2013 Annual Revision Cycle

National Electrical Code® Committee Report on Comments

NOTE: Notice of Intent to Make an NEC® Motion (NITMAM) deadline is May 3, 2013

A compilation of the documented action on comments received by the code-making panels for the 2013 Annual Revision Cycle

NOTE: The proposals contained in the NEC Report on Proposals (ROP) and the comments addressed in this Report on Comments (ROC) will be presented for action at the NFPA June 2013 Annual Association Technical Meeting to be held June 10–13 in Chicago, IL, only when proper Amending Motions have been submitted to the NFPA by the deadline of May 3, 2013. For more information on the new rules and for up-to-date information on schedules and deadlines for processing NFPA Documents, check the NFPA website (www.nfpa.org) or contact NFPA Standards Administration.

Information on NFPA Codes and Standards Development

I. Applicable Regulations. The primary rules governing the processing of NFPA documents (codes, standards, recommended practices, and guides) are the NFPA *Regulations Governing Committee Projects (Regs)*. Other applicable rules include NFPA *Bylaws*, NFPA *Technical Meeting Convention Rules*, NFPA *Guide for the Conduct of Participants in the NFPA Standards Development Process*, and the NFPA *Regulations Governing Petitions to the Board of Directors from Decisions of the Standards Council*. Most of these rules and regulations are contained in the *NFPA Directory*. For copies of the *Directory*, contact Codes and Standards Administration at NFPA Headquarters; all these documents are also available on the NFPA website at "www.nfpa.org."

The following is general information on the NFPA process. All participants, however, should refer to the actual rules and regulations for a full understanding of this process and for the criteria that govern participation.

II. Technical Committee Report. The Technical Committee Report is defined as "the Report of the Technical Committee and Technical Correlating Committee (if any) on a document. A Technical Committee Report consists of the Report on Proposals (ROP), as modified by the Report on Comments (ROC), published by the Association."

III. Step 1: Report on Proposals (ROP). The ROP is defined as "a report to the Association on the actions taken by Technical Committees and/or Technical Correlating Committees, accompanied by a ballot statement and one or more proposals on text for a new document or to amend an existing document." Any objection to an action in the ROP must be raised through the filing of an appropriate Comment for consideration in the ROC or the objection will be considered resolved.

IV. Step 2: Report on Comments (ROC). The ROC is defined as "a report to the Association on the actions taken by Technical Committees and/or Technical Correlating Committees accompanied by a ballot statement and one or more comments resulting from public review of the Report on Proposals (ROP)." The ROP and the ROC together constitute the Technical Committee Report. Any outstanding objection following the ROC must be raised through an appropriate Amending Motion at the Association Technical Meeting or the objection will be considered resolved.

V. Step 3a: Action at Association Technical Meeting. Following the publication of the ROC, there is a period during which those wishing to make proper Amending Motions on the Technical Committee Reports must signal their intention by submitting a Notice of Intent to Make a Motion. Documents that receive notice of proper Amending Motions (Certified Amending Motions) will be presented for action at the annual June Association Technical Meeting. At the meeting, the NFPA membership can consider and act on these Certified Amending Motions as well as Follow-up Amending Motions, that is, motions that become necessary as a result of a previous successful Amending Motion. (See 4.6.2 through 4.6.9 of *Regs* for a summary of the available Amending Motions and who may make them.) Any outstanding objection following action at an Association Technical Meeting (and any further Technical Committee consideration following successful Amending Motions, see *Regs* at 4.7) must be raised through an appeal to the Standards Council or it will be considered to be resolved.

VI. Step 3b: Documents Forwarded Directly to the Council. Where no Notice of Intent to Make a Motion (NITMAM) is received and certified in accordance with the Technical Meeting Convention Rules, the document is forwarded directly to the Standards Council for action on issuance. Objections are deemed to be resolved for these documents.

VII. Step 4a: Council Appeals. Anyone can appeal to the Standards Council concerning procedural or substantive matters related to the development, content, or issuance of any document of the Association or on matters within the purview of the authority of the Council, as established by the *Bylaws* and as determined by the Board of Directors. Such appeals must be in written form and filed with the Secretary of the Standards Council (see 1.6 of *Regs*). Time constraints for filing an appeal must be in accordance with 1.6.2 of the *Regs*. Objections are deemed to be resolved if not pursued at this level.

VIII. Step 4b: Document Issuance. The Standards Council is the issuer of all documents (see Article 8 of *Bylaws*). The Council acts on the issuance of a document presented for action at an Association Technical Meeting within 75 days from the date of the recommendation from the Association Technical Meeting, unless this period is extended by the Council (see 4.8 of *Regs*). For documents forwarded directly to the Standards Council, the Council acts on the issuance of the document at its next scheduled meeting, or at such other meeting as the Council may determine (see 4.5.6 and 4.8 of *Regs*).

IX. Petitions to the Board of Directors. The Standards Council has been delegated the responsibility for the administration of the codes and standards development process and the issuance of documents. However, where extraordinary circumstances requiring the intervention of the Board of Directors exist, the Board of Directors may take any action necessary to fulfill its obligations to preserve the integrity of the codes and standards development process and to protect the interests of the Association. The rules for petitioning the Board of Directors can be found in the *Regulations Governing Petitions to the Board of Directors from Decisions of the Standards Council* and in 1.7 of the *Regs*.

X. For More Information. The program for the Association Technical Meeting (as well as the NFPA website as information becomes available) should be consulted for the date on which each report scheduled for consideration at the meeting will be presented. For copies of the ROP and ROC as well as more information on NFPA rules and for up-to-date information on schedules and deadlines for processing NFPA documents, check the NFPA website (www.nfpa.org) or contact NFPA Codes & Standards Administration at (617) 984-7246.

TYPES OF ACTION

P Partial Revision **N** New Document **R** Reconfirmation **W** Withdrawal

The following classifications apply to Committee members and represent their principal interest in the activity of the Committee.

1. M Manufacturer: A representative of a maker or marketer of a product, assembly, or system, or portion thereof, that is affected by the standard.
2. U User: A representative of an entity that is subject to the provisions of the standard or that voluntarily uses the standard.
3. IM Installer/Maintainer: A representative of an entity that is in the business of installing or maintaining a product, assembly, or system affected by the standard.
4. L Labor: A labor representative or employee concerned with safety in the workplace.
5. RT Applied Research/Testing Laboratory: A representative of an independent testing laboratory or independent applied research organization that promulgates and/or enforces standards.
6. E Enforcing Authority: A representative of an agency or an organization that promulgates and/or enforces standards.
7. I Insurance: A representative of an insurance company, broker, agent, bureau, or inspection agency.
8. C Consumer: A person who is or represents the ultimate purchaser of a product, system, or service affected by the standard, but who is not included in (2).
9. SE Special Expert: A person not representing (1) through (8) and who has special expertise in the scope of the standard or portion thereof.

NOTE 1: "Standard" connotes code, standard, recommended practice, or guide.

NOTE 2: A representative includes an employee.

NOTE 3: While these classifications will be used by the Standards Council to achieve a balance for Technical Committees, the Standards Council may determine that new classifications of member or unique interests need representation in order to foster the best possible Committee deliberations on any project. In this connection, the Standards Council may make such appointments as it deems appropriate in the public interest, such as the classification of "Utilities" in the National Electrical Code Committee.

NOTE 4: Representatives of subsidiaries of any group are generally considered to have the same classification as the parent organization.

FORM FOR FILING NEC® NOTICE OF INTENT TO MAKE A MOTION (NITMAM) AT AN ASSOCIATION TECHNICAL MEETING 2013 REVISION CYCLE FINAL DATE FOR RECEIPT OF NEC® NITMAM: 5:00 pm EDST, May 3, 2013 (NEC only)

If you have questions about filling out or filing the NITMAM, please contact the Codes and Standards Administration at 617-984-7249

For further information on the Codes- and Standards-Making Process see the NFPA website (www.nfpa.org)

3. I am entitled to make this motion in accordance with 4.6.8 of the Regulations Governing Committee Projects, as follows [check (a), (b), or (c)]:

(a)_X_ This motion may be made by the original submitter or their designated representative, and I am the [if you check (a) indicate one of the following]:

X I am the original submitter of the proposal or comment, or

___I am the submitter's designated representative (attach written authorization signed by the original submitter)

(b)____This motion may be made by a Technical Committee Member and I am a Member of the responsible Technical Committee.

(c)____This motion may be made by anyone.

(Form continued on next page)

4. Comments or Clarification (optional): This NITMAM will be reviewed by a Motions Committee. In addition to determining whether your Amending Motion is proper, the Committee may take other actions as described in 2.3 of the Technical Meeting Convention Rules as follows:

> **Restating and Grouping of Motions. Upon request or on its own initiative, and in consultation with the mover(s), the Motions Committee may: (a) restate an Amending Motion to facilitate the making of a proper motion or to clarify the intent of the mover; and (b) group Amending Motions which are dependent on one another into a single Amending Motion. Dependent motions are motions that the mover(s) wish to be considered by the assembly and voted on as single up or down package. In addition to the foregoing, the Motions Committee may take such other actions or make such other recommendations as will facilitate the fair and efficient consideration of motions within the available time.**

The NFPA Staff may contact you to clarify your motion or to consult on the permitted actions in 2.3. If you have any comments, suggestions or requests of the Motions Committee as it reviews your NITMAM and considers actions permitted in 2.3, please provide them below. (Use additional sheet if necessary):

Sequence of Events Leading to Issuance of an NFPA Committee Document

Step 1 Call for Proposals

▼ Proposed new document or new edition of an existing document is entered into one of two yearly revision cycles, and a Call for Proposals is published.

Step 2 Report on Proposals (ROP)

▼ Committee meets to act on Proposals, to develop its own Proposals, and to prepare its Report.

▼ Committee votes by written ballot on Proposals. If two-thirds approve, Report goes forward. Lacking two-thirds approval, Report returns to Committee.

▼ Report on Proposals (ROP) is published for public review and comment.

Step 3 Report on Comments (ROC)

▼ Committee meets to act on Public Comments to develop its own Comments, and to prepare its report.

▼ Committee votes by written ballot on Comments. If two-thirds approve, Report goes forward. Lacking two-thirds approval, Report returns to Committee.

▼ Report on Comments (ROC) is published for public review.

Step 4 Association Technical Meeting

▼ *"Notices of intent to make a motion"* are filed, are reviewed, and valid motions are certified for presentation at the Association Technical Meeting. ("Consent Documents" that have no certified motions bypass the Association Technical Meeting and proceed to the Standards Council for issuance.)

▼ NFPA membership meets each June at the Association Technical Meeting and acts on Technical Committee Reports (ROP and ROC) for documents with "certified amending motions."

▼ Committee(s) vote on any amendments to Report approved at NFPA Annual Membership Meeting.

Step 5 Standards Council Issuance

▼ Notification of intent to file an appeal to the Standards Council on Association action must be filed within 20 days of the NFPA Annual Membership Meeting.

▼ Standards Council decides, based on all evidence, whether or not to issue document or to take other action, including hearing any appeals.

The Association Technical Meeting

The process of public input and review does not end with the publication of the ROP and ROC. Following the completion of the Proposal and Comment periods, there is yet a further opportunity for debate and discussion through the Association Technical Meeting that takes place at the NFPA Annual Meeting.

The Association Technical Meeting provides an opportunity for the final Technical Committee Report (i.e., the ROP and ROC) on each proposed new or revised code or standard to be presented to the NFPA membership for the debate and consideration of motions to amend the Report. The specific rules for the types of motions that can be made and who can make them are set forth in NFPA's rules, which should always be consulted by those wishing to bring an issue before the membership at an Association Technical Meeting. The following presents some of the main features of how a Report is handled.

The Filing of a Notice of Intent to Make a Motion. Before making an allowable motion at an Association Technical Meeting, the intended maker of the motion must file, in advance of the session, and within the published deadline, a Notice of Intent to Make a Motion. A Motions Committee appointed by the Standards Council then reviews all notices and certifies all amending motions that are proper. The Motions Committee can also, in consultation with the makers of the motions, clarify the intent of the motions and, in certain circumstances, combine motions that are dependent on each other together so that they can be made in one single motion. A Motions Committee report is then made available in advance of the meeting listing all certified motions. Only these Certified Amending Motions, together with certain allowable Follow-Up Motions (that is, motions that have become necessary as a result of previous successful amending motions) will be allowed at the Association Technical Meeting.

Consent Documents. Often there are codes and standards up for consideration by the membership that will be noncontroversial and no proper Notices of Intent to Make a Motion will be filed. These "Consent Documents" will bypass the Association Technical Meeting and head straight to the Standards Council for issuance. The remaining documents are then forwarded to the Association Technical Meeting for consideration of the NFPA membership.

What Amending Motions Are Allowed. The Technical Committee Reports contain many Proposals and Comments that the Technical Committee has rejected or revised in whole or in part. Actions of the Technical Committee published in the ROP may also eventually be rejected or revised by the Technical Committee during the development of its ROC. The motions allowed by NFPA rules provide the opportunity to propose amendments to the text of a proposed code or standard based on these published Proposals, Comments, and Committee actions. Thus, the list of allowable motions include motions to accept Proposals and Comments in whole or in part as submitted or as modified by a Technical Committee action. Motions are also available to reject an accepted Comment in whole or part. In addition, Motions can be made to return an entire Technical Committee Report or a portion of the Report to the Technical Committee for further study.

The NFPA Annual Meeting, also known as the NFPA Conference & Expo, takes place in June of each year. A second Fall membership meeting was discontinued in 2004, so the NFPA Technical Committee Report Session now runs once each year at the Annual Meeting in June.

Who Can Make Amending Motions. NFPA rules also define those authorized to make amending motions. In many cases, the maker of the motion is limited by NFPA rules to the original submitter of the Proposal or Comment or his or her duly authorized representative. In other cases, such as a Motion to Reject an accepted Comment, or to Return a Technical Committee Report or a portion of a Technical Committee Report for Further Study, anyone can make these motions. For a complete explanation, the NFPA Regs should be consulted.

Action on Motions at the Association Technical Meeting. In order to actually make a Certified Amending Motion at the Association Technical Meeting, the maker of the motion must sign in at least an hour before the session begins. In this way a final list of motions can be set in advance of the session. At the session, each proposed document up for consideration is presented by a motion to adopt the Technical Committee Report on the document. Following each such motion, the presiding officer in charge of the session opens the floor to motions on the document from the final list of Certified Amending Motions followed by any permissible Follow-Up Motions. Debate and voting on each motion proceeds in accordance with NFPA rules. NFPA membership is not required in order to make or speak to a motion, but voting is limited to NFPA members who have joined at least 180 days prior to the Association Technical Meeting and have registered for the meeting. At the close of debate on each motion, voting takes place, and the motion requires a majority vote to carry. In order to amend a Technical Committee Report, successful amending motions must be confirmed by the responsible Technical Committee, which conducts a written ballot on all successful amending motions following the meeting and prior to the document being forwarded to the Standards Council for issuance.

Standards Council Issuance

One of the primary responsibilities of the NFPA Standards Council, as the overseer of the NFPA codes and standards development process, is to act as the official issuer of all NFPA codes and standards. When it convenes to issue NFPA documents, it also hears any appeals related to the document. Appeals are an important part of assuring that all NFPA rules have been followed and that due process and fairness have been upheld throughout the codes and standards development process. The Council considers appeals both in writing and through the conduct of hearings at which all interested parties can participate. It decides appeals based on the entire record of the process as well as all submissions on the appeal. After deciding all appeals related to a document before it, the Council, if appropriate, proceeds to issue the document as an official NFPA code or standard. Subject only to limited review by the NFPA Board of Directors, the decision of the Standards Council is final, and the new NFPA code or standard becomes effective twenty days after Standards Council issuance.

Mark W. Earley, Chief Electrical Engineer
Mark Cloutier, Senior Electrical Engineer
Christopher Coache, Senior Electrical Engineer
Michael Fontaine, Senior Electrical Engineer
Lee Richardson, Senior Electrical Engineer
Richard Roux, Senior Electrical Engineer
Jean Blanc, Associate Electrical Engineer

Committee Scope: This Committee shall have primary responsibility for documents on minimizing the risk of electricity as a source of electric shock and as a potential ignition source of fires and explosions. It shall also be responsible for text to minimize the propagation of fire and explosions due to electrical installations.

These lists represents the membership at the time the Committee was balloted on the text of this edition. Since that time, changes in the membership may have occurred. A key to classifications is found at the front of this book.

This Report on Comments was prepared by the **National Electrical Code Committee**, and documents its action on the comments received on its Report on NFPA 70, **National Electrical Code**, 2014 edition, as published in the Report on Proposals for the 2014 Annual Revision Cycle.

This Report on Comments has been submitted to letter ballot of the **National Electrical Code Committee**. The results of the balloting, after circulation of any negative votes, can be found in the report.

This Report on Comments has also been submitted to the **Technical Correlating Committee on the National Electrical Code®** (TCC) in two Parts. Part 1 is a letter ballot on the TCC Actions, if any; and Part II is a letter ballot Authorizing the Release of The Report. The TCC, which consists of 12 voting members, votes as follows:

Part 1: 12 voted affirmatively

Part 2: 12 voted affirmatively

19-1 Log #379 NEC-P19 **Final Action: Reject**
(Entire Document)

Submitter: David E. Shapiro, Safety First Electric
Comment on Proposal No: 19-2
Recommendation: Revise text to read as follows:
The terms, "adequate" and "adequately" and "inadequately" and "inadequate" should be <u>removed and, if needed, replaced with terms that can be consistently enforced and understood.</u>
Substantiation: I believe that the action on this proposal should be changed to "Accepted," or "Accepted in principle."
Where these terms can be understood to have clear meanings that permit of consistent enforcement it is most likely because the meanings are specified in writing, as in manufacturers' instructions. Section 110.3 addresses this—explicitly with regard to listed or labeled equipment in Section 110.3(B), Where equipment is not listed or labeled, the AHJ does need need to rely on the the presence of these adjectives to fulfill the responsibilities in Section 110.3(A).
Where these terms do not have clear interpretations based on material such as manufacturers' instructions or product standards, Section 110.12 can be applied. The Informational Note, being advisory only, does not restrict the application of Section 110.12's general duty aspect to items listed in ANSI-NECA 1-2006, such as secure, level and plumb mounting.
Panel Meeting Action: Reject
Panel Statement: The submitter has not indicated what term should be used as replacements, he only states that the terms "adequate", "adequately", "inadequately" and "inadequate" should be replaced. The specific identification and use of alternative language needs to be separately substantiated in each case. Also, these terms tend to qualitative and they allow for a qualified person to make judgment calls in the field and, therefore, are acceptable.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

ARTICLE 90 — INTRODUCTION

1-1 Log #1239 NEC-P01 **Final Action: Accept**
(90.1(C))

TCC Action: The Correlating Committee directs the title of 90.1(A) remain "Practical Safeguarding" and the term "Purpose" be removed.
Submitter: John Masarick, Independent Electrical Contractors, Inc.
Comment on Proposal No: 1-3
Recommendation: I support the panel action and request the panel maintain their position.
Panels Action: Delete 90.1(C) in its entirety and revise 90.1(A) as follows: (A) Practical Safeguarding Purpose. The purpose of this Code is the practical safeguarding of persons and property from hazards arising from the use of electricity. This Code is not intended as a design specification or an instruction manual for untrained persons.
Substantiation: The introduction of the code should be positive yet not contain regulations.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-2 Log #1335 NEC-P01 **Final Action: Reject**
(90.2(A)(5))

Submitter: Paul Dobrowsky, Holley, NY
Comment on Proposal No: 1-5
Recommendation: Accept the proposal in principle and add a definition of Premises as follows:
Premises. Property consisting of land, with or without buildings or structures.
Substantiation: During discussions it appeared that different opinions exist regarding whether land without a building or structure would be considered a premises. Section 90.2(A)(1) uses the word "premises" including "buildings, structures, etc. If the term conductor is removed from the definition of "device" and a change for the 2011 NEC removed the word "material" from the definition of "equipment" it is now unclear if conductors are considered equipment. If a property does not have buildings or structures, but does have wiring and "equipment" does the NEC apply? Adding this definition will provide clarity that the NEC applies to property as stated in 90.1(A) that has no buildings or structures but has "wiring". A panel statement indicating if this position it true would be helpful.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 1-17. The proper location for definitions is in Article 100.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-3 Log #289 NEC-P01 **Final Action: Reject**
(90.2(B)(1), Informational Note 2 (New))

Submitter: Robert C. DeLucia, Electrical Inspector
Comment on Proposal No: 1-8
Recommendation: Add an Informational Note as follows:
Informational Note No. 2: <u>*See Article 625 for the installation of equipment and devices related to electric vehicle charging.*</u>
Substantiation: This Public Comment alerts the user as to the requirements necessary for the electric (automotive) vehicle and brings correlation between 90.2(B)(1) and Article 625.
Panel Meeting Action: Reject
Panel Statement: The proposed comment does not improve clarity and is inappropriate for 90.2(B) as electric vehicle supply equipment is covered in 90.2(A).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-4 Log #1240 NEC-P01 **Final Action: Accept**
(90.2(B)(5))

Submitter: John Masarick, Independent Electrical Contractors, Inc.
Comment on Proposal No: 1-11
Recommendation: I support the action taken by the panel and wish the panel to maintain their position.
Substantiation: Utilization equipment and premises wiring comes under the control of the NEC. The utility distribution system is covered by the NESC, Article 90.2(B)(5)(c) of the NEC should reiterate that the NEC does not cover supply wiring by other written agreements under the conditions of this article.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-5 Log #1349 NEC-P01 **Final Action: Reject**
(90.2(B)(5))

Submitter: Louis Barrios, Shell Global Solutions
Comment on Proposal No: 1-9
Recommendation: The committee action should have been Accept in Principle and modify the text so that it is identical to NFPA 70E- 2012.
Substantiation: During the 2012 revision cycle of NFPA 70E, the committee changed the order of 90.2(B)(5) and modified the language in 90.2(B)(5)(b). The content of 90.2(B)(5) in NFPA 70E and the NEC should match.
Panel Meeting Action: Reject
Panel Statement: It is not a requirement that the language of NFPA 70 and 70E, *Standard for Electrical Safety in the Workplace*, match exactly, since the Standards Council approved a change in the scope of the Technical Committee on Electrical Safety in the Workplace in October 2008.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-6 Log #1496 NEC-P01 **Final Action: Reject**
(90.2(B)(6) (New))

Submitter: Lee M. Kraemer, First Solar
Comment on Proposal No: 1-13
Recommendation: Reconsider the rejection of proposal 2933.
Original proposal
(6) Installations of <u>utility scale</u> PV systems under the exclusive control of a~~n~~ ~~electric~~ public<u> or private</u> utility ~~or independent power producer~~, located outdoors or in a building space used exclusively for such installations. Installations must be on property owned or leased by the ~~electric~~ <u>public or private</u> utility ~~or independent power producer,~~ for the purpose of communications, metering, generation, control, transformation, transmission or distribution of electric energy.
Add informational note describing utility scale PV installations as:
<u>Are of the "free field" or "ground mounted" variety. The PV modules are installed in large open spaces and not on roofs of residential, commercial or industrial structures whose primary purpose are for activities other than strictly supporting the PV modules.</u>
<u>The Point of Interconnection or Point of Common Coupling between the PV system and the Utility is at voltage level at or greater than 12 kV.</u>
<u>The Point of Interconnection or Point of Common Coupling between the PV system and the Utility is through dedicated electrical switchgear, substation, switchyard or similar methods whose sole purpose is to safely and effectively interconnect the two systems. Any electrical loads connected to said electrical equipment are only used for power of auxiliary equipment vital to the generation of the PV power.</u>
<u>The access to the power plants is only by Qualified Personnel.</u>
<u>The access to the power plants by the general public is restricted by a continuous locked fencing system consisting of a minimum height of six feet above ground.</u>

Substantiation: Additional Clarification of Proposal 2933 NEC-P01
We are requesting the clear exclusion of utility scale PV (defined below) from the NEC in order to prevent the erroneous interpretation, on the part of AHJs to apply NEC requirements to utility scale PV installations rather than the appropriate NESC code requirements. Inclusion of section 690 (PV Systems) in the NEC could lead an AHJ to the conclusion that all PV systems are within the scope of the NEC when in fact only PV systems that fall under the scope defined in 90.2 are within the jurisdiction of the NEC.
The only other renewable energy source covered by NEC is "Small Wind Power" which is defined as "Wind (turbine) electric systems that consist of one or more wind electric generators with individual generators having up to and including 100 kW". Therefore, precedence has been set to define a size limitation after-which the NEC does not have jurisdiction over power generation systems.

