant notification systems installed to serve the area where the modular booth is to be located do not provide the required audible and visible signals, then additional devices would be required to be installed within the modular booth.

Statement of Problem and Substantiation for Public Comment

A new Annex section was added to clarify that extending the audible and visible signals into the interior of the modular does not necessary require the installation of a device in the interior of the modular room.

Resolution: The associated public comments 125 & 126 were rejected by MEA committee therefore there are no requirements in 7.2.1.6.5.

Public Comment No. 177-NFPA 101-2022 [New Section after 37.3.4.3.2]

37.3.4.4 Carbon Monoxide Detection

37.3.4.4.1 Existing mercantile occupancies shall be provided with carbon monoxide detection and warning equipment in accordance with Section 9.12 in the locations specified as follows:

- (1) On the ceilings of rooms containing permanently installed fuel-burning appliances or fuel-burning fireplaces
- (2) Centrally located within occupiable spaces served by the first supply air register from permanently installed fuel-burning HVAC systems
- (3)* Centrally located within occupiable spaces adjacent to an attached garage

A.37.3.4.4.1(3) The intent is to require CO detectors in occupiable spaces immediately adjacent, vertically or horizontally, to attached garages, regardless of the presence of openings between the garage and the adjacent occupiable spaces. Other occupiable spaces that are not adjacent to the attached garage do not require CO detectors.

37.3.4.4.2 Carbon monoxide detectors as specified in 37.3.4.4.1 shall not be required in the following locations:

- (1) Garages
- (2) Occupiable spaces with attached garages that are open parking structures as defined in 3.3.282.8.4
- (3) Occupiable spaces with attached garages that are mechanically ventilated in accordance with the mechanical code

Statement of Problem and Substantiation for Public Comment

Existing mercantile occupancies currently lack requirements for CO detection in buildings with known CO hazards, including fuel-burning appliances. The addition of a requirement for CO detection for existing mercantile occupancies will prevent deaths and injuries to occupants in the event of high level CO release within the building.

To clarify, the proposed revision being resubmitted is meant to serve as an example of what is currently required in the Life Safety Code. It is identical to the requirement that is currently in place for Chapter 12. If this proposed example is not considered adequate, the committee is urged to develop what it considers to be an adequate requirement. Similar action was taken by other 101 committees who created first revisions, committee input, or formed task groups to create CO detection requirements within their respective chapters (see page 7 of the Correlating Committee First Draft Meeting Minutes https://www.nfpa.org/assets/files/AboutTheCodes/101/101_A2023_SAF_AAC_FD_Minutes_1_22.pdf)

In response to the committee's request for "technical justification to demonstrate that this is a significant enough issue in Mercantile occupancies to warrant these changes": A CO source in any building that is not monitored by installed CO detection devices is a life safety hazard to occupants. High level CO exposure carries the immediate risk of permanent brain injury and death. Risk is associated with CO producing appliances and equipment, it is not specific to building type. Existing buildings arguably pose a higher risk of exposure due to aging gas appliances and exhaust systems.

Further justification was provided in the substantiation statement for PI 211. Occupants are critically reliant on the building/business owner for their life safety, most of whom likely have no knowledge of the vital need for installed CO detection as there are not universal requirements for them to be knowledgeable about CO safety.

With regard to cost of installation, primary consideration must be given to the unique nature of CO exposure and the inability of occupants to sense when they are being exposed. To avoid injury and death, there is no safe alternative to installed CO detection devices.

Please act to prevent further delay in getting this critical baseline requirement for life safety in place to protect occupants of existing mercantile buildings.

"The lack of an operating alarm can be seen in several of these case studies. Carbon monoxide is colorless and odorless. Committee Statement

Committee Action: Rejected

Resolution: This public comment does not provide any new information from what was provided in the public input. Without further technical justification, the technical committee cannot approve this public comment. The need to provide CO detection in mercantile occupancies has not been provided. Technical justification pointing to the specific need (such as data on incidents, injuries, or fatalities) to provide CO detection in mercantile occupancies has not been provided. Additionally, the requirement for placement of CO detection devices does not address the specific spaces which can be found in a mercantile occupancy, such as large volume spaces, sales floors, big box retailers, storerooms, etc. For example, committee does not see the life safety benefit for a single CO detector to be "centrally located" in a large volume mercantile space, as would be required by the current text. Further clarification is needed for the locations of CO detection. The committee may consider action on CO requirements in mercantile occupancies based upon additional technical justification including Phase II of the Fire Protection Research Foundation report of CO detection. Additionally, the reference to "mechanical code," but does not provide any guidance on which document this specifically references. This public comment is for existing mercantile occupancies, which would retroactively requirement CO detection. Technical justification should be provided to document the need to retroactively requirement CO detection in existing mercantile occupancies.

Public Comment No. 228-NFPA 101-2022 [Section No. 37.4.4.12]

37.4.4.12 Modular Rooms.

37.4.4.12.1

~~Newly~~ Modular rooms installed ~~modular rooms~~ in indoor locations shall comply with Section 10.7.

37.4.4.12.2*

Where provided in areas covered by an occupant notification system, the audible and visible signals shall be extended into the interior of the modular rooms.

A.37.4.4.12.2

Extending the audible and visible signals into the interior does not necessarily mean additional devices need to be installed. Where occupant notification systems installed to serve the area where the modular booth is to be located provide the required audible and visible signals within the modular booth additional devices are not necessary. If the occupant notification systems installed to serve the area where the modular booth is to be located do not provide the required audible and visible signals, then additional devices would be required to be installed within the modular booth.

Statement of Problem and Substantiation for Public Comment

37.4.4.12.1 was revised to match similar references in other occupancy sections. A new Annex section was added to clarify that extending the audible and visible signals into the interior of the modular does not necessary require the installation of a device in the interior of the modular room.

Resolution: SR-6583-NFPA 101-2022

Statement: A new Annex section was added to clarify that extending the audible and visible signals into the interior of the modular does not necessary require the installation of a device in the interior of the modular room.

The modifications to 37.4.4.12.1 were not included in the second revision as this change would make the requirements of 10.7 retroactively applicable to existing modular rooms. Technical justification was not provided showing the need to make these requirements retroactively applicable.

Public Comment No. 133-NFPA 101-2022 [New Section after 38.2.5.3.2]

38.2.5.4 Interlocked-Door Vestibule

An interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress where doors are not required to swing in the direction of egress travel.

Statement of Problem and Substantiation for Public Comment

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 21, 36, 37, 39, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

For this occupancy, this proposal suggests an interlocked-door vestibule should be permitted only where the occupant load of the area served does not require doors to swing in the direction of egress travel.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

The criteria in proposed section 7.2.1.6.5 (via separate public comment) were developed by an informal task group of stakeholders who volunteered to assist with developing requirements for interlocked door vestibules which could be submitted as public comments for second draft consideration.

Committee Statement

Committee Action: Rejected

Resolution: The associated public comments 125 & 126 were rejected by MEA committee therefore there are no requirements in 7.2.1.6.5.

Public Comment No. 178-NFPA 101-2022 [New Section after 38.3.4.5]

38.3.4.6 Carbon Monoxide Detection

38.3.4.6.1 New business occupancies shall be provided with carbon monoxide detection and warning equipment in accordance with Section 9.12 in the locations specified as follows:

- (1) On the ceilings of rooms containing permanently installed fuel-burning appliances or fuel-burning fireplaces
- (2) Centrally located within occupiable spaces served by the first supply air register from permanently installed fuel-burning HVAC systems
- (3)* Centrally located within occupiable spaces adjacent to an attached garage

A.38.3.4.6.1(3) The intent is to require CO detectors in occupiable spaces immediately adjacent, vertically or horizontally, to attached garages, regardless of the presence of openings between the garage and the adjacent occupiable spaces. Other occupiable spaces that are not adjacent to the attached garage do not require CO detectors.

38.3.4.6.2 Carbon monoxide detectors as specified in 38.3.4.6.1 shall not be required in the following locations:

- (1) Garages
- (2) Occupiable spaces with attached garages that are open parking structures as defined in 3.3.282.8.4
- (3) Occupiable spaces with attached garages that are mechanically ventilated in accordance with the mechanical code

Statement of Problem and Substantiation for Public Comment

New business occupancies currently lack requirements for CO detection in buildings with known CO hazards, including fuel-burning appliances. The addition of a requirement for CO detection for new business occupancies will prevent deaths and injuries to occupants in the event of high level CO release within the building.

To clarify, the proposed revision being resubmitted is meant to serve as an example of what is currently required in the Life Safety Code. It is identical to the requirement that is currently in place for Chapter 12. If this proposed example is not considered adequate, the committee is urged to develop what it considers to be an adequate requirement. Similar action was taken by other 101 committees who created first revisions, committee input, or formed task groups to create CO detection requirements within their respective chapters (see page 7 of the Correlating Committee First Draft Meeting Minutes https://www.nfpa.org/assets/files/AboutTheCodes/101/101_A2023_SAF_AAC_FD_Minutes_1_22.pdf)

In response to the committee's request for "technical justification to demonstrate that this is a significant enough issue in Mercantile occupancies to warrant these changes": A CO source in any building that is not monitored by installed CO detection devices is a life safety hazard to occupants. High level CO exposure carries the immediate risk of permanent brain injury and death. Risk is associated with CO producing appliances and equipment, it is not specific to building type.

Further justification was provided in the substantiation statement for PI 211. Occupants are critically reliant on the building/business owner for their life safety, most of whom likely have no knowledge of the vital need for installed CO detection as there are not universal requirements for them to be knowledgeable about CO safety.

With regard to cost of installation, primary consideration must be given to the unique nature of CO exposure and the inability of occupants to sense when they are being exposed. To avoid injury and death, there is no safe alternative to installed CO detection devices.

Please act to prevent further delay in getting this critical baseline life safety requirement in place to protect occupants of new business occupancies.

"The lack of an operating alarm can be seen in several of these case studies. Carbon monoxide is colorless and odorless. Its early onset symptoms are not unique or severe, which leads to mistaking them for something else or thinking there is not a serious problem. These symptoms can quickly escalate to severe symptoms, which usually revolves around the victim becoming unconscious. People do not self-rescue when they are able, because they do not realize that they should. If someone does realize there is problem, it is most likely too late. This common sequence combined with CO's toxicity, and a general negligence, makes CO a very dangerous problem that can happen almost anywhere. Detection is the only safeguard against this problem."

Committee Statement

Committee Rejected
Action:

Resolution: This public comment does not provide any new information from what was provided in the public input. Without further technical justification, the technical committee cannot approve this public comment. The need to provide CO detection in business occupancies has not been provided. Technical justification pointing to the specific need (such as data on incidents, injuries, or fatalities) to provide CO detection in business occupancies has not been provided. Additionally, the requirement for placement of CO detection devices does not address the specific spaces which can be found in large volume spaces such as open floor plan offices, trading floors, etc. For example, committee does not see the life safety benefit for a single CO detector to be "centrally located" in a large volume spaces, as would be required by the current text. Further clarification is needed for the locations of CO detection. The committee may consider action on CO requirements in business occupancies based upon additional technical justification including Phase II of the Fire Protection Research Foundation report of CO detection. Additionally, the reference to "mechanical code," but does not provide any guidance on which document this specifically references.

**Public Comment No. 157-NFPA 101-2022 [Section No. 38.3.5.2]****38.3.5.2**

Where installed, automatic sprinkler systems shall be electrically supervised in accordance with 9.7.2.

Statement of Problem and Substantiation for Public Comment

Business occupancies are not required to be sprinklered, however many business occupancies are sprinklered because of the economic and material tradeoffs available for fully sprinklered buildings per NFPA 13. Electrical supervision has been one of the historical core reasons why tradeoffs are allowed. The instant owner notification of supervisory tamper switch and occupant waterflow alarm, coupled with the quick response sprinkler (in light hazard) benefits the safety to life and danger to life scope of NFPA 101.

Committee Statement

Committee Rejected but see related SR

Action:

Resolution: [SR-6584-NFPA 101-2022](#)

Statement: In response to PC-39 from the Correlating Committee the technical committee reconsidered FR-6603. It is understood there are other occupancies which do not require electrical supervision for sprinkler systems, this change is consistent with the other occupancy chapters.

In chapter 38 wherever alternative requirements are provided for having sprinkler systems, such as increased travel distance, the requirements specify “automatic supervised sprinkler system.” Additionally 9.7.1.5 indicates that sprinkler systems installed as an alternative are to be considered required systems. The installation of sprinkler system for purposes outside the scope of the life safety code are still required to be installed in accordance with NFPA 13 per 38.3.5.1, which would not necessarily require electrical supervised.

**Public Comment No. 39-NFPA 101-2022 [Section No. 38.3.5.2]****38.3.5.2**

Where installed, automatic sprinkler systems shall be electrically supervised in accordance with 9.7.2.

Public Comment No. 233-NFPA 101-2022 [New Section after 38.7.8]

TITLE OF NEW CONTENT

38.7.9 Modular Rooms.

38.7.9.1

Modular rooms installed in indoor locations shall comply with Section 10.7.

38.7.9.2*

Where provided in areas covered by an occupant notification system, the audible and visible signals shall extend into the interior of the modular room.

A.38.7.9.2

Extending the audible and visible signals into the interior does not necessarily mean additional devices need to be installed. Where occupant notification systems installed to serve the area where the modular booth is to be located provide the required audible and visible signals within the modular booth additional devices are not necessary. If the occupant notification systems installed to serve the area where the modular booth is to be located do not provide the required audible and visible signals, then additional devices would be required to be installed within the modular booth.

Statement of Problem and Substantiation for Public Comment

This public comment uses similar language to that approved with FR-6632 that created a new Section 36.4.4.12, 36.4.4.12.1 and 36.4.4.12.2. A new Annex section was added to clarify that extending the audible and visible signals into the interior of the modular does not necessary require the installation of a device in the interior of the modular room.

Resolution: SR-6585-NFPA 101-2022

Statement: This action correlates with similar provisions for modular rooms in mercantile occupancies. These new provisions provide greater uniformity in the application of the code to modular room in various occupancies. The annex language was modified to change "modular booth" to "modular room" to be consistent with terminology used in the code.

Public Comment No. 134-NFPA 101-2022 [New Section after 39.2.5.3]

39.2.5.4 Interlocked-Door Vestibule

An interlocked-door vestibule in accordance with 7.2.1.6.5 shall be permitted in the means of egress where doors are not required to swing in the direction of egress travel.

Statement of Problem and Substantiation for Public Comment

This proposal, along with complementary proposals in 7.2.1.6.5 and Chapters 18, 19, 20, 21, 36, 37, 38, 40, and 42 offer the opportunity for interlocked-door vestibules in these occupancies.

While sally ports are defined in NFPA 101 (3.3.249) and permitted in detention and correctional occupancies, sally ports are typically used as security vestibules and control egress (obviously).

Outside of detention and correctional facilities, the commercial building equivalent of sally ports are utilized for security reasons (i.e. money handling rooms), occupant protection (health care), environmental contamination control (manufacturing clean rooms), controlled substance dispensing (prescription drugs and cannabis), and other uses and applications.

For this occupancy, this proposal suggests an interlocked-door vestibule should be permitted only where the occupant load of the area served does not require doors to swing in the direction of egress travel.

Unfortunately, the term “sally port”, and its definition, is predominately reserved for uses where occupants are restrained against their will in buildings or spaces. An interlocked-door vestibule could be used for that purpose, but would more commonly be used as mentioned above.

Resolution: The associated public comments 125 & 126 were rejected by MEA committee therefore there are no requirements in 7.2.1.6.5.

Public Comment No. 197-NFPA 101-2022 [New Section after 39.3.4.4]

39.3.4.5 Carbon Monoxide Detection

39.3.4.5.1 Existing business occupancies shall be provided with carbon monoxide detection and warning equipment in accordance with Section 9.12 in the locations specified as follows:

- (1) On the ceilings of rooms containing permanently installed fuel-burning appliances or fuel-burning fireplaces
- (2) Centrally located within occupiable spaces served by the first supply air register from permanently installed fuel-burning HVAC systems
- (3)* Centrally located within occupiable spaces adjacent to an attached garage

A.39.3.4.5.1(3) The intent is to require CO detectors in occupiable spaces immediately adjacent, vertically or horizontally, to attached garages, regardless of the presence of openings between the garage and the adjacent occupiable spaces. Other occupiable spaces that are not adjacent to the attached garage do not require CO detectors.

39.3.4.5.2 Carbon monoxide detectors as specified in 39.3.4.5.1 shall not be required in the following locations:

- (1) Garages
- (2) Occupiable spaces with attached garages that are open parking structures as defined in 3.3.282.8.4
- (3) Occupiable spaces with attached garages that are mechanically ventilated in accordance with the mechanical code

Statement of Problem and Substantiation for Public Comment

Existing business occupancies currently lack requirements for CO detection in buildings with known CO hazards, including fuel-burning appliances. The addition of a requirement for CO detection for existing business occupancies will prevent deaths and injuries to occupants in the event of high level CO release within the building.

To clarify, the proposed revision being resubmitted is meant to serve as an example of what is currently required in the Life Safety Code. It is identical to the requirement that is currently in place for Chapter 12. If this proposed example is not considered adequate, the committee is urged to develop what it considers to be an adequate requirement. Similar action was taken by other 101 committees who created first revisions, committee input, or formed task groups to create CO detection requirements within their respective chapters (see page 7 of the Correlating Committee First Draft Meeting Minutes https://www.nfpa.org/assets/files/AboutTheCodes/101/101_A2023_SAF_AAC_FD_Minutes_1_22.pdf)

In response to the committee's request for "technical justification to demonstrate that this is a significant enough issue in Business occupancies to warrant these changes": A CO source in any building that is not monitored by installed CO detection devices is a life safety hazard to occupants. High level CO exposure carries the immediate risk of permanent brain injury and death. Risk is associated with CO producing appliances and equipment, it is not specific to building type. Existing buildings arguably pose a higher risk of exposure due to aging gas appliances and exhaust systems.

Further justification was provided in the substantiation statement for PI 211. Occupants are critically reliant on the building/business owner for their life safety, most of whom likely have no knowledge of the vital need for installed CO detection as there are not universal requirements for them to be knowledgeable about CO safety.

With regard to cost of installation, primary consideration must be given to the unique nature of CO exposure and the inability of occupants to sense when they are being exposed. To avoid injury and death, there is no safe alternative to installed CO detection devices.

Please act to prevent further delay in getting this critical baseline life safety requirement in place to protect occupants of existing business occupancies.

"The lack of an operating alarm can be seen in several of these case studies. Carbon monoxide is colorless and odorless. Its early onset symptoms are not unique or severe, which leads to mistaking them for something else or thinking there is not a serious problem. These symptoms can quickly escalate to severe symptoms, which usually revolves around the victim becoming unconscious. Committee Statement

Committee Action: Rejected

Resolution: This public comment does not provide any new information from what was provided in the public input. Without further technical justification, the technical committee cannot approve this public comment. The need to provide CO detection in business occupancies has not been provided. Technical justification pointing to the specific need (such as data on incidents, injuries, or fatalities) to provide CO detection in business occupancies has not been provided. Additionally, the requirement for placement of CO detection devices does not address the specific spaces which can be found in large volume spaces such as open floor plan offices, trading floors, etc. For example, committee does not see the life safety benefit for a single CO detector to be "centrally located" in a large volume spaces, as would be required by the current text. Further clarification is needed for the locations of CO detection. The committee may consider action on CO requirements in business occupancies based upon additional technical justification including Phase II of the Fire Protection Research Foundation report of CO detection. Additionally, the reference to "mechanical code," but does not provide any guidance on which document this specifically references. This would make the requirements retroactive to existing business occupancies. Technical justification has not been provided to demonstrate the need to retroactive requirements.

Public Comment No. 232-NFPA 101-2022 [New Section after 39.7.6]

39.7.7 Modular Rooms.

39.7.7.1

Modular rooms installed in indoor locations shall comply with Section 10.7.

39.7.7.2*

Where provided in areas covered by an occupant notification system, the audible and visible signals shall extend into the interior of the modular room.

A.39.7.7.2

Extending the audible and visible signals into the interior does not necessarily mean additional devices need to be installed. Where occupant notification systems installed to serve the area where the modular booth is to be located provide the required audible and visible signals within the modular booth additional devices are not necessary. If the occupant notification systems installed to serve the area where the modular booth is to be located do not provide the required audible and visible signals, then additional devices would be required to be installed within the modular booth.

Statement of Problem and Substantiation for Public Comment

This public comment uses similar language to that approved with FR-6632 that created a new Section 36.4.4.12, 36.4.4.12.1 and 36.4.4.12.2. A new Annex section was added to clarify that extending the audible and visible signals into the interior of the modular room does not necessary require the installation of a device in the interior of the modular room.

Second Revision No. 6589-NFPA 101-2022 [Section No. 36.4.6]

36.4.6 Alcohol-Based Hand-Rub (ABHR) Dispensers.

~~The installation and maintenance of alcohol-based hand-rub dispensers and the storage of alcohol-based hand-rub solutions in accordance with 8.7.3.3 shall be permitted.~~

36.4.6.1

The installation and maintenance of ~~alcohol-based hand-rub~~ ABHR dispensers and the storage of ~~alcohol-based hand-rub~~ ABHR solutions in accordance with 8.7.3.3 shall be permitted.

36.4.6.2

The requirements of 36.4.6.1 shall not apply to individual personal use ABHR containers with a nominal volume not exceeding 16 oz (0.5 L).

Submitter Information Verification

Committee: SAF-MER

Submittal Date: Fri Aug 05 13:29:05 EDT 2022

Committee Statement

Committee Statement: The new language clarifies that individual personal use ABHR containers not greater than a nominal volume of 16 oz (0.5 L) are not subject to the provisions of 8.7.3.3. This action varies slightly from that proposed by the FIR Committee in that the container size limitation is cited as “a nominal volume not exceed than a 16 ounces (0.5L)” as opposed to the proposed action of the FIR Committee to exempt such containers that are “less than 16 ounces (0.5 L)”. Commonly available containers have a volume of 16.9 ounces (0.5 L). The proposed action here is intended to highlight a discrepancy between the current proposed language to be considered by the FIR Committee and that proposed here for consideration by the Correlating Committee.

Second Revision No. 6588-NFPA 101-2022 [Section No. 37.3.1]

37.3.1 Protection of Vertical Openings.

Any vertical opening shall be protected in accordance with Section 8.6, except under any of the following conditions:

- (1) In Class A or Class B mercantile occupancies protected throughout by an approved, supervised automatic sprinkler system in accordance with 9.7.1.1(1), unprotected vertical openings shall be permitted at one of the following locations:
 - (a) Between any two floors
 - (b) Among the street floor, the first adjacent floor below, and the adjacent floor (or mezzanine) above
- (2) In Class C mercantile occupancies, unprotected openings shall be permitted between the street floor and the mezzanine.
- (3) The draft ~~stop~~ curtain and closely spaced sprinkler requirements of NFPA 13 shall not be required for unenclosed vertical openings permitted in 36.3.1(1) and 37.3.1(2).
- (4) Unenclosed vertical openings in accordance with 8.6.9.2 shall be permitted.

Submitter Information Verification

Committee: SAF-MER

Submittal Date: Fri Aug 05 13:20:48 EDT 2022

Committee Statement

Committee Statement: At the request of the Correlating Committee, the use of the term "draft stop" was reviewed against the definition. The term "draft stop" was changed to "draft curtain" the 2022 edition of NFPA 13. This change is to make the terminology consistent with the referenced edition of NFPA 13.

Second Revision No. 6583-NFPA 101-2022 [Section No. 37.4.4.12.2]

37.4.4.12.2*

Where provided in areas covered by an occupant notification system, the audible and visible signals shall ~~be extended~~ extend into the interior of the modular rooms.

A.37.4.4.12.2

Extending the audible and visible signals into the interior does not necessarily mean additional devices need to be installed. If the occupant notification systems installed to serve the area where the modular room is to be located provide the required audible and visible signals within the modular room, additional devices are not necessary. If the occupant notification systems installed to serve the area where the modular room is to be located do not provide the required audible and visible signals, then additional devices would be required to be installed within the modular room.

Submitter Information Verification

Committee: SAF-MER

Submittal Date: Thu Aug 04 13:36:44 EDT 2022

Committee Statement

Committee Statement: A new Annex section was added to clarify that extending the audible and visible signals into the interior of the modular does not necessary require the installation of a device in the interior of the modular room.

The modifications to 37.4.4.12.1 were not included in the second revision as this change would make the requirements of 10.7 retroactively applicable to existing modular rooms. Technical justification was not provided showing the need to make these requirements retroactively applicable.

Second Revision No. 6584-NFPA 101-2022 [Section No. 38.3.5.2]

38.3.5.2

~~Where installed, automatic sprinkler systems shall be electrically supervised in accordance with 9.7.2 :~~

Submitter Information Verification

Committee: SAF-MER

Submittal Date: Thu Aug 04 14:20:32 EDT 2022

Committee Statement

Committee Statement: In response to PC-39 from the Correlating Committee the technical committee reconsidered FR-6603. It is understood there are other occupancies which do not require electrical supervision for sprinkler systems, this change is consistent with the other occupancy chapters.

In chapter 38 wherever alternative requirements are provided for having sprinkler systems, such as increased travel distance, the requirements specify “automatic supervised sprinkler system.” Additionally 9.7.1.5 indicates that sprinkler systems installed as an alternative are to be considered required systems. The installation of sprinkler system for purposes outside the scope of the life safety code are still required to be installed in accordance with NFPA 13 per 38.3.5.1, which would not necessarily require electrical supervised.