Specific Response to NEC CMB Statements:

• Regardless of technology, equipment under the exclusive control of an electric utility that is presently addressed by 90.2(B)(5) is already excluded from the scope of the NEC.
— First Solar Response – Agree

• Independent Power Producer (IPP) systems are utility interactive systems not under the exclusive control of a utility.
First Solar Response – Rather than "IPP" the term "Private Utility" should have been used in the proposal. Wording has been revised in the suggested new wording above.
– Section 2 of the 2012 NESC defines utilities as "An organization responsible for the engineering and supervision (design, construction, operation, and maintenance) of a public or private supply, communicating, area lighting, street lighting, signal or railroad utility system." And defines a private utility as "an entity that performs or provides one or more utility services to its own facilities…and/or (b) generates or transmits power that is delivered to another utility."
– NESC also defines a Generating Station as – "A plant wherein electrical energy is produced by conversion from some other form of energy, (e.g., chemical, nuclear, solar, mechanical, or hydraulic) by means of suitable apparatus. This includes all generating station auxiliaries and other associated equipment required for the operation of the plant. Not included are stations producing power exclusively for use with communications systems."
• The submitter's contention that "there are no differences in the design, construction or operation of utility and nonutility systems" has not been substantiated.
— First Solar Response – A clear definition of "Utility Scale PV Power Plant" has been provided
– Are of the "free field" or "ground mounted" variety. The PV modules are installed in large open spaces and not on roofs of residential, commercial or industrial structures whose primary purpose are for activities other than strictly supporting the PV modules.
– The Point of Interconnection or Point of Common Coupling between the PV system and the Utility is at voltage level at or greater than 12 kV.
– The Point of Interconnection or Point of Common Coupling between the PV system and the Utility is through dedicated electrical switchgear, substation, switchyard or similar methods whose sole purpose is to safely and effectively interconnect the two systems. Any electrical loads connected to said electrical equipment are only used for power of auxiliary equipment vital to the generation of the PV power.
– The access to the power plants is only by Qualified Personnel.
– The access to the power plants by the general public is restricted by a continuous locked fencing system consisting of a minimum height of six feet above ground.
• Electric utilities are subjected to specific regulations and utilize other specific installation code requirements that have not been addressed by the proposal, and systems owned and operated by a utility are serviced and maintained by qualified personnel
— First Solar Response - Agreed, utilities are subject to NESC which is the appropriate Code for electricity generation.
– Section 011(8). (Scope) of the 2012 NESC states that the code covers "similar systems to those listed above that that are under the exclusive control of qualified persons, and authorized by a regulating or controlling body, including those associated with an industrial complex or utility interactive system."
– Section 2 of the 2012 NESC defines utilities as "An organization responsible for the engineering and supervision (design, construction, operation, and maintenance) of a public or private supply, communicating, area lighting, street lighting, signal or railroad utility system." And defines a private utility as "an entity that performs or provides one or more utility services to its own facilities…and/or (b) generates or transmits power that is delivered to another utility."
• While the substantiation states that all utility grade sites limit access, there is nothing in this proposal to say that these are limited to "utility grade sites", what such a site is, or that access is limited.
— First Solar Response – A clear definition of "Utility Scale PV Power Plant" has been provided above.
Panel Meeting Action: Reject
Panel Statement: Installations, including photovoltaic installations, that do not fall under one of the items in 90.2(B) are under the scope of the NEC regardless of the scale, mounting means, voltage, etc.
The Informational Note to 90.2(B)(4) and (5) gives examples of entities that are considered "utilities" and therefore not under the jurisdiction of the NEC. However, a key point in that note and this discussion is that those entities are subject to regulatory oversight. By removing "utility scale" systems of any type from these requirements without assurances that some type of regulatory oversight is in place also removes the inherent system safety that the regulatory oversight provides. The Submitter's substantiation indicates that the NESC may include this type of installation but it also notes that the NESC Scope states these are "authorized by a regulating or controlling body." No such body is assured or even indicated in the proposed text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-7 Log #5 NEC-P01 **Final Action: Reject**
(90.2(C))

Submitter: David L. Hittinger, Independent Electrical Contractors of Greater Cincinnati
Comment on Proposal No: 1-15
Recommendation: Revise text to read as follows:
(C) Special Permission. ~~The authority having jurisdiction for enforcing this *Code* may grant exception for the installation of conductors and equipment that are not under the exclusive control of the electric utilities and are used to connect the electric utility supply system to the service conductors of the premises served, provided such installations are outside a building or structure, or terminate inside nearest the point of entrance of the service conductors.~~ <u>By special permission, the authority having jurisdiction may waive specific requirements in this *Code* or permit alternative methods where it is assured that equivalent objectives can be achieved by establishing and maintaining effective safety.</u>
Substantiation: See Proposal 1-15 in the submitter's substantiation that refers to applying 90.4. Revising 90.2(C) to mirror the second paragraph of 90.4 clarifies the intent of what "special permission" is in the Scope of the NEC. The current text is confusing as it reiterates what is not covered in 90.2(B). Revising the Scope to the exact wording found in 90.4 simplifies the Scope and the intent.
Panel Meeting Action: Reject
Panel Statement: This comment removes existing provisions without adequate technical substantiation. The comment removes the recognition and general limitations on lengths of supply conductors that enter a building by special permission of the AHJ.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-8 Log #994 NEC-P01 **Final Action: Reject**
(90.8(B))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 1-19
Recommendation: Revise text to read as follows:
90.8 Wiring Planning.
(B) Number of Circuits in Enclosures. ~~It is elsewhere provided in this *Code* that the number of wires and circuits confined in a single enclosure be varyingly restricted.~~ <u>The number of wires and circuits in a single enclosure is restricted in various ways in other Articles of this *Code*.</u> Limiting the number of circuits in a single enclosure minimizes the effects from a short circuit or ground fault.
Substantiation: 90.8(B) revise first sentence for lucidity:
Panel Meeting Action: Reject
Panel Statement: The existing language is clear. The recommended text does not add clarity or usability.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-9 Log #1111 NEC-P01 **Final Action: Reject**
(90.9)

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 1-20
Recommendation: Revise the existing text of the 2011 NEC as follows:
9**0.9 Units of Measurement**.
(A) Measurement System of Preference. <u>Except as provided in (E), (F) and (G)</u>~~For the purpose of this *Code*~~, metric units of measurement <u>shall be</u> ~~are~~ in accordance with the modernized metric system known as the International System of Units (SI).
(B) Preference Dual System of Units. SI units shall appear first, and inch-pound units shall immediately follow in parentheses. ~~Conversion from inch-pound units to SI units shall be based on hard conversion except as provided in 90.9(C).~~
(C) <u>**Hard Conversion.** Conversion from inch-pound units to SI units shall be based on hard conversion except as provided in (D), (E), (F), and (G).</u>
(D) ~~**Permitted Uses of Soft Conversion.**~~ <u>Where a negative impact on safety</u>

would result, soft conversion shall be used.

~~The cases given in 90.9(C)(1) through (C)(4) shall not be required to use hard conversion and shall be permitted to use soft conversion.~~

(E)(1) Trade Sizes. Where the actual measured size of a product is not the same as the nominal size, trade size designators shall be used rather than dimensions. Trade practices shall be followed in all cases.

(F)~~(2)~~ Extracted Material. Where material is extracted from another standard, the context of the original material shall not be compromised or violated. Any editing of the extracted text shall be confined to making the style consistent with that of the *NEC*.

(G)~~(3)~~ Industry Practice. Where industry practice is to express units in inch-pound units, the inclusion of SI units shall not be required.

~~**(4) Safety. Where a negative impact on safety would result, soft conversion shall be used.**~~

The section will then read as follows:

90.9 Units of Measurement.

(A) Measurement System of Preference. Except as provided in (E), (F) and (G), metric units of measurement shall be in accordance with the modernized metric system known as the International System of Units (SI).

(B) Preference. SI units shall appear first, and inch-pound units shall immediately follow in parentheses.

(C) Hard Conversion. Conversion from inch-pound units to SI units shall be based on hard conversion except as provided in (D), (E), (F), and (G).

(D) Soft Conversion. If a negative impact on safety would result, soft conversion shall be used.

(E) Trade Sizes. Where the actual measured size of a product is not the same as the nominal size, trade size designators shall be used rather than dimensions. Trade practices shall be followed in all cases.

(F) Extracted Material. Where material is extracted from another standard, the context of the original material shall not be compromised or violated. Any editing of the extracted text shall be confined to making the style consistent with that of the NEC.

(G) Industry Practice. Where industry practice is to express units in inch-pound units, the inclusion of SI units shall not be required.

Substantiation: This proposal and comment do not introduce any new material but make improvement in the format and arrangement of the requirements or provisions. Problems with the existing arrangements that are corrected in this proposed re-write include:

1. The requirement that conversion from inch-pound units to SI units shall be based on hard conversion except as provided in 90.9(C) is presently misplaced as a second sentence in (B). This is a major requirement that deserves to be in its own sub-section.

2. The existing subsection (C) is a permissive section stating that the examples shown in (C)(1) through (C)(4) are permitted use of soft conversion which is a more precise conversion than hard conversion. Problems that appear with this concept are as follows:

(a) (C)(1) refers to Trade Sizes and the rule allows Trade Sizes to be used without complying with either the Hard or Soft conversion. These common trade sizes including corresponding Metric Designators are shown in Table 300.1(C). The Informational Note states “Note: The metric designators and trade sizes are for identification purposes only and are not actual dimensions.” So, it is inappropriate for the dialog about Trade Sizes to be under the First Division label “Permitted Uses of Soft Conversion.” The proposal and Comment correct this mis-location.

(b) (C)(2) refers to Extracted Material or material that is extracted from usually another NFPA standard. The rule in (C)(2) requires “the context of the original material shall not be compromised or violated.” The rule does not indicate whether hard or soft conversion is to be used. The rule is presently mis-placed. This is corrected in the Proposal and Comment.

(c) The present (C)(3) refers to Industry Practice. It provides that if “industry practice is to express units in inch-pound units, the inclusion of SI units shall not be required.” This statement has nothing to do with Permitted Use of Soft Conversion and is presently misplaced. This is corrected in the Proposal and Comment.

(d) The present (C)(4) refers to “Safety.” Note that the title of (C) states (C)(1) through (C)(4) are permitted use of soft conversion. However, (C)(4) is a mandatory requirement to use Soft Conversion to avoid a negative impact on safety. This is corrected in the Proposal and Comment.

Panel Meeting Action: Reject

Panel Statement: The second sentence of 90.9(B) is not misplaced. Trade sizes, extracted material and industry practice are permitted uses of soft conversion tabulated in 3.2.7.3 of the NEC Style Manual. The relocation of 90.9(C)(4) is not needed.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

ARTICLE 100 — DEFINITIONS

17-1 Log #920 NEC-P17 **Final Action: Reject**
(100, 422, 518.3(B), 525.23, 600.10(C)(2), and 680)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 17-18a
Recommendation: Revise text to read as follows:

600.10 Portable or Mobile Signs.

(C) Wet or Damp Location.

(2) Ground-Fault Circuit Interrupter. The manufacturer of portable or mobile signs shall provide a listed appliance ground-fault circuit-interrupter protection for personnel. The ground-fault circuit interrupter shall be an integral part of the attachment plug or shall be located in the power-supply cord within 300 mm (12 in.) of the attachment plug. **[ROP 18–108]**

680.33 Luminaires.

(B) Over the Low Voltage Contact Limit But Not over 150 Volts. A lighting assembly without a transformer or power supply and with the luminaire lamp(s) operating at not over 150 volts shall be permitted to be cord-and-plug-connected where the assembly is listed as an assembly for the purpose. The installation shall comply with 680.23(A)(5), and the assembly shall have the following construction features:

(1) No exposed metal parts
(2) An impact-resistant polymeric lens and luminaire body
(3) A ground-fault circuit interrupter with open neutral conductor protection as an integral part of the assembly
(4) The luminaire lamp permanently connected to the listed appliance ground-fault circuit interrupter with open-neutral protection
(5) Compliance with the requirements of 680.23(A)

680.44 Protection. Except as otherwise provided in this section, the outlet(s) that supplies a self-contained spa or hot tub, a packaged spa or hot tub equipment assembly, or a field-assembled spa or hot tub shall be protected by a ground-fault circuit interrupter.

(A) Listed Units. If so marked, a listed self-contained unit or listed packaged equipment assembly that includes integral listed appliance ground-fault circuit-interrupter protection for all electrical parts within the unit or assembly (pumps, air blowers, heaters, lights, controls, sanitizer generators, wiring, and so forth) shall be permitted without additional GFCI protection.

680.62 Therapeutic Tubs (Hydrotherapeutic Tanks).

(A) Protection. Except as otherwise provided in this section, the outlet(s) that supplies a self-contained therapeutic tub or hydrotherapeutic tank, a packaged therapeutic tub or hydrotherapeutic tank, or a field-assembled therapeutic tub or hydrotherapeutic tank shall be protected by a ground-fault circuit interrupter.

(1) Listed Units. If so marked, a listed self-contained unit or listed packaged equipment assembly that includes integral listed appliance ground-fault circuit-interrupter protection for all electrical parts within the unit or assembly (pumps, air blowers, heaters, lights, controls, sanitizer generators, wiring, and so forth) shall be permitted without additional GFCI protection.

Substantiation: I am concerned that existing “portable GFCIs” may not have the 3 properties listed in the definition. I believe these additional properties deserve a more distinctive name.

Portable/cord GFCI appear in other articles and could well need the same level of protection as specified in 422. Suggest that the definition be moved to 100. and referenced in 518.3(B), 525.23, 600.10(C)(2), 680.33(B), 680.44(A), & 680.62(A)(1).

Panel Meeting Action: Reject

Panel Statement: The commenter cites panel proposal 17-18a and seeks to amend 680.33, 680.44, and 680.62. These articles were not part of the original proposal and they make no reference to “portable GFCI’s”, as implied in the commenter’s substantiation. The comment, therefore, represents a new proposal. In addition, the comment proposes a new term, “listed appliance ground-fault circuit-interrupter protection for personnel”, that is not used in the product safety standard (ANSI/UL 943) or on listed devices. Also, the proposed product does not exist. Finally, the substantiation expresses concern that “existing portable GFCIs” may not have the 3 properties listed in the definition.” These properties are applicable to existing listed portable ground-fault circuit-interrupters, per the product safety standard. The suggested language is inconsistent with the existing language in the article.

Number Eligible to Vote: 9

Ballot Results: Affirmative: 9

(100 Scope and Part II)

TCC Action: The Correlating Committee advises that Article Scope Statements are the responsibility of the Correlating Committee and the Correlating Committee accepts the panel action. The Correlating Committee directs that the last sentence of the Part 1 Article Scope and the first paragraph of Part II be revised to read as follows to better correlate:
Part II contains definitions applicable only to articles and parts of articles specifically covering installations and equipment operating at over 600 volts, nominal.
II. Over 600 Volts, Nominal
The definitions in Part I are intended to apply wherever the terms are used throughout this Code, the definitions in Part II are applicable only to articles and parts of articles specifically covering installations and equipment operating at over 600 volts, nominal.
Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 1-72
Recommendation: The Correlating Committee advises that Article Scope statements are the responsibility of the Correlating Committee and the Correlating Committee Rejects the panel action.
The Correlating Committee directs that the panel clarify the panel action on this proposal since the recommended text in this proposal, in the first paragraph of the proposed text, does not have a proposed destination and the second paragraph appears to be inserted into Part II of Article 100. However, it deals with under 600 volts as well as over 600 volts.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the TCC and continues to accept Proposal 1-72 and clarifies its action as follows:
The first recommendation in Proposal 1-72 revises the second sentence of the second paragraph of the Scope of Article 100 in the 2011 NEC by adding "articles and" to precede "parts of articles".
The second recommendation in Proposal 1-72 is intended to revise the opening statement of Part II of Article 100 in the 2011 NEC, which will read as follows:
II. Over 600 Volts, Nominal
The definitions in Part I are intended to apply wherever the terms are used throughout this Code, the definitions in Part II are applicable only to articles and parts of the articles specifically covering installations and equipment operating at over 600 volts, nominal.

1-11 Log #393 NEC-P01 **Final Action: Accept**
(100, Part I Scope)

Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 1-70
Recommendation: Continue to reject the Proposal.
Substantiation: A review and comparison of the present text of Part I of Article 100 with OSHA 1926 shows the OSHA document breaks at 600 Volts. Changing the Scope of Article 100, Part I will create a conflict between the two documents causing voltages from 600 Volts to 1000 Volts to be in violation of OSHA requirements. In addition, a Note within the OSHA document states that "If the electrical installation is made in accordance with the National Electrical Code ANSI/NFPA 70-1984, exclusive of Formal Interpretations and Tentative Interim Amendments, it will be deemed to be in compliance with 1926.403 through 1926.408, except for 1926.404(b)(1) and 1926.405(a)(2)(ii)(E), (F), (G), and (J)." This would further conflict with the proposed text without significant amendment.
Panel Meeting Action: Accept
Panel Statement: A joint task group appointed by the Correlating Committee consisting of representatives from HVTG, CMP 1 and CMP 8 reviewed proposals rejected by CMP 1 and CMP 8 related to replacing 600V to 1000V. The joint task group concluded that neither the joint task group nor the High Voltage Task Group has the necessary background research to further justify technical substantiation for the rejected proposals. Such substantiation would likely need to come from entities such as the manufacturers or the NFPA Research Foundation. The joint task group recommended that CMP 1 and CMP 8 not change the original actions taken during the 2014 proposal stage. In addition, the panel does not necessarily agree with all of all the substantiation for the comment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-12 Log #1241 NEC-P01 **Final Action: Accept**
(100, Part II)

Submitter: John Masarick, Independent Electrical Contractors, Inc.
Comment on Proposal No: 1-70
Recommendation: Continue to reject this proposal which would change 600 volts to 1000 volts.
Substantiation: Replacing 600 volts with 1000 volts will have a major impact on installers, component manufacturers, and industry standards. Increased spacing must be considered when going from 600 volts to 1000 volts. Personal safety must also be considered.
Because the proposer has not provided enough information to the public to justify and understand all the ramifications of the proposal, the committee should continue to reject the submitter's proposal.
Panel Meeting Action: Accept

1-13 Log #4 NEC-P01 **Final Action: Accept in Principle**
(100.Accessible, Readily)

Submitter: Palmer Hickman, Upper Marlboro, MD
Comment on Proposal No: 1-24
Recommendation: Revise text to read as follows:
Accessible, Readily (Readily Accessible). Capable of being reached quickly for operation, renewal, or inspections without requiring those to whom ready access is requisite to use tools, to climb over or remove obstacles, or to resort to portable ladders, and so forth.
Substantiation: This is an editorial revision of Proposal 1-24. The need to use a tool to reach something for operation, renewal, or inspection may make it accessible, but not necessarily readily accessible as substantiated in Proposal 1-24. The need to use a tool, even one as simple as a screw driver, would add another level of action that would impede or delay access.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Accessible, Readily (Readily Accessible). Capable of being reached quickly for operation, renewal, or inspections without requiring those to whom ready access is requisite to actions such as; to use tools, to climb over or remove obstacles, or to resort to portable ladders, and so forth.
Panel Statement: Editorial. Revise the text as follows: add the words "to actions such as" after the word "requisite" and before the words "to use tools"

Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

BARRIOS, L.: The term "readily accessible" is used in multiple articles in the NEC under the jurisdiction of multiple code making panels. CMP-1 rejected proposal 1-24, which proposed to add the phrase "use tools", stating that "a significant change in the definition... may create unintended consequences throughout the Code". Because the panel rejected this proposal, the other code making panels did not get the opportunity to comment on how this change may impact their intended use of the term. During the ROC stage, CMP1 reversed its decision and accepted the addition of "use tools". At this stage, the other code making panels do not get the opportunity to comment on how this change will impact the usage of the term. Therefore, the proper action on this comment should be to Reject.

LABRAKE, JR., N.: Adding "tools" as an obstruction would also include "keys" which is not the intent of this requirement. Also, the Panel's addition of "to use tools" in the definition in Article 100 can cause correlation issues in other sections of the Code such as 230.72(C).

Comment on Affirmative:

BOYCE, K.: The change associated with Comment 1-13 is significant and the need to eliminate the use of any form of tool has not been fully substantiated as it relates to being 'capable of being reached quickly.' This modification may have significant impact throughout the NEC as it relates to the use of the term "readily accessible", and the other Code Panels will not have the benefit of fully analyzing and understanding the implications of this impact. The change will be expected to require considerable product redesign without a clearly defined benefit based on today's practices. It may also require placement of switches and the like in locations where they are subject to nuisance actuation that may lead to other, new problems due to this modified placement.

11-1 Log #802 NEC-P11 **Final Action: Reject**
(100.Adjustable Speed Drive, Adjustable Speed Drive System)

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 11-75
Recommendation: I support assigning the definitions for "Adjustable Speed Drive" and "Adjustable Speed Systems" to Article 100. I do not support the reworked definitions. Return the definitions to the original language used in Section 430.2 of the 2011 NEC to read as follows:
Adjustable Speed Drive. A combination of the power converter, motor, and motor-mounted auxiliary devices such as encoders, tachometers, thermal switches and detectors. air blowers, heaters, and vibration sensors.

Adjustable Speed Drive System. An interconnected combination of equipment that provides a means of adjusting the speed of a mechanical load coupled to a motor. A drive system typically consists of an adjustable speed drive and auxiliary electrical apparatus.
Substantiation: The reworked definitions are incomplete and do not add clarity. Furthermore, these definitions were revised without substantiation. The proposed definition for an "Adjustable Speed Drive System" is very broad and might even include mechanical systems that should not be included in the NEC. The proposed broad definition is so broad that it would include Ward-Leonard systems, or a water wheel driving an alternator. As proposed, it is not particularly useful.

There was no field evidence provided that indicated the existing definitions were not adequate nor that the existing definitions resulted in any field problems.

The current definition for "Adjustable Speed Drive System" that is used in the 2011 NEC, Section 430.2, is the same definition found in IEEE P1 566, Standard for Performance of Adjustable Speed AC Drives Rated 375 kW and Larger.
Changing these definitions could create confusion and application errors in the field due to the broad definition. The difference in this definition and the IEEE P1566 definition is an example of the confusion that will be created.
Panel Meeting Action: Reject
Panel Statement: The definitions in Proposal 11-75 as accepted and revised by CMP 11 provide a more concise and accurate description. It is the panel's intent that the definitions remain in Article 100 but remain under the purview of CMP 11.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-1 Log #916 NEC-P15 **Final Action: Reject**
(100.Alternate Power Source, 517.2, and 551.31)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 15-3
Recommendation: Revise text to read as follows:
100 I
Alternate Power Source. One or more generator sets, or battery systems where permitted, intended to provide power during the interruption of the normal electrical services or the public utility electrical service intended to provide power during interruption of service normally provided by the generating facilities on the premises.
517.2~~**Alternate Power Source.** One or more generator sets, or battery systems where permitted, intended to provide power during the interruption of the normal electrical services or the public utility electrical service intended to provide power during interruption of service normally provided by the generating facilities on the premises.~~
551.31 Multiple Supply Sources.(A) Multiple Supply Sources. Where a multiple supply system consisting of ~~an alternate~~ a secondary power source and a power-supply cord is installed, the feeder from the ~~alternate~~ secondary power source shall be protected by an overcurrent protective device. Installation shall be in accordance with 551.30(A), 551.30(B), and 551.40.
(C) ~~Alternate~~ Secondary Power Sources Exceeding 30 Amperes. If ~~an alternate~~ a secondary power source...".
Substantiation: The term *Alternate Power Source* is used in: section 517, section 551, 695.4(B)(3)(b), 700.4(B), 700.7(B), 701.4, 701.7(B), 702.2 <info fig>, 702.7(B), 708.2 <info fig>, 708.21, 708.22(A,B&C), and 750.20.
In all cases except 551.31 it appears to have the meaning found presently in 517.2. The TCC objected to moving the definition to 100 I because of conflicting usages. I believe that changing the term to *Secondary Power Sources* in 551.31 would allow the 517.2 definition to apply to all other usages and would then belong in 100 I as originally proposed. Another adjective rather than *Secondary* may be better. As it stands in the 2011 code we are using the same phrase for two meanings that can lead to confusion.
NEC Style Manual: 2.2.2.1 Article 100. In general, Article 100 shall contain definitions of terms that appear in two or more other articles of the *NEC*.
Panel Meeting Action: Reject
Panel Statement: In accordance with the direction of the correlating committee on Proposal 15-3 this definition should reside only in 517.2. Removing the definition from 517.2 and moving it to Article 100 with the changes indicated in the comment will lead to confusion of code users. The meaning of the term as used in the other cited NEC sections is different than that used in health care installations. The panel notes that this is extracted material from NFPA 99 and should be referenced as such. [99: 3.3.5].
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

9-1 Log #471 NEC-P09 **Final Action: Accept**
(100.Askarel)

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 9-3
Recommendation: Revise text to read as follows:
Askarel. A generic term for a group of nonflammable synthetic chlorinated hydrocarbons used as electrical insulating media. ~~Askarels of various compositional types are used. Under arcing conditions, the gases produced, while consisting predominantly of noncombustible hydrogen chloride, can include varying amounts of combustible gases, depending on the askarel type.~~
Informational Note: Askarels of various compositional types are used. Under arcing conditions, the gases produced, while consisting predominantly of noncombustible hydrogen chloride, can include varying amounts of combustible gases, depending on the askarel type.
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains the defined term and the NEC manual of style does not permit the definition to contain the defined term. Definitions are not requirements. Moreover, the definition also contains a list that is simply informational. The proposed changes eliminate the defined term. If the CMP believes that this information is a requirement it should place it somewhere else, perhaps within Article 450.
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Coghill, P.

5-1 Log #1144 NEC-P05 **Final Action: Reject**
(100.Bonding Jumper; Bonding Jumper, Main; Grounding Conductor, Equipment and Informational Note No 1 and 3; Bonding Jumper, System; and Separately Derived System)

Submitter: Paul Dobrowsky, American Chemistry Council
Comment on Proposal No: 5-3
Recommendation: The proposal should have been accepted.
Substantiation: The term Equipment Grounding Conductor needs to be replaced. Those opposed have no technical reason for their opposition or any other valid reason. It is not worth the effort and everyone understands what is meant are common responses.

It is very simple: Grounding electrode conductors are the connection to the earth and accomplish grounding. In the present NEC, Equipment Grounding Conductors and bonding jumpers provide a "path back" to the source. Both are always performing a bonding function. If the Grounding Electrode connection is removed or broken, the bonding function remains intact.

Section 250.4 does not permit the earth (ground) to be used as an effective ground fault current path but the term equipment grounding conductor inherently incorrectly contains the word "ground".

Visualize equipment supplied by a portable generator. The generator frame is not required to be connected to the earth. The "green" wire in the flexible cord is not performing a grounding function but is performing a bonding function.

Visualize building one supplied by a service, having the grounded conductor connected to the grounding electrode system by a grounding electrode conductor. A feeder supplies a second building and a grounding electrode conductor is required for grounding any equipment in the second building. An equipment grounding conductor is required to be installed from building 1 to building 2. Not for grounding, but for bonding, providing an effective fault current path.

Making this change has the added benefit of being more harmonized with other international standards and usage of terminology.

Experienced NEC users have to ignore other concepts in other definitions and requirements to use the existing term. This does not help the future NEC user or provide clarity in the existing NEC. Changing the term is the right thing to do and should be supported.

Panel Meeting Action: Reject

Panel Statement: The term "Equipment Grounding Conductor" is a significant and necessary term in the NEC. The substantiation does not provide documentation of any safety problem created for the electrical industry, or other users of the NEC, by the use of the term "equipment grounding conductor". It would be an unnecessary burden on the electrical industry to make such a significant change with no expected improvement in safety.

The Panel has long recognized that the equipment grounding conductor performs both a grounding and a bonding function. See the definition of Equipment Grounding Conductor in Article 100 along with Informational Note 1 that follows. The definition of "Equipment Grounding Conductor" was revised in proposal 5-14a to recognize that the conductor also provides the fault current path for ground faults. It should be noted that it has long been recognized that the Equipment Grounding Conductor provides the path for ground fault current but the definition needed to be changed to be accurate. The connection to earth is made by the grounding electrode. The grounding electrode conductor extends the earth connection to service equipment or separately derived systems. The equipment grounding conductor both extends the earth connection and bonds equipment together.

It would be inaccurate and confusing to change Equipment Grounding Conductor to Equipment Bonding Conductor since there is no definition of Equipment Bonding Conductor in Article 100. The definition of Bonding Conductor or Jumper indicates the conductor connects equipment together. There is no indication in this definition of extending the earth connection. This distinction is important to new as well as seasoned users of the NEC.

In addition, a change of this magnitude cannot be made to only a portion of the Articles where the terms are used. No proposal was made for not less than 47 of the Articles where the term Equipment Grounding Conductor is used.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 13 Negative: 3

Explanation of Negative:

DOBROWSKY, P.: The term "equipment grounding conductor" needs to be replaced with "equipment bonding conductor" throughout the NEC. Yes, the term equipment grounding conductor in Article 100 would need to be changed to the term equipment bonding conductor.

Some have argued that it is just a problem of education. Having the word "grounding" in a term describing conductor that is used primarily for a bonding function is not a problem to be solved by education.

The use of the term "equipment grounding conductor" is confusing both for those new to the electrical industry and even for some experienced users. The problem is compounded when dealing with other international standards.

No technical reason has been provided for not making the change. This conductor always provides a bonding function but does not always provide a grounding function such as in the case of a portable generator installed as a separately derived system.

MOHLA, D.: The comment should have been accepted.

Those opposed to the proposed change have not considered the pertinent substantiation in the proposal 5-3. In that substantiation, it was pointed out that "bonding" and "grounding" have distinct and different meanings. The Panel recognizes that the present term, "equipment grounding conductor", performs a bonding function. However, the revised definition of equipment grounding conductor in Proposal 5-14a indicates that the conductor is for the purpose of carrying ground-fault current even though ground-fault current does not travel principally to ground but, rather, to the source. Thus the use of the terms "equipment grounding conductor" and "ground fault current" erroneously imply that this fault current is intended to flow to ground. How wrong can we be!! Section 250.4(A) (5) specifically prohibits considering the ground as a viable path for current flow.

Additionally, there is a misconception that bonding equipment conductor to the grounded conductor will limit the voltage at the fault location and make the equipment safe. In fact, when fault current travels through the bonding conductor to the source where the virtual connection to ground occurs, the voltage at the fault location (for a grounded system), with respect to ground, is more than half of the supply voltage (voltage division due to the voltage drops in the supply conductor impedance and the bonding conductor impedance).

An appropriate term for the present equipment grounding conductor is necessary but that term should reflect the function of the conductor. Why do we use the term "bonding jumper" or "supply side bonding jumper" when these conductors are part of the same path from the faulted equipment to the source of the current? To be consistent, should not these jumpers be called "grounding" jumpers?

The Panel correctly questions that no safety connection has been documented. Documentation of this type will never be available since it would be rare for a connection of equipment to ground instead of to the source be identified as the proximate cause of an injury. Further, it would be rare to have data on the number of installations that are improperly installed - a condition that is difficult, but not impossible, for an inspector to identify. We simply do not know the extent of injuries that are waiting to happen due to improper bonding to ground instead of to the source.

The Panel indicated that it would be a "burden" on the electrical industry. The burden is a documentation issue that need not be corrected all at once. As documents from UL, NEMA, IAEI, and others are revised, the appropriate terms can then be updated. The immediate effect would be in the training of electricians. As pointed out in a previous proposal substantiation, questions raised at inspectors' forums and at Code classes are a good indication that there are many in the industry that do not fully understand the separate purposes of bonding and of grounding. The Code Panel members understand the distinction as do the large majority of qualified practitioners. This proposed change will not affect those that understand the principles of bonding and grounding but make it easier to understand for those who need to learn the proper installation methods for a safer installation.

Changes in terminology were intentionally submitted only for Chapters 1 through 4. Because the remaining chapters are very specific for special, rather than general, installations, coordination with the new terminology should be made by the appropriate Code Panels who have the expertise necessary to determine if "bonding" or "grounding" should be the operative term.

WILLIAMS, D.: The panel is gaining support for changing the term to bonding verses grounding. The concept of changing the term equipment grounding conductor to equipment bonding conductor is the right thing to do for the electrical industry. The terms in Article 250 should be reflected in their definition. We only ground (for the most part) at the service and everything after the service is bonding back to the service to complete the effective ground-fault current path. When people are explaining what an equipment grounding conductor does, you can't explain it properly without describing it as a bonding conductor. The definition should also include that the equipment bonding conductor provides the effective ground-fault current path for the feeder or branch circuit. I am voting for making the change to equipment bonding conductor knowing there are additional changes needed in this definition. I do agree with the panel that at the ROC stage is not the proper time to make all the changes necessary.

Comment on Affirmative:

PORTER, C.: I do not think replacing the term Equipment Grounding Conductor with the term Equipment Bonding Conductor works because the new term would not reflect the function of limiting the voltage on equipment and materials that the existing term has. I do believe the revised definition of the EGC does help to address some of the concern the submitter has. The discussion about this grounding and bonding conductor deserves to continue in hopes of providing a better term and a better understanding of the term.

5-2 Log #1278 NEC-P05 **Final Action: Reject**

(100.Bonding Jumper; Bonding Jumper, Main; Grounding Conductor, Equipment and Informational Note No 1 and 3; Bonding Jumper, System; and Separately Derived System)

Submitter: Elliot Rappaport, Electro Technology Consultants

Comment on Proposal No: 5-3

Recommendation: Accept proposal.

Substantiation: The Panel is correct in referencing 250.4(A) and (B). 250.4(A)(1) correctly defines system grounding. 250.4(A)(3), (4), and (5) are reasonable definitions for bonding although (3) and (4) are so similar that they might be combined (not part of this proposal). 250.4(A)(2) erroneously implies that a connection to earth will "limit the voltage to ground". Thus, it may be inferred by some, incorrectly, that connection to ground, per se, will make the system "safer".

The term "equipment grounding conductor" has a definite purpose that is not uniquely expressed in the term, i.e. "bond the equipment to a terminal at the source of voltage". As a result, there is a misconception that "grounding", without bonding to the source, will make a system safe. On the contrary, connecting equipment to ground without providing the bonding connection back to the source can make equipment less safe by increasing the time to clear the fault.

Since the "earth shall not be considered as an effective ground-fault path", and the ground fault current must return to the source to allow an overcurrent device to operate, the earth cannot and should not be depended upon to complete the path to the source in order to trip the overcurrent device quickly.

Renaming this conductor as an "Equipment Bonding Conductor (EBC)" will clarify that the primary purpose of this conductor is to bond to the source in order to provide a known path for ground fault current that will facilitate rapid fault clearing.

It is recognized that the term "EGC" has been in use for a long time and that changing it to EBC will cause some concerns including changing written literature that uses the EGC term. After the initial period of understanding, users will correctly understand the purpose of this conductor and this will enhance the safety of personnel.

The fundamental purpose of this and companion proposals is to clearly state that "systems" are "grounded" and "equipment" is "bonded". The fact that the bonding conductor may be grounded also is secondary to the primary function of bonding.

8-1 Log #268 NEC-P08 **Final Action: Accept**
(100.Cable Routing Assembly)

Submitter: Code-Making Panel 16,
Comment on Proposal No: 8-5
Recommendation: Continue to Reject Proposal 8-5.
Substantiation: Proposal 8-5 was referred to CMP 16 for comment by the TCC. A Task Group to review Proposal 8-5 for comment was appointed by CMP16 Chairman Tom Moore. It was the recommendation of the CMP 16 task group that CMP 16 support the CMP 8 panel meeting action to Reject Proposal 8-5. The submitter of Proposal 8-5 wanted to add new definition of Cable Routing Assembly to Article 100.
Proposal 16-3a included the same recommendation by the same submitter as Proposal 8-5. CMP 16 Rejected Proposal 16-3a with a panel statement indicating that cable routing assemblies are not intended for use with power wiring. Placing the definition in Article 100 may lead to confusion concerning the applications of cable routing assemblies. In this case, it is clearer to have the definition closely associated with the applicable articles.
The Task Group members were:
Harry Ohde, Chair, representing: IBEW
George Bish, representing Satellite Broadcasting & Communications Association
Randy Ivans representing Underwriters Laboratories Inc.
Steve Johnson representing National Cable & Communications Association
This comment was developed by a CMP-16 Task Group and balloted through the entire panel with the following ballot results:
16 Eligible to vote
14 Affirmative
2 Ballots Not Returned (D. Ballast and W.F. Murphy)

Recommendation: Revise text to read as follows:

100 Definitions.

<u>**Cable Routing Assembly.** A single channel or connected multiple channels, as well as associated fittings, forming a structural system that is used to support, route and protect high densities of wires and cables, typically communications wires and cables, optical fiber and data (Class 2 and Class 3) cables associated with information technology and communications equipment.</u>

725.2 Definitions.

~~**Cable Routing Assembly.** A single channel or connected multiple channels, as well as associated fittings, forming a structural system that is used to support and route conductors and cables. **[ROP 3–118]**~~

760.2 Definitions.

~~**Cable Routing Assembly.** A single channel or connected multiple channels, as well as associated fittings, forming a structural system that is used to support and route conductors and cables. **[ROP 3–171]**~~

770.2 Definitions.

~~**Cable Routing Assembly.** A single channel or connected multiple channels, as well as associated fittings, forming a structural system that is used to support, route and protect high densities of wires and cables, typically communications wires and cables, optical fiber and data (Class 2 and Class 3) cables associated with information technology and communications equipment.~~

800.2 Definitions.

~~**Cable Routing Assembly** A single channel or connected multiple channels, as well as associated fittings, forming a structural system that is used to support, route and protect high densities of wires and cables, typically communications wires and cables, optical fiber and data (Class 2 and Class 3) cables associated with information technology and communications equipment. **[ROP 16–23]**~~

Substantiation: The term *Cable Routing Assembly* is used in articles 725, 760, 770, 800, 820, and 830.

A term used in multiple articles should be defined in article 100. This is the place readers expect to find such definitions.

The term *Cable Routing Assembl*y is currently defined in 725.2, 760.2, 770.2, and 800.2. There are two different definitions for the same term. This leads to confusion. Defining a term in multiple places can easily lead to different definitions.

800.2 [820.2 830.2] Definitions. See Part I of Article 100. For the purposes of this article, the following additional definitions apply. **[ROP 16–82]**

725, 760, & 770 automatically inherits definitions from 100.

800, 820, & 830 have added a reference to definitions from 100.

[Staff Note: This comment has also been submitted to Panel 1 and Panel 3 for action.]

Panel Meeting Action: Reject

Panel Statement: The Correlating Committee has suggested that the definition of "Cable Routing Assembly" be located in a single article of Chapter 8. See Correlating Committee note to Proposals 3-118, and 3-171, and the April 23-27, 2012 Correlating Committee Meeting Minutes CMP 3 Minute Item suggesting "…that 800.2 may be the most appropriate location for the definition." Further, cable routing assemblies are not intended for use with power wiring and the panel continues to be concerned that placing the definition in Article 100 may lead to confusion regarding the application of cable routing assemblies.

Ballot Not Returned: 1 Ballast, D.

16-3 Log #322 NEC-P16 **Final Action: Reject**

(100.Communications Raceway (New))

TCC Action: The Correlating Committee directs that the Action on Comment 16-3 be reported as Reject and the definition of "Communications Raceway" be relocated to Article 100 in accordance with the NEC Style Manual.

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.

Comment on Proposal No: 16-8

Recommendation: Continue to reject proposal 16-8.

Substantiation: The Communications Cable and Connectivity Association supports the panel's action to reject this proposal. Including the definition of communications raceway in Article 100 could give the impression that communications raceways are suitable for electric light and power wiring. They are not listed for use with electric light and power wiring.

Panel Meeting Action: Accept

Ballot Not Returned: 1 Ballast, D.

10-1 Log #1392 NEC-P10 **Final Action: Reject**

(100.Coordination)

Submitter: Dennis Darling, Stantec Consulting Ltd.

Comment on Proposal No: 10-5

Recommendation: Delete text to read as follows:

Localization of an overcurrent condition to restrict outages to the circuit or equipment affected, accomplished by the ~~choice~~ <u>installation</u> of overcurrent protective devices and their ratings or settings <u>for the full range of available overcurrents, from overload to the maximum available fault current, and for the full range of overcurrent protective device opening times associated with those ovcrcurrents.</u>

Substantiation: I oppose the addition of "and for the full range of overcurrent protective device opening times associated with those overcurrents". I promote selective coordination for specific applications.

Panel Meeting Action: Reject

Panel Statement: The definition of "selective coordination" does not preclude the submitter's concern as noted in his substantiation. See panel action and statement on Comment 10-2. The term "installation" remains but is used in a different context.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-2 Log #945 NEC-P10 **Final Action: Accept in Part**

(100.Coordination (Selective))

Submitter: Ed Larsen, Schneider Electric USA

Comment on Proposal No: 10-5

Recommendation: Delete text to read as follows:

Coordination (Selective). Localization of an overcurrent condition to restrict outages to the circuit or equipment affected, accomplished by the ~~choice~~ <u>selection and installation</u> of overcurrent protective devices and their ratings or settings ~~for the full range of available overcurrents, from overload to the maximum available fault current, and for the full range of overcurrent protective device opening times associated with those overcurrents.~~

Substantiation: The replacement of the word "choice" with the words "selection and installation" is acceptable for the reasons stated in the submitter's substantiation. The remainder of the proposed text should have been rejected.

As the submitter stated, the selective coordination requirement in 700.27 and similar places has caused confusion, but not for the reason stated by the submitter. Engineers know that all systems are selectively coordinated to some

level, so to simply state that emergency and other systems should be selectively coordinated does not make sense, hence many have asked up to what level such systems should be coordinated to. By reading the statements made by CMPs 13 and 20 in past cycles, it is apparent that what they meant to require is “total” coordination up to the theoretical maximum level of fault current, but unfortunately the Code text does not say that. The correct way to fix this problem would be to add the word “total” in 700.27 and similar places in the Code, not to revise the definition in Article 100. Revising the definition in Article 100 presents numerous
problems.

1. Section 240.87 recognizes that in order to reduce the arc-flash hazard it may be necessary to make use of energy-reducing maintenance switching, which effectively reduces the level of selective coordination. When this function is activated, the system is still coordinated, but just to a lower level.

2. NFPA 99 and NFPA 110 define the selective coordination performance requirements for health care and emergency and standby power systems respectively as has been stated by the Standards Council. Neither of these codes requires “total” coordination as defined by the proposed text accepted in ROP 10-5, thus the proposed change in the Article 100 definition will create additional confusion.

3. If the proposed revision to this definition is adopted, what words will be useable to describe a system that meets the 0.10s selective coordination requirements of NFPA 99 or the “optimized” selective coordination requirement in NFPA 110?

4. The revised definition does not agree with the usage of the term “selective coordination” in the IEEE Color Books which recognize, as Section 240.87 does, that there are times when it is not possible to achieve “total” or “full” or “complete” selective coordination. For example, the Buff Book states, “The device setting process is a compromise between the opposite goals of maximum equipment protection and maximum service continuity; therefore, complete selective coordination may not be achieved in all systems.” Note the use of the word “complete” to describe the level of selective coordination. Other Color Book references could be cited.

5. The proposed text contains a requirement. According to the Manual of Style for NFPA Technical Committee Documents, “2.3.2.3 Definitions shall not contain requirements.”

In summary, the proposed revision is not a generic definition but rather a definition for “total coordination”, which is a term not used anywhere in the NEC. While the proposed revision to the definition agrees with what CMPs 13 and 20 have said they wanted to require in their panel and ballot statements, it conflicts with Section 240.87, the industry recognized usage of the term and the performance requirements in NFPA 99 and 110, and is a violation of the Manual of Style requirement for definitions. The insertion of the words “selection and installation” should be accepted and the remaining proposed text should be rejected.

Panel Meeting Action: Accept in Part

CMP-10 continues to accept the deletion of the term “choice” and insertion of the words “selection and installation”.

The panel rejects the proposed deleted text.

Panel Statement: The wording “accept in principle” accepted by CMP 10 during ROP meeting, clearly does not contain a requirement for when or where selective coordination is required. It does however clarify the definition of “Coordination, Selective”.

The NEC needs to remain the quintessential document for the electrical system safety issue, and while the existing definition has served us well for many years, it is now necessary to clarify the definition, not change the meaning. The proposed changes add the specific clarity that is needed.

The wording accepted by CMP 10 is necessary to distinguish between the word “Coordination” and the phrase “Selective Coordination”. The word “Coordination” is often used to describe the isolation of downstream overcurrent conditions over limited ranges of time and currents, but selective coordination is used to describe the isolation of downstream overcurrent conditions over the complete range of available overcurrents and the times associated with those overcurrents.

The 0.1 second limit for isolation of downstream overcurrent conditions, referred to in the substantiation of the submitter, actually describes “Coordination” down to 0.1 seconds, not “Selective Coordination” down to 0.1 seconds.

The submitter is correct in that some Code Making Panels have agreed that they need “total” coordination for certain life-safety related loads, and it is for these life-safety related loads that they have chosen to use the phrase “selective coordination” or “selectively coordinate”, rather than simply the word “coordination” or “coordinate”. See NEC 620.62, 700.27, 701.27, and 708.54.

“Total Coordination” is synonymous with the phrase “Selective Coordination”. The words “coordinate” or “coordination” alone are simply not sufficiently specific enough to describe the concept as utilized by CMPs 12, 13, and 20.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

10-3 Log #1486 NEC-P10 **Final Action: Reject**

(100.Coordination (Selective))

Submitter: Ed Larsen, Schneider Electric USA

Comment on Proposal No: 10-5

Recommendation: Reject the proposal.

Substantiation: The existing definition of selective coordination in Article 100 is general in nature and serves the purpose. The proposed revision to the definition should be rejected for a number of reasons:

1. It is not a generic definition but rather is the definition for “total” selective coordination. While it may be argued based on their statements that “total” selective coordination is what Code Making Panels 13 and 20 were calling for when they added the requirement for selective coordination to Articles 700, 701 and 708, that is not what they said in the Code text. If the submitter wants to clarify what these articles require, which indeed would eliminate confusion, then he should propose adding the word “total” in those articles (and other articles if necessary) and then propose adding a definition for “total” coordination to Article 100.