Second Revision No. 6585-NFPA 101-2022 [New Section after 38.7.8]

38.7.9 Modular Rooms.

38.7.9.1

Modular rooms installed in indoor locations shall comply with Section 10.7 .

38.7.9.2*

Where provided in areas covered by an occupant notification system, the audible and visible signals shall extend into the interior of the modular room.

A.38.7.9.2

Extending the audible and visible signals into the interior does not necessarily mean additional devices need to be installed. If the occupant notification systems installed to serve the area where the modular room is to be located provide the required audible and visible signals within the modular room, additional devices are not necessary. If the occupant notification systems installed to serve the area where the modular room is to be located do not provide the required audible and visible signals, then additional devices would be required to be installed within the modular room.

Submitter Information Verification

Committee: SAF-MER

Submittal Date: Thu Aug 04 15:24:23 EDT 2022

Committee Statement

Committee Statement: This action correlates with similar provisions for modular rooms in mercantile occupancies. These new provisions provide greater uniformity in the application of the code to modular room in various occupancies. The annex language was modified to change "modular booth" to "modular room" to be consistent with terminology used in the code.

Public Comment No. 146-NFPA 101-2022 [Section No. 26.3.2.1]

26.3.2.1 Alcohol-Based Hand-Rub Dispensers.

The installation and maintenance of Alcohol-based hand-rub dispensers and the storage of alcohol-based hand rub solutions in accordance with 8.7.3.3 shall be permitted.

Statement of Problem and Substantiation for Public Comment

The editorial revisions to this section are intended to correlate to the language approved in other Chapters of NFPA 101 by the responsible TCs. The change ensures a consistency in the language pointing to Section 8.7.3.3 for the alcohol based hand-rub (ABHR) dispensers and ABHR solution storage requirements.

Statement: The editorial revisions to this section are intended to correlate to the language approved in other Chapters of NFPA 101 by the responsible TCs. The change ensures a consistency in the language pointing to Section 8.7.3.3 for the alcohol based hand-rub (ABHR) dispensers and ABHR solution storage requirements.

Public Comment No. 181-NFPA 101-2022 [New Section after 26.3.6.2.6]

26.3.6.3 Portable Fire Extinguishers.

Portable fire extinguishers shall be provided in all lodging or rooming homes in accordance with Section 9.9.

Statement of Problem and Substantiation for Public Comment

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Under the Scope of the Life Safety Code, Subsection 1.1.2 entitled, "Danger to Life from Fire," the Code states the following: "The Code addresses those construction, protection, and occupancy features necessary to minimize danger to life from the effects of fire, including smoke, heat, and toxic gases created during a fire." Further, it states in Subsection 1.1.4 entitled, "Other Fire-Related Considerations," the following: "The Code addresses other considerations that are essential to life safety in recognition of the fact that life safety is more than a matter of egress. The Code also addresses protective features and systems, building services, operating features, maintenance activities, and other provisions in recognition of the fact that achieving an acceptable degree of life safety depends on additional safeguards to provide adequate egress time or protection for people exposed to fire."

Studies of building fires indicate that occupants typically exhibit altruistic behavior toward others. Human response to a threatening situation might follow one of a variety of behaviors. Individuals might choose to investigate, sound an alarm, assist with rescue, seek help, or flee. Such actions constitute normal behavior, even when taken collectively. Most people avoid direct contact with a fire while undertaking another action.

There is a fundamental discrepancy between official/policy assumptions and the public in relation to priorities in the event of a fire. Government and professionals focus on avoiding injuries and see that as the sole aspiration, in the pursuit of which everything else is secondary. In contrast, the public have a wide and largely unrecognized range of priorities when encountering a fire, based on their individual circumstances. These include: the avoidance of embarrassment/inconvenience; mitigating the impact of damage to the property, e.g. avoiding the risk of being unable to remain in their place of business; and their concern for the wellbeing of other people. Each are invested by different aspirations in the fire safety ecosystem.

A desire to achieve their self-appointed tasks is a strong motivation for the public's behavior when encountering a fire. For most, this will involve an active response of on average five actions, although for some it will be as many as 11. This includes investigating the initial cues and tackling the fire, often using improvised means. They are usually successful in doing so, with 70% to 80% of fires dealt with

by the public without requiring professional assistance. It is important to note that in doing so, they are willingly acting against official advice and are not being coerced into this. The evidence shows the public to be effective and capable in tackling fires, even in the absence of any professional support, or often without specialized equipment. This is supported by the pioneering studies of the public experience of dwelling fires undertaken by Bryan (1977) and Wood (1972) in the USA and UK, respectively. Their studies supported by their findings that the public did undertake a range of self-appointed tasks including investigating and tackling fires. Recent studies have confirmed similar findings and these behaviors appear consistent over time.

The evidence further identifies that the public is willing and will accept minor consequences in their pursuit of achieving personal humanistic priorities and instinct. Concern for people, pets and possessions are strong and established drivers of behavior in the event of a fire. Therefore, this should be no surprise to see it as an influential feature of most individual's response to a fire.

2013 NFPA Report: "U.S. Experience with Sprinklers" reports that there were 48,460 reported structure fires annually in buildings equipped with sprinkler systems between 2007-2011, and 40,440 (83 percent) never grew large enough to activate the system. Based on this report alone, it's clear that people are reacting to small fires and extinguishing them prior to sprinkler activation. Limiting a fire to the smallest area within a building is a sensible aspiration.

A 2003 UK survey found that across all categories of location, extinguishers were successful in extinguishing 79.9% of fires. Note: Private houses accounted for only 3.3% of extinguisher use. It reported that 58.6% were operated by trained staff, 36.4% were operated by untrained staff and in 5% of incidents, this was unknown.

Data from the National Association of Fire Equipment Distributors (NAFED) provides even more robust validation of the influence of fire extinguishers as used by 'ordinary civilians. Their research and data indicate, "Of 13,221 fire incidents reported, portable fire extinguishers successfully extinguished 12,505 fires (95%)." (NAFED 2010: 2) The combined results of the 34 years of data are based on the performance of 32,756 fire extinguishers used on 13,453 incidents.

Fortunately, most people encountering a fire will avoid any injury or will be exposed to a low, and often considered risk of a minor injury at worst. This is not a matter of luck but due to a combination of their own abilities and to the low level of risk presented by most fires individuals would choose to fight at the incipient stage. A 2015 study identified that there was a disconnect between the fire service/government and the public in terms of what they referred to as 'risk tolerance'. This was most evident in attitude to injuries. Official policy seems to place avoidance of any injury as its highest priority and assumes this to also be the public's main motivation and enough to dictate any response to the discovery of a fire. However, the same study found that almost all those who incurred a minor injury accepted it as a reasonable cost in relation to pursuing or achieving their personal priorities. Further, they stated, in hindsight, they would do the same again.

It should be noted that numerous every day and discretionary activities carry similar or higher levels of risk to those resulting from using an extinguisher. Do-It-Yourself and sport for example are frequently responsible for injuries or even fatalities. In response, the government and industry seek to help make products safer or provide advice. This is preferred to denying people the option to participate in either activity by withdrawing public access to tools or sports equipment. The benefits achieved by the public using extinguishers are significant, given the potential for a fire to otherwise lead to detrimental and life-changing outcomes. A low and calculated level of personal risk willingly accepted by an individual tackling a fire can avoid, or reduce, a much higher risk to others should they ignore the fire and allow it to develop. Where current guidance discourages the provision of extinguishers in public spaces, this policy is neither supported by the evidence or justifiable through a consensus from the public. Rather it is imposed on them and is inconsistent with other approaches to public health.

The fire service's response time to structure fires has increased significantly over the past 25 years for several reasons like traffic, infrastructures, and lately staffing. Hence, the ability for the early interventions of the public are likely to be the most significant determinant of the outcome of a fire event. Most people do respond appropriately, and the literature confirms that they do not panic. Typically, most people are at risk of a minor injury at worst, due to the low risk from the fire and their own ability to assess and act in accordance with the situation.

A significant amount of data has been collected to support the requirement for portable extinguishers, including: WPI/EKU Study: "Ordinary People and the Effective Operation of Fire Extinguishers", which clearly showed that the vast majority of people who have never used an extinguisher can operate one safely and effectively. This willingness of the public to accept minor injuries to protect individuals, the facility or their personal property is supported by literature and data and shows these to be well established behaviors which policy makers need to work with, rather than against.

Reflecting official policy, national and local fire safety messaging has, for some time, urged the public, on discovering a fire in the home, to "Get out, stay out", "Don't put yourself at risk" and 'Leave it to the professionals.' This paternalistic messaging confirms the government policy makers and fire services' belief that a professional response is the only intervention capable of safely tackling fires. Again, this starkly contrasts with the reality that between 70% and 80% of dwelling fires are tackled effectively and at low risk, by the public. The policy also fails to accord with the public who have been shown to be tolerant, or accepting, of the incurrence of minor injuries in pursuit of their personal priorities.

Surveys from the National Association of Fire Equipment Distributors (NAFED) in America reveals the same trend of public firefighting, with even higher percentages not needing the fire service. "In both the 1979 and 1985 surveys, the fire department was only called for 13% of the reported fires. In the 1996 survey, the fire department was called in 24% of the reported fires. However, in the 2010 survey the number dropped to 17% of the time'. And 'These results are not unique to NAFED surveys. A 1978 publication by the U.S. Department of Commerce stated that about 90% of fires in households are not reported, based on their survey of 33,000 fires." (NAFED, 2010: 9)

The public are likely to encounter a fire that is relatively small and often contained to the item first ignited. They are often the ones present when fire starts. In summary, there is a significant difference between official assumptions/guidance and actual public behavior. However, the government and FRS seek to deter this behavior, and, in singularly promoting there, "Get out' message," and remove the simple yet potential life saving devices in sprinklered buildings.

A recent study also showed that the public do not just get out, with 49% never leaving the property during the fire. While this may surprise or concern many professionals, it is likely to be explained by a difference between the fire as perceived by professionals and the lived experience of the public. There is nothing to suggest that the public routinely take unnecessary risks. A more likely explanation is that the fire was small and not sufficiently well-developed to pose an imminent injury or life threat. As such, they were able to remain in the premises safely and relatively comfortably, which is supported by the evidence in relation to the majority of fires not spreading beyond the item first ignited or the room of origin. Inclement weather or other factors may also make remaining in the premises a safer or more comfortable option. Fires, like other emergencies, must also be understood in human terms.

The concept of trading off portable extinguishers in sprinklered buildings has been largely abandoned by fire protection principles. NFPA 10 states in subsection 5.1.2, "The selection of extinguishers shall be independent of whether the building is equipped with automatic sprinklers, standpipe and hose, or other fixed protection equipment." Other codes, and other occupancy chapters have abandoned this concept in recognition of the fact that portable extinguishers are a valuable, cost-effective layer of fire protection, and are intended for a different purpose than sprinklers. Recognition of the valuable role of extinguishers came from a 2003 report which concluded, 'Fire extinguishers are designed to prevent relatively minor incidents becoming major conflagrations.' It is, of course, difficult to prove how many and which fires would have developed to pose a serious risk if not tackled and contained early on. Events such as the Grenfell fire are a reminder of the consequences when this happens.

The National Fire Codes of both NFPA and the ICC require portable fire extinguishers in all occupancy classes including storage which addresses property protection and property loss as well as, the safety of the building occupants. Fire safety is grounded in the engineering discipline which brings many strengths to codes requirements, but it is insufficient, and fire safety effectiveness is limited by ignoring the social sciences of human behavior. It is important to appreciate that while different to official assumptions and desire for evacuation, research shows the public's priorities to be rational and appropriate. The public's experience of fire is vastly different to that of the professionals involved in the planning for and responding to fire.

Official policy and attitudes of the Technical Committee are most singularly directed at avoiding the risk when the public encounters a fire. This is well meaning but the research has shown that this DOES NOT I REPEAT DOES NOT align with the public's attitude or the ability of the general public. The

belief that 'undesirable' behavior can be changed by advice, campaigns or other measures has been shown to be inaccurate. The paternalistic approach by which government and the building safety regulatory sector seek to change human behavior by removing proven and effective appliances such as portable fire extinguishers is WRONG. However, the building safety regulatory sector continue this approach despite the evidence that public behaviors are safe, effective, and largely unaltered by current guidance and campaigns rather than providing appropriate safety devices for use by the public. A portable fire extinguisher is an effective item of fire protection which allows for small fires to be tackled by the occupants of a building and saves 100s of thousands of dollars in property loss.

Concerns have been indicted regarding the requirement for training. Training in the use of extinguishers is an important issue and one in which opinion appears more influential than the evidence. Whether purchased for a private dwelling or provided through regulatory processes, there is no mandatory requirement for training to use an extinguisher, and studies do not reveal training to be a requirement for their safe or effective use. In fact, the available data and studies demonstrate the opposite to be the case.

The Technical Committee should also note that portable fire extinguishers are designed for the novice user. Although, training is recommended for proper use and technique and is wide available through a variety of resources including at online training; there are no specified training requirements even under OSHA unless that is an assigned duty employee by the employer. The proposed requirement is intended as a provision for layered fire protection for the general public and employees for general safety.

Although there is limited data available related to extinguisher use since the removal of portable fire extinguishers in the NIFRS data field, there is little to no data supporting the removal of portable fire extinguishers and sole reliance on building fire sprinkler systems. Limiting a fire to the smallest area within a building is a sensible aspiration.

Cost has been another point of contention. A study by Richard Bukowski in 2014, the life cycle cost of portable fire extinguishers was determined to be between one and a half and four cents per foot annually; if coverage could be maximized to that allowable by code, the cost drops to between a half cent and one cent per foot annually. It's unlikely that any other layer of fire protection is so cost-effective.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Committee Statement

**Committee
Action:** Rejected

Resolution: The intent of not providing fire extinguishers is to allow people to escape and not try to extinguish the fire, allowing trained personnel to handle the fire. The requirement for extinguishers also adds a requirement for the building owner to provide training as well as maintenance. Providing fire extinguishers is a challenge based on cost of providing and maintaining them. There are also instances of misuse by the occupants. The code does not restrict the use of fire extinguishers, therefore fire extinguishers can be added but are not required to be added. The added substantiation provided by the submitter does not provide a reason for the technical committee to change it's decision from the first draft meeting.

**Public Comment No. 36-NFPA 101-2022 [Section No. 28.3.5.1]****28.3.5.1**

All buildings shall be protected throughout by an approved, automatic sprinkler system in accordance with 28.3.5.3 and electrically supervised in accordance with 9.7.2.

Additional Proposed Changes

Statement of Problem and Substantiation for Public Comment

A 2013 NFPA Report: "U.S. Experience with Sprinklers" reports that there were 48,460 reported structure fires annually in buildings equipped with sprinkler systems between 2007-2011, and 40,440 (83 percent) never grew large enough to activate the system. Based on this report alone, it's clear that people are reacting to small fires and extinguishing them prior to sprinkler activation. Limiting a fire to the smallest area within a building is a sensible aspiration.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Under the Scope of the Life Safety Code, Subsection 1.1.2 entitled, "Danger to Life from Fire," the Code states the following: "The Code addresses those construction, protection, and occupancy features necessary to minimize danger to life from the effects of fire, including smoke, heat, and toxic gases created during a fire." Further, it states in Subsection 1.1.4 entitled, "Other Fire-Related Considerations," the following: "The Code addresses other considerations that are essential to life safety in recognition of the fact that life safety is more than a matter of egress. The Code also addresses protective features and systems, building services, operating features, maintenance activities, and other provisions in recognition of the fact that achieving an acceptable degree of life safety depends on additional safeguards to provide adequate egress time or protection for people exposed to fire."

Studies of building fires indicate that occupants typically exhibit altruistic behavior toward others. Human response to a threatening situation might follow one of a variety of behaviors. Individuals might choose to investigate, sound an alarm, assist with rescue, seek help, or flee. Such actions constitute normal behavior, even when taken collectively. Most people avoid direct contact with a fire while undertaking another action.

There is a fundamental discrepancy between official/policy assumptions and the public in relation to priorities in the event of a fire. Government and professionals focus on avoiding injuries and see that as the sole aspiration, in the pursuit of which everything else is secondary. In contrast, the public have a wide and largely unrecognized range of priorities when encountering a fire, based on their individual circumstances. These include: the avoidance of embarrassment/inconvenience; mitigating the impact of damage to the property, e.g. avoiding the risk of being unable to remain in their place of business;

and their concern for the wellbeing of other people. Each are invested by different aspirations in the fire safety ecosystem.

A desire to achieve their self-appointed tasks is a strong motivation for the public's behavior when encountering a fire. For most, this will involve an active response of on average five actions, although for some it will be as many as 11. This includes investigating the initial cues and tackling the fire, often using improvised means. They are usually successful in doing so, with 70% to 80% of fires dealt with by the public without requiring professional assistance. It is important to note that in doing so, they are willingly acting against official advice and are not being coerced into this. The evidence shows the public to be effective and capable in tackling fires, even in the absence of any professional support, or often without specialized equipment. This is supported by the pioneering studies of the public experience of dwelling fires undertaken by Bryan (1977) and Wood (1972) in the USA and UK, respectively. Their studies supported by their findings that the public did undertake a range of self-appointed tasks including investigating and tackling fires. Recent studies have confirmed similar findings and these behaviors appear consistent over time.

The evidence further identifies that the public is willing and will accept minor consequences in their pursuit of achieving personal humanistic priorities and instinct. Concern for people, pets and possessions are strong and established drivers of behavior in the event of a fire. Therefore, this should be no surprise to see it as an influential feature of most individual's response to a fire.

A 2003 UK survey found that across all categories of location, extinguishers were successful in extinguishing 79.9% of fires. Note: Private houses accounted for only 3.3% of extinguisher use. It reported that 58.6% were operated by trained staff, 36.4% were operated by untrained staff and in 5% of incidents, this was unknown.

Data from the National Association of Fire Equipment Distributors (NAFED) provides even more robust validation of the influence of fire extinguishers as used by 'ordinary civilians. Their research and data indicate, "Of 13,221 fire incidents reported, portable fire extinguishers successfully extinguished 12,505 fires (95%)." (NAFED 2010: 2) The combined results of the 34 years of data are based on the performance of 32,756 fire extinguishers used on 13,453 incidents.

Fortunately, most people encountering a fire will avoid any injury or will be exposed to a low, and often considered risk of a minor injury at worst. This is not a matter of luck but due to a combination of their own abilities and to the low level of risk presented by most fires individuals would choose to fight at the incipient stage. A 2015 study identified that there was a disconnect between the fire service/government and the public in terms of what they referred to as 'risk tolerance'. This was most evident in attitude to injuries. Official policy seems to place avoidance of any injury as its highest priority and assumes this to also be the public's main motivation and enough to dictate any response to the discovery of a fire. However, the same study found that almost all those who incurred a minor injury accepted it as a reasonable cost in relation to pursuing or achieving their personal priorities. Further, they stated, in hindsight, they would do the same again.

It should be noted that numerous every day and discretionary activities carry similar or higher levels of risk to those resulting from using an extinguisher. Do-It-Yourself and sport for example are frequently responsible for injuries or even fatalities. In response, the government and industry seek to help make products safer or provide advice. This is preferred to denying people the option to participate in either activity by withdrawing public access to tools or sports equipment. The benefits achieved by the public using extinguishers are significant, given the potential for a fire to otherwise lead to detrimental and life-changing outcomes. A low and calculated level of personal risk willingly accepted by an individual tackling a fire can avoid, or reduce, a much higher risk to others should they ignore the fire and allow it to develop. Where current guidance discourages the provision of extinguishers in public spaces, this policy is neither supported by the evidence or justifiable through a consensus from the public. Rather it is imposed on them and is inconsistent with other approaches to public health.

The fire service's response time to structure fires has increased significantly over the past 25 years for several reasons like traffic, infrastructures, and lately staffing. Hence, the ability for the early interventions of the public are likely to be the most significant determinant of the outcome of a fire event. Most people do respond appropriately, and the literature confirms that they do not panic. Typically, most people are at risk of a minor injury at worst, due to the low risk from the fire and their own ability to assess and act in accordance with the situation.

A significant amount of data has been collected to support the requirement for portable extinguishers, including: WPI/EKU Study: "Ordinary People and the Effective Operation of Fire Extinguishers", which clearly showed that the vast majority of people who have never used an extinguisher can operate one safely and effectively. This willingness of the public to accept minor injuries to protect individuals, the facility or their personal property is supported by literature and data and shows these to be well established behaviors which policy makers need to work with, rather than against.

Reflecting official policy, national and local fire safety messaging has, for some time, urged the public, on discovering a fire in the home, to "Get out, stay out", "Don't put yourself at risk" and 'Leave it to the professionals.' This paternalistic messaging confirms the government policy makers and fire services' belief that a professional response is the only intervention capable of safely tackling fires. Again, this starkly contrasts with the reality that between 70% and 80% of dwelling fires are tackled effectively and at low risk, by the public. The policy also fails to accord with the public who have been shown to be tolerant, or accepting, of the incurrence of minor injuries in pursuit of their personal priorities.

Surveys from the National Association of Fire Equipment Distributors (NAFED) in America reveals the same trend of public firefighting, with even higher percentages not needing the fire service. "In both the 1979 and 1985 surveys, the fire department was only called for 13% of the reported fires. In the 1996 survey, the fire department was called in 24% of the reported fires. However, in the 2010 survey the number dropped to 17% of the time'. And 'These results are not unique to NAFED surveys. A 1978 publication by the U.S. Department of Commerce stated that about 90% of fires in households are not reported, based on their survey of 33,000 fires." (NAFED, 2010: 9)

The public are likely to encounter a fire that is relatively small and often contained to the item first ignited. They are often the ones present when fire starts. In summary, there is a significant difference between official assumptions/guidance and actual public behavior. However, the government and FRS seek to deter this behavior, and, in singularly promoting there, "Get out' message," and remove the simple yet potential life saving devices in sprinklered buildings.

A recent study also showed that the public do not just get out, with 49% never leaving the property during the fire. While this may surprise or concern many professionals, it is likely to be explained by a difference between the fire as perceived by professionals and the lived experience of the public. There is nothing to suggest that the public routinely take unnecessary risks. A more likely explanation is that the fire was small and not sufficiently well-developed to pose an imminent injury or life threat. As such, they were able to remain in the premises safely and relatively comfortably, which is supported by the evidence in relation to the majority of fires not spreading beyond the item first ignited or the room of origin. Inclement weather or other factors may also make remaining in the premises a safer or more comfortable option. Fires, like other emergencies, must also be understood in human terms.

The concept of trading off portable extinguishers in sprinklered buildings has been largely abandoned by fire protection principles. NFPA 10 states in subsection 5.1.2, "The selection of extinguishers shall be independent of whether the building is equipped with automatic sprinklers, standpipe and hose, or other fixed protection equipment." Other codes, and other occupancy chapters have abandoned this concept in recognition of the fact that portable extinguishers are a valuable, cost-effective layer of fire protection, and are intended for a different purpose than sprinklers. Recognition of the valuable role of extinguishers came from a 2003 report which concluded, 'Fire extinguishers are designed to prevent relatively minor incidents becoming major conflagrations.' It is, of course, difficult to prove how many and which fires would have developed to pose a serious risk if not tackled and contained early on. Events such as the Grenfell fire are a reminder of the consequences when this happens.

The National Fire Codes of both NFPA and the ICC require portable fire extinguishers in all occupancy classes including storage which addresses property protection and property loss as well as, the safety of the building occupants. Fire safety is grounded in the engineering discipline which brings many strengths to codes requirements, but it is insufficient, and fire safety effectiveness is limited by ignoring the social sciences of human behavior. It is important to appreciate that while different to official assumptions and desire for evacuation, research shows the public's priorities to be rational and appropriate. The public's experience of fire is vastly different to that of the professionals involved in the planning for and responding to fire.

Official policy and attitudes of the Technical Committee are most singularly directed at avoiding the risk when the public encounters a fire. This is well meaning but the research has shown that this DOES

NOT I REPEAT DOES NOT align with the publics' attitude or the ability of the general public. The belief that 'undesirable' behavior can be changed by advice, campaigns or other measures has been shown to be inaccurate. The paternalistic approach by which government and the building safety regulatory sector seek to change human behavior by removing proven and effective appliances such as portable fire extinguishers is WRONG. However, the building safety regulatory sector continue this approach despite the evidence that public behaviors are safe, effective, and largely unaltered by current guidance and campaigns rather than providing appropriate safety devices for use by the public. A portable fire extinguisher is an effective item of fire protection which allows for small fires to be tackled by the occupants of a building and saves 100s of thousands of dollars in property loss.

Concerns have been indicted regarding the requirement for training. Training in the use of extinguishers is an important issue and one in which opinion appears more influential than the evidence. Whether purchased for a private dwelling or provided through regulatory processes, there is no mandatory requirement for training to use an extinguisher, and studies do not reveal training to be a requirement for their safe or effective use. In fact, the available data and studies demonstrate the opposite to be the case.

The Technical Committee should also note that portable fire extinguishers are designed for the novice user. Although, training is recommended for proper use and technique and is wide available through a variety of resources including at online training; there are no specified training requirements even under OSHA unless that is an assigned duty employee by the employer. The proposed requirement is intended as a provision for layered fire protection for the general public and employees for general safety.

Although there is limited data available related to extinguisher use since the removal of portable fire extinguishers in the NIFRS data field, there is little to no data supporting the removal of portable fire extinguishers and sole reliance on building fire sprinkler systems. Limiting a fire to the smallest area within a building is a sensible aspiration.