2. This definition is contrary to the usage of the term in the IEEE color books. (See Buff Book 1.3, 15.1, 15.7.1; Orange Book 6.2; Red Book 5.15.6, 5.7.1; Gray Book 9.7, 9.7.1, 9.7.2, 9.7.3; Brown Book 15.1, 15.2.)

3. This definition conflicts with the requirements for selective coordination and usage of the term in NFPA 99 and 110.

In summary, the proposed change in the definition is an improper use of the English language and is improper Code text.

Panel Meeting Action: Reject

Panel Statement: The “Accept in Principle” wording accepted by CMP 10 during ROP meeting, clearly does not contain a requirement for when or where selective coordination is required. It does however clarify the definition of “Coordination, Selective”. This clarification is necessary because, as described in the original substantiation;

The NEC needs to remain the quintessential document for the electrical system safety issue, and while the existing definition has served us well for many years, it is now necessary to clarify the definition, not change the meaning. The proposed changes add the specific clarity that is needed.

The wording accepted by CMP 10 is necessary to distinguish between the word “Coordination” and the phrase “Selective Coordination”. The word “Coordination” is often used to describe the isolation of downstream overcurrent conditions over limited ranges of time and currents, but selective coordination is used to describe the isolation of downstream overcurrent conditions over the complete range of available overcurrents and the times associated with those overcurrents.

The 0.1 second limit for isolation of downstream overcurrent conditions, referred to in the substantiation of the submitter in the reference to NFPA 99, actually describes “Coordination” down to 0.1 seconds, not “Selective Coordination” down to 0.1 seconds.

“Total Coordination” is synonymous with the phrase “Selective Coordination”. The words “coordinate” or “coordination” alone are simply not sufficiently specific enough to describe the concept as utilized by CMPs 12, 13, and 20.

2-1 Log #1339 NEC-P02 **Final Action: Reject**

(100.Demand Factor)

Submitter: James E. Degnan, Sparling

Comment on Proposal No: 2-6

Recommendation: Add text to read as follows:

Demand Factor. The ratio of maximum demand of a system, or part of a system, to the total connected load of a system or the part of the system under consideration. <u>Since demand load cannot be greater than the connected load, the demand factor cannot be greater than unity.</u>

Substantiation: If CMP 2 chooses to reject this proposal the submitter would be appreciative if the panel would answer the following question in their substantiation statement: “Can a demand factor be greater than 1.0?” On the other hand the submitter would also be entirely gracious if the proposal is accepted.

The Panel is requested to consider two documents: The NEC Style manual and the definition of “demand factor” in the IEEE Standard Dictionary of Electrical and Electronic Terms.

From the NEC Style manual: “3.3.4 Word Clarity. Words and terms used in the NEC shall be specific and clear in meaning, and shall avoid jargon, trade terminology, industry-specific terms, or colloquial language that is difficult to understand. “

From IEEE Standard Dictionary of Electrical and Electronic Terms (IEEE 100-2000, 7th Edition):

“demand factor (1) (power operations) The ratio of the maximum coincident demand of a system, or part of a system, to the total connected load of the system, or part of the system under consideration. (PE/PSE)

(2) (electric power systems in commercial buildings) The ratio of the maximum demand of a system to the total connected load of the system. Notes: 1. Since demand load cannot be greater than the connected load, the demand factor cannot be greater than unity. 2. Those demand factors permitted by the NEC (for example services and feeders) must be considered in sizing the electric system (with few exceptions this is 100%); otherwise the circuit may be sized to support the anticipated load. (IA/PSE)

(3) The ratio of the maximum coincident demand of a system or part of a system, to the total connected load of the system, or part of the system, under consideration. The resultant is always 1 or less and can range from 0.8 to 1 to as low as 0.15 to 0.25 for some plants with very low diversity.(IA/PSE)

(4) The ratio of operating load demand of a system, or part of a system, to the

total connected load of the system, or part of the system, under consideration. (IA/MT).”
In the above IEEE 100 text the parenthetic acronyms at the end of the definition help identify the source or usage of the definition, with PE denoting Power Engineering, which is typically a utility environment, and IA denoting Industrial Applications, which is typically a customer environment addressed by the suggested application of the NEC.
In substantiation for rejecting the original proposal CMP2 noted that the NEC definition is consistent with the IEEE definition, which it is, except two of the three (IA) sources in the IEEE definition also makes it clear that the demand factor is less than unity. This was the same intent of the original proposal which added the definition of a “demand load “ as a load less than the connected load, which would result in the demand factor being less than unity. Without further clarification as offered by IEEE, “demand” or “demand factor” could be interpreted in different ways. For example, some industry participants will say that the requirement in NEC-210.19 for branch circuits to be rated at 125% of the continuous load is a “demand factor” resulting in a demand factor greater than unity. Others will say that it is not, and that “Demand or Demand Factor” should be used consistent with the usage of the term by IEEE. The use of “demand” when “demand load” is intended constitutes jargon. Accordingly “demand factor” needs clarification per the style manual.
The proposed text is in keeping with the concept of the original proposal, and is not new material, it just rewords the proposal to align with IEEE, for which the panel indicated an affiliation. Acceptance of this wording or the original proposal meets my intent.
Appendix: IEEE’s web site notes that IEEE-100 has been superseded, the document is no longer available, I believe the 7th edition was the last version of IEEE-100 published. IEEE had the various working groups that make up the organization create their individual definitions and terms, because many terms had meanings that were dependent on specific applications. From the perspective of the power/industrial/commercial users, the closest replacement document is IEEE SA 1459-2010 “IEEE Standard Definitions for the Measurement of Electric Power Quantities Under Sinusoidal, Nonsinusoidal, Balanced, or Unbalanced Conditions” but this new document has no definitions for demand, demand factor, connected load, etc., it mostly focuses on the math associated with the terms used in the title. Without IEEE publishing a current document defining these terms the NEC must stand alone on its content.
Panel Meeting Action: Reject
Panel Statement: For the purposes of the NEC “demand factor” is correctly defined. Adding that the demand factor cannot be greater than unity does not add clarity to the definition.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

5-3 Log #535 NEC-P05 **Final Action: Accept**
(100.Effective Ground-Fault Current Path)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions (ATIS)
Comment on Proposal No: 5-6
Recommendation: The proposed revised definition is incorrect in the preprint. Revise to state: “**Effective Ground-Fault Current Path.** An intentionally constructed, low-impedance electrically conductive path designed and intended to carry current ~~underground-fault~~ under ground-fault conditions from the point of a ground fault on a wiring system to the electrical supply source and that facilitates the operation of the overcurrent protective device or ground-fault detectors.”
Substantiation: There was a typographical error in earlier versions of the Panel Action on this Proposal where the phrase “under ground-fault” was inadvertently displayed as “underground-fault”. See the comment on affirmative by T. Bowmer. The typo appears to have been corrected in the ROP but somehow found its way into the preprint.
Panel Meeting Action: Accept
Panel Statement: This corrects an error in the ROP draft. The panel action as documented in proposal 5-6 is correct.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

10-4 Log #476 NEC-P10 **Final Action: Accept**
(100.Electronically Actuated Fuse)

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 10-7
Recommendation: Revise text to read as follows:
Electronically Actuated Fuse. An overcurrent protective device that generally consists of a control module that provides current sensing, electronically derived time–current characteristics, energy to initiate tripping, and an interrupting module that interrupts current when an overcurrent occurs. Such fuses ~~Electronically actuated fuses~~ may or may not operate in a current-limiting fashion, depending on the type of control selected.
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains the defined term and the NEC manual of style does not permit the definition to contain the defined term. Definitions are not requirements. The proposed changes eliminate the defined term.
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Suggested informational notes as an alternative, eliminating the second sentence:
Informational Note: Electronically actuated fuses may or may not operate in a current-limiting fashion, depending on the type of control selected.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

5-4 Log #687 NEC-P05 **Final Action: Reject**
(100.Equipment Ground-Fault Protection)

Submitter: Christopher M. Jensen, North Logan City
Comment on Proposal No: 5-8
Recommendation: Accept the proposal with the amended text:
Equipment Ground-Fault Protection. A system intended to disconnect the electric circuit from the source of supply when ground-fault current is detected between 30 to 50 milliamps. This protective system is intended to operate upon a condition of excessive ground-fault leakage current from equipment, rather than minimize damage due to arcing faults in services.
Substantiation: Because this new term would be used in more than 1 code article CMP I would be a more appropriate panel to review this proposal.
This new definition is a companion proposal to change the term “Ground fault protection of Equipment” to “Equipment ground fault protection” in NEC sections 426.28 and 427.22
UL has 2 distinct White Book categories for ground fault protection of equipment. Category (KDAX) covers Ground fault protection of Equipment for compliance with 230.95 and 215.10 and the ground fault settings are between 1 and 1200 amperes. Category (DIYA) “Circuit Breakers with Equipment Ground Fault Protection” covers the requirements for 426.28 and 427.22. GFPE in 230.95 is designed to stop damaging arcs from high impedance ground faults that can occur in 480 volt 1000 ampere equipment whereas Equipment ground fault protection from426.28 and 427.22 is designed to detect and interrupt the supply to deicing and snow melting equipment due to leakage current that can occur when the equipment’s insulation breaks down over time.
This is a companion proposal to a change in term in 426.28 and 427.22.
Panel Meeting Action: Reject
Panel Statement: The proposed new definition introduces a term “ground fault leakage current” that is not defined in the NEC. Equipment ground-fault protection can be higher or lower than the 30 to 50 mA proposed depending on design and equipment capability.
Code users may use the current UL information for installations unique to ground fault protection of equipment installations as required in 210.15, 230.95, 426.28 and 427.22.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 14 Negative: 2
Explanation of Negative:
MELLO, C.: The submitter of the original proposal and the comment is correct that the ground fault device referenced in Articles 426 and 427 is neither a “Ground Fault Circuit Interrupter” nor a “Ground Fault Protection for Equipment” device. Applying the definitions from Article 100, GFCI is for protection of people from shock hazards and GPFE is for protection of major power service and distribution equipment from the damage associated with high current ground faults, including arcing faults to ground. GFPE is applied where the voltage exceeds 150 volts to ground and the circuit size exceeds 1000 amps. The devices referenced in Articles 426 and 427 are rated 15 or 20 amps for 120 or 240 Volt applications and are for protection of specific equipment from excessive leakage, as measured in milli-amps to ground. The construction, application and UL listings for each of these devices are different and therefore the Code should recognize the difference. These devices are listed under the UL Category Code DIYA, “Circuit Breakers with Equipment Ground Fault Protection”, therefore the product name as proposed coincides with the product name used in the listing.
PORTER, C.: The panel should have accepted this comment. It should be noted that the correct reference is 215.10, and not 210.15.I disagree that the term Ground Fault Leakage Current is a new term that needs a definition. The term leakage current is used in 440.2, 440.65, 516.10, 517.2, and the term ground-fault is also well understood. There is a difference between the ground-fault protection of equipment that is required for Services and Feeder and what is required for systems covered under Articles 426 and 427. Using the same term for both can be confusing and should not rely on another source for clarity.

1-14 Log #935 NEC-P01 **Final Action: Reject**
(100.Fixed Wiring and 110.27)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 1-118
Recommendation: Add text to read as follows:
100 I Fixed Wiring. Conductors, raceways, etc. installed under Chapter 3 methods.**110.27 Uninterrupted Power Supply (UPS) Connected to Fixed Wiring.**

(A) Labeling.
(1) When a UPS supplies fixed wiring, each place the UPS supplied circuit(s) is accessible shall have a clearly legible marking in letters not less than 6 mm (¼ in.) high reading "UPS Supplied". The label shall comply with 110.21(B).
(2) When a control panel contains a UPS which supplies current to fixed wiring external to the control panel, the control panel shall have a clearly legible sign in letters not less than 6 mm (¼ in.) high reading "Caution this panel contains a UPS". The sign shall comply with 110.21(B).
(B) Disconnecting Means. A disconnect meeting the requirements of 110.25 shall be installed for all output circuits from the UPS.*Exception: The requirements 110.27 do not apply to areas meeting all the requirements of 645 Information Technology Equipment or 646 Modular Data Centers.*
Substantiation: 90.1(A) Practical Safeguarding.
The purpose of this Code is the practical safeguarding of persons and property from hazards arising from the use of electricity.The recent introduction of fixed wiring in buildings fed from UPSs in other than Information Technology Equipment areas has introduced a new hazard. Until recently when you opened the main service disconnect for a building you would be able to assume that fixed wiring was no longer energized. APC and other manufacturers are selling UPS accessories for their products to facilitate connection to fixed wiring. (For example see http://www.apcmedia.com/salestools/A...8L95_R0_EN.pdf). This installation guide does not require an output disconnect.
The recent introduction of UPSs embedded in control panels which feed external fixed wiring presents a similar hazard. I have directly experienced a case of this sort. I was tasked to replace a shunt-trip 3-pole circuit breaker with trip alarm contacts. I opened all the circuits serving the control cabinet. I measured the voltages on the circuit breaker power connections, the shunt-trip, and the trip alarm contacts. I found that the shunt-trip circuit was de-energized, but that the trip alarm contact was still energized. I opened the control cabinet (not something I normally would do, because the cabinet and associated equipment were maintained under contract by a third-party). I found that a standalone style UPS like one might buy in a big box store was inside and its output was energizing the trip alarm contacts. I also confirmed that all external power to the control panel was indeed turned off.
I am proposing the addition of **110.27** and the associated **100 I Fixed Wiring** additions to the NEC to warn electricians of these new hazards. I am suggesting the use of "UPS supplied" as labeling for receptacle outlet covers (and other covers) because it also serves as useful label for non-electrician users.The exception is proposed because those qualified personnel working in 645/646 areas are already expecting UPS supplied receptacles.
Basis for 100 Fixed WiringTerms
akin to Fixed Wiring are used in:
220.14(H) Fixed Multioutlet Assemblies.

550.32(D) fixed wiring method
620.21(A)(2)(b) fixed wiring
Basis for UPS labeling
I posted a poll on forums.mikeholt.com/showthread.php?t=148012 which asked in essence "would you check for voltage at receptacles and switches after turning off and locking the service main?". There were 26 responses to the poll, 5 said they would NOT check, basically 24%. Three who chose a testing method said they would not turn off main for various reasons. The poll was posted in the Safety forum to bias the answers towards testing.
Changing switches and receptacles
Let's assume you've got a job that consists of changing the receptacles, switches, and cover plates throughout a house from ivory to almond. You ask why and the guy who hired you said it is a directive from "She Who Must Be Obeyed". They are going away for the week. So you show up and decide the simplest way to do this is to put on a head lamp and turn off the main breaker. You turn it off and padlock it.
View Poll Results: Now when you go to each box, what do you do?
Voters 21. This poll is closed
· test for voltage with a non-contact voltage stick 6 28.57%
· test using a wiggly 5 23.81%
· test using a Digital Volt Meter 5 23.81%
· test using a shorting plug (for receptacles) 0 0%
· test? are you crazy, the power is off! 5 23.81%
The response from CMP-1 limited itself to the original example (an elevator control panel, and not to the general cases supplied above).Panel Statement: The problem identified by the submitter relates to productdesign and marking rather than installation. In addition, the submitter isproposing specific requirements in the general section of the code which maybe more appropriate in other sections of the code. In sections such as620.52(B), the submitter's concerns are addressed.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original action on Proposal 1-118. The proposed definition of "Fixed Wiring" would not include those installations that use other than Chapter 3 wiring methods for fixed wiring, such as 501.140(A)(2), 505.17, 511.7 and 513.7. The proposed 110.27 would add specific requirements (UPS), which may be more appropriate in other sections of the code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

5-5 Log #583 NEC-P05 **Final Action: Accept**
(100.Intersystem Bonding Termination)

Submitter: Trevor N. Bowmer, Telcordia Technologies / Rep. Alliance for Telecommunications Industry Solutions (ATIS)
Comment on Proposal No: 5-17
Recommendation: Continue to reject this proposal as per Panel action.
Substantiation: The Panel acted correctly in rejecting the proposed action. Including an undefined and vague term such as "other systems" into a definition makes the code less clear.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
PORTER, C.: This comment should have been rejected. There is nothing in the definition nor in the requirements for this device that limits it only the systems of 770, 800, 810, 820, or 830. There is also nothing to prevent a bus bar meeting the requirements of 250.64(F)(3) from being used for these systems as well as the Service. If the device used has the proper number of and size of terminations for any system required to be connected to the grounding electrode of a structure it should be permitted to be used.

1-15 Log #456 NEC-P01 **Final Action: Accept in Principle**
(100.Location, Damp)

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 1-52
Recommendation: Revise text to read as follows:
Location, Damp. Locations protected from weather and not subject to saturation with water or other liquids but subject to moderate degrees of moisture. ~~Examples of such locations include partially protected locations under canopies, marquees, roofed open porches, and like locations, and interior locations subject to moderate degrees of moisture, such as some basements, some barns, and some cold-storage warehouses.~~
Informational Note: Examples of such locations include partially protected locations under canopies, marquees, roofed open porches, and like locations, and interior locations subject to moderate degrees of moisture, such as some basements, some barns, and some cold-storage warehouses.
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains a list of examples that is simply informational. The proposed changes eliminate the list and place it as information. If the CMP believes that this information is a requirement it should place it somewhere else, perhaps within an article addressing damp locations.
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel reaffirms its accept action and statement on Proposal 1-52.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-16 Log #3 NEC-P01 **Final Action: Reject**
(100.Location, Wet)

Submitter: David L. Hittinger, Independent Electrical Contractors of Greater Cincinnati
Comment on Proposal No: 1-66
Recommendation: Add text to read as follows:
Location, Wet. Installations underground or in concrete slabs or masonry in direct contact with the earth; in locations subject to saturation with water

or other liquids, such as vehicle washing areas; and in unprotected locations exposed to weather.
Informational Note: See 314-15 which addresses boxes, conduit bodies and fittings installed in wet locations.
Substantiation: See Proposals 1-66 and 1-67 where the submitter has identified a situation where the informational note would increase awareness and usability in the Code. At the 2014 ROP Panel 1 discussed this issue and there appears to be a lack of understanding in the industry that fittings installed in a wet location are required to be raintight.
Panel Meeting Action: Reject
Panel Statement: The informational note is unnecessary and addresses requirements that are dealt with generally in Section 110.3(B). No justification has been provided to reference only the requirements in 314.15 when suitability of use applies to all wiring methods and equipment covered by the NEC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-2 Log #500 NEC-P18 **Final Action: Reject**
(100.Luminaire and Informational Note (New))

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 18-6
Recommendation: Revise text to read as follows:
Luminaire. A complete lighting unit consisting of a light source such as a lamp or lamps, together with the parts designed to position the light source and connect it to the power supply. ~~It~~ Such a lighting unit may also include parts to protect the light source or the ballast or to distribute the light. ~~A lampholder itself is not a luminaire.~~
Informational Note: A lampholder itself is not a luminaire.
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains the defined term and the NEC manual of style does not permit the definition to contain the defined term. Definitions are not requirements. The proposed changes eliminate the defined term. If the CMP believes that this information is a requirement it should place it somewhere else, perhaps within Article 411.
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Panel Meeting Action: Reject
Panel Statement: Present code is clear. Since informational notes are not enforceable, the proposed addition removes an important distinction needed for Listed lamp holders.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

9-2 Log #117 NEC-P09 **Final Action: Accept**
(100.Metal-Enclosed Power Switchgear)

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 9-7
Recommendation: It was the action of the Correlating Committee that further consideration be given to the comments expressed in the voting regarding use of a single voltage, rather than “below 600 (or 1000) volts”.
In addition, the NEC standard method of referencing the voltage levels of “600 volts or less” or “1000 volts or less” must be followed for consistency throughout the NEC.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Change “below 600 (or 1000) volts” to “1000 volts or less” in the Informational Note.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1
Ballot Not Returned: 1 Coghill, P.
Explanation of Negative:
FERRARO, J.: It is recognized that increasing voltage from 600 volts to 1000 volts may be applicable to specific installations. However, adequate technical substantiation has not been provided to support the change in this Article.

9-3 Log #472 NEC-P09 **Final Action: Accept in Principle**
(100.Metal-Enclosed Power Switchgear and Informational Note (New))

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 9-8
Recommendation: Revise text to read as follows:
Metal-Enclosed Power Switchgear. A switchgear assembly completely enclosed on all sides and top with sheet metal (except for ventilating openings and inspection windows) and containing primary power circuit switching, interrupting devices, or both, with buses and connections. The assembly may include control and auxiliary devices. Access to the interior of the enclosure is provided by doors, removable covers, or both. ~~Metal-enclosed power switchgear is available in non-arc-resistant or arc-resistant constructions.~~
Informational Note: Metal-enclosed power switchgear is available in non-arc-resistant or arc-resistant constructions.
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains the defined term and the NEC manual of style does not permit the definition to contain the defined term. Definitions are not requirements. The proposed changes eliminate the defined term. If the CMP believes that this information is a requirement it should place it somewhere else, perhaps within Article 408.
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Panel Meeting Action: Accept in Principle
Make no further revision to the text accepted under the action on Proposal 9-7 and Comment 9-2 thereto.
Panel Statement: T he panel actions as cited fully accomplish the submitter’s objectives.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Coghill, P.

9-4 Log #876 NEC-P09 **Final Action: Reject**
(100.Metal-Enclosed Power Switchgear)

Submitter: C. Douglas White, Center Point Energy / Rep. Edison Electric Institute/Electric Light & Power Group
Comment on Proposal No: 9-7
Recommendation: Statement of Issue:
The panel action should have been to accept in principle. The IEEE definition for switchgear should be used.
The definition should read as follows:
Switchgear
A general term covering switching and interrupting devices and their combination with associated control, metering, protective, and regulating devices; also assemblies of these devices with associated interconnections, accessories, enclosures, and supporting structures, used primarily in connection with the generation, transmission, distribution and conversion of electric power.
Substantiation: The 2011 NEC definition of “Metal-Enclosed Power Switchgear” has been taken verbatim from IEEE C37.100 “Standard Definitions for Power Switchgear”.
Since the definition name has been changed to “Switchgear”, the definition should be changed to be consistent with IEEE C37.100.
Panel Meeting Action: Reject
Panel Statement: CMP 9 concludes that the definition as stated more accurately tracks the expected NEC usage.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 8 Negative: 3
Ballot Not Returned: 1 Coghill, P.
Explanation of Negative:
FERRARO, J.: The 2011 NEC definition of “Metal-Enclosed Power Switchgear” has been taken verbatim from IEEE C.37.100 “Standard Definitions for Power Switchgear”. Since the definition name has been changed to “Switchgear”, the definition should be changed to be consistent with IEEE C37.100.
SENGUPTA, S.: NEC usage is for installation safety.
Over a long-term period, the IEEE C37.100 “Standard Definition for Power Switchgear” has been used by Engineers, Designers, Electrical Equipment Manufacturers, Nationally Recognized Testing Laboratories and Installation Contractors to maintain switchgear’s performance specification and installation safety.
NFPA has always followed industry standards and guidelines established by IEEE, ASTM, ANSI, UL etc. A new definition in NEC may result in confusion. As a result, CMP 9 should maintain NFPA practices of recognizing these standards.
The panel is incorrect in stating in the Informational Note that all switchgear over 1000 V is metal enclosed or metal clad.
YOUNG, R.: The IEEE definition should be used to provide consistency with the standard that covers the equipment design.