Cost has been another point of contention. A study by Richard Bukowski in 2014, the life cycle cost of portable fire extinguishers was determined to be between one and a half and four cents per foot annually; if coverage could be maximized to that allowable by code, the cost drops to between a half cent and one cent per foot annually. It's unlikely that any other layer of fire protection is so cost-effective.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Committee Statement

Committee Action: Rejected

Resolution: The intent of not providing fire extinguishers is to allow people to escape and not try to extinguish the fire, allowing trained personnel to handle the fire. The requirement for extinguishers also adds a requirement for the building owner to provide training as well as maintenance. Providing fire extinguishers is a challenge based on cost of providing and maintaining them. There are also instances of misuse by the occupants. The code does not restrict the use of fire extinguishers, therefore fire extinguishers can be added but are not required to be added. The added substantiation provided by the submitter does not provide a reason for the technical committee to change it's decision from the first draft meeting. The change in proposed language removes an incentive to provide an automatic sprinkler system.

Public Comment No. 183-NFPA 101-2022 [Section No. 28.3.5.6]

28.3.5.6

In buildings other than those protected throughout with an approved, supervised automatic sprinkler system in accordance with 28.3.5.3, portable Portable fire extinguishers shall be provided as specified in Section 9.9 in hazardous areas addressed by 28.3.2.2.

Statement of Problem and Substantiation for Public Comment

A 2013 NFPA Report: "U.S. Experience with Sprinklers" reports that there were 48,460 reported structure fires annually in buildings equipped with sprinkler systems between 2007-2011, and 40,440 (83 percent) never grew large enough to activate the system. Based on this report alone, it's clear that people are reacting to small fires and extinguishing them prior to sprinkler activation. Limiting a fire to the smallest area within a building is a sensible aspiration.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Under the Scope of the Life Safety Code, Subsection 1.1.2 entitled, "Danger to Life from Fire," the Code states the following: "The Code addresses those construction, protection, and occupancy features necessary to minimize danger to life from the effects of fire, including smoke, heat, and toxic gases created during a fire." Further, it states in Subsection 1.1.4 entitled, "Other Fire-Related Considerations," the following: "The Code addresses other considerations that are essential to life safety in recognition of the fact that life safety is more than a matter of egress. The Code also addresses protective features and systems, building services, operating features, maintenance activities, and other provisions in recognition of the fact that achieving an acceptable degree of life safety depends on additional safeguards to provide adequate egress time or protection for people exposed to fire."

Studies of building fires indicate that occupants typically exhibit altruistic behavior toward others. Human response to a threatening situation might follow one of a variety of behaviors. Individuals might choose to investigate, sound an alarm, assist with rescue, seek help, or flee. Such actions constitute normal behavior, even when taken collectively. Most people avoid direct contact with a fire while undertaking another action.

There is a fundamental discrepancy between official/policy assumptions and the public in relation to priorities in the event of a fire. Government and professionals focus on avoiding injuries and see that as the sole aspiration, in the pursuit of which everything else is secondary. In contrast, the public have a wide and largely unrecognized range of priorities when encountering a fire, based on their individual circumstances. These include: the avoidance of embarrassment/inconvenience; mitigating the impact of damage to the property, e.g. avoiding the risk of being unable to remain in their place of business;

and their concern for the wellbeing of other people. Each are invested by different aspirations in the fire safety ecosystem.

A desire to achieve their self-appointed tasks is a strong motivation for the public's behavior when encountering a fire. For most, this will involve an active response of on average five actions, although for some it will be as many as 11. This includes investigating the initial cues and tackling the fire, often using improvised means. They are usually successful in doing so, with 70% to 80% of fires dealt with by the public without requiring professional assistance. It is important to note that in doing so, they are willingly acting against official advice and are not being coerced into this. The evidence shows the public to be effective and capable in tackling fires, even in the absence of any professional support, or often without specialized equipment. This is supported by the pioneering studies of the public experience of dwelling fires undertaken by Bryan (1977) and Wood (1972) in the USA and UK, respectively. Their studies supported by their findings that the public did undertake a range of self-appointed tasks including investigating and tackling fires. Recent studies have confirmed similar findings and these behaviors appear consistent over time.

The evidence further identifies that the public is willing and will accept minor consequences in their pursuit of achieving personal humanistic priorities and instinct. Concern for people, pets and possessions are strong and established drivers of behavior in the event of a fire. Therefore, this should be no surprise to see it as an influential feature of most individual's response to a fire.

A 2003 UK survey found that across all categories of location, extinguishers were successful in extinguishing 79.9% of fires. Note: Private houses accounted for only 3.3% of extinguisher use. It reported that 58.6% were operated by trained staff, 36.4% were operated by untrained staff and in 5% of incidents, this was unknown.

Data from the National Association of Fire Equipment Distributors (NAFED) provides even more robust validation of the influence of fire extinguishers as used by 'ordinary civilians. Their research and data indicate, "Of 13,221 fire incidents reported, portable fire extinguishers successfully extinguished 12,505 fires (95%)." (NAFED 2010: 2) The combined results of the 34 years of data are based on the performance of 32,756 fire extinguishers used on 13,453 incidents.

Fortunately, most people encountering a fire will avoid any injury or will be exposed to a low, and often considered risk of a minor injury at worst. This is not a matter of luck but due to a combination of their own abilities and to the low level of risk presented by most fires individuals would choose to fight at the incipient stage. A 2015 study identified that there was a disconnect between the fire service/government and the public in terms of what they referred to as 'risk tolerance'. This was most evident in attitude to injuries. Official policy seems to place avoidance of any injury as its highest priority and assumes this to also be the public's main motivation and enough to dictate any response to the discovery of a fire. However, the same study found that almost all those who incurred a minor injury accepted it as a reasonable cost in relation to pursuing or achieving their personal priorities. Further, they stated, in hindsight, they would do the same again.

It should be noted that numerous every day and discretionary activities carry similar or higher levels of risk to those resulting from using an extinguisher. Do-It-Yourself and sport for example are frequently responsible for injuries or even fatalities. In response, the government and industry seek to help make products safer or provide advice. This is preferred to denying people the option to participate in either activity by withdrawing public access to tools or sports equipment. The benefits achieved by the public using extinguishers are significant, given the potential for a fire to otherwise lead to detrimental and life-changing outcomes. A low and calculated level of personal risk willingly accepted by an individual tackling a fire can avoid, or reduce, a much higher risk to others should they ignore the fire and allow it to develop. Where current guidance discourages the provision of extinguishers in public spaces, this policy is neither supported by the evidence or justifiable through a consensus from the public. Rather it is imposed on them and is inconsistent with other approaches to public health.

The fire service's response time to structure fires has increased significantly over the past 25 years for several reasons like traffic, infrastructures, and lately staffing. Hence, the ability for the early interventions of the public are likely to be the most significant determinant of the outcome of a fire event. Most people do respond appropriately, and the literature confirms that they do not panic. Typically, most people are at risk of a minor injury at worst, due to the low risk from the fire and their own ability to assess and act in accordance with the situation.

A significant amount of data has been collected to support the requirement for portable extinguishers, including: WPI/EKU Study: "Ordinary People and the Effective Operation of Fire Extinguishers", which clearly showed that the vast majority of people who have never used an extinguisher can operate one safely and effectively. This willingness of the public to accept minor injuries to protect individuals, the facility or their personal property is supported by literature and data and shows these to be well established behaviors which policy makers need to work with, rather than against.

Reflecting official policy, national and local fire safety messaging has, for some time, urged the public, on discovering a fire in the home, to "Get out, stay out", "Don't put yourself at risk" and 'Leave it to the professionals.' This paternalistic messaging confirms the government policy makers and fire services' belief that a professional response is the only intervention capable of safely tackling fires. Again, this starkly contrasts with the reality that between 70% and 80% of dwelling fires are tackled effectively and at low risk, by the public. The policy also fails to accord with the public who have been shown to be tolerant, or accepting, of the incurrence of minor injuries in pursuit of their personal priorities.

Surveys from the National Association of Fire Equipment Distributors (NAFED) in America reveals the same trend of public firefighting, with even higher percentages not needing the fire service. "In both the 1979 and 1985 surveys, the fire department was only called for 13% of the reported fires. In the 1996 survey, the fire department was called in 24% of the reported fires. However, in the 2010 survey the number dropped to 17% of the time'. And 'These results are not unique to NAFED surveys. A 1978 publication by the U.S. Department of Commerce stated that about 90% of fires in households are not reported, based on their survey of 33,000 fires." (NAFED, 2010: 9)

The public are likely to encounter a fire that is relatively small and often contained to the item first ignited. They are often the ones present when fire starts. In summary, there is a significant difference between official assumptions/guidance and actual public behavior. However, the government and FRS seek to deter this behavior, and, in singularly promoting there, "Get out' message," and remove the simple yet potential life saving devices in sprinklered buildings.

A recent study also showed that the public do not just get out, with 49% never leaving the property during the fire. While this may surprise or concern many professionals, it is likely to be explained by a difference between the fire as perceived by professionals and the lived experience of the public. There is nothing to suggest that the public routinely take unnecessary risks. A more likely explanation is that the fire was small and not sufficiently well-developed to pose an imminent injury or life threat. As such, they were able to remain in the premises safely and relatively comfortably, which is supported by the evidence in relation to the majority of fires not spreading beyond the item first ignited or the room of origin. Inclement weather or other factors may also make remaining in the premises a safer or more comfortable option. Fires, like other emergencies, must also be understood in human terms.

The concept of trading off portable extinguishers in sprinklered buildings has been largely abandoned by fire protection principles. NFPA 10 states in subsection 5.1.2, "The selection of extinguishers shall be independent of whether the building is equipped with automatic sprinklers, standpipe and hose, or other fixed protection equipment." Other codes, and other occupancy chapters have abandoned this concept in recognition of the fact that portable extinguishers are a valuable, cost-effective layer of fire protection, and are intended for a different purpose than sprinklers. Recognition of the valuable role of extinguishers came from a 2003 report which concluded, 'Fire extinguishers are designed to prevent relatively minor incidents becoming major conflagrations.' It is, of course, difficult to prove how many and which fires would have developed to pose a serious risk if not tackled and contained early on. Events such as the Grenfell fire are a reminder of the consequences when this happens.

The National Fire Codes of both NFPA and the ICC require portable fire extinguishers in all occupancy classes including storage which addresses property protection and property loss as well as, the safety of the building occupants. Fire safety is grounded in the engineering discipline which brings many strengths to codes requirements, but it is insufficient, and fire safety effectiveness is limited by ignoring the social sciences of human behavior. It is important to appreciate that while different to official assumptions and desire for evacuation, research shows the public's priorities to be rational and appropriate. The public's experience of fire is vastly different to that of the professionals involved in the planning for and responding to fire.

Official policy and attitudes of the Technical Committee are most singularly directed at avoiding the risk when the public encounters a fire. This is well meaning but the research has shown that this DOES

NOT I REPEAT DOES NOT align with the publics' attitude or the ability of the general public. The belief that 'undesirable' behavior can be changed by advice, campaigns or other measures has been shown to be inaccurate. The paternalistic approach by which government and the building safety regulatory sector seek to change human behavior by removing proven and effective appliances such as portable fire extinguishers is WRONG. However, the building safety regulatory sector continue this approach despite the evidence that public behaviors are safe, effective, and largely unaltered by current guidance and campaigns rather than providing appropriate safety devices for use by the public. A portable fire extinguisher is an effective item of fire protection which allows for small fires to be tackled by the occupants of a building and saves 100s of thousands of dollars in property loss.

Concerns have been indicted regarding the requirement for training. Training in the use of extinguishers is an important issue and one in which opinion appears more influential than the evidence. Whether purchased for a private dwelling or provided through regulatory processes, there is no mandatory requirement for training to use an extinguisher, and studies do not reveal training to be a requirement for their safe or effective use. In fact, the available data and studies demonstrate the opposite to be the case.

The Technical Committee should also note that portable fire extinguishers are designed for the novice user. Although, training is recommended for proper use and technique and is wide available through a variety of resources including at online training; there are no specified training requirements even under OSHA unless that is an assigned duty employee by the employer. The proposed requirement is intended as a provision for layered fire protection for the general public and employees for general safety.

Although there is limited data available related to extinguisher use since the removal of portable fire extinguishers in the NIFRS data field, there is little to no data supporting the removal of portable fire extinguishers and sole reliance on building fire sprinkler systems. Limiting a fire to the smallest area within a building is a sensible aspiration.

Cost has been another point of contention. A study by Richard Bukowski in 2014, the life cycle cost of portable fire extinguishers was determined to be between one and a half and four cents per foot annually; if coverage could be maximized to that allowable by code, the cost drops to between a half cent and one cent per foot annually. It's unlikely that any other layer of fire protection is so cost-effective.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate. This proposal is to provide for the Technical Committee the ability to at a minimum place the requirement for portable fire extinguishers into hazardous areas only.

This was most evident in attitude to injuries. Official policy seems to place avoidance of any injury as its highest priority and assumes this to also be the public's main motivation and enough to dictate any response to the discovery of a fire. However, the same study found that almost all those who incurred a minor injury accepted it as a reasonable cost in relation to pursuing or achieving their personal priorities. Further, they stated, in hindsight, they would do the same again.

It should be noted that numerous every day and discretionary activities carry similar or higher levels of risk to those resulting from using an extinguisher. Do-It-Yourself and sport for example are frequently responsible for injuries or even fatalities. In response, the government and industry seek to help make products safer or provide advice. This is preferred to denying people the option to participate in either activity by withdrawing public access to tools or sports equipment. The benefits achieved by the public using extinguishers are significant, given the potential for a fire to otherwise lead to detrimental and life-changing outcomes. A low and calculated level of personal risk willingly accepted by an individual tackling a fire can avoid, or reduce, a much higher risk to others should they ignore the fire and allow it to develop. Where current guidance discourages the provision of extinguishers in public spaces, this policy is neither supported by the evidence or justifiable through a consensus from the public. Rather it is imposed on them and is inconsistent with other approaches to public health.

The fire service's response time to structure fires has increased significantly over the past 25 years for several reasons like traffic, infrastructures, and lately staffing. Hence, the ability for the early interventions of the public are likely to be the most significant determinant of the outcome of a fire event. Most people do respond appropriately, and the literature confirms that they do not panic. Typically, most people are at risk of a minor injury at worst, due to the low risk from the fire and their own ability to assess and act in accordance with the situation.

A significant amount of data has been collected to support the requirement for portable extinguishers, including: WPI/EKU Study: "Ordinary People and the Effective Operation of Fire Extinguishers", which clearly showed that the vast majority of people who have never used an extinguisher can operate one safely and effectively. This willingness of the public to accept minor injuries to protect individuals, the facility or their personal property is supported by literature and data and shows these to be well established behaviors which policy makers need to work with, rather than against.

Reflecting official policy, national and local fire safety messaging has, for some time, urged the public, on discovering a fire in the home, to "Get out, stay out", "Don't put yourself at risk" and 'Leave it to the professionals.' This paternalistic messaging confirms the government policy makers and fire services' belief that a professional response is the only intervention capable of safely tackling fires. Again, this starkly contrasts with the reality that between 70% and 80% of dwelling fires are tackled effectively and at low risk, by the public. The policy also fails to accord with the public who have been shown to be tolerant, or accepting, of the incurrence of minor injuries in pursuit of their personal priorities.

Surveys from the National Association of Fire Equipment Distributors (NAFED) in America reveals the same trend of public firefighting, with even higher percentages not needing the fire service. "In both the 1979 and 1985 surveys, the fire department was only called for 13% of the reported fires. In the 1996 survey, the fire department was called in 24% of the reported fires. However, in the 2010 survey the number dropped to 17% of the time'. And 'These results are not unique to NAFED surveys. A 1978 publication by the U.S. Department of Commerce stated that about 90% of fires in households are not reported, based on their survey of 33,000 fires." (NAFED, 2010: 9)

The public are likely to encounter a fire that is relatively small and often contained to the item first ignited. They are often the ones present when fire starts. In summary, there is a significant difference between official assumptions/guidance and actual public behavior. However, the government and FRS seek to deter this behavior, and, in singularly promoting there, "Get out' message," and remove the simple yet potential life saving devices in sprinklered buildings.

A recent study also showed that the public do not just get out, with 49% never leaving the property during the fire. While this may surprise or concern many professionals, it is likely to be explained by a difference between the fire as perceived by professionals and the lived experience of the public. There is nothing to suggest that the public routinely take unnecessary risks. A more likely explanation is that the fire was small and not sufficiently well-developed to pose an imminent injury or life threat. As such, they were able to remain in the premises safely and relatively comfortably, which is supported by the evidence in relation to the majority of fires not spreading beyond the item first ignited or the room of origin. Inclement weather or other factors may also make remaining in the premises a safer or more comfortable option. Fires, like other emergencies, must also be understood in human terms.

The concept of trading off portable extinguishers in sprinklered buildings has been largely abandoned by fire protection principles. NFPA 10 states in subsection 5.1.2, "The selection of extinguishers shall be independent of whether the building is equipped with automatic sprinklers, standpipe and hose, or other fixed protection equipment." Other codes, and other occupancy chapters have abandoned this concept in recognition of the fact that portable extinguishers are a valuable, cost-effective layer of fire protection, and are intended for a different purpose than sprinklers. Recognition of the valuable role of extinguishers came from a 2003 report which concluded, 'Fire extinguishers are designed to prevent relatively minor incidents becoming major conflagrations.' It is, of course, difficult to prove how many and which fires would have developed to pose a serious risk if not tackled and contained early on. Events such as the Grenfell fire are a reminder of the consequences when this happens.

The National Fire Codes of both NFPA and the ICC require portable fire extinguishers in all occupancy classes including storage which addresses property protection and property loss as well as, the safety of the building occupants. Fire safety is grounded in the engineering discipline which brings many strengths to codes requirements, but it is insufficient, and fire safety effectiveness is limited by ignoring the social sciences of human behavior. It is important to appreciate that while different to official assumptions and desire for evacuation, research shows the public's priorities to be rational and appropriate. The public's experience of fire is vastly different to that of the professionals involved in the planning for and responding to fire.

Official policy and attitudes of the Technical Committee are most singularly directed at avoiding the risk when the public encounters a fire. This is well meaning but the research has shown that this DOES

NOT I REPEAT DOES NOT align with the publics' attitude or the ability of the general public. The belief that 'undesirable' behavior can be changed by advice, campaigns or other measures has been shown to be inaccurate. The paternalistic approach by which government and the building safety regulatory sector seek to change human behavior by removing proven and effective appliances such as portable fire extinguishers is WRONG. However, the building safety regulatory sector continue this approach despite the evidence that public behaviors are safe, effective, and largely unaltered by current guidance and campaigns rather than providing appropriate safety devices for use by the public. A portable fire extinguisher is an effective item of fire protection which allows for small fires to be tackled by the occupants of a building and saves 100s of thousands of dollars in property loss.

Concerns have been indicted regarding the requirement for training. Training in the use of extinguishers is an important issue and one in which opinion appears more influential than the evidence. Whether purchased for a private dwelling or provided through regulatory processes, there is no mandatory requirement for training to use an extinguisher, and studies do not reveal training to be a requirement for their safe or effective use. In fact, the available data and studies demonstrate the opposite to be the case.

The Technical Committee should also note that portable fire extinguishers are designed for the novice user. Although, training is recommended for proper use and technique and is wide available through a variety of resources including at online training; there are no specified training requirements even under OSHA unless that is an assigned duty employee by the employer. The proposed requirement is intended as a provision for layered fire protection for the general public and employees for general safety.

Although there is limited data available related to extinguisher use since the removal of portable fire extinguishers in the NIFRS data field, there is little to no data supporting the removal of portable fire extinguishers and sole reliance on building fire sprinkler systems. Limiting a fire to the smallest area within a building is a sensible aspiration.

Cost has been another point of contention. A study by Richard Bukowski in 2014, the life cycle cost of portable fire extinguishers was determined to be between one and a half and four cents per foot annually; if coverage could be maximized to that allowable by code, the cost drops to between a half cent and one cent per foot annually. It's unlikely that any other layer of fire protection is so cost-effective.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Committee Statement

**Committee
Action:** Rejected

Resolution: The intent of not providing fire extinguishers is to allow people to escape and not try to extinguish the fire, allowing trained personnel to handle the fire. The requirement for extinguishers also adds a requirement for the building owner to provide training as well as maintenance. Providing fire extinguishers is a challenge based on cost of providing and maintaining them. There are also instances of misuse by the occupants. The code does not restrict the use of fire extinguishers, therefore fire extinguishers can be added but are not required to be added. The added substantiation provided by the submitter does not provide a reason for the technical committee to change it's decision from the first draft meeting.

Public Comment No. 185-NFPA 101-2022 [Section No. 29.3.5.8]

29.3.5.8

In buildings other than those protected throughout with an approved, supervised automatic sprinkler system in accordance with 29.3.5.3, ~~portable~~ Portable fire extinguishers shall be provided as specified in Section 9.9 in hazardous areas addressed by 29.3.2.2.

Statement of Problem and Substantiation for Public Comment

A 2013 NFPA Report: "U.S. Experience with Sprinklers" reports that there were 48,460 reported structure fires annually in buildings equipped with sprinkler systems between 2007-2011, and 40,440 (83 percent) never grew large enough to activate the system. Based on this report alone, it's clear that people are reacting to small fires and extinguishing them prior to sprinkler activation. Limiting a fire to the smallest area within a building is a sensible aspiration.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Under the Scope of the Life Safety Code, Subsection 1.1.2 entitled, "Danger to Life from Fire," the Code states the following: "The Code addresses those construction, protection, and occupancy features necessary to minimize danger to life from the effects of fire, including smoke, heat, and toxic gases created during a fire." Further, it states in Subsection 1.1.4 entitled, "Other Fire-Related Considerations," the following: "The Code addresses other considerations that are essential to life safety in recognition of the fact that life safety is more than a matter of egress. The Code also addresses protective features and systems, building services, operating features, maintenance activities, and other provisions in recognition of the fact that achieving an acceptable degree of life safety depends on additional safeguards to provide adequate egress time or protection for people exposed to fire."

Studies of building fires indicate that occupants typically exhibit altruistic behavior toward others. Human response to a threatening situation might follow one of a variety of behaviors. Individuals might choose to investigate, sound an alarm, assist with rescue, seek help, or flee. Such actions constitute normal behavior, even when taken collectively. Most people avoid direct contact with a fire while undertaking another action.

There is a fundamental discrepancy between official/policy assumptions and the public in relation to priorities in the event of a fire. Government and professionals focus on avoiding injuries and see that as the sole aspiration, in the pursuit of which everything else is secondary. In contrast, the public have a wide and largely unrecognized range of priorities when encountering a fire, based on their individual circumstances. These include: the avoidance of embarrassment/inconvenience; mitigating the impact of damage to the property, e.g. avoiding the risk of being unable to remain in their place of business;

and their concern for the wellbeing of other people. Each are invested by different aspirations in the fire safety ecosystem.

A desire to achieve their self-appointed tasks is a strong motivation for the public's behavior when encountering a fire. For most, this will involve an active response of on average five actions, although for some it will be as many as 11. This includes investigating the initial cues and tackling the fire, often using improvised means. They are usually successful in doing so, with 70% to 80% of fires dealt with by the public without requiring professional assistance. It is important to note that in doing so, they are willingly acting against official advice and are not being coerced into this. The evidence shows the public to be effective and capable in tackling fires, even in the absence of any professional support, or often without specialized equipment. This is supported by the pioneering studies of the public experience of dwelling fires undertaken by Bryan (1977) and Wood (1972) in the USA and UK, respectively. Their studies supported by their findings that the public did undertake a range of self-appointed tasks including investigating and tackling fires. Recent studies have confirmed similar findings and these behaviors appear consistent over time.

The evidence further identifies that the public is willing and will accept minor consequences in their pursuit of achieving personal humanistic priorities and instinct. Concern for people, pets and possessions are strong and established drivers of behavior in the event of a fire. Therefore, this should be no surprise to see it as an influential feature of most individual's response to a fire.

A 2003 UK survey found that across all categories of location, extinguishers were successful in extinguishing 79.9% of fires. Note: Private houses accounted for only 3.3% of extinguisher use. It reported that 58.6% were operated by trained staff, 36.4% were operated by untrained staff and in 5% of incidents, this was unknown.

Data from the National Association of Fire Equipment Distributors (NAFED) provides even more robust validation of the influence of fire extinguishers as used by 'ordinary civilians. Their research and data indicate, "Of 13,221 fire incidents reported, portable fire extinguishers successfully extinguished 12,505 fires (95%)." (NAFED 2010: 2) The combined results of the 34 years of data are based on the performance of 32,756 fire extinguishers used on 13,453 incidents.

Fortunately, most people encountering a fire will avoid any injury or will be exposed to a low, and often considered risk of a minor injury at worst. This is not a matter of luck but due to a combination of their own abilities and to the low level of risk presented by most fires individuals would choose to fight at the incipient stage. A 2015 study identified that there was a disconnect between the fire service/government and the public in terms of what they referred to as 'risk tolerance'. This was most evident in attitude to injuries. Official policy seems to place avoidance of any injury as its highest priority and assumes this to also be the public's main motivation and enough to dictate any response to the discovery of a fire. However, the same study found that almost all those who incurred a minor injury accepted it as a reasonable cost in relation to pursuing or achieving their personal priorities. Further, they stated, in hindsight, they would do the same again.