3-3 Log #1528 NEC-P03 **Final Action: Reject**
(100.Non-Power-Limited Fire Alarm Circuit (NPLFA) (New) and 760.2)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 16-12
Recommendation: Add definition to Article 100 and delete from 760.2 as follows:
100
Non–Power-Limited Fire Alarm Circuit (NPLFA). A fire alarm circuit powered by a source that complies with 760.41 and 760.43.
760.2
~~**Non–Power-Limited Fire Alarm Circuit (NPLFA).** A fire alarm circuit powered by a source that complies with 760.41 and 760.43.~~
Substantiation: The defined term is referenced in several articles of the NEC: 336, 725, 760, 800, 820, 830, 840. (OK, so I had a typo in the original

submission.)
Panel Meeting Action: Reject
Panel Statement: The text in the introduction to Article 100 and in the NEC Style Manual states that, in general, any word that is used in more than one article within the NEC should have its definition located in Article 100. However, there certainly are exceptions to this general requirement. Where the article and, thus, the definition are used by other industries that do not normally have access to Article 100 or where the definition is an integral part of a table or a section within that article, then the definition should remain in the article or the table, not in Article 100. Article 760 is used by the fire alarm industry; therefore, the definition must remain in Article 760.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

10-5 Log #477 NEC-P10 **Final Action: Accept**
(100.Overcurrent Protective Device, Branch-Circuit)

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 10-10
Recommendation: Revise text to read as follows:
Overcurrent Protective Device, Branch-Circuit. A device capable of providing protection for service, feeder, and branch circuits and equipment over the full range of overcurrents between its rated current and its interrupting rating. ~~Branch-circuit overcurrent protective devices~~ Such devices are provided with interrupting ratings appropriate for the intended use but no less than 5000 amperes.
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains the defined term and the NEC manual of style does not permit the definition to contain the defined term. Definitions are not requirements. The proposed changes eliminate the defined term. If the CMP believes that this information is a requirement it should place it somewhere else, perhaps within Article 240.
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
As an alternative consider creating an informational note as follows:
Informational Note: Branch-circuit overcurrent protective devices are provided with interrupting ratings appropriate for the intended use but no less than 5000 amperes.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

3-4 Log #105 NEC-P03 **Final Action: Accept**
(100.Power-Limited Tray Cable Type PLTC)

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 7-15
Recommendation: It was the action of the Correlating Committee that this proposal be referred to Code-Making Panel 3 for action.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepted the direction of the Correlating Committee and modified the definition in Comment 3-45a (Log #CC3).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

1-17 Log #1336 NEC-P01 **Final Action: Reject**
(100.Premises (New))

Submitter: Paul Dobrowsky, Holley, NY
Comment on Proposal No: 1-58
Recommendation: Accept the proposal in principle and add a definition of Premises as follows:
Premises. Property consisting of land, with or without buildings or structures
Substantiation: During discussions it appeared that different opinions exist regarding whether land without a building or structure would be considered a premises. Section 90.2(A)(1) uses the word "premises" including "buildings, structures, etc. If the term conductor is removed from the definition of "device" and a change for the 2011 NEC removed the word "material" from the definition of "equipment" it is now unclear if conductors are considered equipment. If a property does not have buildings or structures, but does have wiring and "equipment" does the NEC apply? Adding this definition will provide clarity that the NEC applies to property as stated in 90.1(A) that has no buildings or structures but has "wiring". A panel statement indicating if this position it true would be helpful.
Panel Meeting Action: Reject
Panel Statement: As "premises wiring" is defined, there is no need to add a definition for "premise". Electrical installations that are not specifically excluded by 90.2(B) are under the scope of the NEC regardless of the presence or absence of buildings on the land.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-18 Log #1345 NEC-P01 **Final Action: Reject**
(100.Premises)

Submitter: Louis Barrios, American Chemistry Council
Comment on Proposal No: 1-58
Recommendation: The committee action should have been Accept In Principle and change the definition to the one provided in NFPA Glossary of Terms and NEC 800.2, which states: "The land and buildings of a user located on the user side of the utility-user network point of demarcation."
Substantiation: The need for a definition of "premises" became apparent during panel deliberations when it was not clear following the panel action whether or not premises are required to have structures on them to be considered "premises". The proposed definition is extracted from the NFPA Glossary of Terms and NEC 800.2, " The land and buildings of a user located on the user side of the utility-user network point of demarcation."
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 1-17.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-19 Log #1387 NEC-P01 **Final Action: Reject**
(100.Premises)

Submitter: Greg Marchand, Briggs & Stratton
Comment on Proposal No: 1-61
Recommendation: Add new text to read as follows:
A stand-alone generator that is supplying only cord connected equipment is not considered to be premises wiring.
Generators, including integral outlets are considered to belong to the power source and are not considered to be premises wiring.
Substantiation: We are in full support of the more complete substantiation presented by the Portable Generator Manufacturers Association authored by Joseph Harding and John Loud of Exponent, Inc.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original action on Proposal 1-61 which provides examples of power sources as they relate to premises wiring systems. Also see the panel action and statement on comment 1-23.
The proposed content conflicts with the definition and with the NEC Style Manual 2.2.2.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-20 Log #1536 NEC-P01 **Final Action: Accept**
(100.Premises (New))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 1-58
Recommendation: Continue to Reject.
Substantiation: The proposed definition would literally remove many outdoor electrical installations from the scope of the NEC. It is not possible to occupy a disconnect mounted on a structure to supply HVAC equipment. It is not possible to occupy an outdoor luminaire. There are countless other examples. Read the proposed definition as written, it recognizes a built structure or structures and " the land on which the structures are situated." That means only the land on which the structure sits, it recognizes only the footprint of a structure.
The definition of "Premises Wiring" has served the industry well for decades. Users of the NEC have no problem reading, understanding and applying the defined term "Premises Wiring." While CMP-1 apparently had an interesting discussion on this proposal, we need to focus on the intent of the proposal. A review of proposals and comments in the last NEC cycle and this NEC cycle from this submitter as well as the submitter of proposal 1-60, clearly reveals their intent. The intent is to exclude portable generators supplying power to a structure during a loss of power or any other reason from the scope of the NEC. There is no other reason for this proposal. There is not a problem with this definition. It is crystal clear. Everything on the load side of the service point is included in the scope of the NEC and where there is no service, (power outages or temporary) the power source is also included. If the application of this definition was creating an enforcement issue, CMP-1 would be flooded with proposals. Acceptance of this proposal gives them what they want because the portable generator will occupy land that is not within the footprint of the structure.
If this proposed definition is accepted, there are dozens of NEC rules that must be deleted and the purview of the NEC would be limited only to structures that can be occupied. The NESC will gladly step in and take purview over all electrical installations that can not be occupied.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-21 Log #457 NEC-P01 **Final Action: Reject**
(100.Premises Wiring (System))

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 1-59
Recommendation: Revise text to read as follows:
Premises Wiring (System). Interior and exterior wiring, including power, lighting, control, and signal circuit wiring together with all their associated hardware, fittings, and wiring devices, both permanently and temporarily installed. This includes (a) wiring from the service point or power source to the outlets or (b) wiring from and including the power source to the outlets where there is no service point. ~~Such wiring does not include wiring internal to appliances, luminaires, motors, controllers, motor control centers, and similar equipment.~~<u>**Informational Note:** Such wiring does not include wiring internal to appliances, luminaires, motors, controllers, motor control centers, and similar equipment.</u>
Substantiation: I accept the point that NEC definitions need not be in single sentences. However, the last sentence of the existing definition simply gives examples and is definitely not part of the definition. This is consistent with the comments by Mr. Anthony and Mr. Barrios and with action by CMP 1 on some other proposals.
Panel Meeting Action: Reject
Panel Statement: The recommendation does not enhance the clarity or usability of the code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-22 Log #1293 NEC-P01 **Final Action: Reject**
(100.Premises Wiring (System))

Submitter: Joseph Harding, Portable Generator Manufacturers Association
Comment on Proposal No: 1-61
Recommendation: Revise text to read as follows:
Informational Note <u>No.1:</u> Power sources include, but are not limited to, interconnected or stand-alone batteries, solar photovoltaic systems, other distributed generation systems, or generators.
<u>Informational Note No. 2: Generators. including integral outlets are considered to belong to the power source and are not considered to be premises wiring.</u>
<u>Informational Note No. 3: A stand-alone generator that is supplying only cord-connected equipment is not considered to be premises wiring.</u>
Substantiation: The added Informational Note in Proposal 1-61 will lead to unintended consequences, as detailed below:
1. If the outlets on generators are considered as premises wiring, then this will indirectly mean that isolated output (also known as "floating neutral") generators will no longer be allowed, since 250.26 specifies the conductor to be grounded in AC premises wiring systems. According to a recent PGMA survey, approximately 50% of all portable generators sold in the U.S. are the isolated output type. Portable generators that are used in "stand alone" mode are not normally connected to a grounding electrode (as allowed in 250.34(A)). In this configuration, isolated output generators pose no risk of a shock hazard (please refer to the presentation and videos associated with this comment). It is also the experience of the portable generator industry that there have been no reported incidents of electrical shock associated with these generators over at least the last five years for which data is readily available. Requiring the neutral conductor to be connected to the grounding conductor in a portable generator outlet only serves to increase the risk of electrical shock (again please refer to the presentation and video associated with this comment).
2. If isolated output generators are no longer allowed, then all generators used for backup power during power outages would need to be connected as separately derived systems. This is required because not doing so would result in the system having two points where the neutral is bonded to the grounding electrode (the main bonding jumper and the generator). The dual bonding points allow neutral current to flow on equipment bonding conductors under normal conditions, resulting in nuisance tripping of GFCIs, etc. Connecting a generator as a separately derived system requires the use of an extra pole in the transfer switch in order to switch the neutral conductor. According to industry sources, 99% or more of portable generators used for home backup power are connected as non-separately derived systemsby using single or dual pole transfer switches. If this proposal is accepted, it will then force those owners who subsequently replace their portable generator to also replace their current transfer switch at considerable expense and without any real-world safety benefit. If the owner chooses to operate a new portable generator with the existing transfer switch, the system will not be in compliance with the NEC. Considering the significant expense of replacing a transfer switch, it is the belief of PGMA members that some owners would then attempt to modify their new generator or their existing transfer switch and this would then pose significant safety risks where one would not otherwise exist It is finally noted that the Code currently has a provision for connecting generators as non-separately derived systems (250.30 Informational Note I).
3. There will continue to be considerable uncertainty in the Code regarding what part of a generator, if any, would be considered as premises wiring. In the case of a standby generator, where a service point exists, the question remains regarding where does the "power source" end and the "premises wiring" begin? Also, the current definition states that premises wiring "includes (a) wiring from the service point or power source to the outlets". Are the "outlets" to be considered outlets that may be
present on the generator itself or the "normal" outlets in the home, building, etc.?
There will also continue to be considerable uncertainty in the Code in the case of "stand-alone" generators. A stand-alone generator that operates in the middle of a field supplying only cord-connected equipment is not covered by the scope of the NEC (90.2(A)) and therefore cannot be considered as premises wiring. If it were, then once again the question remains about what part of that system would be considered as premises wiring and what part would not. This similarly draws into question what other devices with internal power sources (e.g. shavers or cell phones) may also be misinterpreted to be a premises wiring system. According to the proposal, since no service point exists. the entire generator is premises wiring. This would include not only the generator outlets but also the alternator windings, spark plug wire etc. Acceptance of this proposal would be in direct conflict of 90.1(C), as it would prescribe very specific design requirements for the internal wiring on generators.
For this reason, as well as the reasons given in unintended consequences 1. and 2. above, it is proposed that no part of the generator should be considered as premises
wiring for clarity.
The proposed addition of Informational Notes 2 and 3 attempts to address all of the unintended consequences outlined above. Please refer to the supporting documentation on this comment (presentation and videos) for further information.
PUMA members represent a significant majority of the portable generator industry. Our member companies include:

Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original action on Proposal 1-61 which provides examples of power sources as they relate to premises wiring systems. Also see the panel action and statement on comment 1-23.
The proposed content in Informational Notes 2 & 3 conflicts with the definition.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
ANTHONY, M.: The electrical industry has benefited from the technical points the generator consortia has raised in this comment. Product innovation -- particularly with respect to homeowner use of generators - might result in a resolution to some of the difficulties presented here.

1-23 Log #1299 NEC-P01 **Final Action: Reject**
(100.Premises Wiring (System))

Submitter: James Jongkind, American Honda Motor Co., Inc.
Comment on Proposal No: 1-61
Recommendation: Please reject the proposal.
Substantiation: This proposal seeks to require that all portable generators have their neutral conductors connected to the generator frame by classifying the internal wiring as a "premises wiring system." Most of the portable generators that Honda has sold for the past 40 years are of the floating neutral design and are used safely everyday by millions of consumers. To require that all newly produced I portable generators be bonded is not only unjustified by the lack of incident data, but it would also introduce a safety risk where one did not previously exist. The output on these floating neutral generators is isolated, so there is no path back to the source through I which users can be shocked. This is a well established and proven safety strategy for this type of product and should not be arbitrarily eliminated.
Panel Meeting Action: Reject
Panel Statement: Portable generators are electrical equipment. As such, use of portable generators is included in the purpose of the NEC to provide practical safeguarding of persons and property from hazards arising from the use of electricity. Use of portable generators is also under the scope of the NEC based on 90.2(A), which covers the installation of electrical equipment. Additionally, Sec. 250.34 and Article 590 clearly contain requirements addressing use of portable generators. The requirements, such as bonding and grounding, for portable generators are not under the purview of Panel 1.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
ANTHONY, M.: See my statement on Comment 1-22.

1-24 Log #1462 NEC-P01 **Final Action: Reject**
(100.Premises Wiring (System))

Submitter: Michael O. Flegel, Reliance Controls Corporation
Comment on Proposal No: 1-61
Recommendation: Reject the proposal.
Substantiation: OSHA requires bonded neutral generators in their regulations for construction sites. In reading these regulations, they appear to be identical to the NEC requirements except for this bonding requirement. The interpretation in Appendix A explains their position. To completely understand OSHA's response, please read the request letter by Mr. Iwasa (provided). It appears OSHA incorrectly interprets the NEC. OSHA says a generator in stand-alone use is a separately derived system (see Article 100) and as such needs to be bonded. However, the NEC definition of a separately derived system says it is a premises wiring system. A generator in stand-alone use is not a premises wiring system so it is not separately derived. Please note the OSHA interpretation does not have any safety arguments other than misinterpreting the NEC which leaves it with no technical merit. As such it has no relevance in this discussion because it is circular logic.

What is relevant is the definition of a premises wiring system. Separately derived systems are limited to premises wiring systems by definition and separately derived systems must be bonded. This change now means all portable generators used in stand-alone use must be bonded. A portable generator in stand-alone use (which I define as powering only cord connected equipment) in the middle of a field is not a premises wiring system. It is not a premises wiring system until it is connected to my house as either a separately derived system or a non-separately designed system.

I believe this change in the definition meets a UL objective because they believe all generators should be bonded when, in fact and in theory, using a floating-neutral generator in stand-alone use is safer than a bonded-neutral generator. Using a bonded-neutral generator allows the neutral of the generator to come into contact to the ground more easily since the neutral is connected to the frame. As soon as the frame is grounded, you have the possibility of ground faults, a condition that does not exist for floating-neutral generators. Add to that the numbers of floating neutral generators in use today with no safety problems, and one can see UL is being a bit stubborn in their objective. In addition, many floating-neutral generators are being installed in non-separately derived systems and now the homeowner would be violating the NEC if he used the generator to power only cord connected equipment in his back yard.

If the definition stands and the panel's intent is not to bar floating-neutral generator use in stand-alone applications, then maybe it needs to be taken up by other panels before the change takes place so other sections of the code can be changed as to not affect portable generator use.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original action on Proposal 1-61 which provides examples of power sources as they relate to premises wiring systems. Also see the panel action and statement on Comment 1-23.

Submitter: Richard Torine, BR Forbes
Comment on Proposal No: 1-61
Recommendation: Delete text to read as follows:
~~Informational Note: Power sources include, but are not limited to, interconnected or stand-alone batteries, solar voltaic systems, other distributed systems, or generators.~~
Substantiation: The substantiation for this proposal admits that U.L. is trying to use the NEG to force its own Standards Technical Panel to do something that the panel does not agree with. Defining a stand-alone generator as a premises has many far-reaching implications. A portable generator would then be subject to bonding and grounding standards that are completely unnecessary for a portable generator and that may actually compromise safety. The 2201 STP is fully aware of this and must take this into account when developing the standard. They are a panel of experts that is uniquely qualified to make decisions about the safe use of portable generators.

I support any proper clarification that makes it easier for users of the NEG to do their jobs. However, this Informational Note looks more like a political tool that is being used to force a highly contested issue into the U.L. standard for portable generators.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original action on Proposal 1-61 which provides examples of power sources as they relate to premises wiring systems. Also see the panel action and statement on Comment 1-23.

1-26 Log #1494 NEC-P01 **Final Action: Reject**
(100.Premises Wiring (System))

Submitter: Jeff Baldwin, JPB Design and Engineering LLC
Comment on Proposal No: 1-61
Recommendation: Please reject this proposal.
Substantiation: This proposal seeks to include batteries and generators in the definition of premises. Merriam-Webster clearly defines premises (when used as a noun) as:
a) a tract of land with the buildings thereon
b) a building or a part of a building usually with its appurtences (as grounds)
Batteries and generators that are not connected to anything don't come close to the Webster definition of premises, and this is confusing. The NFPA Manual of Style clause 2.3.2 prohibits re-defining common words, and premises is certainly a common word.
The NFPA Glossary of Terms defines the following:
Premises: the land and buildings of a user located on the user's side of the utility-user network point of demarcation. Responsible document is NFPA 70 (the NEC).
Also from the NFPA Glossary of Terms:
Premises Wiring: the circuits located on the user side of the network interface unit
The network point is the transformer, meter or service entrance on the premises. Nothing can be on the user side of a utility when there is no utility present. Batteries and generators are not utilities and must not be treated as such. They also do not fit the definition of a premises in the NFPA Glossary of Terms.
This informational note will only increase confusion for users of the NEC.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original action on Proposal 1-61 which provides examples of power sources as they relate to premises wiring systems. Also see the panel action and statement on Comment 1-23.
Number Eligible to Vote: 12

1-27 Log #1537 NEC-P01 **Final Action: Accept**
(100.Premises Wiring (System))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 1-60
Recommendation: Continue to Reject.
Substantiation: The proposed revision is an attempt to exclude portable generators used to supply power to a building or structure from the scope of the NEC.
Read the submitters substantiation. The submitter wants to exclude a portable generator used during a power outage or for temporary purposes from all NEC requirements because in his words it is "unrelated to said premises." If CMP-1 agrees with the submitter, there are serious safety implications created and dozens of other changes that must be made throughout the NEC.

The definition of "Premises Wiring" has served the industry well for decades. Users of the NEC have no problem reading, understanding and applying the defined term "Premises Wiring." While CMP-1 apparently had an interesting discussion on this proposal, we need to focus on the intent of the proposal. A review of proposals and comments in the last NEC cycle and this NEC cycle from this submitter as well as the submitter of proposal 1-58, clearly reveals their intent. The intent is to exclude portable generators supplying power to a structure during a loss of power or any other reason from the scope of the NEC. There is no other reason for this proposal. There is not a problem with this definition. It is crystal clear. Everything on the load side of the service point is included in the scope of the NEC and where there is no service, (power outages or temporary) the power source is also included. If the application of this definition was creating an enforcement issue, CMP-1 would be flooded with proposals.

If this proposed definition is accepted, there are dozens of NEC rules that must be deleted and the purview of the NEC would be limited only to the interior of structures. The NESC will gladly step in and take purview over all outdoor electrical installations.
Panel Meeting Action: Accept
Panel Statement: The panel does not agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-3 Log #109 NEC-P08 **Final Action: Accept**
(100.Raceway)

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 8-24
Recommendation: The Correlating Committee directs the panel to reconsider the action on this proposal dealing with the word change from "metal" to "metallic", since in accordance with the NEC Style Manual, "metal" is the

correct term as it relates to this proposal.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: CMP-8 accepts the Correlating Committee's direction to reconsider. CMP-8 reaffirms its position to Accept in Part, Proposal 8-24 with the text as stated in the Panel Action. The Correlating Committee states that "metal" is the correct term to used based on the NEC Style Manual. "Metallic" is also an acceptable term per the NEC Style Manual and is found in the same list as "metal". "Metallic" is used to describe the material and is used in 366.2. It is noted that "metallic" appears 375 locations and CMP-8 is supportive of a task group to correlate the terms "metal" and "metallic" for consistency throughout the entire NEC, per the Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-4 Log #468 NEC-P08 **Final Action: Reject**
(100.Raceway and Informational Note (New))

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 8-25
Recommendation: Revise text to read as follows:
Raceway. An enclosed channel of metal or nonmetallic materials designed expressly for holding wires, cables, or busbars, with additional functions as permitted in this *Code*. ~~Raceways include, but are not limited to, rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, liquidtight flexible conduit, flexible metallic tubing, flexible metal conduit, electrical nonmetallic tubing, electrical metallic tubing, underfloor raceways, cellular concrete floor raceways, cellular metal floor raceways, surface raceways, wireways, and busways~~
Informational Note: Raceways include, but are not limited to, rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, liquidtight flexible conduit, flexible metallic tubing, flexible metal conduit, electrical nonmetallic tubing, electrical metallic tubing, underfloor raceways, cellular concrete floor raceways, cellular metal floor raceways, surface raceways, wireways, and busways.
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains the defined term and the NEC manual of style does not permit the definition to contain the defined term. Definitions are not requirements. Moreover, the definition also contains a list that is simply informational. The proposed changes eliminate the defined term and place the list as information, where it belongs. If the CMP believes that this information is a requirement it should place it somewhere else, perhaps within one or more of the raceway articles.
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Panel Meeting Action: Reject
Panel Statement: CMP-8 reaffirms its position to accept in part Proposal 8-24. The submitter has revised text that has been removed per Proposal 8-24.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-5 Log #591 NEC-P08 **Final Action: Reject**
(100.Raceway, Informational Note)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 8-24
Recommendation: Revise text to read as follows:
100 Definitions.
Raceway. An enclosed channel of metallic or nonmetallic materials designed expressly for holding wires, cables, or busbars, with additional functions as permitted in this *Code*.
Informational Note: A raceway is identified ~~within specific article definitions.~~ in articles 342 through 390. Communications raceway is identified in article 800.
Substantiation: It would be a good idea to add a little more information to the informational note.
Panel Meeting Action: Reject
Panel Statement: CMP-8 reaffirms its position to accept in part, Proposal 8-24. The submitter revised text would include articles where the wiring method is not identified as a raceway within their definitions. CMP-8 does not want a list of articles within the definition.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

18-3 Log #501 NEC-P18 **Final Action: Reject**
(100.Receptacle, 406.3.1 and 406.3.2 (New))

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 18-8
Recommendation: Revise text to read as follows:
Receptacle. A receptacle is a contact device installed at the outlet for the connection of an attachment plug. ~~A single receptacle is a single contact device with no other contact device on the same yoke. A multiple receptacle is two or more contact devices on the same yoke.~~**406.3 1 Single receptacle.** A single receptacle is a single contact device with no other contact device on the same yoke.
406.3.2 Multiple receptacle. A multiple receptacle is a device with two or more contact devices on the same yoke.
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains the defined term and the NEC manual of style does not permit the definition to contain the defined term. Definitions are not requirements. The proposed changes eliminate the defined term and places the information into Article 406, where it serves as a valid requirement, if the CMP believes this is a requirement.
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Alternate approach to eliminating the defined term is to make the second and third sentences into informational notes, as follows:
Informational Note 1: A single receptacle is a single contact device with no other contact device on the same yoke.
Informational Note 2: A multiple receptacle has two or more contact devices on the same yoke.
Another alternative is to make the second and third sentences into new definitions, as follows:
Single receptacle. A single contact device with no other contact device on the same yoke.
Multiple receptacle. A contact device which has two or more contact devices on the same yoke.
Panel Meeting Action: Reject
Panel Statement: The proposed change to place the descriptions as an informational note would render them unenforceable. The terms are used in multiple articles throughout the NEC and are required to be placed in the definitions as required 2.2.2.1 of the NEC Style Manual.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