It should be noted that numerous every day and discretionary activities carry similar or higher levels of risk to those resulting from using an extinguisher. Do-It-Yourself and sport for example are frequently responsible for injuries or even fatalities. In response, the government and industry seek to help make products safer or provide advice. This is preferred to denying people the option to participate in either activity by withdrawing public access to tools or sports equipment. The benefits achieved by the public using extinguishers are significant, given the potential for a fire to otherwise lead to detrimental and life-changing outcomes. A low and calculated level of personal risk willingly accepted by an individual tackling a fire can avoid, or reduce, a much higher risk to others should they ignore the fire and allow it to develop. Where current guidance discourages the provision of extinguishers in public spaces, this policy is neither supported by the evidence or justifiable through a consensus from the public. Rather it is imposed on them and is inconsistent with other approaches to public health.

The fire service's response time to structure fires has increased significantly over the past 25 years for several reasons like traffic, infrastructures, and lately staffing. Hence, the ability for the early interventions of the public are likely to be the most significant determinant of the outcome of a fire event. Most people do respond appropriately, and the literature confirms that they do not panic. Typically, most people are at risk of a minor injury at worst, due to the low risk from the fire and their own ability to assess and act in accordance with the situation.

A significant amount of data has been collected to support the requirement for portable extinguishers, including: WPI/EKU Study: "Ordinary People and the Effective Operation of Fire Extinguishers", which clearly showed that the vast majority of people who have never used an extinguisher can operate one safely and effectively. This willingness of the public to accept minor injuries to protect individuals, the facility or their personal property is supported by literature and data and shows these to be well established behaviors which policy makers need to work with, rather than against.

Reflecting official policy, national and local fire safety messaging has, for some time, urged the public, on discovering a fire in the home, to "Get out, stay out", "Don't put yourself at risk" and 'Leave it to the professionals.' This paternalistic messaging confirms the government policy makers and fire services' belief that a professional response is the only intervention capable of safely tackling fires. Again, this starkly contrasts with the reality that between 70% and 80% of dwelling fires are tackled effectively and at low risk, by the public. The policy also fails to accord with the public who have been shown to be tolerant, or accepting, of the incurrence of minor injuries in pursuit of their personal priorities.

Surveys from the National Association of Fire Equipment Distributors (NAFED) in America reveals the same trend of public firefighting, with even higher percentages not needing the fire service. "In both the 1979 and 1985 surveys, the fire department was only called for 13% of the reported fires. In the 1996 survey, the fire department was called in 24% of the reported fires. However, in the 2010 survey the number dropped to 17% of the time'. And 'These results are not unique to NAFED surveys. A 1978 publication by the U.S. Department of Commerce stated that about 90% of fires in households are not reported, based on their survey of 33,000 fires." (NAFED, 2010: 9)

The public are likely to encounter a fire that is relatively small and often contained to the item first ignited. They are often the ones present when fire starts. In summary, there is a significant difference between official assumptions/guidance and actual public behavior. However, the government and FRS seek to deter this behavior, and, in singularly promoting there, "Get out' message," and remove the simple yet potential life saving devices in sprinklered buildings.

A recent study also showed that the public do not just get out, with 49% never leaving the property during the fire. While this may surprise or concern many professionals, it is likely to be explained by a difference between the fire as perceived by professionals and the lived experience of the public. There is nothing to suggest that the public routinely take unnecessary risks. A more likely explanation is that the fire was small and not sufficiently well-developed to pose an imminent injury or life threat. As such, they were able to remain in the premises safely and relatively comfortably, which is supported by the evidence in relation to the majority of fires not spreading beyond the item first ignited or the room of origin. Inclement weather or other factors may also make remaining in the premises a safer or more comfortable option. Fires, like other emergencies, must also be understood in human terms.

The concept of trading off portable extinguishers in sprinklered buildings has been largely abandoned by fire protection principles. NFPA 10 states in subsection 5.1.2, "The selection of extinguishers shall be independent of whether the building is equipped with automatic sprinklers, standpipe and hose, or other fixed protection equipment." Other codes, and other occupancy chapters have abandoned this concept in recognition of the fact that portable extinguishers are a valuable, cost-effective layer of fire protection, and are intended for a different purpose than sprinklers. Recognition of the valuable role of extinguishers came from a 2003 report which concluded, 'Fire extinguishers are designed to prevent relatively minor incidents becoming major conflagrations.' It is, of course, difficult to prove how many and which fires would have developed to pose a serious risk if not tackled and contained early on. Events such as the Grenfell fire are a reminder of the consequences when this happens.

The National Fire Codes of both NFPA and the ICC require portable fire extinguishers in all occupancy classes including storage which addresses property protection and property loss as well as, the safety of the building occupants. Fire safety is grounded in the engineering discipline which brings many strengths to codes requirements, but it is insufficient, and fire safety effectiveness is limited by ignoring the social sciences of human behavior. It is important to appreciate that while different to official assumptions and desire for evacuation, research shows the public's priorities to be rational and appropriate. The public's experience of fire is vastly different to that of the professionals involved in the planning for and responding to fire.

Official policy and attitudes of the Technical Committee are most singularly directed at avoiding the risk when the public encounters a fire. This is well meaning but the research has shown that this DOES

NOT I REPEAT DOES NOT align with the publics' attitude or the ability of the general public. The belief that 'undesirable' behavior can be changed by advice, campaigns or other measures has been shown to be inaccurate. The paternalistic approach by which government and the building safety regulatory sector seek to change human behavior by removing proven and effective appliances such as portable fire extinguishers is WRONG. However, the building safety regulatory sector continue this approach despite the evidence that public behaviors are safe, effective, and largely unaltered by current guidance and campaigns rather than providing appropriate safety devices for use by the public. A portable fire extinguisher is an effective item of fire protection which allows for small fires to be tackled by the occupants of a building and saves 100s of thousands of dollars in property loss.

Concerns have been indicted regarding the requirement for training. Training in the use of extinguishers is an important issue and one in which opinion appears more influential than the evidence. Whether purchased for a private dwelling or provided through regulatory processes, there is no mandatory requirement for training to use an extinguisher, and studies do not reveal training to be a requirement for their safe or effective use. In fact, the available data and studies demonstrate the opposite to be the case.

The Technical Committee should also note that portable fire extinguishers are designed for the novice user. Although, training is recommended for proper use and technique and is wide available through a variety of resources including at online training; there are no specified training requirements even under OSHA unless that is an assigned duty employee by the employer. The proposed requirement is intended as a provision for layered fire protection for the general public and employees for general safety.

Although there is limited data available related to extinguisher use since the removal of portable fire extinguishers in the NIFRS data field, there is little to no data supporting the removal of portable fire extinguishers and sole reliance on building fire sprinkler systems. Limiting a fire to the smallest area within a building is a sensible aspiration.

Cost has been another point of contention. A study by Richard Bukowski in 2014, the life cycle cost of portable fire extinguishers was determined to be between one and a half and four cents per foot annually; if coverage could be maximized to that allowable by code, the cost drops to between a half cent and one cent per foot annually. It's unlikely that any other layer of fire protection is so cost-effective.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

This proposal is to provide for the Technical Committee the ability to at a minimum place the requirement for portable fire extinguishers into hazardous areas only.

Public Comment No. 186-NFPA 101-2022 [Section No. 30.3.5.6]

30.3.5.6 Portable Fire Extinguishers.

Portable fire extinguishers shall be provided in accordance with Section 9.9- ~~shall be provided in hazardous areas addressed by 30.3.2.4 , unless the building is protected throughout with an approved, supervised automatic sprinkler system in accordance with 30.3.5.1.4 - .~~

Statement of Problem and Substantiation for Public Comment

A 2013 NFPA Report: “U.S. Experience with Sprinklers” reports that there were 48,460 reported structure fires annually in buildings equipped with sprinkler systems between 2007-2011, and 40,440 (83 percent) never grew large enough to activate the system. Based on this report alone, it’s clear that people are reacting to small fires and extinguishing them prior to sprinkler activation. Limiting a fire to the smallest area within a building is a sensible aspiration.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it’s small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public’s priorities and judgment for fight or flight are rational and appropriate.

Under the Scope of the Life Safety Code, Subsection 1.1.2 entitled, “Danger to Life form Fire,” the Code states the following: “The Code addresses those construction, protection, and occupancy features necessary to minimize danger to life from the effects of fire, including smoke, heat, and toxic gases created during a fire.” Further, it states in Subsection 1.1.4 entitled, “Other Fire-Related Considerations,” the following: “The Code addresses other considerations that are essential to life safety in recognition of the fact that life safety is more than a matter of egress. The Code also addresses protective features and systems, building services, operating features, maintenance activities, and other provisions in recognition of the fact that achieving an acceptable degree of life safety depends on additional safeguards to provide adequate egress time or protection for people exposed to fire.”

Studies of building fires indicate that occupants typically exhibit altruistic behavior toward others. Human response to a threatening situation might follow one of a variety of behaviors. Individuals might choose to investigate, sound an alarm, assist with rescue, seek help, or flee. Such actions constitute normal behavior, even when taken collectively. Most people avoid direct contact with a fire while undertaking another action.

There is a fundamental discrepancy between official/policy assumptions and the public in relation to priorities in the event of a fire. Government and professionals focus on avoiding injuries and see that as the sole aspiration, in the pursuit of which everything else is secondary. In contrast, the public have a wide and largely unrecognized range of priorities when encountering a fire, based on their individual circumstances. These include: the avoidance of embarrassment/inconvenience; mitigating the impact of damage to the property, e.g. avoiding the risk of being unable to remain in their place of business;

and their concern for the wellbeing of other people. Each are invested by different aspirations in the fire safety ecosystem.

A desire to achieve their self-appointed tasks is a strong motivation for the public's behavior when encountering a fire. For most, this will involve an active response of on average five actions, although for some it will be as many as 11. This includes investigating the initial cues and tackling the fire, often using improvised means. They are usually successful in doing so, with 70% to 80% of fires dealt with by the public without requiring professional assistance. It is important to note that in doing so, they are willingly acting against official advice and are not being coerced into this. The evidence shows the public to be effective and capable in tackling fires, even in the absence of any professional support, or often without specialized equipment. This is supported by the pioneering studies of the public experience of dwelling fires undertaken by Bryan (1977) and Wood (1972) in the USA and UK, respectively. Their studies supported by their findings that the public did undertake a range of self-appointed tasks including investigating and tackling fires. Recent studies have confirmed similar findings and these behaviors appear consistent over time.

The evidence further identifies that the public is willing and will accept minor consequences in their pursuit of achieving personal humanistic priorities and instinct. Concern for people, pets and possessions are strong and established drivers of behavior in the event of a fire. Therefore, this should be no surprise to see it as an influential feature of most individual's response to a fire.

A 2003 UK survey found that across all categories of location, extinguishers were successful in extinguishing 79.9% of fires. Note: Private houses accounted for only 3.3% of extinguisher use. It reported that 58.6% were operated by trained staff, 36.4% were operated by untrained staff and in 5% of incidents, this was unknown.

Data from the National Association of Fire Equipment Distributors (NAFED) provides even more robust validation of the influence of fire extinguishers as used by 'ordinary civilians. Their research and data indicate, "Of 13,221 fire incidents reported, portable fire extinguishers successfully extinguished 12,505 fires (95%)." (NAFED 2010: 2) The combined results of the 34 years of data are based on the performance of 32,756 fire extinguishers used on 13,453 incidents.

Fortunately, most people encountering a fire will avoid any injury or will be exposed to a low, and often considered risk of a minor injury at worst. This is not a matter of luck but due to a combination of their own abilities and to the low level of risk presented by most fires individuals would choose to fight at the incipient stage. A 2015 study identified that there was a disconnect between the fire service/government and the public in terms of what they referred to as 'risk tolerance'. This was most evident in attitude to injuries. Official policy seems to place avoidance of any injury as its highest priority and assumes this to also be the public's main motivation and enough to dictate any response to the discovery of a fire. However, the same study found that almost all those who incurred a minor injury accepted it as a reasonable cost in relation to pursuing or achieving their personal priorities. Further, they stated, in hindsight, they would do the same again.

It should be noted that numerous every day and discretionary activities carry similar or higher levels of risk to those resulting from using an extinguisher. Do-It-Yourself and sport for example are frequently responsible for injuries or even fatalities. In response, the government and industry seek to help make products safer or provide advice. This is preferred to denying people the option to participate in either activity by withdrawing public access to tools or sports equipment. The benefits achieved by the public using extinguishers are significant, given the potential for a fire to otherwise lead to detrimental and life-changing outcomes. A low and calculated level of personal risk willingly accepted by an individual tackling a fire can avoid, or reduce, a much higher risk to others should they ignore the fire and allow it to develop. Where current guidance discourages the provision of extinguishers in public spaces, this policy is neither supported by the evidence or justifiable through a consensus from the public. Rather it is imposed on them and is inconsistent with other approaches to public health.

The fire service's response time to structure fires has increased significantly over the past 25 years for several reasons like traffic, infrastructures, and lately staffing. Hence, the ability for the early interventions of the public are likely to be the most significant determinant of the outcome of a fire event. Most people do respond appropriately, and the literature confirms that they do not panic. Typically, most people are at risk of a minor injury at worst, due to the low risk from the fire and their own ability to assess and act in accordance with the situation.

A significant amount of data has been collected to support the requirement for portable extinguishers, including: WPI/EKU Study: "Ordinary People and the Effective Operation of Fire Extinguishers", which clearly showed that the vast majority of people who have never used an extinguisher can operate one safely and effectively. This willingness of the public to accept minor injuries to protect individuals, the facility or their personal property is supported by literature and data and shows these to be well established behaviors which policy makers need to work with, rather than against.

Reflecting official policy, national and local fire safety messaging has, for some time, urged the public, on discovering a fire in the home, to "Get out, stay out", "Don't put yourself at risk" and 'Leave it to the professionals.' This paternalistic messaging confirms the government policy makers and fire services' belief that a professional response is the only intervention capable of safely tackling fires. Again, this starkly contrasts with the reality that between 70% and 80% of dwelling fires are tackled effectively and at low risk, by the public. The policy also fails to accord with the public who have been shown to be tolerant, or accepting, of the incurrence of minor injuries in pursuit of their personal priorities.

Surveys from the National Association of Fire Equipment Distributors (NAFED) in America reveals the same trend of public firefighting, with even higher percentages not needing the fire service. "In both the 1979 and 1985 surveys, the fire department was only called for 13% of the reported fires. In the 1996 survey, the fire department was called in 24% of the reported fires. However, in the 2010 survey the number dropped to 17% of the time'. And 'These results are not unique to NAFED surveys. A 1978 publication by the U.S. Department of Commerce stated that about 90% of fires in households are not reported, based on their survey of 33,000 fires." (NAFED, 2010: 9)

The public are likely to encounter a fire that is relatively small and often contained to the item first ignited. They are often the ones present when fire starts. In summary, there is a significant difference between official assumptions/guidance and actual public behavior. However, the government and FRS seek to deter this behavior, and, in singularly promoting there, "Get out' message," and remove the simple yet potential life saving devices in sprinklered buildings.

A recent study also showed that the public do not just get out, with 49% never leaving the property during the fire. While this may surprise or concern many professionals, it is likely to be explained by a difference between the fire as perceived by professionals and the lived experience of the public. There is nothing to suggest that the public routinely take unnecessary risks. A more likely explanation is that the fire was small and not sufficiently well-developed to pose an imminent injury or life threat. As such, they were able to remain in the premises safely and relatively comfortably, which is supported by the evidence in relation to the majority of fires not spreading beyond the item first ignited or the room of origin. Inclement weather or other factors may also make remaining in the premises a safer or more comfortable option. Fires, like other emergencies, must also be understood in human terms.

The concept of trading off portable extinguishers in sprinklered buildings has been largely abandoned by fire protection principles. NFPA 10 states in subsection 5.1.2, "The selection of extinguishers shall be independent of whether the building is equipped with automatic sprinklers, standpipe and hose, or other fixed protection equipment." Other codes, and other occupancy chapters have abandoned this concept in recognition of the fact that portable extinguishers are a valuable, cost-effective layer of fire protection, and are intended for a different purpose than sprinklers. Recognition of the valuable role of extinguishers came from a 2003 report which concluded, 'Fire extinguishers are designed to prevent relatively minor incidents becoming major conflagrations.' It is, of course, difficult to prove how many and which fires would have developed to pose a serious risk if not tackled and contained early on. Events such as the Grenfell fire are a reminder of the consequences when this happens.

The National Fire Codes of both NFPA and the ICC require portable fire extinguishers in all occupancy classes including storage which addresses property protection and property loss as well as, the safety of the building occupants. Fire safety is grounded in the engineering discipline which brings many strengths to codes requirements, but it is insufficient, and fire safety effectiveness is limited by ignoring the social sciences of human behavior. It is important to appreciate that while different to official assumptions and desire for evacuation, research shows the public's priorities to be rational and appropriate. The public's experience of fire is vastly different to that of the professionals involved in the planning for and responding to fire.

Official policy and attitudes of the Technical Committee are most singularly directed at avoiding the risk when the public encounters a fire. This is well meaning but the research has shown that this DOES

NOT I REPEAT DOES NOT align with the publics' attitude or the ability of the general public. The belief that 'undesirable' behavior can be changed by advice, campaigns or other measures has been shown to be inaccurate. The paternalistic approach by which government and the building safety regulatory sector seek to change human behavior by removing proven and effective appliances such as portable fire extinguishers is WRONG. However, the building safety regulatory sector continue this approach despite the evidence that public behaviors are safe, effective, and largely unaltered by current guidance and campaigns rather than providing appropriate safety devices for use by the public. A portable fire extinguisher is an effective item of fire protection which allows for small fires to be tackled by the occupants of a building and saves 100s of thousands of dollars in property loss.

Concerns have been indicted regarding the requirement for training. Training in the use of extinguishers is an important issue and one in which opinion appears more influential than the evidence. Whether purchased for a private dwelling or provided through regulatory processes, there is no mandatory requirement for training to use an extinguisher, and studies do not reveal training to be a requirement for their safe or effective use. In fact, the available data and studies demonstrate the opposite to be the case.

The Technical Committee should also note that portable fire extinguishers are designed for the novice user. Although, training is recommended for proper use and technique and is wide available through a variety of resources including at online training; there are no specified training requirements even under OSHA unless that is an assigned duty employee by the employer. The proposed requirement is intended as a provision for layered fire protection for the general public and employees for general safety.

Although there is limited data available related to extinguisher use since the removal of portable fire extinguishers in the NIFRS data field, there is little to no data supporting the removal of portable fire extinguishers and sole reliance on building fire sprinkler systems. Limiting a fire to the smallest area within a building is a sensible aspiration.

Cost has been another point of contention. A study by Richard Bukowski in 2014, the life cycle cost of portable fire extinguishers was determined to be between one and a half and four cents per foot annually; if coverage could be maximized to that allowable by code, the cost drops to between a half cent and one cent per foot annually. It's unlikely that any other layer of fire protection is so cost-effective.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Committee Statement

**Committee
Action:** Rejected

Resolution: The intent of not providing fire extinguishers is to allow people to escape and not try to extinguish the fire, allowing trained personnel to handle the fire. The requirement for extinguishers also adds a requirement for the building owner to provide training as well as maintenance. Providing fire extinguishers is a challenge based on cost of providing and maintaining them. There are also instances of misuse by the occupants. The code does not restrict the use of fire extinguishers, therefore fire extinguishers can be added but are not required to be added. The added substantiation provided by the submitter does not provide a reason for the technical committee to change it's decision from the first draft meeting.

Public Comment No. 187-NFPA 101-2022 [Section No. 30.3.5.6]

30.3.5.6 Portable Fire Extinguishers.

Portable fire extinguishers in accordance with Section 9.9 shall be provided in hazardous areas addressed by 30.3.2.1, ~~unless the building is protected throughout with an approved, supervised automatic sprinkler system in accordance with 30.3.5.1.1.~~

Statement of Problem and Substantiation for Public Comment

A 2013 NFPA Report: "U.S. Experience with Sprinklers" reports that there were 48,460 reported structure fires annually in buildings equipped with sprinkler systems between 2007-2011, and 40,440 (83 percent) never grew large enough to activate the system. Based on this report alone, it's clear that people are reacting to small fires and extinguishing them prior to sprinkler activation. Limiting a fire to the smallest area within a building is a sensible aspiration.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Under the Scope of the Life Safety Code, Subsection 1.1.2 entitled, "Danger to Life from Fire," the Code states the following: "The Code addresses those construction, protection, and occupancy features necessary to minimize danger to life from the effects of fire, including smoke, heat, and toxic gases created during a fire." Further, it states in Subsection 1.1.4 entitled, "Other Fire-Related Considerations," the following: "The Code addresses other considerations that are essential to life safety in recognition of the fact that life safety is more than a matter of egress. The Code also addresses protective features and systems, building services, operating features, maintenance activities, and other provisions in recognition of the fact that achieving an acceptable degree of life safety depends on additional safeguards to provide adequate egress time or protection for people exposed to fire."

Studies of building fires indicate that occupants typically exhibit altruistic behavior toward others. Human response to a threatening situation might follow one of a variety of behaviors. Individuals might choose to investigate, sound an alarm, assist with rescue, seek help, or flee. Such actions constitute normal behavior, even when taken collectively. Most people avoid direct contact with a fire while undertaking another action.

There is a fundamental discrepancy between official/policy assumptions and the public in relation to priorities in the event of a fire. Government and professionals focus on avoiding injuries and see that as the sole aspiration, in the pursuit of which everything else is secondary. In contrast, the public have a wide and largely unrecognized range of priorities when encountering a fire, based on their individual circumstances. These include: the avoidance of embarrassment/inconvenience; mitigating the impact of damage to the property, e.g. avoiding the risk of being unable to remain in their place of business;

and their concern for the wellbeing of other people. Each are invested by different aspirations in the fire safety ecosystem.

A desire to achieve their self-appointed tasks is a strong motivation for the public's behavior when encountering a fire. For most, this will involve an active response of on average five actions, although for some it will be as many as 11. This includes investigating the initial cues and tackling the fire, often using improvised means. They are usually successful in doing so, with 70% to 80% of fires dealt with by the public without requiring professional assistance. It is important to note that in doing so, they are willingly acting against official advice and are not being coerced into this. The evidence shows the public to be effective and capable in tackling fires, even in the absence of any professional support, or often without specialized equipment. This is supported by the pioneering studies of the public experience of dwelling fires undertaken by Bryan (1977) and Wood (1972) in the USA and UK, respectively. Their studies supported by their findings that the public did undertake a range of self-appointed tasks including investigating and tackling fires. Recent studies have confirmed similar findings and these behaviors appear consistent over time.

The evidence further identifies that the public is willing and will accept minor consequences in their pursuit of achieving personal humanistic priorities and instinct. Concern for people, pets and possessions are strong and established drivers of behavior in the event of a fire. Therefore, this should be no surprise to see it as an influential feature of most individual's response to a fire.

A 2003 UK survey found that across all categories of location, extinguishers were successful in extinguishing 79.9% of fires. Note: Private houses accounted for only 3.3% of extinguisher use. It reported that 58.6% were operated by trained staff, 36.4% were operated by untrained staff and in 5% of incidents, this was unknown.

Data from the National Association of Fire Equipment Distributors (NAFED) provides even more robust validation of the influence of fire extinguishers as used by 'ordinary civilians. Their research and data indicate, "Of 13,221 fire incidents reported, portable fire extinguishers successfully extinguished 12,505 fires (95%)." (NAFED 2010: 2) The combined results of the 34 years of data are based on the performance of 32,756 fire extinguishers used on 13,453 incidents.

Fortunately, most people encountering a fire will avoid any injury or will be exposed to a low, and often considered risk of a minor injury at worst. This is not a matter of luck but due to a combination of their own abilities and to the low level of risk presented by most fires individuals would choose to fight at the incipient stage. A 2015 study identified that there was a disconnect between the fire service/government and the public in terms of what they referred to as 'risk tolerance'. This was most evident in attitude to injuries. Official policy seems to place avoidance of any injury as its highest priority and assumes this to also be the public's main motivation and enough to dictate any response to the discovery of a fire. However, the same study found that almost all those who incurred a minor injury accepted it as a reasonable cost in relation to pursuing or achieving their personal priorities. Further, they stated, in hindsight, they would do the same again.

It should be noted that numerous every day and discretionary activities carry similar or higher levels of risk to those resulting from using an extinguisher. Do-It-Yourself and sport for example are frequently responsible for injuries or even fatalities. In response, the government and industry seek to help make products safer or provide advice. This is preferred to denying people the option to participate in either activity by withdrawing public access to tools or sports equipment. The benefits achieved by the public using extinguishers are significant, given the potential for a fire to otherwise lead to detrimental and life-changing outcomes. A low and calculated level of personal risk willingly accepted by an individual tackling a fire can avoid, or reduce, a much higher risk to others should they ignore the fire and allow it to develop. Where current guidance discourages the provision of extinguishers in public spaces, this policy is neither supported by the evidence or justifiable through a consensus from the public. Rather it is imposed on them and is inconsistent with other approaches to public health.

The fire service's response time to structure fires has increased significantly over the past 25 years for several reasons like traffic, infrastructures, and lately staffing. Hence, the ability for the early interventions of the public are likely to be the most significant determinant of the outcome of a fire event. Most people do respond appropriately, and the literature confirms that they do not panic. Typically, most people are at risk of a minor injury at worst, due to the low risk from the fire and their own ability to assess and act in accordance with the situation.

A significant amount of data has been collected to support the requirement for portable extinguishers, including: WPI/EKU Study: "Ordinary People and the Effective Operation of Fire Extinguishers", which clearly showed that the vast majority of people who have never used an extinguisher can operate one safely and effectively. This willingness of the public to accept minor injuries to protect individuals, the facility or their personal property is supported by literature and data and shows these to be well established behaviors which policy makers need to work with, rather than against.

Reflecting official policy, national and local fire safety messaging has, for some time, urged the public, on discovering a fire in the home, to "Get out, stay out", "Don't put yourself at risk" and 'Leave it to the professionals.' This paternalistic messaging confirms the government policy makers and fire services' belief that a professional response is the only intervention capable of safely tackling fires. Again, this starkly contrasts with the reality that between 70% and 80% of dwelling fires are tackled effectively and at low risk, by the public. The policy also fails to accord with the public who have been shown to be tolerant, or accepting, of the incurrence of minor injuries in pursuit of their personal priorities.

Surveys from the National Association of Fire Equipment Distributors (NAFED) in America reveals the same trend of public firefighting, with even higher percentages not needing the fire service. "In both the 1979 and 1985 surveys, the fire department was only called for 13% of the reported fires. In the 1996 survey, the fire department was called in 24% of the reported fires. However, in the 2010 survey the number dropped to 17% of the time'. And 'These results are not unique to NAFED surveys. A 1978 publication by the U.S. Department of Commerce stated that about 90% of fires in households are not reported, based on their survey of 33,000 fires." (NAFED, 2010: 9)

The public are likely to encounter a fire that is relatively small and often contained to the item first ignited. They are often the ones present when fire starts. In summary, there is a significant difference between official assumptions/guidance and actual public behavior. However, the government and FRS seek to deter this behavior, and, in singularly promoting there, "Get out' message," and remove the simple yet potential life saving devices in sprinklered buildings.

A recent study also showed that the public do not just get out, with 49% never leaving the property during the fire. While this may surprise or concern many professionals, it is likely to be explained by a difference between the fire as perceived by professionals and the lived experience of the public. There is nothing to suggest that the public routinely take unnecessary risks. A more likely explanation is that the fire was small and not sufficiently well-developed to pose an imminent injury or life threat. As such, they were able to remain in the premises safely and relatively comfortably, which is supported by the evidence in relation to the majority of fires not spreading beyond the item first ignited or the room of origin. Inclement weather or other factors may also make remaining in the premises a safer or more comfortable option. Fires, like other emergencies, must also be understood in human terms.

The concept of trading off portable extinguishers in sprinklered buildings has been largely abandoned by fire protection principles. NFPA 10 states in subsection 5.1.2, "The selection of extinguishers shall be independent of whether the building is equipped with automatic sprinklers, standpipe and hose, or other fixed protection equipment." Other codes, and other occupancy chapters have abandoned this concept in recognition of the fact that portable extinguishers are a valuable, cost-effective layer of fire protection, and are intended for a different purpose than sprinklers. Recognition of the valuable role of extinguishers came from a 2003 report which concluded, 'Fire extinguishers are designed to prevent relatively minor incidents becoming major conflagrations.' It is, of course, difficult to prove how many and which fires would have developed to pose a serious risk if not tackled and contained early on. Events such as the Grenfell fire are a reminder of the consequences when this happens.

The National Fire Codes of both NFPA and the ICC require portable fire extinguishers in all occupancy classes including storage which addresses property protection and property loss as well as, the safety of the building occupants. Fire safety is grounded in the engineering discipline which brings many strengths to codes requirements, but it is insufficient, and fire safety effectiveness is limited by ignoring the social sciences of human behavior. It is important to appreciate that while different to official assumptions and desire for evacuation, research shows the public's priorities to be rational and appropriate. The public's experience of fire is vastly different to that of the professionals involved in the planning for and responding to fire.

Official policy and attitudes of the Technical Committee are most singularly directed at avoiding the risk when the public encounters a fire. This is well meaning but the research has shown that this DOES

NOT I REPEAT DOES NOT align with the publics' attitude or the ability of the general public. The belief that 'undesirable' behavior can be changed by advice, campaigns or other measures has been shown to be inaccurate. The paternalistic approach by which government and the building safety regulatory sector seek to change human behavior by removing proven and effective appliances such as portable fire extinguishers is WRONG. However, the building safety regulatory sector continue this approach despite the evidence that public behaviors are safe, effective, and largely unaltered by current guidance and campaigns rather than providing appropriate safety devices for use by the public. A portable fire extinguisher is an effective item of fire protection which allows for small fires to be tackled by the occupants of a building and saves 100s of thousands of dollars in property loss.

Concerns have been indicted regarding the requirement for training. Training in the use of extinguishers is an important issue and one in which opinion appears more influential than the evidence. Whether purchased for a private dwelling or provided through regulatory processes, there is no mandatory requirement for training to use an extinguisher, and studies do not reveal training to be a requirement for their safe or effective use. It's unlikely that any other layer of fire protection is so cost-effective.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

This proposal is to provide for the Technical Committee the ability to at a minimum place the requirement for portable fire extinguishers into hazardous areas only.

Statement: A task group has been formed to coordinate with the NFPA 30 and NFPA 1 Alcohol Task Group.

Providing a pointer to section 8.7.3.3 will provide a direct link to all the requirements needed for safe installation, use, and maintenance of alcohol based hand rub dispensers as well as the storage of any alcohol based hand rub materials not in use.

Public Comment No. 218-NFPA 101-2022 [Section No. 30.7.5]

30.7.5 – Valet Trash Collection Services.

30.7.5.1 –

Combustible trash or recycling materials in corridors or on egress balconies awaiting scheduled collection shall be placed completely inside a container that does not exceed a capacity of 15 gal (60 L) in corridors and 22 gal (95 L) on egress balconies.

30.7.5.2 –

Valet trash and recycling containers shall meet all of the following requirements:

- (1) The containers shall be of liquidtight construction.
- (2) The containers shall be equipped with lids.
- (3) The lids shall be in the fully closed position.

30.7.5.3 –

Containers and lids shall be constructed entirely of noncombustible materials or materials that meet a peak rate of heat release not exceeding 300 kW/m^2 when tested in accordance with ASTM E1354, *Standard Test Method for Heat and Visible Smoke Release Rates for Materials and Products Using an Oxygen Consumption Calorimeter*, at an incident heat flux of 50 kW/m^2 in the horizontal orientation.

30.7.5.4 –

Containers shall not be required to comply with 30.7.5.3 for the following:

- (1) Containers in sprinklered corridors or egress balconies in buildings provided with a sprinkler system complying with 30.3.5
- (2) Containers on egress balconies in buildings with noncombustible or limited combustible exteriors.

30.7.5.5 –

Containers shall not obstruct the minimum egress width required by 30.2.3.

30.7.5.6 –

Containers shall not occupy a corridor for a single period exceeding 18 hours.

30.7.5.7 –

Combustible trash or recycling materials shall not occupy a corridor for a single period exceeding 5 hours.

Statement of Problem and Substantiation for Public Comment

Valet Trash is an extremely bad idea and the implication in the text for this section is too focused on the fire dangers which are only part of the problem with the concept of valet trash within the public corridor (sole means of egress) for the vast majority of apartments in a multistory building. It is also a really bad idea relative to the ecological implications, especially the assumption—with a single container—that all trash will be commingled. As a longtime resident of two multistory apartment buildings, one about 60 years old and about 20 storeys high and the other about six year old and about 15 storeys high. Both have dedicated, fire-separated rooms for tenants to use for depositing sorted

trash of which the largest component by volume is paper and the largest component by weight is compostible material. The newer of my two homes has provision for at least four different kinds of trash and is located on each floor (with fire-protected chutes for two trash categories, for landfill and for recycling. This is a superior solution with many benefits related to both fire and other issues.

The benefits above accrue to all occupants of the building. There are some additional benefits that accrue to me as a frequent traveler who, if leaving on a trip that could be days or weeks in duration, is not in a position to retrieve his storage bin from a corridor location after its contents are picked up for collection. Such a corridor bin would have to sit outside the apartment door for times exceeding those stipulated in the rules proposed.

Corridors should not be the modern form of trash disposal in the way that, in more primitive times trash, etc., was simply dumped, from ones window or balcony into the street. This damage the character of the street and the public health of its users. Why are we returning to a relatively barbaric form of handling trash?

- (3) The lids shall be in the fully closed position.

30.7.5.3 –

Containers and lids shall be constructed entirely of noncombustible materials or materials that meet a peak rate of heat release not exceeding 300 kW/m^2 when tested in accordance with ASTM E1354, *Standard Test Method for Heat and Visible Smoke Release Rates for Materials and Products Using an Oxygen Consumption Calorimeter*, at an incident heat flux of 50 kW/m^2 in the horizontal orientation.

30.7.5.4 –

Containers shall not be required to comply with 30.7.5.3 for the following:

- (1) Containers in sprinklered corridors or egress balconies in buildings provided with a sprinkler system complying with 30.3.5
- (2) Containers on egress balconies in buildings with noncombustible or limited combustible exteriors.

30.7.5.5 –

Containers shall not obstruct the minimum egress width required by 30.2.3.

30.7.5.6 –

Containers shall not occupy a corridor for a single period exceeding 18 hours.

30.7.5.7 –

Combustible trash or recycling materials shall not occupy a corridor for a single period exceeding 5 hours.

Statement of Problem and Substantiation for Public Comment

The committee has provided no technical substantiation for the proposed change.

The proposed text by the Residential TC has many concerns for AHJ's as well as fire and life safety: The proposed text is in conflict with proven fire safety principles used for many years which prohibit combustible materials in egress corridors. Past fire history has shown how combustibles in the means of egress contributes to fire spread, hampers firefighting efforts, and limits the occupant's ability to egress. Materials, especially combustible materials, are fire fighter safety issues as it creates a new

fire load when stored in the means of egress and may inhibit quick and effective firefighting operations.

For years one of the biggest violations to the code is storage, etc. in the means of egress. This proposal eliminates a basic fire safety of maintaining a clear and unobstructed means of egress for building occupants. The introduction of trash in corridors of any occupancy goes against the basic principles of egress for occupant and creates a fire and life safety, property protection and fire fighter safety hazard, and is in direct violation of section 7.1.10.1 Maintenance. Means of egress shall be continuously maintained free of all obstructions or impediments to full instant use in the case of fire or other emergency and 7.1.10.2.1 which states 7.1.10.2.1 No furnishings, decorations, or other objects shall obstruct exits or their access thereto, egress therefrom, or visibility thereof. 30 and 31.3.2.1.1 lists trash collection rooms as a hazardous area and requires protection over and above the occupancy requirements. 30 and 31.7.2.2 prohibits contents and furnishings of a highly flammable character from use outside the dwelling unit.

Conflicting provisions on how long the container can occupy the corridor 18 or 5 hours. It appears the TC is permitting the container to be empty in the corridor for 18 hours, trash can only be in the container for 5 hours. This has been noted by the CC. This is unenforceable and again no technical justification has been provided on these timeframes. The timeframe will extend well into the overnight hours which is when fires in residential properties pose the greatest risk.

No fire testing or fire modeling has been performed to justify or validate the proposed requirements in the residential setting.

Many of the provisions are not easily enforced due to the nature of the service.

Resolution: The substantiations did not provide enough information to remove the Valet Trash section. The language in the requirement was provided by a task group with a wide range of stakeholders. If there is no language in the code, valet trash is still allowed but there will be no requirements on how it is done.

Public Comment No. 55-NFPA 101-2022 [Section No. 30.7.5]

30.7.5

—

Valet Trash Collection Services.

30.7.5.1 Where permitted by the AHJ, combustible trash or recycling materials shall comply with 30.7.5.

30.7.5.1 —

Combustible trash or recycling materials in corridors or on egress balconies awaiting scheduled collection shall be placed completely inside a container that does not exceed a capacity of 15 gal (60 L) in corridors and 22 gal (95 L) on egress balconies.

30.7.5.2

—

Valet

Valet trash and recycling containers shall meet all of the following requirements:

- The containers shall be of liquidtight construction.
- The containers shall be equipped with lids.
- The lids shall be in the fully closed position.

30.7.5.3 —

- Containers in sprinklered corridors or egress balconies in buildings provided with a sprinkler system complying with 30.3.5

Containers

(1) — Containers and lids shall be constructed entirely of noncombustible materials or materials that meet a peak rate of heat release not exceeding 300 kW/m^2 when tested in accordance with ASTM E1354, *Standard Test Method for Heat and Visible Smoke Release Rates for Materials and Products Using an Oxygen Consumption Calorimeter*, at an incident heat flux of 50 kW/m^2 in the horizontal orientation.

30.7.5.4 —

Containers shall not be required to comply with 30.7.5.3 for the following:

- (2) The containers shall be of liquidtight construction.
- (3) — The containers shall be equipped with lids.
- (4) — The lids shall be in the fully closed position.
- (5) Containers shall be placed on the same side of the corridor.
- (6) Containers shall be — located so as to not obstruct access to building service and fire protection equipment.
- (7) Containers shall be grouped such that each grouping does not exceed a projected floor area of 400 sq in (3.7 m^2).
- (8) — More than two containers shall be in each grouping.
- (9) The groupings addressed in (7) are separated from each other by a distance of at least 10 ft (3050 mm).

30.7.5.3 — Containers shall not be required to comply with 30.7.5.3 (1) on egress balconies in buildings with noncombustible or limited combustible exteriors.

30.7.5.

4 -

~~Containers shall not obstruct the minimum egress width required by 30.2.3.~~

30.7.5.6 -

~~Containers shall not occupy a corridor for a single period exceeding~~

~~18 hours~~

~~12 hours between the hours of 7am to 7pm.~~

30.7.5.7 -

~~Combustible trash or recycling materials shall not occupy a corridor for a single period exceeding 5 hours between the hours of 7am to 7pm.~~

~~30.7.5.8 Building where valet trash collection services are permitted shall have an approved fire sprinkler system installed.~~

Statement of Problem and Substantiation for Public Comment

The committee has provided no technical substantiation for the proposed change.

The proposed text by the Residential TC has many concerns for AHJ's as well as fire and life safety: The proposed text is in conflict with proven fire safety principles used for many years which prohibit combustible materials in egress corridors. Past fire history has shown how combustibles in the means of egress contributes to fire spread, hampers firefighting efforts, and limits the occupant's ability to egress. Materials, especially combustible materials, are fire fighter safety issues as it creates a new fire load when stored in the means of egress and may inhibit quick and effective firefighting operations.

For years one of the biggest violations to the code is storage, etc. in the means of egress. This proposal eliminates a basic fire safety of maintaining a clear and unobstructed means of egress for building occupants. The introduction of trash in corridors of any occupancy goes against the basic principles of egress for occupant and creates a fire and life safety, property protection and fire fighter safety hazard, and is in direct violation of section 7.1.10.1 Maintenance. Means of egress shall be continuously maintained free of all obstructions or impediments to full instant use in the case of fire or other emergency and 7.1.10.2.1 which states 7.1.10.2.1 No furnishings, decorations, or other objects shall obstruct exits or their access thereto, egress therefrom, or visibility thereof. 30 and 31.3.2.1.1 lists trash collection rooms as a hazardous area and requires protection over and above the occupancy requirements. 30 and 31.7.2.2 prohibits contents and furnishings of a highly flammable character from use outside the dwelling unit.

Conflicting provisions on how long the container can occupy the corridor 18 or 5 hours. It appears the TC is permitting the container to be empty in the corridor for 18 hours, trash can only be in the container for 5 hours. This has been noted by the CC. This is unenforceable and again no technical justification has been provided on these timeframes. The timeframe will extend well into the overnight hours which is when fires in residential properties pose the greatest risk.

No fire testing or fire modeling has been performed to justify or validate the proposed requirements in the residential setting.

Many of the provisions are not easily enforced due to the nature of the service.

X.7.5.1 was added to let the ahj determine if valet trash would be permitted for the specific building taking into account protection, past issues with the building, occupants of valet trash company. As currently proposed, it is a blanket permission to allow.

X.7.5.3 was moved so all the container construction issues are in the same place.

X.7.5.5 adds requirements, similar to health care on items in corridors, to permit containers only on one side, grouping and separation.

X.7.5.6 Limits the time containers and trash can be in the corridor. Also based on fire death and injury data limits the times to when most residents of the building would be awake in the event of a fire. By permitting during hours of sleeping it will take longer for occupants to escape in the event of a fire.

x.7.5.8 requires fire sprinkler to control the fire permitting occupants to exit the building before the environment gets to toxic. Hold the fire for fire fighters to gain entry and extinguish.

Committee Statement

Committee Action: Rejected

Resolution: The intent of section 30.7.5.6 is that containers can be in the corridor for a total of 18 hours, while the intent of section 30.7.5.7 is that if there is combustible trash or any recycling materials can only occupy the corridor not exceeding 5 hours. The language is clear. HOAs currently regulate the amount of time trash containers can be at the curb, this is a similar scenario. Having timeframes also gives a management company a target for developing a valet trash program, and such targets are important.

Public Comment No. 54-NFPA 101-2022 [New Section after 30.7.5.7]

30.7.5.8 Valet trash collection services shall be permitted in building with an approved fire sprinkler systems is installed.

Statement of Problem and Substantiation for Public Comment

The committee has provided no technical substantiation for the proposed change.

The proposed text by the Residential TC has many concerns for AHJ's as well as fire and life safety: The proposed text is in conflict with proven fire safety principles used for many years which prohibit combustible materials in egress corridors. Past fire history has shown how combustibles in the means of egress contributes to fire spread, hampers firefighting efforts, and limits the occupant's ability to egress. Materials, especially combustible materials, are fire fighter safety issues as it creates a new fire load when stored in the means of egress and may inhibit quick and effective firefighting operations. Sprinklers would at least control the fire giving occupants and fire fighter time to leave the building or enter the building for fire fighting purposes.

For years one of the biggest violations to the code is storage, etc. in the means of egress. This proposal eliminates a basic fire safety of maintaining a clear and unobstructed means of egress for building occupants. The introduction of trash in corridors of any occupancy goes against the basic principles of egress for occupant and creates a fire and life safety, property protection and fire fighter safety hazard, and is in direct violation of section 7.1.10.1 Maintenance. Means of egress shall be continuously maintained free of all obstructions or impediments to full instant use in the case of fire or other emergency and 7.1.10.2.1 which states 7.1.10.2.1 No furnishings, decorations, or other objects shall obstruct exits or their access thereto, egress therefrom, or visibility thereof. 30 and 31.3.2.1.1 lists trash collection rooms as a hazardous area and requires protection over and above the occupancy requirements. 30 and 31.7.2.2 prohibits contents and furnishings of a highly flammable character from use outside the dwelling unit.

Conflicting provisions on how long the container can occupy the corridor 18 or 5 hours. It appears the TC is permitting the container to be empty in the corridor for 18 hours, trash can only be in the container for 5 hours. This has been noted by the CC. This is unenforceable and again no technical justification has been provided on these timeframes. The timeframe will extend well into the overnight hours which is when fires in residential properties pose the greatest risk.

No fire testing or fire modeling has been performed to justify or validate the proposed requirements in the residential setting.

Many of the provisions are not easily enforced due to the nature of the service.

Resolution: Chapter 30 already requires automatic sprinklers for new apartment buildings. Valet trash is not allowed in exit corridors, only exit access corridors. The proposed language does not restrict valet trash in non-sprinklered building only permits valet trash in sprinklered buildings.

Public Comment No. 188-NFPA 101-2022 [Section No. 31.3.5.10]

31.3.5.10

Portable fire extinguishers shall be provided in accordance with Section 9.9- ~~shall be provided in hazardous areas addressed by 31.3.2.4 , unless the building is protected throughout with an approved, supervised automatic sprinkler system in accordance with 31.3.5.2 ; _~~

Statement of Problem and Substantiation for Public Comment

A 2013 NFPA Report: “U.S. Experience with Sprinklers” reports that there were 48,460 reported structure fires annually in buildings equipped with sprinkler systems between 2007-2011, and 40,440 (83 percent) never grew large enough to activate the system. Based on this report alone, it’s clear that people are reacting to small fires and extinguishing them prior to sprinkler activation. Limiting a fire to the smallest area within a building is a sensible aspiration.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it’s small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public’s priorities and judgment for fight or flight are rational and appropriate.

Under the Scope of the Life Safety Code, Subsection 1.1.2 entitled, “Danger to Life form Fire,” the Code states the following: “The Code addresses those construction, protection, and occupancy features necessary to minimize danger to life from the effects of fire, including smoke, heat, and toxic gases created during a fire.” Further, it states in Subsection 1.1.4 entitled, “Other Fire-Related Considerations,” the following: “The Code addresses other considerations that are essential to life safety in recognition of the fact that life safety is more than a matter of egress. The Code also addresses protective features and systems, building services, operating features, maintenance activities, and other provisions in recognition of the fact that achieving an acceptable degree of life safety depends on additional safeguards to provide adequate egress time or protection for people exposed to fire.”

Studies of building fires indicate that occupants typically exhibit altruistic behavior toward others. Human response to a threatening situation might follow one of a variety of behaviors. Individuals might choose to investigate, sound an alarm, assist with rescue, seek help, or flee. Such actions constitute normal behavior, even when taken collectively. Most people avoid direct contact with a fire while undertaking another action.

There is a fundamental discrepancy between official/policy assumptions and the public in relation to priorities in the event of a fire. Government and professionals focus on avoiding injuries and see that as the sole aspiration, in the pursuit of which everything else is secondary. In contrast, the public have a wide and largely unrecognized range of priorities when encountering a fire, based on their individual circumstances. These include: the avoidance of embarrassment/inconvenience; mitigating the impact of damage to the property, e.g. avoiding the risk of being unable to remain in their place of business;

and their concern for the wellbeing of other people. Each are invested by different aspirations in the fire safety ecosystem.

A desire to achieve their self-appointed tasks is a strong motivation for the public's behavior when encountering a fire. For most, this will involve an active response of on average five actions, although for some it will be as many as 11. This includes investigating the initial cues and tackling the fire, often using improvised means. They are usually successful in doing so, with 70% to 80% of fires dealt with by the public without requiring professional assistance. It is important to note that in doing so, they are willingly acting against official advice and are not being coerced into this. The evidence shows the public to be effective and capable in tackling fires, even in the absence of any professional support, or often without specialized equipment. This is supported by the pioneering studies of the public experience of dwelling fires undertaken by Bryan (1977) and Wood (1972) in the USA and UK, respectively. Their studies supported by their findings that the public did undertake a range of self-appointed tasks including investigating and tackling fires. Recent studies have confirmed similar findings and these behaviors appear consistent over time.

The evidence further identifies that the public is willing and will accept minor consequences in their pursuit of achieving personal humanistic priorities and instinct. Concern for people, pets and possessions are strong and established drivers of behavior in the event of a fire. Therefore, this should be no surprise to see it as an influential feature of most individual's response to a fire.

A 2003 UK survey found that across all categories of location, extinguishers were successful in extinguishing 79.9% of fires. Note: Private houses accounted for only 3.3% of extinguisher use. It reported that 58.6% were operated by trained staff, 36.4% were operated by untrained staff and in 5% of incidents, this was unknown.

Data from the National Association of Fire Equipment Distributors (NAFED) provides even more robust validation of the influence of fire extinguishers as used by 'ordinary civilians. Their research and data indicate, "Of 13,221 fire incidents reported, portable fire extinguishers successfully extinguished 12,505 fires (95%)." (NAFED 2010: 2) The combined results of the 34 years of data are based on the performance of 32,756 fire extinguishers used on 13,453 incidents.

Fortunately, most people encountering a fire will avoid any injury or will be exposed to a low, and often considered risk of a minor injury at worst. This is not a matter of luck but due to a combination of their own abilities and to the low level of risk presented by most fires individuals would choose to fight at the incipient stage. A 2015 study identified that there was a disconnect between the fire service/government and the public in terms of what they referred to as 'risk tolerance'. This was most evident in attitude to injuries. Official policy seems to place avoidance of any injury as its highest priority and assumes this to also be the public's main motivation and enough to dictate any response to the discovery of a fire. However, the same study found that almost all those who incurred a minor injury accepted it as a reasonable cost in relation to pursuing or achieving their personal priorities. Further, they stated, in hindsight, they would do the same again.

It should be noted that numerous every day and discretionary activities carry similar or higher levels of risk to those resulting from using an extinguisher. Do-It-Yourself and sport for example are frequently responsible for injuries or even fatalities. In response, the government and industry seek to help make products safer or provide advice. This is preferred to denying people the option to participate in either activity by withdrawing public access to tools or sports equipment. The benefits achieved by the public using extinguishers are significant, given the potential for a fire to otherwise lead to detrimental and life-changing outcomes. A low and calculated level of personal risk willingly accepted by an individual tackling a fire can avoid, or reduce, a much higher risk to others should they ignore the fire and allow it to develop. Where current guidance discourages the provision of extinguishers in public spaces, this policy is neither supported by the evidence or justifiable through a consensus from the public. Rather it is imposed on them and is inconsistent with other approaches to public health.

The fire service's response time to structure fires has increased significantly over the past 25 years for several reasons like traffic, infrastructures, and lately staffing. Hence, the ability for the early interventions of the public are likely to be the most significant determinant of the outcome of a fire event. Most people do respond appropriately, and the literature confirms that they do not panic. Typically, most people are at risk of a minor injury at worst, due to the low risk from the fire and their own ability to assess and act in accordance with the situation.

A significant amount of data has been collected to support the requirement for portable extinguishers, including: WPI/EKU Study: "Ordinary People and the Effective Operation of Fire Extinguishers", which clearly showed that the vast majority of people who have never used an extinguisher can operate one safely and effectively. This willingness of the public to accept minor injuries to protect individuals, the facility or their personal property is supported by literature and data and shows these to be well established behaviors which policy makers need to work with, rather than against.