18-4 Log #233 NEC-P18 **Final Action: Accept**
(100.Retrofit Kit (New))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 18-9
Recommendation: The Correlating Committee directs that the panel clarify the panel action on this proposal according to the NEC Style Manual as it relates to the use of the word "Listed" which creates a requirement in a definition.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Delete word "listed".
Panel Statement: The panel accepts the direction of the TCC and has removed the word "listed" from the definition. The listing requirement remains in 410.6 and 600.3.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

18-5 Log #1207 NEC-P18 **Final Action: Accept**
(100.Retrofit Kit (New))

Submitter: Leo F. Martin, Sr., Martin Electrical Consulting
Comment on Proposal No: 18-9
Recommendation: Continue to accept in principle in part.
Substantiation: There are many locations in the 2012 UL White Book that address retrofit kits; therefore, it is appropriate to include a definition of this term in Article 100.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

5-6 Log #1060 NEC-P05 **Final Action: Accept in Principle**
(100.Separately Derived System)

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 5-20
Recommendation: Continue to accept the proposal in principle and reword the definition for clarity and combine the two sentences into one as follows:
Separately Derived System. A stand-alone electric supply system other than a service, or a system derived from a power supply source other than a service, that has no direct electrical connections to the circuit conductors of that power supply source other than those established by system grounding and bonding connections.
Substantiation: The proposed revisions do not improve clarity for the current definition. As revised by Proposal 5-20 the definition would not be applicable to some systems that are separately derived. Referring to an entire premises

wiring system or portion thereof a "separately derived system" is inaccurate as the defined term and associated requirements are really about the energy source and not what it eventually supplies. Also, stand-alone separately derived systems are not adequately covered by the current or proposed definition. This comment is an attempt to build on the spirit and intent of proposal 5-20.
Panel Meeting Action: Accept in Principle
Revise the definition to read as follows:
Separately Derived System. An electrical source, other than a service, having no direct connection(s) to circuit conductors of any other electrical source other than those established by grounding and bonding connections.
Panel Statement: The proposed language was simplified. It was also modified to be technically correct because separately derived systems have direct connections to the conductors they supply.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

(100.Solar Photovoltaic System)

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 4-8a
Recommendation: The Correlating Committee directs that the panel clarify the panel action on this proposal to correlate with the panel action on Proposal 4-184 and determine the placement of the definition, Article 100 or 690.2.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Move definition of solar photovoltaic system to Article 100.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-28 Log #1093 NEC-P01 **Final Action: Reject**
(100.Source)

Submitter: Ron B. Chilton, Rep. NC Code Clearing Committee
Comment on Proposal No: 1-64
Recommendation: The Panel should have "Accepted" this proposal.
Substantiation: Due to no explanation of the term "source" used extensively throughout the Code, engineers and electrical contractors attempt to make up a definition based on the manner of installation they desire to use for their particular site. The Code Panel statement in itself is substantiation to indicate the need to address this term used in various Sections of the Code. Webster may include several variations of this word based on intentions of use but in the National Electrical Code, the source is the origin of the energy for the system regardless of what that may be as noted, "source of power". In the Panel's response, no conflict in this term was noted as pertaining to how the Code uses the word, and it does meet the Style Manual's criteria for a definition as noted also in the Panel Statement, that being its use to multiple Code Sections.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original action on this proposal. No additional substantiation has been provided to demonstrate the new definition would not be in conflict with how the generic term "source" is used throughout the NEC. See committee action and statement on Proposal 1-61 which provides examples of sources.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-5 Log #45 NEC-P09 **Final Action: Accept**
(100.Substation (New))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 4-9
Recommendation: The Correlating Committee clarifies that Code-Making Panel 4 has accepted Proposal 4-89 to transfer the text in 225.70 for substations to Article 490 covering equipment over 600 volts. By this transfer of text, the jurisdiction of the definition of "substation" is now assigned to Code-Making Panel 9 and the existing text in 225.70 is transferred to a new section in Article 490.
The Correlating Committee directs that this proposal be forwarded to Code-Making Panel 9 for action.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The final text is that in proposal 9-8a as modified by the panel action on Comment 9-6.

1-29 Log #509 NEC-P01 **Final Action: Reject**
(100.Suitable for Wet Locations)

Submitter: Robert A. Jones, IEC Texas Gulf Coast
Comment on Proposal No: 1-66
Recommendation: Accept proposal 1-66.
Substantiation: I appreciate the "comment on affirmative" by Mr. Hickman; however the reference to 314.15 will not clarify the requirement "suitable for wet locations". The following is the panel statement from Panel 4 to my proposal 4-36 - "Regardless of how well an exterior electrical system is designed and installed there is always a possibility that moisture can collect inside of a raceway, this could be from something as simple as condensation, if moisture does collect inside of a raceway it should be arranged so that the moisture will be able to drain from the raceway. Suitable for wet locations does not mean the raceway is raintight."
There is a need for a definition of "suitable for wet locations" since a technical committee has determined the phrase does not mean raintight. What is the criterion that has to be met in order for an exterior raceway system to be judged "suitable for wet locations"? I do not know of any listing as "suitable for wet locations".
Panel Meeting Action: Reject
Panel Statement: The proposed definition is unnecessary and addresses suitability requirements that are already dealt with generally in Section 110.3(B).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-30 Log #1242 NEC-P01 **Final Action: Reject**
(100.Suitable for Wet Locations)

Submitter: John Masarick, Independent Electrical Contractors, Inc.
Comment on Proposal No: 1-66
Recommendation: I recommend the panel accept proposal 1-66 and add the following definition.
Suitable for Wet Locations. Constructed so that water or other liquids will not enter or accumulate within a raceway, enclosure, outlet box, junction box or

fitting.
Substantiation: There should be a definition in Article 100 for "Suitable for Wet Location". When a product is tested by a testing laboratory there is a very different interpretation for "Suitable for Damp Locations" and Suitable for "Wet Locations" Article 314.15 appears to treat both damp and wet the same.
Panel Meeting Action: Reject
Panel Statement: The proposed definition is unnecessary and addresses suitability requirements that are already dealt with generally in Section 110.3(B).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-8 Log #473 NEC-P09 **Final Action: Accept in Principle**
(100.Switchboard and Informational Note (New))

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 9-13
Recommendation: Revise text to read as follows:
Switchboard. A large single panel, frame, or assembly of panels on which are mounted on the face, back, or both, switches, overcurrent and other protective devices, buses, and usually instruments. ~~Switchboards are generally accessible from the rear as well as from the front and are not intended to be installed in cabinets.~~
Informational Note: Switchboards are generally accessible from the rear as well as from the front and are not intended to be installed in cabinets.
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains the defined term and the NEC manual of style does not permit the definition to contain the defined term. Definitions are not requirements. The proposed changes eliminate the defined term. An alternative, if CMP 9 believes this is a requirement is to place the information into Article 408, where it would serve as a valid requirement.
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Alternate approach, could be as follows (with renumbering of sections 408.3 through 408.5):
408.3 Switchboard. Switchboards shall not be installed as cabinets and shall be permitted to be accessible from the rear as well as from the front.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Switchboard. A large single panel, frame, or assembly of panels on which are mounted on the face, back, or both, switches, overcurrent and other protective devices, buses, and usually instruments. These assemblies ~~Switchboards~~ are generally accessible from the rear as well as from the front and are not intended to be installed in cabinets.
Panel Statement: The panel changed the word "switchboards" to "These assemblies" therefore negating the need for an informational note.

1-31 Log #394 NEC-P01 **Final Action: Accept**
(100, Part II Scope)

Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 1-71
Recommendation: Continue to reject the Proposal.
Substantiation: A review and comparison of the present text of Part II of Article 100 with OSHA 1926 shows the OSHA document breaks at 600 Volts. Changing the Scope of Article 100, Part II will create a conflict between the two documents causing voltages from 600 Volts to 1000 Volts to be in violation of OSHA requirements. In addition, a Note within the OSHA document states that "If the electrical installation is made in accordance with the National Electrical Code ANSI/NFPA 70-1984, exclusive of Formal Interpretations and Tentative Interim Amendments, it will be deemed to be in compliance with 1926.403 through 1926.408, except for 1926.404(b)(1) and 1926.405(a)(2)(ii)(E), (F), (G), and (J)." This would further conflict with the proposed text without significant amendment.
Panel Meeting Action: Accept
Panel Statement: A joint task group appointed by the Technical Correlating Committee consisting of representatives from HVTG, CMP 1 and CMP 8 reviewed proposals rejected by CMP 1 and CMP 8 related to replacing 600V to 1000V. The joint task group concluded that neither the joint task group nor the High Voltage Task Group has the necessary background research to further justify technical substantiation for the rejected proposals. Such substantiation would likely need to come from entities such as the manufacturers or the NFPA Research Foundation. The joint task group recommended that CMP 1 and CMP 8 not change the original actions taken during the 2014 proposal stage. In addition, the Panel does not necessarily agree with all of all the substantiation for the comment.
Number Eligible to Vote: 12

ARTICLE 110 — REQUIREMENTS FOR ELECTRICAL INSTALLATIONS

1-33 Log #1273 NEC-P01 **Final Action: Reject**
(110)

Submitter: Elliot Rappaport, Electro Technology Consultants
Comment on Proposal No: 1-73
Recommendation: Accept proposal.
Substantiation: The term "equipment grounding conductor" has a definite purpose that is not uniquely expressed in the term, i.e. "bond the equipment to a terminal at the source of voltage". As a result, there is a misconception that "grounding", without bonding to the source, will make a system safe. On the contrary, connecting equipment to ground without providing the bonding connection back to the source can make equipment less safe by increasing the time to clear the fault.
The Panel statement that the equipment grounding conductor is used to both bond and ground does not place sufficient significance of the importance of bonding over grounding. Bonding provides sufficient ground fault current back to the source of voltage to operate an overcurrent device and clear the fault quickly. Connection to ground limits the voltage to ground on normally non-current-carrying parts during non-fault conditions. During fault conditions, the value of grounding is minimal since the primary safety concern is to remove the fault voltage as quickly as possible. A path to ground for fault current is not necessary since ground fault current must return to the source of voltage, not to ground.

Renaming this conductor as an "Equipment Bonding Conductor (EBC)" will clarify that the primary purpose of this conductor is to bond to the source in order to provide a known path for ground fault current that will facilitate rapid fault clearing.

It is recognized that the term "EGC" has been in use for a long time and that changing it to EBC will cause some concerns including changing written literature that uses the EGC term. After the initial period of understanding, users will correctly understand the purpose of this conductor and this will enhance the safety of personnel.

The fundamental purpose of this and companion proposals is to clearly state that "systems" are "grounded" and "equipment" is "bonded". The fact that the bonding conductor may be grounded also is secondary to the primary function of bonding.

Panel Meeting Action: Reject

Panel Statement: No evidence has been presented to indicate that the existing definition of Equipment Grounding Conductor has caused confusion. CMP-1 also notes that all components of an electrical system that are bonded together are ultimately bonded to ground, in accordance with Article 250.

The panel reaffirms its original position and action on this proposal and remains consistent with the actions of CMP-5 on this proposal. No additional information has been provided to reverse the original panel action on this proposal. NEC CMP-5 rejected these concepts and proposals during the 2005 NEC cycle through the collective work of a TCC assigned Task Group. The results of that work retained the term "equipment grounding conductor" and included an informational note that provides the clarification that the EGC performs bonding functions.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 1 Abstain: 1

Explanation of Negative:

FLOYD, H.: The panel should accept the original proposal. The proposal improves the technical accuracy of the use of the terms "equipment grounding conductor" and "equipment bonding conductor". The IEEE has reviewed all the statements on this subject by various panels. The following represents the IEEE position on the issue of equipment grounding conductor or equipment bonding conductor. Similar proposals have been presented in the past and have been rejected. Reasons given often relate to cost, significant changes in documentation required, or the fact that knowledgeable people understand the use of this conductor. There is no justification for retaining an incorrect and potentially hazardous electrical installation just because this definition has been used in the NEC for many years. Costs associated with documentation changes should never be an argument where safety is concerned. Further, not all electrical practitioners are knowledgeable in the main intent of this conductor. The intent of the proposed change is to provide a descriptive name to a construction element that has resulted in much misunderstanding with possible hazardous operating conditions in electrical installations. The use of the term "grounding" implies that grounding is its principal function. Although grounding may be desirable, providing an effective fault current path (i.e. bonding) is and should be the emphasis. There are many who assert that a connection to a water pipe meets the needs of equipment grounding, however, this connection does not perform the necessary effective fault current path back to the source. There are two conductors described in the Code performing the same function but named differently. The "bonding jumper" is a short conductor that assures the electrical integrity of enclosure to raceway. The longer conductor, intended to provide a low impedance path to the source, is presently named a "grounding" conductor instead of its real function as a "bonding" conductor. Technically, the definition in Article 100 may be adequate for Panel members and those that teach. Practically, the definition is confusing if the terminology does not fit the function performed. The equipment bonding conductor, as it should be called, provides its primary function whether or not it is grounded. For a grounded system, it is grounded because the system is grounded. For an ungrounded system, it is grounded to limit the voltage due to a lightning strike or contact with a higher voltage system. Changing the name will assist in educating users of the Code as to why they are installing a conductor that needs to be continuous all of the way back to the source.

Explanation of Abstention:

ANTHONY, M.: This concept is one of several in the NEC with more tradition/cultural difficulties than technical difficulties. This change has been needed for a very long time but no one knows the safest way to get us there. If it were easier to drive through the vocabulary of our industry without the risk of Babylonian confusion (likely to create safety risk as a new generation of electrical professionals acclimates itself to the clarification possible with the use of the word "bonding") this committee, and other committees, would accept this concept. But it isn't easy and therein lies the technical problem. I will not add to the difficulty of keeping the discussion alive for the future, however.

1-34 Log #1348 NEC-P01 **Final Action: Reject**
(110)

Submitter: Louis Barrios, American Chemistry Council

Comment on Proposal No: 1-73

Recommendation: The committee should have accepted this proposal.

Substantiation: The primary function of the conductor presently defined as an "equipment grounding conductor" is actually a bonding function. The grounding electrode conductor grounds systems and equipment. Accepting this change will help increase usability and understanding of the associated requirements.

Panel Meeting Action: Reject

Panel Statement: No evidence has been presented to indicate that the existing definition of Equipment Grounding Conductor has caused confusion. CMP-1 also notes that all components of an electrical system that are bonded together are ultimately bonded to ground, in accordance with Article 250.

The panel reaffirms its original position and action on this proposal and remains consistent with the actions of CMP-5 on this proposal. No additional information has been provided to reverse the original panel action on this proposal. NEC CMP-5 rejected these concepts and proposals during the 2005 NEC cycle through the collective work of a TCC assigned Task Group. The results of that work retained the term "equipment grounding conductor" and included an informational note that provides the clarification that the EGC performs bonding functions.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

BARRIOS, L.: The ACC continues to support that changing the term "equipment grounding conductor" to "equipment bonding conductor" would help clarify the primary function of this conductor and to help clarify existing confusion in industry associated with bonding and grounding.

FLOYD, H.: The panel should accept the original proposal. The proposal improves the technical accuracy of the use of the terms "equipment grounding conductor" and "equipment bonding conductor". The IEEE has reviewed all the statements on this subject by various panels. The following represents the IEEE position on the issue of equipment grounding conductor or equipment bonding conductor. Similar proposals have been presented in the past and have been rejected. Reasons given often relate to cost, significant changes in documentation required, or the fact that knowledgeable people understand the use of this conductor. There is no justification for retaining an incorrect and potentially hazardous electrical installation just because this definition has been used in the NEC for many years. Costs associated with documentation changes should never be an argument where safety is concerned. Further, not all electrical practitioners are knowledgeable in the main intent of this conductor. The intent of the proposed change is to provide a descriptive name to a construction element that has resulted in much misunderstanding with possible hazardous operating conditions in electrical installations. The use of the term "grounding" implies that grounding is its principal function. Although grounding may be desirable, providing an effective fault current path (i.e. bonding) is and should be the emphasis. There are many who assert that a connection to a water pipe meets the needs of equipment grounding, however, this connection does not perform the necessary effective fault current path back to the source. There are two conductors described in the Code performing the same function but named differently. The "bonding jumper" is a short conductor that assures the electrical integrity of enclosure to raceway. The longer conductor, intended to provide a low impedance path to the source, is presently named a "grounding" conductor instead of its real function as a "bonding" conductor. Technically, the definition in Article 100 may be adequate for Panel members and those that teach. Practically, the definition is confusing if the terminology does not fit the function performed. The equipment bonding conductor, as it should be called, provides its primary function whether or not it is grounded. For a grounded system, it is grounded because the system is grounded. Submitter: Lawrence W. Forshner, Bard, Rao + Athanas Consulting Engineers LLC

Comment on Proposal No: 1-86

Recommendation: This proposal should be accepted, or accepted in principle with an informational note referencing 705.16.

Substantiation: "705.16 Interrupting and Short-Circuit Current Rating. Consideration shall be given to the contribution of fault currents from all interconnected power sources for the interrupting and short-circuit current ratings of equipment on interactive systems." Code rules from Chapter 7 can modify rules from Chapter 1. However there is still no clear direction for the designer when two sources interconnect for 6 cycles (100 milliseconds). The general consensus of all the equipment manufacturer's application engineers that I have spoken to, is that the probability of a fault to ground or bolted short circuit during a.1 second closed transition event, is so unlikely that engineering judgment can be used to rule it out. Thus they have given *consideration* of the fault current contributions from two interactive power sources and have determined that the risk is insufficient to warrant the cost of **higher** AIC rated equipment., bigger rooms etc.

Panel Meeting Action: Reject

Panel Statement: The submitter provided multiple options and has not provided specific language that the panel can consider and is therefore not in

proper format in accordance with 4.4.5(c) and (d) of the Annual 2013 NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-36 Log #1350 NEC-P01 **Final Action: Accept**
(110.9)

Submitter: Louis Barrios, Shell Global Solutions
Comment on Proposal No: 1-85a
Recommendation: Change the first sentence in the panel's proposed text to "Equipment intended to interrupt current at fault levels shall have an interrupting rating at nominal circuit voltage sufficient for the current that is available at the line terminals of the equipment."
Substantiation: This was an important change made by the panel to revert back to the 2008 Code language to improve the clarity of this section. One more improvement can be made, and that is to make both statements parallel structure. This proposed change relocates "nominal circuit voltage" in the sentence to indicate the "interrupting rating at nominal circuit voltage" and now makes both statements in this section parallel in structure.
Panel Meeting Action: Accept

(110.12(C) (New))

Submitter: T. J. Woods, Wyoming Electrical JATC
Comment on Proposal No: 1-92
Recommendation: Add new text to read as follows:
110.12<u>(C) Installation. All wiring, protection, wiring methods, materials, and equipment in this code shall be installed by qualified persons.</u>
<u>Informational Note: See Article 100 for the definition of qualified person.</u>
Substantiation: Only qualified persons should be installing electrical systems because of its hazardous nature, to protect persons and property. I respectfully disagree with the panel's decision to reject this proposal. I, in agreement with panel members Palmer Hickman and David Hittinger, cannot think of any situation where it would be practical or legitimate for anyone other than a qualified person to perform electrical installations. Please grant this proposal a reconsideration.
Panel Meeting Action: Reject
Panel Statement: The NEC references to qualified persons are in contemplation of specific requirements and not to be applied generally.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
HICKMAN, P.: We reaffirm our ballot statement from Proposal 1-92. It is not unreasonable to expect that electrical equipment be installed by one who has skills and knowledge related to the construction and operation of the electrical equipment and installations and has received safety training to recognize and avoid the hazards involved.

1-40 Log #1412 NEC-P01 **Final Action: Reject**
(110.12(C))

Submitter: Keith Fager, Bayer CropScience
Comment on Proposal No: 1-92
Recommendation: Add text to read as follows:
<u>110.12(C) Installation. All wiring, protection, wiring methods, materials, and equipment in this code shall be installed by qualified persons.</u>
<u>Informational Note: See Article 100 for the definition of qualified person.</u>
Substantiation: The panel action should have been Accept. A qualified person is "one who has the skills and knowledge related to the construction and operation …". The proposal is consistent with 90.1 (A) and 90.1 (C). Installation of electrical systems by unqualified persons is not likely to safeguard persons and property from electrical hazards. In many cases, the AHJ also licenses electricians to ensure electrical installations within their jurisdictions are installed by qualified persons.
Panel Meeting Action: Reject
Panel Statement: The NEC references to qualified persons are in contemplation of specific requirements and not to be applied generally.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
HICKMAN, P.: See our explanation of negative vote on Comment 1-39.

1-41 Log #1317 NEC-P01 **Final Action: Reject**
(110.14)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 1-93
Recommendation: Revise text to read as follows:
110.14 Electrical Connections.
Informational Note: Many terminations and equipment are either marked with tightening torque or are identified as to tightening torque in the installation instructions provided. <u>If this information is unavailable, see Informative Annex.</u>
[ROP 1–93]
Substantiation: Let's put a little more information in the informational note.
Panel Meeting Action: Reject
Panel Statement: The proposed text is unnecessary, because Chapter 9, Table 10 is already referenced in the requirement. The recommended Informational Note is contrary to the requirements of 110.3(B).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-42 Log #453 NEC-P01 **Final Action: Reject**
(110.14(A))

Submitter: Robert G. Fahey, City of Janesville
Comment on Proposal No: 1-94
Recommendation: Revise text to read:
110.14(A) Terminals. Connection of conductors to terminal parts shall ensure a thoroughly good connection without damaging the conductors and shall be made by means of pressure connectors (including set-screw type), solder lugs, or splices to flexible leads. Connection by means of wire-binding screws or studs and nuts that have upturned lugs or the equivalent shall be permitted for 10 AWG or smaller conductors. <u>Device terminals utilized for stranded wire shall be constructed to encapsulate all strands of the conductors with clamps or similar means.</u> Terminals for more than one conductor and terminals used to connect aluminum shall be so identified.
Substantiation: I have provided pictures of recent installations where standard THHN, THWN stranded wires, not fine stranded wire, are terminated on devices which Underwriters Laboratories (UL) have indicated are listed for stranded conductors. The pictures illustrate the problems in which I encounter in many installations where the stranded wire, typically #14 through #10 are

terminated on devices such as switches, receptacles and lighting fixtures in which the device terminal does not capture all of the strands of the conductor which is terminated. The termination's which present the issues are the lower grade of devices (residential grade devices) in which the terminals do not appear to be manufactured for stranded conductors, but instead are more compatible for solid conductors. I would encourage the Code Panel members would reconsider the rejection of the additional language I have proposed, the new text would provide a much better and safer termination of these conductors.

Note: Supporting Material is available for review at NFPA headquarters.

Panel Meeting Action: Reject

Panel Statement: The proposed change is more appropriately addressed in the product standards for wiring devices that include terminals for connecting stranded or solid conductors. Unless otherwise marked, product terminations are evaluated for solid and stranded conductors.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

ANTHONY, M.: This practice probably appears in one of the National Electrical Installation Standards developed by the National Electrical Contractors Association.

1-43 Log #20 NEC-P01 **Final Action: Accept**
(110.14(C)(1))

Submitter: Technical Correlating Committee on National Electrical Code®

Comment on Proposal No: 1-98

Recommendation: The Correlating Committee directs that the panel clarify the panel action on this proposal as it relates to the accepted text by following the same format for the new second sentence. The action should be clarified as to which table is being referenced.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Panel Statement: See committee actions and statements on Comments 1-44 and 1-45.