Reflecting official policy, national and local fire safety messaging has, for some time, urged the public, on discovering a fire in the home, to "Get out, stay out", "Don't put yourself at risk" and 'Leave it to the professionals.' This paternalistic messaging confirms the government policy makers and fire services' belief that a professional response is the only intervention capable of safely tackling fires. Again, this starkly contrasts with the reality that between 70% and 80% of dwelling fires are tackled effectively and at low risk, by the public. The policy also fails to accord with the public who have been shown to be tolerant, or accepting, of the incurrence of minor injuries in pursuit of their personal priorities.

Surveys from the National Association of Fire Equipment Distributors (NAFED) in America reveals the same trend of public firefighting, with even higher percentages not needing the fire service. "In both the 1979 and 1985 surveys, the fire department was only called for 13% of the reported fires. In the 1996 survey, the fire department was called in 24% of the reported fires. However, in the 2010 survey the number dropped to 17% of the time'. And 'These results are not unique to NAFED surveys. A 1978 publication by the U.S. Department of Commerce stated that about 90% of fires in households are not reported, based on their survey of 33,000 fires." (NAFED, 2010: 9)

The public are likely to encounter a fire that is relatively small and often contained to the item first ignited. They are often the ones present when fire starts. In summary, there is a significant difference between official assumptions/guidance and actual public behavior. However, the government and FRS seek to deter this behavior, and, in singularly promoting there, "Get out' message," and remove the simple yet potential life saving devices in sprinklered buildings.

A recent study also showed that the public do not just get out, with 49% never leaving the property during the fire. While this may surprise or concern many professionals, it is likely to be explained by a difference between the fire as perceived by professionals and the lived experience of the public. There is nothing to suggest that the public routinely take unnecessary risks. A more likely explanation is that the fire was small and not sufficiently well-developed to pose an imminent injury or life threat. As such, they were able to remain in the premises safely and relatively comfortably, which is supported by the evidence in relation to the majority of fires not spreading beyond the item first ignited or the room of origin. Inclement weather or other factors may also make remaining in the premises a safer or more comfortable option. Fires, like other emergencies, must also be understood in human terms.

The concept of trading off portable extinguishers in sprinklered buildings has been largely abandoned by fire protection principles. NFPA 10 states in subsection 5.1.2, "The selection of extinguishers shall be independent of whether the building is equipped with automatic sprinklers, standpipe and hose, or other fixed protection equipment." Other codes, and other occupancy chapters have abandoned this concept in recognition of the fact that portable extinguishers are a valuable, cost-effective layer of fire protection, and are intended for a different purpose than sprinklers. Recognition of the valuable role of extinguishers came from a 2003 report which concluded, 'Fire extinguishers are designed to prevent relatively minor incidents becoming major conflagrations.' It is, of course, difficult to prove how many and which fires would have developed to pose a serious risk if not tackled and contained early on. Events such as the Grenfell fire are a reminder of the consequences when this happens.

The National Fire Codes of both NFPA and the ICC require portable fire extinguishers in all occupancy classes including storage which addresses property protection and property loss as well as, the safety of the building occupants. Fire safety is grounded in the engineering discipline which brings many strengths to codes requirements, but it is insufficient, and fire safety effectiveness is limited by ignoring the social sciences of human behavior. It is important to appreciate that while different to official assumptions and desire for evacuation, research shows the public's priorities to be rational and appropriate. The public's experience of fire is vastly different to that of the professionals involved in the planning for and responding to fire.

Official policy and attitudes of the Technical Committee are most singularly directed at avoiding the risk when the public encounters a fire. This is well meaning but the research has shown that this DOES

NOT I REPEAT DOES NOT align with the publics' attitude or the ability of the general public. The belief that 'undesirable' behavior can be changed by advice, campaigns or other measures has been shown to be inaccurate. The paternalistic approach by which government and the building safety regulatory sector seek to change human behavior by removing proven and effective appliances such as portable fire extinguishers is WRONG. However, the building safety regulatory sector continue this approach despite the evidence that public behaviors are safe, effective, and largely unaltered by current guidance and campaigns rather than providing appropriate safety devices for use by the public. A portable fire extinguisher is an effective item of fire protection which allows for small fires to be tackled by the occupants of a building and saves 100s of thousands of dollars in property loss.

Concerns have been indicted regarding the requirement for training. Training in the use of extinguishers is an important issue and one in which opinion appears more influential than the evidence. Whether purchased for a private dwelling or provided through regulatory processes, there is no mandatory requirement for training to use an extinguisher, and studies do not reveal training to be a requirement for their safe or effective use. In fact, the available data and studies demonstrate the opposite to be the case.

The Technical Committee should also note that portable fire extinguishers are designed for the novice user. Although, training is recommended for proper use and technique and is wide available through a variety of resources including at online training; there are no specified training requirements even under OSHA unless that is an assigned duty employee by the employer. The proposed requirement is intended as a provision for layered fire protection for the general public and employees for general safety.

Although there is limited data available related to extinguisher use since the removal of portable fire extinguishers in the NIFRS data field, there is little to no data supporting the removal of portable fire extinguishers and sole reliance on building fire sprinkler systems. Limiting a fire to the smallest area within a building is a sensible aspiration.

Cost has been another point of contention. A study by Richard Bukowski in 2014, the life cycle cost of portable fire extinguishers was determined to be between one and a half and four cents per foot annually; if coverage could be maximized to that allowable by code, the cost drops to between a half cent and one cent per foot annually. It's unlikely that any other layer of fire protection is so cost-effective.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Committee Statement

**Committee
Action:** Rejected

Resolution: The intent of not providing fire extinguishers is to allow people to escape and not try to extinguish the fire, allowing trained personnel to handle the fire. The requirement for extinguishers also adds a requirement for the building owner to provide training as well as maintenance. Providing fire extinguishers is a challenge based on cost of providing and maintaining them. There are also instances of misuse by the occupants. The code does not restrict the use of fire extinguishers, therefore fire extinguishers can be added but are not required to be added. The added substantiation provided by the submitter does not provide a reason for the technical committee to change it's decision from the first draft meeting.

Public Comment No. 189-NFPA 101-2022 [Section No. 31.3.5.10]

31.3.5.10

Portable fire extinguishers in accordance with Section 9.9 shall be provided in hazardous areas addressed by 31.3.2.1, ~~unless the building is protected throughout with an approved, supervised automatic sprinkler system in accordance with 31.3.5.2~~.

Statement of Problem and Substantiation for Public Comment

A 2013 NFPA Report: "U.S. Experience with Sprinklers" reports that there were 48,460 reported structure fires annually in buildings equipped with sprinkler systems between 2007-2011, and 40,440 (83 percent) never grew large enough to activate the system. Based on this report alone, it's clear that people are reacting to small fires and extinguishing them prior to sprinkler activation. Limiting a fire to the smallest area within a building is a sensible aspiration.

To avoid addressing fires in their earliest stages is counter-intuitive, and studies have shown that people will almost always attempt to extinguish a fire if it's small and they believe they can mitigate the hazard. Thus, it is important to give the public the intelligently designed and placed tools intended for their use and not the necessarily firefighters. If a fire extinguisher is not available, people have (and will continue to) use makeshift means to try to extinguish the fire, which is far less safe than using a portable extinguisher that is designed for safe and effective use by novices. (Ref: An Evaluation of the Role of Fire Extinguishers by David Wales)

The Technical Committee should note that by adding this requirement, the committee is not requiring an individual to stay in a building and fight a fire but, is providing an everyday tool for an individual to utilize in the event that a fire is discovered in its incipient stages and allows for the protection of not only life but also the preservation of property. A portable fire extinguisher is an item which allows for small fires to be tackled by members of the public and it is important to appreciate that while different to official assumptions, research shows the public's priorities and judgment for fight or flight are rational and appropriate.

Under the Scope of the Life Safety Code, Subsection 1.1.2 entitled, "Danger to Life from Fire," the Code states the following: "The Code addresses those construction, protection, and occupancy features necessary to minimize danger to life from the effects of fire, including smoke, heat, and toxic gases created during a fire." Further, it states in Subsection 1.1.4 entitled, "Other Fire-Related Considerations," the following: "The Code addresses other considerations that are essential to life safety in recognition of the fact that life safety is more than a matter of egress. The Code also addresses protective features and systems, building services, operating features, maintenance activities, and other provisions in recognition of the fact that achieving an acceptable degree of life safety depends on additional safeguards to provide adequate egress time or protection for people exposed to fire."

Studies of building fires indicate that occupants typically exhibit altruistic behavior toward others. Human response to a threatening situation might follow one of a variety of behaviors. Individuals might choose to investigate, sound an alarm, assist with rescue, seek help, or flee. Such actions constitute normal behavior, even when taken collectively. Most people avoid direct contact with a fire while undertaking another action.

There is a fundamental discrepancy between official/policy assumptions and the public in relation to priorities in the event of a fire. Government and professionals focus on avoiding injuries and see that as the sole aspiration, in the pursuit of which everything else is secondary. In contrast, the public have a wide and largely unrecognized range of priorities when encountering a fire, based on their individual circumstances. These include: the avoidance of embarrassment/inconvenience; mitigating the impact of damage to the property, e.g. avoiding the risk of being unable to remain in their place of business;

and their concern for the wellbeing of other people. Each are invested by different aspirations in the fire safety ecosystem.

A desire to achieve their self-appointed tasks is a strong motivation for the public's behavior when encountering a fire. For most, this will involve an active response of on average five actions, although for some it will be as many as 11. This includes investigating the initial cues and tackling the fire, often using improvised means. They are usually successful in doing so, with 70% to 80% of fires dealt with by the public without requiring professional assistance. It is important to note that in doing so, they are willingly acting against official advice and are not being coerced into this. The evidence shows the public to be effective and capable in tackling fires, even in the absence of any professional support, or often without specialized equipment. This is supported by the pioneering studies of the public experience of dwelling fires undertaken by Bryan (1977) and Wood (1972) in the USA and UK, respectively. Their studies supported by their findings that the public did undertake a range of self-appointed tasks including investigating and tackling fires. Recent studies have confirmed similar findings and these behaviors appear consistent over time.

The evidence further identifies that the public is willing and will accept minor consequences in their pursuit of achieving personal humanistic priorities and instinct. Concern for people, pets and possessions are strong and established drivers of behavior in the event of a fire. Therefore, this should be no surprise to see it as an influential feature of most individual's response to a fire.

A 2003 UK survey found that across all categories of location, extinguishers were successful in extinguishing 79.9% of fires. Note: Private houses accounted for only 3.3% of extinguisher use. It reported that 58.6% were operated by trained staff, 36.4% were operated by untrained staff and in 5% of incidents, this was unknown.

Data from the National Association of Fire Equipment Distributors (NAFED) provides even more robust validation of the influence of fire extinguishers as used by 'ordinary civilians. Their research and data indicate, "Of 13,221 fire incidents reported, portable fire extinguishers successfully extinguished 12,505 fires (95%)." (NAFED 2010: 2) The combined results of the 34 years of data are based on the performance of 32,756 fire extinguishers used on 13,453 incidents.

Fortunately, most people encountering a fire will avoid any injury or will be exposed to a low, and often considered risk of a minor injury at worst. This is not a matter of luck but due to a combination of their own abilities and to the low level of risk presented by most fires individuals would choose to fight at the incipient stage. A 2015 study identified that there was a disconnect between the fire service/government and the public in terms of what they referred to as 'risk tolerance'. This was most evident in attitude to injuries. Official policy seems to place avoidance of any injury as its highest priority and assumes this to also be the public's main motivation and enough to dictate any response to the discovery of a fire. However, the same study found that almost all those who incurred a minor injury accepted it as a reasonable cost in relation to pursuing or achieving their personal priorities. Further, they stated, in hindsight, they would do the same again.

It should be noted that numerous every day and discretionary activities carry similar or higher levels of risk to those resulting from using an extinguisher. Do-It-Yourself and sport for example are frequently responsible for injuries or even fatalities. In response, the government and industry seek to help make products safer or provide advice. This is preferred to denying people the option to participate in either activity by withdrawing public access to tools or sports equipment. The benefits achieved by the public using extinguishers are significant, given the potential for a fire to otherwise lead to detrimental and life-changing outcomes. A low and calculated level of personal risk willingly accepted by an individual tackling a fire can avoid, or reduce, a much higher risk to others should they ignore the fire and allow it to develop. Where current guidance discourages the provision of extinguishers in public spaces, this policy is neither supported by the evidence or justifiable through a consensus from the public. Rather it is imposed on them and is inconsistent with other approaches to public health.

The fire service's response time to structure fires has increased significantly over the past 25 years for several reasons like traffic, infrastructures, and lately staffing. Hence, the ability for the early interventions of the public are likely to be the most significant determinant of the outcome of a fire event. Most people do respond appropriately, and the literature confirms that they do not panic. Typically, most people are at risk of a minor injury at worst, due to the low risk from the fire and their own ability to assess and act in accordance with the situation.

A significant amount of data has been collected to support the requirement for portable extinguishers, including: WPI/EKU Study: "Ordinary People and the Effective Operation of Fire Extinguishers", which clearly showed that the vast majority of people who have never used an extinguisher can operate one safely and effectively. This willingness of the public to accept minor injuries to protect individuals, the facility or their personal property is supported by literature and data and shows these to be well established behaviors which policy makers need to work with, rather than against.

Reflecting official policy, national and local fire safety messaging has, for some time, urged the public, on discovering a fire in the home, to "Get out, stay out", "Don't put yourself at risk" and 'Leave it to the professionals.' This paternalistic messaging confirms the government policy makers and fire services' belief that a professional response is the only intervention capable of safely tackling fires. Again, this starkly contrasts with the reality that between 70% and 80% of dwelling fires are tackled effectively and at low risk, by the public. The policy also fails to accord with the public who have been shown to be tolerant, or accepting, of the incurrence of minor injuries in pursuit of their personal priorities.

Surveys from the National Association of Fire Equipment Distributors (NAFED) in America reveals the same trend of public firefighting, with even higher percentages not needing the fire service. "In both the 1979 and 1985 surveys, the fire department was only called for 13% of the reported fires. In the 1996 survey, the fire department was called in 24% of the reported fires. However, in the 2010 survey the number dropped to 17% of the time'. And 'These results are not unique to NAFED surveys. A 1978 publication by the U.S. Department of Commerce stated that about 90% of fires in households are not reported, based on their survey of 33,000 fires." (NAFED, 2010: 9)

The public are likely to encounter a fire that is relatively small and often contained to the item first ignited. They are often the ones present when fire starts. In summary, there is a significant difference between official assumptions/guidance and actual public behavior. However, the government and FRS seek to deter this behavior, and, in singularly promoting there, "Get out' message," and remove the simple yet potential life saving devices in sprinklered buildings.

A recent study also showed that the public do not just get out, with 49% never leaving the property during the fire. While this may surprise or concern many professionals, it is likely to be explained by a difference between the fire as perceived by professionals and the lived experience of the public. There is nothing to suggest that the public routinely take unnecessary risks. A more likely explanation is that the fire was small and not sufficiently well-developed to pose an imminent injury or life threat. As such, they were able to remain in the premises safely and relatively comfortably, which is supported by the evidence in relation to the majority of fires not spreading beyond the item first ignited or the room of origin. Inclement weather or other factors may also make remaining in the premises a safer or more comfortable option. Fires, like other emergencies, must also be understood in human terms.

The concept of trading off portable extinguishers in sprinklered buildings has been largely abandoned by fire protection principles. NFPA 10 states in subsection 5.1.2, "The selection of extinguishers shall be independent of whether the building is equipped with automatic sprinklers, standpipe and hose, or other fixed protection equipment." Other codes, and other occupancy chapters have abandoned this concept in recognition of the fact that portable extinguishers are a valuable, cost-effective layer of fire protection, and are intended for a different purpose than sprinklers. Recognition of the valuable role of extinguishers came from a 2003 report which concluded, 'Fire extinguishers are designed to prevent relatively minor incidents becoming major conflagrations.' It is, of course, difficult to prove how many and which fires would have developed to pose a serious risk if not tackled and contained early on. Events such as the Grenfell fire are a reminder of the consequences when this happens.

The National Fire Codes of both NFPA and the ICC require portable fire extinguishers in all occupancy classes including storage which addresses property protection and property loss as well as, the safety of the building occupants. Fire safety is grounded in the engineering discipline which brings many strengths to codes requirements, but it is insufficient, and fire safety effectiveness is limited by ignoring the social sciences of human behavior. It is important to appreciate that while different to official assumptions and desire for evacuation, research shows the public's priorities to be rational and appropriate. The public's experience of fire is vastly different to that of the professionals involved in the planning for and responding to fire.

Official policy and attitudes of the Technical Committee are most singularly directed at avoiding the risk when the public encounters a fire. This is well meaning but the research has shown that this DOES

NOT I REPEAT DOES NOT align with the publics' attitude or the ability of the general public. The belief that 'undesirable' behavior can be changed by advice, campaigns or other measures has been shown to be inaccurate. The paternalistic approach by which government and the building safety regulatory sector seek to change human behavior by removing proven and effective appliances such as portable fire extinguishers is WRONG. However, the building safety regulatory sector continue this approach despite the evidence that public behaviors are safe, effective, and largely unaltered by current guidance and campaigns rather than providing appropriate safety devices for use by the public. A portable fire extinguisher is an effective item of fire protection which allows for small fires to be tackled by the occupants of a building and saves 100s of thousands of dollars in property loss.

Concerns have been indicted regarding the requirement for training. Training in the use of extinguishers is an important issue and one in which opinion appears more influential than the evidence. Whether purchased for a private dwelling or provided through regulatory processes, there is no mandatory requirement for training to use an extinguisher, and studies do not reveal training to be a requirement for their safe or effective use. In fact, the available data and studies demonstrate the opposite to be the case.

The Technical Committee should also note that portable fire extinguishers are designed for the novice user. Although, training is recommended for proper use and technique and is wide available through a variety of resources including at online training; there are no specified training requirements even under OSHA unless that is an assigned duty employee by the employer. Public Comment No. 113-NFPA 101-2022 [Section No. 31.7.5]

31.7.5 – Valet Trash Collection Services.

31.7.5.1 –

Combustible trash or recycling materials in corridors or on egress balconies awaiting scheduled collection shall be placed completely inside a container that does not exceed a capacity of 15 gal (60 L) in corridors and 22 gal (95 L) on egress balconies.

31.7.5.2 –

Valet trash and recycling containers shall meet all of the following requirements:

- (1) The containers shall be of liquidtight construction.
- (2) The containers shall be equipped with lids.
- (3) The lids shall be in the fully closed position.

31.7.5.3 –

Containers and lids shall be constructed entirely of noncombustible materials or materials that meet a peak rate of heat release not exceeding 300 kW/m^2 when tested in accordance with ASTM E1354, *Standard Test Method for Heat and Visible Smoke Release Rates for Materials and Products Using an Oxygen Consumption Calorimeter*, at an incident heat flux of 50 kW/m^2 in the horizontal orientation.

31.7.5.4 –

Containers shall not be required to comply with 31.7.5.3 for the following:

- (1) Containers in sprinklered corridors or egress balconies in buildings provided with a sprinkler system complying with 31.3.5
- (2) Containers on egress balconies in buildings with noncombustible or limited combustible exteriors.

31.7.5.5 –

Containers shall not obstruct the minimum egress width required by 31.2.3.

31.7.5.6 –

Containers shall not occupy a corridor for a single period exceeding 18 hours.

31.7.5.7 –

Combustible trash or recycling materials shall not occupy a corridor for a single period exceeding 5 hours.

Statement of Problem and Substantiation for Public Comment

The committee has provided no technical substantiation for the proposed change.

The proposed text by the Residential TC has many concerns for AHJ's as well as fire and life safety: The proposed text is in conflict with proven fire safety principles used for many years which prohibit combustible materials in egress corridors. Past fire history has shown how combustibles in the means of egress contributes to fire spread, hampers firefighting efforts, and limits the occupant's ability to egress. Materials, especially combustible materials, are fire fighter safety issues as it creates a new

fire load when stored in the means of egress and may inhibit quick and effective firefighting operations.

For years one of the biggest violations to the code is storage, etc. in the means of egress. This proposal eliminates a basic fire safety of maintaining a clear and unobstructed means of egress for building occupants. The introduction of trash in corridors of any occupancy goes against the basic principles of egress for occupant and creates a fire and life safety, property protection and fire fighter safety hazard, and is in direct violation of section 7.1.10.1 Maintenance. Means of egress shall be continuously maintained free of all obstructions or impediments to full instant use in the case of fire or other emergency and 7.1.10.2.1 which states 7.1.10.2.1 No furnishings, decorations, or other objects shall obstruct exits or their access thereto, egress therefrom, or visibility thereof. 30 and 31.3.2.1.1 lists trash collection rooms as a hazardous area and requires protection over and above the occupancy requirements. 30 and 31.7.2.2 prohibits contents and furnishings of a highly flammable character from use outside the dwelling unit.

Conflicting provisions on how long the container can occupy the corridor 18 or 5 hours. It appears the TC is permitting the container to be empty in the corridor for 18 hours, trash can only be in the container for 5 hours. This has been noted by the CC. This is unenforceable and again no technical justification has been provided on these timeframes. The timeframe will extend well into the overnight hours which is when fires in residential properties pose the greatest risk.

No fire testing or fire modeling has been performed to justify or validate the proposed requirements in the residential setting.

Many of the provisions are not easily enforced due to the nature of the service.

X.7.5.1 was added to let the ahj determine if valet trash would be permitted for the specific building taking into account protection, past issues with the building, occupants of valet trash company. As currently proposed, it is a blanket permission to allow.

X.7.5.3 was moved so all the container construction issues are in the same place.

X.7.5.5 adds requirements, similar to health care on items in corridors, to permit containers only on one side, grouping and separation.

X.7.5.6 Limits the time containers and trash can be in the corridor. Also based on fire death and injury data limits the times to when most residents of the building would be awake in the event of a fire. By permitting during hours of sleeping it will take longer for occupants to escape in the event of a fire.

x.7.5.8 requires fire sprinkler to control the fire permitting occupants to exit the building before the environment gets to toxic. Hold the fire for fire fighters to gain entry and extinguish.

Containers and lids shall be constructed entirely of noncombustible materials or materials that meet a peak rate of heat release not exceeding 300 kW/m^2 when tested in accordance with ASTM E1354, *Standard Test Method for Heat and Visible Smoke Release Rates for Materials and Products Using an Oxygen Consumption Calorimeter*, at an incident heat flux of 50 kW/m^2 in the horizontal orientation.

31.7.5.4 –

Containers shall not be required to comply with 31.7.5.3 for the following:

- (1) Containers in sprinklered corridors or egress balconies in buildings provided with a sprinkler system complying with 31.3.5
- (2) Containers on egress balconies in buildings with noncombustible or limited combustible exteriors.

31.7.5.5 –

Containers shall not obstruct the minimum egress width required by 31.2.3.

31.7.5.6 –

Containers shall not occupy a corridor for a single period exceeding 18 hours.

31.7.5.7 –

Combustible trash or recycling materials shall not occupy a corridor for a single period exceeding 5 hours.

Statement of Problem and Substantiation for Public Comment

The committee has provided no technical substantiation for the proposed change.

The proposed text by the Residential TC has many concerns for AHJ's as well as fire and life safety: The proposed text is in conflict with proven fire safety principles used for many years which prohibit combustible materials in egress corridors. Past fire history has shown how combustibles in the means of egress contributes to fire spread, hampers firefighting efforts, and limits the occupant's ability to egress. Materials, especially combustible materials, are fire fighter safety issues as it creates a new

fire load when stored in the means of egress and may inhibit quick and effective firefighting operations.

For years one of the biggest violations to the code is storage, etc. in the means of egress. This proposal eliminates a basic fire safety of maintaining a clear and unobstructed means of egress for building occupants. The introduction of trash in corridors of any occupancy goes against the basic principles of egress for occupant and creates a fire and life safety, property protection and fire fighter safety hazard, and is in direct violation of section 7.1.10.1 Maintenance. Means of egress shall be continuously maintained free of all obstructions or impediments to full instant use in the case of fire or other emergency and 7.1.10.2.1 which states 7.1.10.2.1 No furnishings, decorations, or other objects shall obstruct exits or their access thereto, egress therefrom, or visibility thereof. 30 and 31.3.2.1.1 lists trash collection rooms as a hazardous area and requires protection over and above the occupancy requirements. 30 and 31.7.2.2 prohibits contents and furnishings of a highly flammable character from use outside the dwelling unit.

Conflicting provisions on how long the container can occupy the corridor 18 or 5 hours. It appears the TC is permitting the container to be empty in the corridor for 18 hours, trash can only be in the container for 5 hours. This has been noted by the CC. This is unenforceable and again no technical justification has been provided on these timeframes. The timeframe will extend well into the overnight hours which is when fires in residential properties pose the greatest risk.

No fire testing or fire modeling has been performed to justify or validate the proposed requirements in the residential setting.

Many of the provisions are not easily enforced due to the nature of the service.

Committee Statement

Committee Action: Rejected

Resolution: The substantiations did not provide enough information to remove the Valet Trash section. The language in the requirement was provided by a task group with a wide range of stakeholders. If there is no language in the code, valet trash is still allowed but there will be no requirements on how it is done.

Public Comment No. 56-NFPA 101-2022 [Section No. 31.7.5]

31.7.5

—

Valet Trash Collection Services.

31.7.5.1 Where permitted by the AHJ, combustible trash or recycling materials shall comply with 30.7.5.

31.7.5.1 —

Combustible trash or recycling materials in corridors or on egress balconies awaiting scheduled collection shall be placed completely inside a container that does not exceed a capacity of 15 gal (60 L) in corridors and 22 gal (95 L) on egress balconies.

31.7.5.2

—

Valet

Valet trash and recycling containers shall meet all of the following requirements:

- ~~The containers shall be of liquidtight construction.~~
- ~~The containers shall be equipped with lids.~~
- ~~The lids shall be in the fully closed position.~~

31.7.5.3 —

- ~~Containers in sprinklered corridors or egress balconies in buildings provided with a sprinkler system complying with 31.3.5~~

Containers

~~(1) — Containers and lids shall be constructed entirely of noncombustible materials or materials that meet a peak rate of heat release not exceeding 300 kW/m^2 when tested in accordance with ASTM E1354, *Standard Test Method for Heat and Visible Smoke Release Rates for Materials and Products Using an Oxygen Consumption Calorimeter*, at an incident heat flux of 50 kW/m^2 in the horizontal orientation.~~

31.7.5.4 —

~~Containers shall not be required to comply with 31.7.5.3 for the following:~~

~~(2) The containers shall be of liquidtight construction.~~

~~(3) The containers shall be equipped with lids.~~

~~(4) The lids shall be in the fully closed position.~~

~~(5) Containers shall be placed on the same side of the corridor.~~

~~(6) Containers shall be - located so as to not obstruct access to building service and fire protection equipment.~~

~~(7) Containers shall be grouped such that each grouping does not exceed a projected floor area of 400sqin (3.7 m2).~~

~~(8) - More than two containers shall be in each grouping.~~

~~(9) The groupings addressed in (7) are separated from each other by a distance of at least 10 ft (3050 mm).~~

~~31.7.5.3 -~~

~~Containers shall not be required to comply with 30.7.5.2 (1) on egress balconies in buildings with noncombustible or limited combustible exteriors.~~

~~31.7.5.~~

~~5~~

~~4 -~~

~~Containers shall not obstruct the minimum egress width required by~~

~~31~~

~~30.2.3.~~

~~31.7.5.~~

~~6~~

~~5 -~~

~~Containers shall not occupy a corridor for a single period exceeding~~

~~18 hours~~

~~12 hours between the hours of 7am to 7pm .~~

~~31.7.5.~~

~~7~~

~~6 -~~

~~Combustible trash or recycling materials shall not occupy a corridor for a single period exceeding 5 hours between the hours of 7am to 7pm .~~

~~31.7.5.7 Building where valet trash collection services are permitted shall have an approved fire sprinkler system installed.~~

Statement of Problem and Substantiation for Public Comment

The committee has provided no technical substantiation for the proposed change.

The proposed text by the Residential TC has many concerns for AHJ's as well as fire and life safety: The proposed text is in conflict with proven fire safety principles used for many years which prohibit combustible materials in egress corridors. Past fire history has shown how combustibles in the means of egress contributes to fire spread, hampers firefighting efforts, and limits the occupant's ability to egress. Materials, especially combustible materials, are fire fighter safety issues as it creates a new

fire load when stored in the means of egress and may inhibit quick and effective firefighting operations.

For years one of the biggest violations to the code is storage, etc. in the means of egress. This proposal eliminates a basic fire safety of maintaining a clear and unobstructed means of egress for building occupants. The introduction of trash in corridors of any occupancy goes against the basic principles of egress for occupant and creates a fire and life safety, property protection and fire fighter safety hazard, and is in direct violation of section 7.1.10.1 Maintenance. Means of egress shall be continuously maintained free of all obstructions or impediments to full instant use in the case of fire or other emergency and 7.1.10.2.1 which states 7.1.10.2.1 No furnishings, decorations, or other objects shall obstruct exits or their access thereto, egress therefrom, or visibility thereof. 30 and 31.3.2.1.1 lists trash collection rooms as a hazardous area and requires protection over and above the occupancy requirements. 30 and 31.7.2.2 prohibits contents and furnishings of a highly flammable character from use outside the dwelling unit.

Conflicting provisions on how long the container can occupy the corridor 18 or 5 hours. It appears the TC is permitting the container to be empty in the corridor for 18 hours, trash can only be in the container for 5 hours. This has been noted by the CC. This is unenforceable and again no technical justification has been provided on these timeframes. The timeframe will extend well into the overnight hours which is when fires in residential properties pose the greatest risk.

No fire testing or fire modeling has been performed to justify or validate the proposed requirements in the residential setting.

Many of the provisions are not easily enforced due to the nature of the service.

X.7.5.1 was added to let the ahj determine if valet trash would be permitted for the specific building taking into account protection, past issues with the building, occupants of valet trash company. As currently proposed, it is a blanket permission to allow.

X.7.5.3 was moved so all the container construction issues are in the same place.

X.7.5.5 adds requirements, similar to health care on items in corridors, to permit containers only on one side, grouping and separation.

X.7.5.5 Limits the time containers and trash can be in the corridor. Also based on fire death and injury data limits the times to when most residents of the building would be awake in the event of a fire. By permitting during hours of sleeping it will take longer for occupants to escape in the event of a fire.

x.7.5.7 requires fire sprinkler to control the fire permitting occupants to exit the building before the environment gets to toxic. Hold the fire for fire fighters to gain entry and extinguish.

Committee: SAF-RES

Committee Statement

Committee Action: Rejected

Resolution: The intent of section 31.7.5.6 is that containers can be in the corridor for a total of 18 hours, while the intent of section 31.7.5.7 is that if there is combustible trash or any recycling materials can only occupy the corridor not exceeding 5 hours. The language is clear. HOAs currently regulate the amount of time trash containers can be at the curb, this is a similar scenario. Having timeframes also gives a management company a target for developing a valet trash program, and such targets are important.

Statement of Problem and Substantiation for Public Comment

The committee has provided no technical substantiation for the proposed change.

The proposed text by the Residential TC has many concerns for AHJ's as well as fire and life safety: The proposed text is in conflict with proven fire safety principles used for many years which prohibit combustible materials in egress corridors. Past fire history has shown how combustibles in the means of egress contributes to fire spread, hampers firefighting efforts, and limits the occupant's ability to egress. Materials, especially combustible materials, are fire fighter safety issues as it creates a new fire load when stored in the means of egress and may inhibit quick and effective firefighting operations. Sprinklers would at least control the fire giving occupants and fire fighter time to leave the building or enter the building for fire fighting purposes.

For years one of the biggest violations to the code is storage, etc. in the means of egress. This proposal eliminates a basic fire safety of maintaining a clear and unobstructed means of egress for building occupants. The introduction of trash in corridors of any occupancy goes against the basic principles of egress for occupant and creates a fire and life safety, property protection and fire fighter safety hazard, and is in direct violation of section 7.1.10.1 Maintenance. Means of egress shall be continuously maintained free of all obstructions or impediments to full instant use in the case of fire or other emergency and 7.1.10.2.1 which states 7.1.10.2.1 No furnishings, decorations, or other objects shall obstruct exits or their access thereto, egress therefrom, or visibility thereof. 30 and 31.3.2.1.1 lists trash collection rooms as a hazardous area and requires protection over and above the occupancy requirements. 30 and 31.7.2.2 prohibits contents and furnishings of a highly flammable character from use outside the dwelling unit.

Conflicting provisions on how long the container can occupy the corridor 18 or 5 hours. It appears the TC is permitting the container to be empty in the corridor for 18 hours, trash can only be in the container for 5 hours. This has been noted by the CC. This is unenforceable and again no technical justification has been provided on these timeframes. The timeframe will extend well into the overnight hours which is when fires in residential properties pose the greatest risk.

No fire testing or fire modeling has been performed to justify or validate the proposed requirements in the residential setting.

Many of the provisions are not easily enforced due to the nature of the service.

Public Comment No. 43-NFPA 101-2022 [Section No. A.24.2.8.1.3]

A.24.2.8.1.3

The *Code* does not require water closet grab bars and stanchions to be installed to improve the usability and safety of water closets. "Where provided," water closet grab bars and stanchions might be in close proximity to bathtubs or showers and could be used to comply with the bathtub or shower grab bar requirements. Preferences for two vertical points of control for water closets include one installed on each side and one in front of the water closet. One of these could be installed in accordance with the requirements for a bathtub or shower. The requirements for grab bars in showers and bathtubs was added to the scope of the *Code* in 2018. Insights on best practices can be found in the study by Kenny et al. "Toilet Grab-Bar Preference and Center of Pressure Deviation During Toilet Transfers in Healthy Seniors, Seniors With Hip Replacements, and Seniors Having Suffered a Stroke." ICC-A117.1, *Accessible and Usable Buildings and Facilities*, is an additional reference for ambulatory accessible water closets.

SUBJECT: NFPA 101® Second Draft TC FINAL Ballot Results (A2023)

According to the final ballot results, all ballot items received the necessary affirmative votes to pass ballot.

31 **Members Eligible to Vote**

5 **Members Not Returned** (*Haidar, Ramseur, Shah, Sharry, Zwirn*)

The attached report shows the number of affirmative, negative, and abstaining votes as well as the explanation of the vote for **each** revision.

To pass ballot, **each** revision requires: (1) a simple majority of those eligible to vote and (2) an affirmative vote of $\frac{2}{3}$ of ballots returned. See Sections 3.3.4.3.(c) and 4.3.10.1 of the ***Regulations Governing the Development of NFPA Standards***.

Second Revision No. 6643-NFPA 101-2022 [Section No. 24.2.8]

24.2.8* ~~Grab Bars and Stanchions for Bathtubs, Bathtub-Shower Combinations, Showers and, if Provided, for Water Closets .~~

24.2.8.1 General.

24.2.8.1.1

New bathtubs, bathtub-shower combinations, and showers shall be provided with grab bars or stanchions unless otherwise permitted by 24.2.8.1.2.

24.2.8.1.2*

Grab bars or stanchions shall not be required in showers where the transition from the room floor to the shower floor does not exceed 0.5 in. (13 mm) in height and all shower surfaces are slip resistant when wet.

24.2.8.1.3*

Where provided for bathing and showering, grab bars or stanchions shall comply with 24.2.8.2 through 24.2.8.4.

24.2.8.1.4

Where grab bars and stanchions are provided for increased safety or usability of water closets, grab bars or stanchions shall comply with the requirements of ICC A117.1, *Accessible and Usable Buildings and Facilities*, for either ambulatory accessible use or other accessibility-based uses.

24.2.8.1.5

All dimensions shall be measured to the centerline of the grab bar or stanchion unless otherwise stated.

24.2.8.2* Vertical Grab Bar or Stanchion.

24.2.8.2.1 Bathtubs and Bathtub-Shower Combinations.

For bathtubs, including bathtub-shower combinations, either of the following shall be provided:

- (1) A vertical grab bar on the control end wall or the end wall opposite the control end wall of the bathtub or bathtub-shower combination in accordance with 24.2.8.2.3
- (2) A vertical stanchion in accordance with 24.2.8.2.3

24.2.8.2.2 Showers.

For showers, either of the following shall be provided:

- (1) A vertical grab bar in accordance with 24.2.8.2.4, or a vertical stanchion in accordance with 24.2.8.2.5
- (2) A vertical grab bar in accordance with 24.2.8.2.5

24.2.8.2.3* Bathtub End Wall Vertical Grab Bars.

End wall vertical grab bars for bathtubs shall comply with all of the following:

- (1) Vertical grab bars shall have a length of not less than 36 in. (914 mm).
- (2) Vertical grab bars shall be located between 24 in. (610 mm) minimum and 60 in. (686 mm) maximum above the finished floor.
- (3) Vertical grab bars shall be installed at the end that is least obstructed for entry and egress.
- (4) The horizontal position, relative to the exterior plane of the bathtub or bathtub-shower combination, of vertical grab bars shall be located in accordance with either of the following:
 - (a) Between 9 in. (228 mm) and 12 in. (305 mm) inward
 - (b) Between 2 in. (51 mm) inward from the exterior plane to 6 in. (152 mm) outside the exterior plane

24.2.8.2.4 Shower Grab Bars.

Vertical grab bars for showers shall comply with all of the following:

- (1) Vertical grab bars shall have a length of not less than 36 in. (914 mm).
- (2) Vertical grab bars shall be located 24 in. (610 mm) minimum and 60 in. (1524 mm) maximum above the finished floor.
- (3) Vertical grab bars shall be located within 28 in. (711 mm), measured horizontally, of the center of the entrance opening to the shower at the sill, threshold, or other boundary between wet interior and dry exterior underfoot conditions.

24.2.8.2.5* Vertical Stanchions for Bathtubs and Showers.

Vertical stanchions shall be fixed to the floor or the bathtub rim, if of steel construction, and either the room ceiling or an adjacent wall and shall comply with all of the following:

- (1) Stanchions shall be located within 6 in. (150 mm), measured horizontally, of the outside or outer edge of the bathtub, bathtub-shower combination, or shower.
- (2) Stanchions shall be located within 30 in. (760 mm), measured horizontally, of the vertical plane of the control end wall of a bathtub or bathtub-shower combination.
- (3) Stanchions shall be located within 28 in. (711 mm), measured horizontally, of the center of the entrance opening to the shower at the sill, threshold, or other boundary between wet interior and dry exterior underfoot conditions.

24.2.8.3 Bathtub Nonaccess Side Grab Bar or Horizontal Stanchion.

For bathtubs and bathtub-shower combinations, a diagonal grab bar in accordance with 24.2.8.3.1, a horizontal grab bar in accordance with 24.2.8.3.2, or a horizontal stanchion in accordance with 24.2.8.3.3 shall be provided at the nonaccess side of the bathtub.

24.2.8.3.1* Nonaccess Side Diagonal Grab Bars.

Diagonal grab bars shall comply with all of the following:

- (1) Diagonal grab bars shall have a length of not less than 36 in. (914 mm).
- (2) Diagonal grab bars shall be located so the higher end is closer to the control end wall.
- (3) Higher ends of diagonal grab bars shall be located a maximum of 12 in. (305 mm) from the control end wall.
- (4) Diagonal grab bar slope, relative to level, shall be 30 degrees minimum to 60 degrees maximum.
- (5) Lower ends of diagonal grab bars shall be located 32 in. (813 mm) minimum and 35 in. (889 mm) maximum above the finished floor level.

24.2.8.3.2 Nonaccess Side Horizontal Grab Bars.

Horizontal grab bars shall comply with all of the following:

- (1) Horizontal grab bars shall be located 32 in. (813 mm) minimum and 35 in. (889 mm) maximum above the finished floor level.
- (2) Horizontal grab bars shall have a minimum length of 36 in. (914 mm) centered within the length of the bathtub.

24.2.8.3.3 Nonaccess Side Horizontal Stanchions.

Nonaccess side horizontal stanchions, extending full length and fixed between end walls of the bathtub, shall be located 32 in. (813 mm) minimum and 35 in. (889 mm) maximum above the finished floor level.

24.2.8.4* Grab Bar and Stanchion Details.**24.2.8.4.1**

Grab bars and stanchions shall be circular in cross section with a minimum diameter of 1¼ in. (32 mm) and a maximum diameter of 2 in. (51 mm).

24.2.8.4.2

Where adjacent to a surface or water control, grab bars and stanchions shall provide a clearance for hand grasp of 1½ in. (38 mm) minimum.

24.2.8.4.3

Clearance or spacing with other surfaces, which shall be free of sharp or abrasive elements, shall comply with ICC A117.1, *Accessible and Usable Buildings and Facilities*.

24.2.8.4.4

Grab bars and stanchions shall not rotate within their fittings.

24.2.8.4.5

Grab bars and stanchions shall be designed and constructed to maintain, throughout their service life and with the effects of water, the structural loading conditions in accordance with the building code.

24.2.8.4.6

Components subject to water intrusion shall be provided with permanent drainage, such as weep holes, to reduce the time during which components, such as voids for fixing plates, with screws, visually concealed behind cover plates, are subject to moisture.

Spangler, Kevin

To be consistent with other areas of the code, the grab bar section should be relocated to Chapter 7. This would be consistent with other code elements, such as stairs, doors, handrails. Chapter 24 should only be referencing Chapter 7. Correlation committee should investigate.

Second Revision No. 6628-NFPA 101-2022 [Section No. 26.3.2.1]

26.3.2.1 Alcohol-Based Hand-Rub (ABHR) Dispensers.

~~Alcohol~~ The installation and maintenance of ~~based hand-rub~~ ABHR dispensers and the storage of ABHR solutions in accordance with 8.7.3.3 shall be permitted.

Second Revision No. 6644-NFPA 101-2022 [Section No. A.24.2.8.1.3]

A.24.2.8.1.3

The *Code* does not require water closet grab bars and stanchions to be installed to improve the usability and safety of water closets. “Where provided,” water closet grab bars and stanchions might be in close proximity to bathtubs or showers and could be used to comply with the bathtub or shower grab bar requirements. Preferences for two vertical points of control for water closets include one installed on each side ~~and one in of the~~ front of the water closet: ~~One and within the functional reach of water closet users. In addition to these criteria, one~~ of these could be installed in accordance with the vertical points of control requirements for a bathtub or shower. The requirements for grab bars ~~in and stanchions for~~ showers and bathtubs ~~was were~~ added to the scope of the *Code* in 2018 ~~and 2021~~. Insights on best practices can be found in the study by Kenny Kennedy, et al., “Toilet Grab-Bar Preference and Center of Pressure Deviation During Toilet Transfers in Healthy Seniors, Seniors With Hip Replacements, and Seniors Having Suffered a Stroke.” ~~ICC-A117.1, Accessible and Usable Buildings and Facilities~~, is an additional reference for ambulatory accessible water closets.

To be consistent with other areas of the code, the grab bar section should be relocated to Chapter 7. This would be consistent with other code elements, such as stairs, doors, handrails. Chapter 24 should only be referencing Chapter 7. Correlation committee should investigate.

NATIONAL FIRE PROTECTION ASSOCIATION

The leading information and knowledge resource on fire, electrical and related hazards

M E M O R A N D U M

TO: Correlating Committee on Safety to Life

FROM: Jenny Depew, *Committee Administrator*

DATE: February 13, 2023

SUBJECT: NFPA 101® Second Draft CC FINAL Ballot Results (A2023)

According to the final ballot results, all Second Correlating Revisions and the Ballot to Forward NFPA 101 through the Development Process received the necessary affirmative votes to pass ballot.

Second Correlating Revisions (SCRs):

10 **Members Eligible to Vote**
0 **Members Not Returned**

Ballot to Forward NFPA 101 through the Development Process:

10 **Members Eligible to Vote**
0 **Members Not Returned**

The attached report shows the number of affirmative, negative, and abstaining votes as well as the explanation of the vote for **each** Second Correlating Revision.

To pass ballot, **each** Second Correlating Revision requires: (1) simple majority of those eligible to vote and (2) an affirmative vote of $\frac{3}{4}$ of ballots returned. See Sections 3.3.4.3.(c) and 4.4.11.5 of the *Regulations Governing the Development of NFPA Standards*.

Second Correlating Revision No. 22-NFPA 101-2022 [Section No. 8.7.3.3]

8.7.3.3* Alcohol-Based Hand-Rub (ABHR) Dispensers.

Where permitted by Chapters 11 through 43, ~~alcohol-based hand-rub~~ ABHR dispensers shall be permitted provided they meet all of the following criteria in 8.7.3.3.1 through 8.7.3.3.5 :

~~The maximum individual dispenser fluid capacity shall be as follows:~~

~~0.32 gal (1.2 L) for dispensers in corridors and areas open to corridors~~

~~0.53 gal (2.0 L) for dispensers in rooms or suites of rooms separated from corridors~~

~~Where aerosol containers are used, the maximum capacity of the aerosol dispenser shall be 18 oz (0.51 kg) and shall be limited to Level 1 aerosols as defined in NFPA 30B :~~

~~Dispensers shall be separated from each other by horizontal spacing of not less than 48 in. (1220 mm):~~

~~Not more than an aggregate 10 gal (37.8 L) of alcohol-based hand-rub solution or 1135 oz (32.2 kg) of Level 1 aerosols, or a combination of liquids and Level 1 aerosols not to exceed, in total, the equivalent of 10 gal (37.8 L) or 1135 oz (32.2 kg,) shall be in use outside of a storage cabinet in a single smoke compartment or fire compartment or story, whichever is less in area. One dispenser complying with 8.7.3.3(1) per room and located in that room shall not be included in the aggregated quantity.~~

~~Storage of quantities greater than 5 gal (18.9 L) in a single smoke compartment or fire compartment or story, whichever is less in area, shall meet the requirements of NFPA 30 :~~

~~Dispensers shall not be installed in the following locations:~~

~~Above an ignition source for a horizontal distance of 1 in. (25 mm) to each side of the ignition source~~

~~To the side of an ignition source within a 1 in. (25 mm) horizontal distance from the ignition source~~

~~Beneath an ignition source within a 1 in. (25 mm) vertical distance from the ignition source~~

~~Dispensers installed directly over carpeted floors shall be permitted only in sprinklered areas of the building:~~

~~The alcohol-based hand-rub solution shall not exceed 95 percent alcohol content by volume:~~

~~Operation of the dispenser shall comply with the following criteria:~~

~~The dispenser shall not release its contents except when the dispenser is activated, either manually or automatically by touch-free activation:~~

~~Any activation of the dispenser shall only occur when an object is placed within 4 in. (100 mm) of the sensing device:~~

~~An object placed within the activation zone and left in place shall not cause more than one activation:~~

~~The dispenser shall not dispense more solution than the amount required for hand hygiene consistent with label instructions:~~

~~The dispenser shall be designed, constructed, and operated in a manner that ensures accidental or malicious activation of the dispensing device is minimized:~~

~~The dispenser shall be tested in accordance with the manufacturer's care and use instructions each time a new refill is installed:~~

8.7.3.3.1 Personal Use Containers.

The requirements of 8.7.3.3 shall not apply to individual personal use ABHR containers with a volume not exceeding 16.9 oz (500 mL).

8.7.3.3.2 ABHR Dispenser Capacity.

The capacity of ABHR dispensers shall comply with all of the following:

- (1) The maximum individual dispenser fluid capacity shall be as follows:
 - (a) ~~0.32~~ 0.53 gal (~~1.2~~ 2.0 L) for dispensers in corridors and areas open to corridors
 - (b) 1.06 gal (4.0 L) for dispensers in corridors and areas open to corridors in buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7
 - (c) ~~0.53~~ 1.06 gal (~~2.0~~ 4.0 L) for dispensers in rooms or suites of rooms separated from corridors
- (2) Where aerosol containers are used, the maximum capacity of the aerosol dispenser shall be 18 oz (0.51 kg) and shall be limited to Level 1 aerosols as defined in NFPA 30B.
- (3) ~~Not in buildings without an automatic sprinkler system, not~~ more than an aggregate 10 gal (37.8 L) of ~~alcohol-based hand-rub~~ ABHR solution or 1135 oz (32.2 kg) of Level 1 aerosols, or a combination of liquids and Level 1 aerosols not to exceed, in total, the equivalent of 10 gal (37.8 L) or 1135 oz (32.2 kg), shall be in use outside of a storage cabinet in a single smoke compartment or fire compartment or story, whichever is less in area. One dispenser complying with 8.7.3.3.2(1) per room and located in that room shall not be included in the aggregated quantity.
- (4) In buildings protected throughout by an approved, supervised automatic sprinkler system in accordance with Section 9.7, not more than an aggregate 20 gal (75.6 L) of ABHR solution shall be in use outside of a storage cabinet in a single smoke compartment or fire compartment or story, whichever is less in area. One dispenser complying with 8.7.3.3.2(1) per room and located in that room shall not be included in the aggregated quantity.

8.7.3.3.3 ABHR Dispenser Location.

The locations of ABHR dispensers shall comply with all of the following:

- (1) Dispensers shall not be installed in the following locations:
 - (a) Above an ignition source for a horizontal distance of 1 in. (25 mm) to each side of the ignition source
 - (b) To the side of an ignition source within a 1 in. (25 mm) horizontal distance from the ignition source
 - (c) Beneath an ignition source within a 1 in. (25 mm) vertical distance from the ignition source
- (2) Dispensers installed directly over carpeted floors shall be permitted only in sprinklered areas of the building.
- (3) ABHR dispensers shall be separated from each other by horizontal spacing of not less than 48 in. (1220 mm).

8.7.3.3.4 ABHR Dispenser Operation and Testing.

Operation ~~The operation~~ of ~~the~~ dispensers shall comply with all of the following ~~criteria~~ :

- (1) ~~The dispenser~~ Dispensers shall not release ~~its~~ their contents except when ~~the dispenser~~ is activated, either manually or automatically by touch-free activation.
- (2) Any activation of ~~the a~~ dispenser shall only occur when an object is placed within 4 in. (100 mm) of the sensing device.
- (3) An object placed within ~~the an~~ activation zone and left in place shall not cause more than one activation.
- (4) ~~The dispenser~~ Dispensers shall not dispense more solution than the amount required for hand hygiene consistent with label instructions.
- (5) ~~The dispenser~~ Dispensers shall be designed, constructed, and operated in a manner that ensures accidental or malicious activation of ~~the~~ dispensing devices is minimized.
- (6) ~~The dispenser~~ Dispensers shall be tested in accordance with the manufacturer's care and use instructions each time ~~a~~ new refills are ~~is~~ installed.

8.7.3.3.5 Spill Containment and Maintenance.

Maintenance and spill containment of dispensers shall comply with all of the following:

- (1) Spill containment for dispensers shall be provided.
- (2) Any ABHR solution spilled during a refill process shall be removed following the refill operation.
- (3) Catch basins or spill collection means shall be kept free of accumulated ABHR material and refuse.