1-44 Log #1112 NEC-P01 **Final Action: Accept in Principle**
(110.14(C)(1))

Submitter: Phil Simmons, Simmons Electrical Services

Comment on Proposal No: 1-98

Recommendation: Revise the text of the 2014 NEC ROP Draft as follows:

(1) Equipment Provisions. The determination of termination provisions of equipment shall be based on 110.14(C)(1)(a) or (C)(1)(b). Unless the equipment is listed and marked otherwise, conductor ampacities used in determining equipment termination provisions shall be based on Table 310.15(B)(16) as appropriately modified by 310.15(B)(7). ~~Table 400.5(A)(1) ampacities shall be used for flexible cords and cables.~~

Substantiation: The new text allowing Table 400.5(A)(1) ampacities to be used for flexible cords should be deleted. Some of these ampacities are higher than provided for in Table 310.15(B)(16). No documentation was submitted to show that electrical equipment manufacturers have designed or tested their equipment at these higher ampacities. It also seems the UL Safety standard would have to be revised to determine that the terminals can function safely at these elevated ampacities.

Panel Meeting Action: Accept in Principle

Panel Statement: See committee action on Comment 1-45 which meets the submitter's intent.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-45 Log #1499 NEC-P01 **Final Action: Accept**
(110.14(C)(1))

Submitter: Alan Manche, Schneider Electric

Comment on Proposal No: 1-98

Recommendation: The panel should reconsider and reject this proposal 1-98.

Substantiation: A few fundamental issues exist with this proposal. The first concern is that Table 400.5 does not exist, as there are multiple ampacity tables in NEC 400.5. The more significant concern is the permission to use the ampacities found in these tables. Thermal testing of equipment is performed in accordance with wire using the ampacities found in Table 310.15(B)(16). Unless the equipment is specifically Listed for the use of smaller conductors at the same ampacity such as Table 400.5(A)(2) will permit, the general permission granted by the acceptance of proposal 1-98 places thermal performance of equipment at risk and more specifically the terminal integrity itself. The existing language permits equipment to be Listed for such use. This proposal should be rejected.

Panel Meeting Action: Accept

1-46 Log #272 NEC-P01 **Final Action: Accept**
(110.15 (New))

Submitter: Code-Making Panel 19,

Comment on Proposal No: 1-131

Recommendation: Reject Proposal 1-131.

Substantiation: The consensus of Code Making Panel 19 (CMP-19) Task Force is we do not believe that this Proposal is needed, and in any case, is probably unenforceable, mainly due to inspection before occupancy and before the arrangement of furniture and appliances after occupancy.

CMP-19 is periodically asked to incorporate Article 100 definitions and normally responds that specific requirements should be located in specific sections for clarity of purpose. L. Barrios of Panel 1 had a similar concern stated in his comment on negative balloting on Proposal 1-131.

GFCI receptacles have been around for decades and as a matter of course, GFCI receptacles are not always periodically tested. Making them "readily accessible" will not change this fact. As an example, kitchen counter backsplashes are probably the most readily accessible area in a home but questioning of people over the years leads to the conclusion that they aren't tested. An example of a readily accessible area that could quickly become inaccessible is a circuit breaker panel on the outside of a home where gardening tools, etc., have been stored against or in front of the panel door.

CMP-19's response to the submitter of Proposal 1-131's substantiation is that it is very dated. The field survey mentioned in the substantiation was completed in January of 2001, 11 years ago. The results of this survey caused a revision to UL Standard 943 that by UL's testing of GFCI's a year after the change, showed a greatly improved survivability rate.

Some people don't periodically test their GFCI's, regardless of the recommendation of the manufacturer, therefore, some manufacturers have produced self-testing devices, which are not presently required by the UL Standard or by the NEC. This has led to proposed revisions in UL Standard 943 to require self-testing and shutoff at end of life in the next edition.

This comment was developed by a CMP-19 Task Group and balloted through the entire panel with the following ballot results:

14 Eligible to vote

10 Affirmative

2 Negative (See voting comments below)

2 Ballots Not Returned (S.R. Goodman and B.A. Hopkins)

NEGATIVE:

W. ELLIOTT: I agree with Mr. P. Hickman: There is inadequate substantiation to include AFCI in this proposal. We should not be in the business of anticipating future commercial products. Furthermore, very little substantiation is provided concerning accessible versus readily accessible.

M.L. ZIEMAN: I concur with Mr. Barrios' negative comment that specific requirements should be placed in the specific sections that apply to these devices and not in Article 110. I concur with Mr. Hickman's negative comment that "This proposed recommendation is overly broad and restrictive". Based on the above, I also concur with Mr. Hittinger's negative comments.

The proposal would make it a code violation to place a chair, waste can our similar piece of common household or office furniture in front of a wall receptacle.

Panel Meeting Action: Accept

Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-47 Log #119 NEC-P01 **Final Action: Accept**

Submitter: Technical Correlating Committee on National Electrical Code®

Comment on Proposal No: 9-14a

Recommendation: The Correlating Committee understands that the panel action on this proposal incorporates the modified definition of "Metal Enclosed Power Switchgear" to "Switchgear" in Proposal 9-7.

It was the action of the Correlating Committee that this proposal be referred to Code-Making Panel 1 for action.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-48 Log #969 NEC-P01 **Final Action: Reject**
(110.16)

Submitter: Daleep C. Mohla, DCM Electrical Consulting Services, Inc.

Comment on Proposal No: 1-103

Recommendation: The proposal should have been accepted.

Substantiation: Evaluating the potential arc flash hazard during the design stage will provide user/owner of the degree of hazard before equipment installation is done and an opportunity to reduce the hazards by an alternative design. Alternative design could use current limiting devices and/or smaller size transformers to reduce the hazard These options cannot be easily exercised after equipment is installed. This is the essential principle of safety by design- eliminate or reduce the hazard during design. Providing a label with arc flash hazard warning without quantifying the hazards transfers the problem to operating and maintenance personnel with no possibility of reducing the hazard. Personal Protective Equipment (PPE) does not protect against all arc flash hazards and only reduces the risk if proper PPE is used. Optimum protection is reduction of hazards during the design stage. Calculations have to be done to ensure equipment has proper interrupting rating and short circuit raing. At the same time, arc flash hazard calculation should be done to improve the safety. This will also ensure that AHJ can check and enforce this requirement before equipment is put in service.

Panel Meeting Action: Reject

Panel Statement: The panel reaffirms its original position and action on Proposal 1-103. Additional substantiation has not been provided that would warrant including the proposed additional requirements for the label. The concerns of the submitter are addressed in NFPA 70E, *Standard for Electrical Safety in the Workplace*, which deals with workplace safety requirements and not installations. Refer to Informational Note 1.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Abstain: 1

Explanation of Abstention:

ANTHONY, M.: The practical effect of the submitter's original proposal and comment is that PPE information would be required for a certificate of occupancy. The committee prefers the requirement remain in NFPA 70E where workplace safety practices are more fully developed and includes the recommendation that equipment be de-energized instead -- the safest practice -- thus removing the need for PPE.

1-49 Log #970 NEC-P01 **Final Action: Reject**
(110.16)

Submitter: Daleep C. Mohla, DCM Electrical Consulting Services, Inc.

Comment on Proposal No: 1-104

Recommendation: Revise text to read as follows:

Arc-Flash Hazard Warning. Electrical equipment, such as switchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers, that are in other than dwelling units, and are likely to require **<u>opening and closing of disconnecting device</u>**, examination, adjustment, servicing, or maintenance while energized shall be field marked to warn qualified persons of potential electric arc flash hazards. The marking shall be located so as to be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment.

Substantiation: Operation has been replaced by a descriptive term "opening and closing of disconnect device which is normally understood to mean operation of the equipment.

Opening and closing of the disconnect devices is likely to pose the greatest risk to person performing this work due to possibility of failure of the equipment and resulting arc flash. Risk of arc flash is greatest during change of state of the disconnect device. Personnel opening or closing the disconnect device need to be warned of such risk.

Panel Meeting Action: Reject

Panel Statement: Inadequate substantiation has been provided to support the submitter's claim that opening and closing disconnecting devices is "likely to pose the greatest risk to persons performing this work."

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 1 Abstain: 1

Explanation of Negative:

HICKMAN, P.: Panel 1 asked the submitter to clarify what was meant by "operation" in Proposal 1-104. He has done so. We submit that "operation" and "opening and closing of disconnecting device" appears to be no more restrictive than the existing provisions such as "examination" for example.

Explanation of Abstention:

ANTHONY, M.: This one of those "common sense" concepts with a lot of anecdotal evidence that supports the submitter's claim (especially under load) but is difficult, uneconomical, or both, to substantiate with sufficient data.

1-50 Log #1306 NEC-P01 **Final Action: Reject**
(110.16)

Submitter: James M. Imlah, Hillsboro, OR

Comment on Proposal No: 1-104

Recommendation: Revise text to read as follows:

110.16 Arc-Flash Hazard Warning.

Electrical equipment, such as switchboards, panelboards, industrial control panels, meter socket enclosures, and motor control centers, that are in other than dwelling units, and are likely to require <u>operation,</u> examination, adjustment, servicing, or maintenance while energized shall be field marked to warn qualified persons of potential electric arc flash hazards. The marking shall be located so as to be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment.

Substantiation: Asking the panel to reconsider their action of "Reject" to "Accept" by the addition of the word "operation" within 110.16 NEC.

Operation as defined in Webster's dictionary is performance of practical work or something involving a practical application. "Operation" is the exertion of power (force) or a method of functioning that can be manual or automatic with the use of preset protection devices. Operation is showing the intent of action or intent of purpose either manual operation or sensing action (device tripping or fuse blowing) as part of the system deisgn. It is when there is an action (intentional) or reaction (unintentional) condition to occur when a higher fault current usually exits.

Why as electricians and inspectors are we taught to not stand in front of electrical equipment of any type when it is being energized, or de-energized, one should always be to the side from the possible direct action of power flow? Why are their arc shields on disconnects, but for arc fault condition upon opening and closing of any electrical devices. It is important to re-affirm that an arc-flash hazard does exist so persons are aware, please remember not all persons are qualified, trained, or understand the affects of arc-flash when and if they perform an action.

Panel Meeting Action: Reject

Panel Statement: The use of the term "operation" as proposed is overly broad and implies that all the equipment identified in this section poses an arc-flash hazard.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

HICKMAN, P.: See our explanation of negative vote on Comment 1-49.

(110.16 and 110.24)

Submitter: James F. Williams, Fairmont, WV

Comment on Proposal No: 1-112

Recommendation: Revise text to read as follows:

110.16 Arc-Flash Hazard Warning. Electrical equipment, such as switchboards, switchgear, panelboards, industrial control panels, meter socket enclosures, and motor control centers, ~~that are in other than dwelling units,~~ and are likely to require examination, adjustment, servicing, or maintenance while energized shall be field or factory marked to warn qualified persons of potential electric arc flash hazards. The marking shall meet the requirements in Section 110.21(B) and shall be located so as to be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment.

<u>*Exception: Service equipment in dwellings with services not greater than 400A and not greater than 240V line-to-line shall not be subject to the requirements of Section 110.16.*</u>

110.24 Available Fault Current.

(A) Field Marking. Service equipment ~~in other than dwelling units~~ shall be legibly marked in the field with the maximum available fault current. The field marking(s) shall include the date the fault current calculation was performed and be of sufficient durability to withstand the environment involved.

<u>*Exception: Service equipment in dwellings with services not greater than 400A and not greater than 240V line-to-line shall not be subject to the requirements of Section 110.24.*</u>

Substantiation: THIS IS A SAFETY ISSUE. Arc flash hazard is a function of voltage and available current. The location of the equipment is not a factor in arc flash.

Multi-family building and massive single family dwellings may present arc flash hazards comparable to industrial installations.

The intent of the changes is to apply Sections 110.16 and 110.24 to equipment that presents a hazard in buildings containing dwellings.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided adequate technical substantiation to support this comment and the current and voltage levels indicated.

1-52 Log #1413 NEC-P01 **Final Action: Accept in Part**
(110.16)

Submitter: Keith Fager, Bayer CropScience

Comment on Proposal No: 1-101

Recommendation: Revise proposal text as follows:

110.16 Arc-Flash Hazard Warning. Electrical equipment, such as switchboards<u>, switchgear</u>, panelboards, industrial control panels, meter socket enclosures, and motor control centers, that are in other than dwelling units, and are likely to require examination, adjustment, servicing, or maintenance while energized shall be field marked to warn qualified persons of potential arc flash hazards. The marking shall be located so as to be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment. <u>The marking shall include the necessary information to select the work practices and PPE appropriate for the level of hazard to which the qualified person will be exposed.</u>

Substantiation: Panel Action should have been Reject. The durability of the marking is covered by 110.21. The detailed information in the proposal is too restrictive and doesn't coordinate with the requirements in NFPA 70E. The label information requirements in NFPA 70 should be the minimum information required for a worker to use the proper work practices and PPE to protect himself or herself. If more detailed hazard information is not included

there is no reason to require the marking or label at all. By definition a qualified person is already aware of the arc flash hazard. The proposed text is general and will not have to be revised to coordinate with revisions to NFPA 70E. Marking durability is covered by 110.21. Informing the worker of the level of the hazard is related to the equipment installation and enables the worker to select the proper work practices and PPE as outlined in NFPA 70E.
Panel Meeting Action: Accept in Part
Panel Statement: The panel accepts the part to add "switchgear" in the first sentence according to the Panel's action on Comment 1-47 (Proposal 9-14a). The panel rejects the new sentence on marking according to the panel action and statement on Comment 1-48.
Number Eligible to Vote: 12

(110.16)

Submitter: Keith Fager, Bayer CropScience
Comment on Proposal No: 1-103
Recommendation: Panel action should have been "Accept in Principle". Revise proposal text as follows:
110.16 Arc-Flash Hazard Warning. Electrical equipment, such as switchboards<u>, switchgear</u>, panelboards, industrial control panels, meter socket enclosures, and motor control centers, that are in other than dwelling units, and are likely to require examination, adjustment, servicing, or maintenance while energized shall be field marked to warn qualified persons of potential arc flash hazards. The marking shall be located so as to be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment. <u>The marking shall include the necessary information to select the work practices and PPE appropriate for the level of hazard to which the person will be exposed.</u>
Substantiation: By definition, a qualified person is aware of the potential arc flash hazard. If the degree of the hazard or the minimum PPE requirements are not included on the label, the label does not contribute to the safety of the electrician in the field. The design and installation of the electrical system determines the incident energy level of the arc flash hazard, so the level of the hazard is related to installation and not work practices. This information would then be used to develop procedures and work practices required for the work on that specific equipment and its associated hazard.
Panel Meeting Action: Accept in Part
Revise text to read as follows:
110.16 Arc-Flash Hazard Warning. Electrical equipment, such as switchboards<u>, switchgear</u>, panelboards, industrial control panels, meter socket enclosures, and motor control centers, that are in other than dwelling units, and are likely to require examination, adjustment, servicing, or maintenance while energized shall be field marked to warn qualified persons of potential arc flash hazards. The marking shall be located so as to be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment.
Panel Statement: The panel accepts the part to add "switchgear" in the first sentence according to the Panel's action on Comment 1-47 (Proposal 9-14a). The panel rejects the new sentence on marking according to the panel action and statement on Comment 1-48.

(110.16)

Submitter: Keith Fager, Bayer CropScience
Comment on Proposal No: 1-105
Recommendation: Panel action should have been Reject. Paragraph should be revised as follows:
110.16 Arc-Flash Hazard Warning. Electrical equipment, such as switchboards<u>, switchgear</u>, panelboards, industrial control panels, meter socket enclosures, and motor control centers, that are in other than dwelling units, and are likely to require examination, adjustment, servicing, or maintenance while energized shall be field marked to warn qualified persons of potential arc flash hazards. The marking shall be located so as to be clearly visible to qualified persons before examination, adjustment, servicing, or maintenance of the equipment. <u>The marking shall include the necessary information to select the work practices and PPE appropriate for the level of hazard to which the qualified person will be exposed.</u>
Substantiation: By definition, a qualified person is already aware of the potential arc flash hazard. A factory applied label can not be anything more than a general warning of the hazard. The current requirements for the label don't include listing specific incident energy levels or PPE requirements and it's not clear who is responsible for applying the marking or label (see Proposal 1-105 explanation of negative). The installing contractor may or may not have the resources and information to conduct an arc flash study, and if they do their contract would have to include that in the scope of work. If the degree of the hazard or minimum level of PPE is not going to be identified on the label, the required label does nothing to increase the safety of the qualified person(s) working on the equipment. The proposed text is general and will not have to be revised to coordinate with revisions to NFPA 70E.
Panel Meeting Action: Accept in Part
Panel Statement: The panel accepts the part to add "switchgear" in the first sentence according to the panel's action on Comment 1-47 (Proposal 9-14a). The panel rejects the new sentence on marking according to the panel action and statement on Comment 1-48.

(110.17 (New))

Submitter: Russel LeBlanc, The Peterson School of Engineering
Comment on Proposal No: 1-110
Recommendation: Continue to accept this proposal as modified by the CMP.
Substantiation: Thank you. This has been a long battle (since the 2002 NEC) for me trying to get the wording just right and trying to get this requirement in the NEC. This workspace encroachment problem has been and continues to be a real threat to worker safety. While no signage is ever a guarantee for safety, if just one injury or catastrophe is prevented because somebody DID pay attention to the sign, then it is worth the time and effort to install the signage!
Panel Meeting Action: Reject
Panel Statement: After further consideration and discussion by the panel, the value of additional marking to support existing requirements is not clear. In addition to the substantiation provided with Comment 1-59, the panel is concerned about the need for a label as the clear space requirements are already in the Code.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
HITTINGER, D.: The panel should have removed the reference to the substantiation in comment 1-57. See my explanation on comment 1-59.

1-58 Log #1007 NEC-P01 **Final Action: Reject**
(110.17 (New))

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 1-110
Recommendation: Revise text to read as follows:
110.17 Working Space Marking. Equipment working space required <u>by 110.27(A)</u> ~~elsewhere in this code~~ shall be field marked to indicate the working space required…(remainder unchanged).
Substantiation: According to the opening statement of Section 110.27, *all* electrical equipment requires working space. Section 110.27(A) gives specific dimensions for equipment that is likely to require examination, adjustment, etc. while energized. As currently proposed, literally every piece of electrical equipment would have to have the markings discussed in this section.
Panel Meeting Action: Reject
Panel Statement: The action taken on Comment 1-59 removed the section this comment is directed toward and therefore it is no longer needed. In addition, there may be other sections where this text is in the code that were not included in the comment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-59 Log #1346 NEC-P01 **Final Action: Accept**
(110.17 (New))

Submitter: Louis Barrios, American Chemistry Council
Comment on Proposal No: 1-110
Recommendation: The committee action should have been to reject this proposal.
Substantiation: Equipment markings to indicate safe working spaces are typically intended for non-qualified persons who may place boxes and other obstacles in front of electrical equipment within the working space. Labels on equipment and lines on the floor have not proven to be a 100% effective deterrent in preventing obstacles from being placed in the safe working space. There is also a concern that additional labeling will add additional clutter on the front panels of electrical equipment, further complicating the ability to read the other safety markings.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
HICKMAN, P.: We find the negative vote and ballot statement of Mr. Hittinger persuasive.
HITTINGER, D.: The Panel voted 11-1 to accept proposal 1-110. They reversed and rejected based on one comment. The comment substantiation states “labels on equipment and lines on the floor have not been an effective deterrent in preventing obstacles from being placed in the safe working space”. The proposal was to add a label that does not exist. There is no compelling substantiation to reject the proposal.
Comment on Affirmative:
ANTHONY, M.: Our interest urges electrical manufacturers to innovate product solutions that resolve the site specific factors that make conformity to the NEC work space rules difficult from an operations and maintenance standpoint.
LABRAKE, JR., N.: Final Code compliance and maintenance of that compliance is the responsibility of the owner.

1-60 Log #1500 NEC-P01 **Final Action: Accept in Principle**
(110.21)

Submitter: Alan Manche, Schneider Electric
Comment on Proposal No: 1-114
Recommendation: The panel should reconsider this proposal and only accept the newly proposed Informational Note and reject the prescriptive marking requirements in the new text proposed in 110.21(B).
~~(B) Field-Applied Markings. Where caution, warning, or danger signs or labels are required by this code, the labels shall meet the following requirements.~~
~~1. The following colors shall be used for the hazard labels.~~
~~a. DANGER Label: Black text, with white and red background~~
~~b. WARNING Label: Black text with white and orange background~~
~~c. CAUTION Label: Black text with yellow and white background~~
~~2. The label shall be permanently affixed to the equipment or wiring method and shall not be hand written.~~
~~3. The label shall be suitable for the environment where it is installed.~~
Substantiation: ANSI Z535.4 is the industry standard that establishes appropriate markings. Attempting to boil this industry standard down into a few bullets has multiple issues:
1) The language is not enforceable. Look at the Danger label requirement – Black Text with white and Rd background. The inspector would have to accept a candy-cane stripe background with black letters or how about yellow poke-a-dots on a white background with black letters, that is far from the requirements in ANSI Z535.4
2) The language can be in conflict with the ANSI Z535.4 requirements which can drive an ambiguous requirement that makes a compliant ANSI Z535 compliant label not acceptable to the enforcer. ANSI Z535 has very definite lettering and color schemes and if the installer and enforcer has specific concerns about the lack of warning signage on equipment, they have the Informational Note to lean on as serving to provide an acceptable means to mark the equipment.
3) Manufacturers of electrical equipment have rigorous safety messaging that can be called into question based on the proposed prescriptive requirements. The addition of the Information Note is a good addition; however the prescriptive requirements in (B) should be rejected.
Panel Meeting Action: Accept in Principle
Panel Statement: See committee action and statement on Comment 1-61 which meets the intent of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-61 Log #1061 NEC-P01 **Final Action: Accept in Part**
(110.21(A) and (B))

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 1-114
Recommendation: Revise original proposal as follows:
110.21 Marking.
(<u>A</u>) Manufacturers Markings. The manufacturer’s name, trademark, or other descriptive marking by which the organization responsible for the product can be identified shall be placed on all electrical equipment. Other markings that indicate voltage, current, wattage, or other ratings shall be provided as specified elsewhere in this *Code*. The marking shall be of sufficient durability to withstand the environment involved.
(B) <u>Field-Applied Hazard</u> Markings. Where caution, warning, or danger signs or labels are required by this code, the labels shall meet the following requirements.
1. The <u>marking shall adequately warn of the hazard using effective words and/or colors and/or symbols</u> ~~following colors shall be used for the hazard labels.~~
~~a. DANGER Label: Black text, with white and red background~~
~~b. WARNING Label: Black text with white and orange background~~
~~c. CAUTION Label: Black text with yellow and white background~~
<u>Informational Note: ANSI Z535.4-2011, Product Safety Signs and Labels, provides guidelines for suitable font sizes, words, colors, symbols and location requirements for labels.</u>
2. The label shall be permanently affixed to the equipment or wiring method<u>,</u> <u>shall be clearly visible,</u> and shall not be hand written.
<u>*Exception to 2: Portions of labels or markings that are variable or could be subject to changes, shall be permitted to be hand written and shall be legible.*</u>
3. The label shall be <u>of sufficient durability to withstand the environment involved</u> ~~suitable for the environment where it is installed~~.
Informational Note: ANSI Z535.4-2011, Product Safety Signs and Labels, provides guidelines for the design and durability of safety signs and labels for application to electrical equipment. ~~This standard provides more specific information related to suitable font sizes, colors, various symbols and location requirements for labels.~~
Substantiation: This comment incorporates editorial adjustments to address concerns expressed in the negative balloting. The revisions to the original proposal are in the interest of resulting in practical requirements for these markings that are applied consistently across the NEC where the signal words “danger” “caution” and “warning” are used. The new exception to list item 2 is an effort to allow hand written information on some labels or markings that may be subject to change periodically to remain accurate, such as labels

required by Section 110.22 for series rated systems and 110.24 for available fault current.