Submitter Information Verification

Committee: SAF-AAC

Submittal Date: Mon Dec 19 10:16:52 EST 2022

Committee Statement

Committee Statement: The SCR revises 8.7.3.3.1 to correlate with the intent of the exemption for containers with a "nominal volume" of not more than 16 oz in Chs. 36-39, which intended to permit 500 mL containers. The revision to 8.7.3.3.1 eliminates the need for the exemptions in Chs. 36-39, which have been deleted by related SCRs. The SCR also deletes 8.7.3.3.3 item 4 re. detention and correctional occupancies. The deleted item 4 might create confusion since nothing mandates the installation of ABHR dispensers and Chapters 22 and 23 adequately address their installation in that occupancy.

Second Correlating Revision No. 2-NFPA 101-2022 [Section No. 9.6.2.10]

9.6.2.10 Smoke Alarms.

9.6.2.10.1

Where required by another section of this *Code*, single-station and multiple-station smoke alarms shall be in accordance with *NFPA 72* unless otherwise provided in 9.6.2.10.4 ; 9.6.2.10.5 ; 9.6.2.10.7 9.6.2.10.7.1 ; or 9.6.2.10.8.

9.6.2.10.2

Where automatic smoke detection is required by Chapters 11 through 43, smoke alarms shall not be used as a substitute.

9.6.2.10.3 ~~Smoke Alarms in Sleeping Rooms.~~

In new construction, where required by Chapters 11 through 43, the alarm notification signal in sleeping rooms resulting from activation of smoke alarms shall be a 520 Hz low-frequency signal complying with *NFPA 72*.

9.6.2.10.4*

~~The interconnection of smoke alarms shall apply only to new construction as provided in 9.6.2.10.10 ;~~

A.9.6.2.10.7.1

~~*NFPA 72* mandates smoke alarms in all sleeping rooms, and interconnection of smoke alarms is required for both new and existing installations. Per 9.6.2.10.1 , the residential occupancy chapters determine whether smoke alarms are needed within sleeping rooms. Paragraph 9.6.2.10.4 9.6.2.10.7.1 limits the requirement for interconnection of smoke alarms to those in new construction. This *Code* does not intend to require compliant, existing smoke alarm installations to be interconnected. This *Code* is periodically revised to add retrospective requirements only where the need is clearly substantiated.~~

9.6.2.10.5*

~~Unless otherwise provided in 9.6.2.10.7 , smoke alarms and smoke detectors shall not be installed within an area of exclusion determined by a 10 ft (3.0 m) radial distance along a horizontal flow path from a stationary or fixed cooking appliance, unless listed for installation in close proximity to cooking appliances. Smoke alarms and smoke detectors installed between 10 ft (3.0 m) and 20 ft (6.1 m) along a horizontal flow path from a stationary or fixed cooking appliance shall be equipped with an alarm-silencing means or use photoelectric detection. [72 : 29.11.3.4(4)]~~

~~A.9.6.2.10.5~~

As per annex material located in A.29.5.1 of *NFPA 72*, it is not normally recommended that smoke alarms or smoke detectors be placed in kitchen spaces. This section of the code provides guidelines for safe installation if a need exists to install a smoke alarm or smoke detector in a residential kitchen space or cooking area:

Within this *Code* section, a fixed cooking appliance is any appliance that is intended to be permanently connected electrically to the wiring system or the fuel source. A stationary cooking appliance is any appliance that is intended to be fastened in place or located in a dedicated space and is connected to the supply circuit or fuel source:

Smoke alarms and smoke detectors that are currently available to consumers are susceptible to particles released into the air during normal cooking procedures. If smoke alarms and smoke detectors are placed too close to the area where the cooking source originates, a high level of nuisance alarms can occur. Frequent nuisance alarms can result in an occupant disabling the smoke alarm or smoke detector:

Nuisance alarm studies show that commercially available residential smoke alarms and smoke detectors are susceptible to nuisance alarms when installed too close to cooking appliances. As the horizontal distance between the smoke alarm or smoke detectors and the cooking appliance increases, the frequency of nuisance alarms decreases. Smoke alarms or smoke detectors that use ionization smoke detection have been shown to be more susceptible to cooking nuisance alarms than those that use photoelectric smoke detection when the alarms or detectors are installed within 10 ft (3.0 m) along a horizontal smoke travel path from a cooking appliance. Smoke alarms or smoke detectors that use photoelectric smoke detection produce nuisance alarms when installed less than 10 ft (3.0 m) from a cooking appliance, though to a lesser degree:

The occurrence of the higher frequency of nuisance alarms observed in smoke alarms or smoke detectors that use ionization detection have been documented in the fire research data. Due to the differences in technology between ionization detection and photoelectric detection, the sensitivity typically used for ionization detection is much higher than that used for photoelectric detection. This sensitivity difference is a result of each type of the detection being required to satisfy UL 217, *Single and Multiple Station Smoke Alarms*; performance tests. Removing detection technology from consideration, the frequency of nuisance alarms is solely due to the sensitivity of the detection method used. Thus, both ionization and photoelectric detector technologies will produce nuisance alarms due to cooking, but currently available smoke alarms and smoke detectors that use ionization detection typically produce more cooking-related nuisance alarms:

The higher sensitivities of currently available smoke alarms and smoke detectors that use ionization detection do provide a benefit at the expense of a potentially higher rate of cooking-related nuisance alarms. Research has demonstrated that ionization detection will typically respond faster than photoelectric detection to flaming fires, providing earlier warning to occupants that might allow for quicker intervention or faster egress. In general, the installation of smoke alarms or smoke detectors that use ionization detection will result in increased fire safety at the risk of a higher frequency of nuisance alarms. The installation of smoke alarms or smoke detectors that use photoelectric detection will result in reduced fire safety for flaming fires and a reduced risk of nuisance alarms. Based on the trade-off between faster response to fires and the frequency of nuisance alarms, detectors that utilize both technologies (i.e., ionization, photoelectric, and a combination) are allowed to be installed between 10 ft (3.0 m) and 20 ft (6.1 m) along a horizontal flow path from a standard or fixed cooking appliance if the specific detector is equipped with an alarm silencing means or is of the photoelectric type. Nuisance alarm studies provide data on cooking nuisances that emanate from both fixed cooking appliances and stationary cooking appliances (e.g., stove, oven) as well as portable cooking appliances (e.g., toaster). Based on these studies, which demonstrate the potential of all cooking appliances to generate nuisance sources, a zone of exclusion has been specified surrounding each stationary or fixed cooking appliance. The purpose of this zone is to limit the installation of smoke alarms and detectors in areas where stationary, fixed, or portable cooking appliances will be located within the residential kitchen space such that potential nuisance alarms are minimized. The size of the zone of exclusion is specified to attempt to take into account the unknown and transitory locations of portable cooking appliances. This zone of exclusion is determined by measuring a 10 ft (3.0 m) radial distance from the closest edge of a

stationary or fixed cooking appliance. The zone of exclusion is not intended to pass through walls or doorways. Figure A.9.6.2.10.5(a) provides an example of the zone of exclusion in a generalized residential kitchen. If other areas of this Code require that a smoke alarm or smoke detector be placed within a horizontal flow path distance between 10 ft (3.0 m) and 20 ft (6.1 m) from a stationary or fixed cooking appliance, the following method should be used to determine the distance, and only photoelectric detection or smoke alarms/detectors with alarm silencing means can be installed in this area:

To install a smoke alarm or detector between 10 ft (3.0 m) and 20 ft (6.1 m) from the cooking appliance, an installer must first determine the 10 ft (3.0 m) area of exclusion. Once the area of exclusion is determined, an installer must then determine the horizontal flow distance. This is the horizontal distance along the ceiling from the closest edge of the cooking appliance to the smoke alarm or detector. The horizontal distance can consist of line segments due to impediments, such as interior partitions. Once an impediment is met, the measurement of the distance will then continue along the new horizontal path segment until the distance requirement is met or another impediment is encountered. Figure A.9.6.2.10.5(b) provides an example for placement outside a kitchen in a nearby hallway. Figure A.9.6.2.10.5(c) provides another example of appropriate placement outside of a kitchen in an adjacent room. At a horizontal flow path distance of greater than 20 ft (6.1 m), any type of smoke alarm or smoke detector can be installed. In rare cases, a residential dwelling can be of such size and configuration that an area of exclusion of 10 ft (3.0 m) from a stationary or fixed cooking appliance excludes the placement of a smoke alarm or smoke detector required by other areas of this Code. In these cases, a smoke alarm or smoke detector using photoelectric detection can be installed at least 72 in. (1.83 m) from the fixed or stationary cooking appliance. Figure A.9.6.2.10.5(d) provides an example of this situation in practice where a smoke alarm or smoke detector is required outside of the sleeping area but the space is in close proximity to the kitchen space. [72: A.29.8.3.4(4)]

Figure A.9.6.2.10.5(a) Example of Zone of Exclusion (gray area) Within Typical Residential Kitchen. [72: Figure A.29.8.3.4(4)(a)]

Figure A.9.6.2.10.5(b) Example of Smoke Alarm or Smoke Detector Placement Between 10 ft (3.0 m) and 20 ft (6.1 m) Away in Hallway from Center of Stationary or Fixed Cooking Appliance. [72: Figure A.29.8.3.4(4)(b)]

Figure A.9.6.2.10.5(c) Example of Smoke Alarm or Smoke Detector Placement Between 10 ft (3.0 m) and 20 ft (6.1 m) Away in Hallway from Center of Stationary or Fixed Cooking Appliance. [72: Figure A.29.8.3.4(4)(c)]

Figure A.9.6.2.10.5(d) Example of Exception Placement of Photoelectric Smoke Alarm or Smoke Detector at 72 in. (1.83 m) from Stationary or Fixed Cooking Appliance. [72: Figure A.29.8.3.4(4)(d)]

9.6.2.10.6

Smoke alarms or smoke detectors that use photoelectric detection shall be permitted for installation at a radial distance greater than 6 ft (1.8 m) from any stationary or fixed cooking appliance when the following conditions are met:

The kitchen or cooking area and adjacent spaces have no clear interior partitions or headers.

The 10 ft (3.0 m) area of exclusion would prohibit the placement of a smoke alarm or smoke detector required by other sections of *NFPA 72* - [72 : 29.11.3.4(5)]

9.6.2.10.4

The installation of smoke alarms and smoke detectors near stationary or fixed cooking appliances shall be in accordance with *NFPA 72* .

9.6.2.10.5

~~Smoke~~ The installation of smoke alarms and smoke detectors shall not be installed within a 36 in. (910 mm) horizontal path from near a door to a bathroom containing a shower or tub unless listed for installation in close proximity to such locations shall be in accordance with *NFPA 72* . [72 : 29.11.3.4(7)]

A.9.6.2.10.7

~~Studies indicate that smoke alarms and smoke detectors that use ionization detection, photoelectric detection, or a combination of ionization and photoelectric detection are susceptible to nuisance alarms caused by steam. Little research has been done on the comparative response of these types of detection to steam. Steam particles, in general, are visible, reflect light easily, and are typically produced in a size range that would be more likely to activate a photoelectric sensor. Thus, it is required that smoke alarms and smoke detectors be installed greater than 36 in. (910 mm) from the bathroom door where possible. Increasing the distance between the smoke alarm or smoke detector and the bathroom door can reduce the frequency of nuisance alarms from bathroom steam. Frequent nuisance alarms can result in the occupant disabling the smoke alarm. Each incremental increase in separation, up to 10 ft (3.0 m), between the bathroom door and the smoke alarm or smoke detector is expected to reduce the frequency of nuisance alarms. [72: A.29.8.3.4(5)]~~

9.6.2.10.6

Smoke alarms, other than battery-operated smoke alarms as permitted by other sections of this *Code*, shall be powered in accordance with the requirements of *NFPA 72*.

9.6.2.10.7 Interconnection.**9.6.2.10.7.1***

The interconnection of smoke alarms shall apply only to new construction.

A.9.6.2.10.7.1

~~*NFPA 72* mandates smoke alarms in all sleeping rooms, and interconnection of smoke alarms is required for both new and existing installations. Per 9.6.2.10.1, the residential occupancy chapters determine whether smoke alarms are needed within sleeping rooms. Paragraph 9.6.2.10.4 9.6.2.10.7.1 limits the requirement for interconnection of smoke alarms to those in new construction. This *Code* does not intend to require compliant, existing smoke alarm installations to be interconnected. This *Code* is periodically revised to add retrospective requirements only where the need is clearly substantiated.~~

9.6.2.10.7.2*

In new construction, where two or more smoke alarms are required within a dwelling unit, suite of rooms, or similar area, they shall be arranged so that operation of any smoke alarm shall cause the alarm in all smoke alarms within the dwelling unit, suite of rooms, or similar area to sound, unless otherwise permitted by one of the following:

- (1) The requirement of 9.6.2.10.7.29-6.2.10.10 shall not apply where permitted by another section of this *Code*.
- (2) The requirement of 9.6.2.10.7.29-6.2.10.10 shall not apply to configurations that provide equivalent distribution of the alarm signal.

9.6.2.10.8

System smoke detectors in accordance with *NFPA 72* and arranged to function in the same manner as single-station or multiple-station smoke alarms shall be permitted in lieu of smoke alarms.

9.6.2.10.9

The alarms described in 9.6.2.10.7.2 shall sound only within an individual dwelling unit, suite of rooms, or similar area and shall not actuate the building fire alarm system, unless otherwise permitted by the authority having jurisdiction.

9.6.2.10.10

Smoke alarms shall be permitted to be connected to the building fire alarm system for the purpose of annunciation in accordance with *NFPA 72*.

Submitter Information Verification

Committee: SAF-AAC

Submittal Date: Wed Nov 23 11:23:56 EST 2022

Committee Statement

Committee Statement: The revision further revises SR-6563 (now CC-6563) by correcting the cross-references in 9.6.2.10.1 and A.9.6.2.10.7.1.

Second Correlating Revision No. 16-NFPA 101-2022 [Section No. 9.15.1]

9.15.1

Where provided, in-building emergency responder communications enhancement systems shall comply with the design, installation, testing, inspection, and maintenance requirements of NFPA 1225.

Submitter Information Verification

Committee: SAF-AAC

Submittal Date: Wed Dec 14 11:13:28 EST 2022

Committee Statement

Committee Statement: CCN-6/PC-8 sought clarification on whether Section 9.15 intended to require the installation of in-building emergency responder communications enhancement systems, which was subsequently rejected by SAF-BSF. The SCR clarifies that the requirements of NFPA 1225 apply where systems are installed and that it is not the intent to require the installation of in-building emergency responder communications enhancement systems in all buildings.

Second Correlating Revision No. 8-NFPA 101-2022 [Section No. 10.7]

10.7* Modular Rooms and Sleep Pods.

A.10.7

Modular rooms such as lactation stations and other small privacy enclosures, including sleep pods, are ~~showing up being installed~~ in an increasing number of indoor locations. These include airports, convention centers, businesses, and government buildings. These are typically factory-built products that are required to be listed to UL 962, *Household and Commercial Furnishings*, rather than being constructed as a structure in accordance with the local building code.

10.7.1* General.

~~Modular rooms and sleep pods provided in indoor locations shall comply with 10.7.1 through 10.7.4 and other applicable requirements in the Code .~~

10.7.1.1

~~Modular~~ Newly installed modular rooms and sleep pods provided in indoor locations shall comply with 10.7.1 through ~~10.7.4~~ 10.7.5.2 ~~and other applicable requirements in the Code .~~

10.7.1.2

Modular rooms and sleep pods shall comply with other requirements in the Code , including requirements in 10.3.2 and 10.3.3 related to upholstered furniture and mattresses.

10.7.2 Dimensions.

10.7.2.1

The maximum dimensions of modular rooms and sleep pods shall comply with the following:

- (1) Modular rooms: 100 ft² (9.3 m²) or less in floor area and 8 ft (2438 mm) or less in height
- (2) Sleep pods: 36 ft² (3.3 m²) or less in floor area, 8 ft (2438 mm) or less in height, and 4 ft (1219 mm) or less in width

10.7.2.2

~~Modular rooms and sleep pods exceeding the dimensions in 10.6.4~~ 10.7.2.1 shall comply with all applicable requirements in this Code and the applicable building code.

10.7.3 Listing.

Modular rooms and sleep pods shall be listed and labeled in accordance with UL 962, *Household and Commercial Furnishings*, and installed in accordance with the listing and the manufacturer's instructions.

10.7.4* Interior Finish.

Modular rooms and sleep pods shall comply with the interior finish requirements in Section 10.2 as follows and be marked as having met the requirements:

- (1) Interior wall and ceiling finish materials, other than cellular or foamed plastic materials, shall comply with 10.2.3.
- (2) Interior wall and ceiling finish cellular or foamed plastic materials shall comply with 10.2.4.3.
- (3) For modular rooms and sleep pods with integrated floors, the interior floor finish materials shall comply with 10.7.4(1) or 10.7.4(2), as appropriate.

10.7.5 Locations.

~~Modular rooms and sleep pods shall only be installed in approved locations and shall not obstruct required means of egress.~~

10.7.5.1

Modular rooms and sleep pods shall only be installed in approved locations.

10.7.5.2

Modular rooms and sleep pods shall not obstruct required means of egress.

Submitter Information Verification

Committee: SAF-AAC

Submittal Date: Wed Dec 07 09:29:17 EST 2022

Committee Statement

Committee Statement: The SCR limits the applicability of Sec. 10.7 to newly installed modular rooms and sleep pods lacking sufficient justification for its application to existing conditions. The SCR also splits the two requirements in 10.7.5 into two separate paragraphs in accordance with the NFPA Manual of Style and updates the cross-reference in 10.7.1.1 accordingly.

Harbuck, Stanley C.

It is now clear the best way to deal with this issue is through both a NITMAM and an expedient TIA process. Nevertheless, this is my thinking: This provision strikes out the requirement that sleeping pods satisfy any other building code provisions outside of this section unless they are larger than a particular size (10.7.1.1, 10.7.2.2). This new broad-based exemption without significant review relating to typical sleeping room safety requirements and code should not be approved. For instance, the 101 Residential committee did not make any significant sleeping room related review of this provision. In addition, since many locations where these would be placed would represent assembly structures, no similar evaluation was made for assembly issues, including issues related to anchored or unanchored units and their effect on the capacity of rooms. None of these other committees appear to have had an opportunity to review these issues in detail. This is too significant a development to allow it to initially be exempt from a more significant review. In addition, the application of UL 962, a Standard for Household and Commercial Furnishings, does not make up for this exemption as it primarily only relates to aspects such as furniture flammability, mechanical strength, electrification, etc. For instance, its ventilation requirements relate primarily to equipment ventilation, not ventilation for the purpose of human occupancy. My thinking here is to file a partial NITMAM that removes the strikeout of the requirement that the standard size sleeping pods need to satisfy code. The effect of this would be to re-insert the language that has been stricken out. While heretofore NFPA 101 has not treated ventilation requirements as a life safety issue, in the case of very small compartments, such as the sleeping pods, without some ventilation requirements, they may pose an asphyxiation risk to the occupants. As a result, it also seems appropriate to ask for a TIA with the 101 Residential committee to consider at least some ventilation requirements for the sleeping pods, either by setting certain cubic feet per minute ventilation requirements for occupants, or adopting some of the specific provisions of ASHRAE 62.1, and/or 62.2.

Second Correlating Revision No. 3-NFPA 101-2022 [Section No. 19.3.2.5.4]

19.3.2.5.4*

Within a smoke compartment, residential or commercial cooking equipment that is used to prepare meals for 30 or fewer persons shall be permitted, provided that the cooking facility complies with all of the following conditions:

- (1) The space containing the cooking equipment is not a sleeping room.
- (2) The space containing the cooking equipment shall be separated from the corridor by partitions complying with 19.3.6.2 through 19.3.6.5.
- (3) The requirements of 19.3.2.5.3(1) through 19.3.2.5.3(10) and ~~19.3.2.5.3(13)~~ 19.3.2.5.3(15) are met.

Submitter Information Verification

Committee: SAF-AAC

Submittal Date: Wed Nov 23 13:46:25 EST 2022

Committee Statement

Committee Statement: The revision corrects the cross-reference in 19.3.2.5.4(3). TIA 101-12-2 resulted in the renumbering of 19.3.2.5.3(13) to 19.3.2.5.3(15). This renumbering was inadvertently not made to the cross-reference in 19.3.2.5.4(3).

Second Correlating Revision No. 5-NFPA 101-2022 [Section No. A.6.1.2.1]

A.6.1.2.1 Assembly Occupancy.

Assembly occupancies might include the following:

- (1) Armories
- (2) Assembly halls
- (3) Auditoriums
- (4) Bowling lanes
- (5) Club rooms
- (6) College and university classrooms, 50 persons and over
- (7) Conference rooms
- (8) Courtrooms
- (9) Dance halls
- (10) Drinking establishments
- (11) Exhibition halls
- (12) Gymnasiums
- (13) Libraries
- (14) Mortuary chapels
- ~~Motion picture theaters~~
- (15) Museums
- (16) Nightclubs
- (17) Passenger stations and terminals of air, surface, underground, and marine public transportation facilities
- (18) Places of religious worship
- (19) Pool rooms
- (20) Recreation piers
- (21) Restaurants
- (22) Skating rinks
- (23) Special amusement buildings, regardless of occupant load
- (24) Theaters

Assembly occupancies are characterized by the presence or potential presence of crowds with attendant panic hazard in case of fire or other emergency. They are generally or occasionally open to the public, and the occupants, who are present voluntarily, are not ordinarily subject to discipline or control. Such buildings are ordinarily not used for sleeping purposes. Special conference rooms, snack areas, and other areas incidental to, and under the control of, the management of other occupancies, such as offices, fall under the 50-person limitation.

Restaurants and drinking establishments with an occupant load of fewer than 50 persons should be classified as mercantile occupancies.

Occupancy of any room or space for assembly purposes by fewer than 50 persons in another occupancy, and incidental to such other occupancy, should be classified as part of the other occupancy and should be subject to the provisions applicable thereto.

For special amusement buildings, see 12.4.9 and 13.4.9.

Submitter Information Verification

Committee: SAF-AAC

Submittal Date: Tue Dec 06 11:25:16 EST 2022

Committee Statement

Committee Statement: The revision correlates with action taken by the TC on Assembly Occupancies in SR-6598 on A.3.3.205.2 Assembly Occupancy.

Second Correlating Revision No. 1-NFPA 101-2022 [Section No. C.2.4]

C.2.4 NFPA 55.

Subsection 4.1.2 1.3.2 of NFPA 55 states: "This code shall not apply to the following items (reference standards for some of which appear in Annex L) :

~~Portable LP-Gas appliances and equipment of all types that are not connected to a fixed fuel piping system~~

~~Installation of appliances such as brooders, dehydrators, dryers, and irrigation equipment used for agricultural purposes~~

~~Raw material (feedstock) applications except for piping to special atmosphere generators~~

~~Oxygen-fuel gas cutting and welding systems~~

~~Industrial gas applications using such gases as acetylene and acetylenic compounds, hydrogen, ammonia, carbon monoxide, oxygen, and nitrogen~~

~~Petroleum refineries, pipeline compressor or pumping stations, loading terminals, compounding plants, refinery tank farms, and natural gas processing plants~~

~~Large integrated chemical plants or portions of such plants where flammable or combustible liquids or gases are produced by chemical reactions or used in chemical reactions~~

~~LP-Gas installations at utility gas plants~~

- (1) Off-site transportation of materials covered by this code
 - (2) Storage, use, and handling of radioactive gases in accordance with NFPA 801
 - (3) Use and handling of medical compressed gases at health care facilities in accordance with NFPA 99 , except as specified in Chapter 17
 - (4) Systems consisting of cylinders of oxygen and cylinders of fuel gas used for welding and cutting in accordance with NFPA 51
 - (5) Flammable gases used as a vehicle fuel when stored on a vehicle
 - (6) Storage, use, and handling of liquefied and nonliquefied compressed gases in laboratory work areas in accordance with NFPA 45
 - (7) Storage, use, and handling of liquefied petroleum gases in accordance with NFPA 58
 - (8) Storage, use, and handling of compressed gases within closed-cycle refrigeration systems complying with the mechanical code
 - (9) Liquefied natural gas (LNG) installations storage at utility plants under NFPA 59A
- ~~Fuel gas piping in electric utility power plants~~
- ~~Proprietary items of equipment, apparatus, or instruments such as gas generating sets, compressors, and calorimeters~~
- ~~LP-Gas equipment for vaporization, gas mixing, and gas manufacturing~~
- ~~LP-Gas piping for buildings under construction or renovations that is not to become part of the permanent building piping system — that is, temporary fixed piping for building heat~~
- ~~Installation of LP-Gas systems for railroad switch heating~~
- (10) Installation of LP-Gas and compressed Compressed natural gas (CNG) systems on vehicles and LNG utilized as a vehicle fuel in accordance with NFPA 52
 - (11) Compressed hydrogen gas (GH ₂), or liquefied hydrogen gas (LH ₂), generated, installed, stored, piped, used, or handled in accordance with NFPA 2 when there are no specific or applicable requirements in NFPA 55
 - (12) Nonflammable mixtures of ethylene oxide with other chemicals
 - (13) Ethylene oxide in chambers 10 scf (0.283 Nm³) or less in volume or for containers holding 7.05 oz (200 g) of ethylene oxide or less"

~~Gas piping, meters, gas pressure regulators, and other appurtenances used by the serving gas supplier in distribution of gas, other than undiluted LP-Gas~~

~~Building design and construction, except as specified herein~~

~~Fuel gas systems on recreational vehicles manufactured in accordance with NFPA 1192~~

~~Fuel gas systems using hydrogen as a fuel~~

~~Construction of appliances"~~