Panel Meeting Action: Accept in Part

Revise text to read as follows:

110.21 Marking.

(A) Manufacturers Markings. The manufacturer's name, trademark, or other descriptive marking by which the organization responsible for the product can be identified shall be placed on all electrical equipment. Other markings that indicate voltage, current, wattage, or other ratings shall be provided as specified elsewhere in this *Code*. The marking shall be of sufficient durability to withstand the environment involved.

(B) Field-Applied Hazard Markings. Where caution, warning, or danger signs or labels are required by this code, the labels shall meet the following requirements.

1. The marking shall adequately warn of the hazard using effective words and/or colors and/or symbols ~~following colors shall be used for the hazard labels.~~

~~a. DANGER Label: Black text, with white and red background~~

~~b. WARNING Label: Black text with white and orange background~~

~~c. CAUTION Label: Black text with yellow and white background~~

Informational Note: ANSI Z535.4-2011, Product Safety Signs and Labels, provides guidelines for suitable font sizes, words, colors, symbols and location requirements for labels.

2. The label shall be permanently affixed to the equipment or wiring method and shall not be hand written.

Exception to 2: Portions of labels or markings that are variable or could be subject to changes, shall be permitted to be hand written and shall be legible.

3. The label shall be of sufficient durability to withstand the environment involved ~~suitable for the environment where it is installed~~.

Informational Note: ANSI Z535.4-2011, Product Safety Signs and Labels, provides guidelines for the design and durability of safety signs and labels for application to electrical equipment. ~~This standard provides more specific information related to suitable font sizes, colors, various symbols and location requirements for labels.~~

Panel Statement: The Panel rejects the change of the title of 110.21(B) from "Field Applied Markings" to "Hazard Markings". Other ANSI standards have accepted product markings schemes that do not necessarily follow ANSI Z535; the proposed title change may cause significant unintended impact. The Panel also rejected inserting the words "shall be clearly visible" based upon the content of ANSI Z535.4 which addresses this issue. The Panel accepts the other changes in the comment.

1-63 Log #770 NEC-P01 **Final Action: Reject**

(110.22(B) and (C))

Submitter: James Dorsey, Douglas County Electrical Inspector

Comment on Proposal No: 1-117

Recommendation: Revise text to read as follows:

The marking shall meet the requirements in 110.21(B) and (C) and shall be readily visible and state the following

CAUTION – SERIES COMBINATION SYSTEM RATED ________ AMPERES. IDENTIFIED REPLACEMENT COMPONENTS REQUIRED.

The field markings shall also include, the sum of the motors full load current in amperes and the date the calculation was performed.

Substantiation: I have been a commercial inspector for 11 years in a county which has high fault currents. A large portion of the projects end up with a series rating installation. The problem I would like the code panel to address is requiring that the labeling includes the sum of the motor loads and the date of installation somewhat mirroring 110.24. I have witnessed on multiple occasions where the breakers may add up to well over the 1% for perhaps an oversight, inefficient design or for whatever reason, but with manipulating of the fla's and non-coincidental loads the engineer can often brings the fla's say to just under 1% in the original installation.

The problem becomes when future build outs or simply adding a roof top unit, exhaust fan or any other motor load. The service electrician, inspector or owner has no ideal that they have now exceeded the 1% and has put the installation in a vulnerable and dangerous predicament. The additional labeling would give all parties the knowledge to design and install in a safe manner. This may also change the original design to a fully rated panel for present and future motor loads. With the premise of the NEC & practical Safeguarding, I hope you consider this additional verbiage to the original proposal. Thank you

Panel Meeting Action: Reject

Panel Statement: Proposal 1-117 addressed format of the label. The comment to add a requirement for the sum of the motor loads is not in accordance with 4.4.5(d) of the NFPA Regulations Governing Committee Projects. In addition, there is no section 110.21 (C).

(110.24)

Submitter: William Fiske, Intertek

Comment on Proposal No: 1-121

Recommendation: Accept Proposal 1-121 in Principle, and Accept Proposal 1-124 as submitted.

Substantiation: Available fault current is a factor in determining arc-flash hazard, but it is not the only factor. It is misleading to say that marking the Available Fault Current relates only to short-circuit current ratings of the equipment. Note also Mr. Hickman's comment in vote on the ROP ballot of Proposal 1-124.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

HICKMAN, P.: We do not necessarily agree with all of the substantiation in Proposal 1-124.

1-65 Log #765 NEC-P01 **Final Action: Reject**

(110.24)

Submitter: Rob Redfoot, Eaton Corp.

Comment on Proposal No: 1-123

Recommendation: Delete the following text:

~~110.24 Available Fault Current..."~~

Substantiation: The submitter recommended deleting this section in it's entirety because they were worried the information on the field label would not remain accurate. I think this valuable information to have shown and I don't recommend deleting it but there is merit to the idea that the information may not always be accurate. In my experience, most contractors will take fault current shown on engineers drawings and use that for their field markings. The problem is that the engineers use worse case values from the utility and the true values could vary widely from project to project. The calculations should be done using actual transformer KVA and impedance. I would recommend adding these values to the field label as a means to verify accuracy of the available fault current.

Panel Meeting Action: Reject

Panel Statement: The panel reaffirms its original action on the proposal. No additional or new substantiation has been provided beyond Comments 1-114, 1-116, 1-117, 1-118, 1-119, 1-120, 1-122 and 1-123 in the 2010 ROC, to indicate that the section should be deleted.

The comment is not clear for the recommended action for the substantiation according to 4.4.5(c) of the A2013 NFPA Regulations Governing Committee Projects.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-66 Log #1397 NEC-P01 **Final Action: Accept in Principle**

(110.24)

Submitter: Vincent J. Saporita, Cooper Bussmann

Comment on Proposal No: 1-121

Recommendation: Change to read as follows

Arc Flash hazard analysis information is available in NFPA 70E. Maximum available fault current at the service is intended for application ~~to~~ of the interrupting ratings of equipment, the short-current ratings of equipment, and the use of the "Table Method" of Hazard/Risk Category Classifications per NFPA 70E-2012 Table 130. 7(C)(15)(a). ~~and not for arc flash hazard analysis.~~ It is not for calculation of incident energies.

Substantiation: (1) It needs to be clarified that the maximum available fault current is also needed for compliance with equipment short-circuit current ratings (NEC 110.10)

(2) The maximum available fault current is also perfectly suited for use with the "Table" method in NFPA 70E.

(3) Clarity would be improved if "arc flash hazard analysis" were replaced with "calculation of incident energies".

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action on Comment 1-64 which meets the intent of the submitter.

(110.24)

Submitter: Keith Fager, Bayer CropScience
Comment on Proposal No: 1-123
Recommendation: The panel action should be Accept. Delete this section.
Substantiation: This section was added to make it easier to enforce sections 110.9 and 110.10. As part of the permitting process, our AHJ requires documentation on the construction drawings that the requirements of those sections are met. The inspector only has to verify the equipment installed has the short-circuit current rating indicated on the approved permit drawings. The field marking requirement in 110.24 has obviously created some confusion, based on the proposals submitted to add an informational note to explain the purpose of the posted value. It is important to know the maximum available fault current and the service equipment short circuit current rating, but the field marking requirement is not the best way to communicate that information.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original action on the proposal. No additional or new substantiation has been provided beyond Comments 1-114, 1-116, 1-117, 1-118, 1-119, 1-120, 1-122 and 1-123 in the 2010 ROC, to indicate that the section should be deleted.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-70 Log #1543 NEC-P01 **Final Action: Reject**
(110.24)

Submitter: Frederic P. Hartwell, Rep. Massachusetts Electrical Code Advisory Committee
Comment on Proposal No: 1-123
Recommendation: Accept the proposal to delete this section.
Substantiation: The panel statement rejecting the proposal asserts that it provides no new substantiation beyond that submitted during the comment period in the prior cycle. That statement is only partially true, and entirely beside the point. This proposal included additional information relative to the placement of this section in Part I of the article and thereby making it applicable to medium voltage installations. The available fault currents on these networks change frequently. In addition, CMP 1 has failed to provide any arguments that respond to the other merits of this proposal, either directly or by reference. In the prior cycle all comments were dealt with through a reference to Comment 1-115. That comment came from a task group formed to correlate actions between CMP 1 and 10. That task group recommended a minor wording change that was designed to address concerns that the posted fault current would be used for arc flash calculations. CMP 1 correctly addressed that concern, both in the previous cycle and on Proposal 1-121 in this cycle and the Advisory Committee recognizes this as a positive development.
However, the new section is still fatally flawed for reasons unaddressed by CMP 1 up to this point. The marking can and likely will become dangerously outdated after it has been posted. As such it requires wording that should not be believed, in order for safety to be served. Only contemporaneous consultations with the serving utility can prevent the misapplication of equipment. This is why NFPA 70E (a workplace safety standard) diverges in scope from NFPA 70 (an installation standard). Section 90.1(B) expressly provides notice that an NEC compliant installation is essentially free from hazard, but not necessarily adequate in the future. This proposal made the argument that Section 110.24 “would require an action to be taken on an electrical installation even if no activity, by reason of simple maintenance or otherwise, were performed on site.” As such, the requirement exceeds the scope of the NEC and cannot be enforced after the final inspection has been completed. The Advisory Committee respectfully requests that CMP 1 reconsider the merits of this section.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original action on the proposal. No additional or new substantiation has been provided beyond Comments 1-114, 1-116, 1-117, 1-118, 1-119, 1-120, 1-122 and 1-123 in the 2010 ROC, to indicate that the section should be deleted.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
LABRAKE, JR., N.: As has been noted in the discussions on this Section during both this cycle and previous ones, the required markings cannot be considered accurate beyond the immediate moment. To require labeling of this number invites assumptions of safety requirements that may not be appropriate for the situation at the time.

1-71 Log #245 NEC-P01 **Final Action: Reject**
(110.25)

Submitter: Edward G. Kroth, Verona, WI
Comment on Proposal No: 1-111
Recommendation: Rather than number the new section as 110.25 this new section should be numbered 110.21 and current 110.21 could be renumbered 110.20 (see also proposal 1-130).
Alternatively, 110.25 could be numbered 110.23 and current 110.23 could be renumbered 110.25. In either case other proposals submitted by the task group would need to be modified since those proposals specifically mention new 110.25.
Substantiation: From a codeology view point it would seem to make sense to have sections 110.22 numerically proceed or follow this new proposal since both are concerned with disconnects and a person looking for general rules on disconnects may not read far enough to get to the lockable rule. Refer also to my comment proposal 1-130.
Panel Meeting Action: Reject
Panel Statement: The submitter provided multiple options and has not provided specific language that the panel can consider and is therefore not in proper format in accordance with 4.4.5(c) of the Annual 2013 NFPA Regulations Governing Committee Projects.

(110.25 (New))

Submitter: Code-Making Panel 3,
Comment on Proposal No: 1-131
Recommendation: Reject Proposal 1-131.
Substantiation: Code-Making Panel 1 should have rejected the proposal. General statements were used to substantiate the proposal. The inadequate substantiation does not justify the need to add new material describing GFCI and AFCI shall be in a readily accessible location as opposed to accessible..

This comment was developed by a CMP-3 Task Group and balloted through the entire panel with the following ballot results:
15 Eligible to Vote
13 Affirmative (see affirmative comment below)
2 Ballots Not Returned (A.D. Corbin and D.T. Mills)
The following Comments on Vote were received:
AFFIRMATIVE:
S.L. STENE: The ready access for both GFCI and AFCI devices should not be mandated by Panel 1 but rather by the Panel having jurisdiction over the use of GFCI and AFCI devices for their particular application. An example of requiring the GFCI devices to be accessible as applied to equipment versus readily accessible would be the GFCI devices required by 620.85 that each 125-volt, single-phase, 15- and 20-ampere receptacle installed in pits, in hoistways, on elevator car tops, and in escalator and moving walk wellways shall be of the ground-fault circuit-interrupter type. The difference would be that these receptacles are accessible, rather than the readily accessible required by the proposed new text in 110.25. Even though 90.3 permits Chapters 5, 6, and 7 to modify or supplement the text in Article 110, this additional text makes the NEC more complex without any technical substantiation for the change.
Accessible (as applied to equipment). Admitting close approach; not guarded by locked doors, elevation, or other effective means.
Accessible, Readily (Readily Accessible). Capable of being reached quickly for operation, renewal, or inspections without requiring those to whom ready access is requisite to climb over or remove obstacles or to resort to portable ladders, and so forth.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-74 Log #274 NEC-P01 **Final Action: Accept**
(110.25 (New))

Submitter: Code-Making Panel 18,
Comment on Proposal No: 1-131
Recommendation: This proposal should be Rejected.
Substantiation: The current wording of 210.8, requires that all GFCIs required in this section, regardless of type, to be installed in a readily accessible location. Any other locations in the code are special applications such as for temporary wiring or vending machines, etc. and those panels responsible for those applications are better suited to take into consideration the possibly unique characteristics of these different types of installations that will affect the accessibility requirements for a GFCI. The accessibility of a GFCI should be considered within the context of the specific Article that requires installation of these products. No substantiation was provided to support the inclusion of an AFCI in this proposed requirement.
This comment was developed by a CMP-18 Task Group and balloted through the entire panel with the following ballot results:
12 Eligible to vote
9 Affirmative
1 Abstention (see below)
2 Ballots Not Returned (M.N. Ber and K.J. Clemente)
The following Affirmative Comment on Vote was received:
M.S. O'BOYLE: I agree that the proposal should be Rejected. I also agree that accessibility should be considered within the context of specific articles that require installation of a device. Additionally, I agree that no substantiation was provided to support inclusion of AFCI devices.
As defined in Article 100, "Readily Accessible" means that a device is capable of being reached for inspections without climbing over or removing obstacles. When a GFCI (or AFCI) is installed in an outlet box, it is not always possible to predict if furniture or another obstacle might be placed in a way that would render the device not readily accessible. Accordingly, the requirement would be difficult to enforce.
The following Negative Comment on Vote was received:
M.J. KOCHAN: All three negative votes by L. Barrios, P. Hickman and D. Hittinger have stated the substantiation does not justify the approval of the proposal. In this I concur. In the Informational Note Mr. Larsen suggests and assumes that by placing the GFCI in a readily accessible location will facilitate periodic testing required by the product installation instruction that are supplied with the receptacle. Not so, the electrician who is installing the GFCI does what they know to do and installs the GFCI receptacle and throws the box and instructions away. When a new homeowner or business facility moves in there is no instruction and if there were, who would see that these receptacles are tested periodically. Maybe the electrical contractor should be responsible to notify all homeowners and business facilities with a list of all GFCI receptacles and their locations and a copy of all instructions. In many cases, the GFCI has been installed in a readily accessible location like a kitchen, bathroom or a garage, but not always. There is that whirlpool tub in the master bathroom where the GFCI receptacle is located under the tub. There are bathrooms in national chains that require a key access as well as office buildings that require key access.
210.8 states GFCI receptacles be installed in a readily accessible location which is too broad of a statement. Mr. Larsen also mentions that the 2 dozen or so other areas in the code should be addressed the same way. Many of those come under Chapters 5, 6 and 7 which does allow for modifications and should be addressed in accordance with the articles of those chapters.
I would like a better understanding as to why this proposal is being placed as 110.25. The SCOPE of Article 110 states the following:
"This article covers general requirements for the examination and approval, installation and use, access to and space about electrical conductors and equipment enclosures intended for personnel entry; and tunnel installations."
The following Abstention was received:
F.L. CARPENTER: There was no clear consensus on whether NEMA should support or oppose the proposed comment on Proposal 1-131.
Panel Meeting Action: Accept
Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-75 Log #279 NEC-P01 **Final Action: Accept**
(110.25 (New))

TCC Action: The Correlating Committee directs that the proposed renumbering of 110.26 Spaces About Electrical Equipment to 110.27 be returned to its original location (110.26) since Proposal 1-131 was not accepted as a result of the action taken on Comment 1-75. As a result of this action, all references to 110.27 should be changed to 110.26.
Submitter: Code-Making Panel 2,
Comment on Proposal No: 1-131
Recommendation: Reject the entire proposal.
Substantiation: The proposal is overly broad and does not take into consideration the possibly unique characteristics of different types of installations covered by the code that will affect the accessibility requirements for GFCIs and AFCIs. The current wording of 210.8 requires all GFCIs required in this section, regardless of type, to be installed in a readily accessible location. CMP 2's action on Proposal 2-116 would require all AFCIs specified by section 210.12, regardless of type, to likewise be installed in a readily accessible location. Any other locations in the code where these protection devices are required are special applications such as for temporary wiring or vending machines, and the panels responsible for those applications are better suited to take into consideration the possibly unique characteristics of these different types of installations that will affect the accessibility requirements for GFCI's and AFCI's. The accessibility of GFCI's and AFCIs should be considered within the context of the Articles that require installation of these products.
This comment was developed by a CMP-2 Task Group and balloted through the entire panel with the following ballot results:
11 Eligible to vote
7 Affirmative
3 Negative (See voting comments below)
1 Ballot Not Returned (R.E. Duren)
The following Comments on Vote were received:
NEGATIVE:
M.R. Hilbert: The recommendation on Proposal 1-131 should have been to accept in principle.
CMP 2 addressed the accessibility issues for branch circuit GFCI devices covered under 210.8(A) – (C) in the 2011 NEC and has accepted a proposal for 2014 that would do the same for branch circuit AFCI devices. Therefore, it seems logical to include a general requirement in Article 110. This requirement can, as it already is in some cases, be modified for a specific application.
Although including a general requirement in Article 110 as proposed has merit, consideration should be given to expanding it to address all AFCI and GFCI devices not just the receptacle type. Shouldn't the same ready access requirements apply to the test and reset buttons for all AFCI and GFCI devices?
For example, take a vending machine located indoors. If the vending machine comes equipped with GFCI protection integral with the attachment cap or cord, there is no specific requirement in 422.51 to provide ready access to the GFCI device. However with a general requirement in Article 110 for receptacle type devices, a receptacle type GFCI device installed for a vending machine without integral GFCI protection would require the ready access. These accessibility requirements would be better afforded to all types of devices.
For consistency in terminology, the heading of the proposed new section

should be changed to read "Ground-Fault Circuit–Interrupter and Outlet Branch-Circuit Arc-Fault Circuit-Interrupter receptacles."

In my opinion, a general requirement in Article 110 will not create any conflict with the ready access to a GFCI device installed on a rooftop as part of a branch circuit to meet 210.63. As defined in Article 100, equipment is readily accessible when it is capable of being reached by "those to whom ready access is requisite." In the case of a receptacle placed on a rooftop for servicing heating or air conditioning equipment, it is the rooftop service personnel to whom the access is requisite and therefore a receptacle type GFCI device would only need to be readily accessible from on the rooftop.

J. Pauley: NEMA voted affirmative on proposal 1-131 during the ROP stage. Both
GFCIs and AFCIs have test and reset functions that need ready access. The GFCI industry has over
many years gotten a black eye with consumers because they lose power on a circuit and then
cannot find the reset mechanism (or find whether a GFCI is even installed) because it is buried
behind furniture, equipment or similar items.
Proposal 1-131 would require that all AFCIs and GFCIs be readily accessible. I cannot think of a single instance where ready access is inappropriate. Some have brought up the issue of being
located on a rooftop and that this would not be readily accessible. That's not an accurate
assessment. The definition of readily accessible is specific to include the words "those to whom
ready access is requisite". In a rooftop situation, the people who require access are already on the
roof and as such the device is readily accessible. I believe we are missing a significant opportunity
by not putting in a simple rule that will help everyone who uses a GFCI and/or an AFCI.

R.G. Wilkinson: The substantiation does not support the frequency of failures. Monthly testing and recording has been addressed.

Panel Meeting Action: Accept

Panel Statement: The panel does not necessarily agree with all of the submitter's substantiation.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

1-76 Log #351 NEC-P01 **Final Action: Accept in Principle**
(110.25 (New))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Comment on Proposal No: 1-130

Recommendation: Revise the text of the Panel Action on Proposal 1-130 to read as follows:

110.25 Lockable Disconnecting Means. Where a disconnecting means is required to be lockable open, elsewhere in this Code, it shall be capable of being locked in the open position. The provisions for locking shall remain in place with or without the lock installed.

<u>*Exception: Where a disconnecting means for cord-and-plug-connected equipment is required to be lockable open and is permitted to be an attachment plug, the provision for locking of the attachment plug shall remain in place with the lock installed.*</u>

Substantiation: Without addition of the Exception indicated above, the new 110.25 requirement and many companion requirements proposed throughout the Code do not draw any distinction between lockable disconnecting means for permanently connected equipment and lockable disconnecting means for cord-and-plug-connected equipment where the attachment plug serves as the disconnecting means. As such, these unconditional provision-for-locking-without-the-lock-installed requirements negate substantive compliance with OSHA's lock-out regulations for worker safety [29 CFR 1910.147] regarding cord-and-plug-connected equipment. Where the attachment plug serves as the disconnecting means, provision for locking consists of lockable "clamshell" that surrounds the attachment plug, thereby precluding energization of cord-and-plug-connected equipment being serviced. When not locking out such equipment, the "clamshell" is stored on the flexible cable above the plug. In either mode of "clamshell" usage or storage, it is intended that the lock must be used. This "provision for locking" therefore does NOT "remain in place … without the lock installed."

Many requirements for disconnecting means, including 410.130(G)(1) Exception No. 3, 422.33(A), 426.50(A), 427.55(B), 430.109(F), 440.13, 440.63, 517.71(C) and 590.4 and references thereto, permit attachment plugs to serve as the disconnecting means for cord-and-plug-connected equipment. Requirements proposed and accepted throughout the Code in this Code cycle that disconnecting means be lockable are generalized and in many instances are located in other Sections or by reference.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Add new text to read as follows:

110.25 Lockable Disconnecting Means. Where a disconnecting means is required to be lockable open, elsewhere in this Code, it shall be capable of being locked in the open position. The provisions for locking shall remain in place with or without the lock installed.

<u>*Exception: Cord-and-plug connection locking provisions shall not be required to remain in place without the lock installed.*</u>

Panel Statement: The panel reworded the proposed exception for clarity and to meet the Style Manual.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

HICKMAN, P.: We believe an exception has been created to provide an exception from something that is not required. We are not aware of a cord-and-plug connection that would be required to be "lockable open" as required by 110.25. However, if there were a case where a cord-and-plug connection would be required to be "lockable open" then we conclude that the provisions for locking need to remain in place with or without the lock installed.

1-77 Log #382 NEC-P01 **Final Action: Reject**
(110.25 (New))

Submitter: John Houdek, Allied Industrial Marketing, Inc.

Comment on Proposal No: N/A

Recommendation: Add new text to read as follows:

<u>Total power factor at the utility service point of a facility, shall be 0.90 or higher (lagging).</u>

<u>Motor loads totaling 50 HP or higher shall have a power factor of 0.90 or higher.</u>

<u>Harmonic voltage distortion shall be limited to 5% THD-v or less at the primary side of the utility transformer serving a facility.</u>

Substantiation: The NEC needs to define requirements for electrical power quality to assure the most efficient supply of electricity by utilities and to minimize disturbances caused by one facility from disrupting the service to another (neighboring) facility.

Both low power factor and elevated harmonic distortion are wasteful of electricity. Total power factor is a function of both fundamental frequency displacement power factor and distortion power factor. Low power factor causes elevated current to flow into the branch circuit conductors, transformer and switchgear. It is more costly for utilities to distribute electricity when power factor is low. To maximize total power factor, minimize distribution losses and losses within facilities, total power factor should be near 1.0.

Panel Meeting Action: Reject

Panel Statement: The proposed wording is outside the purpose of the NEC as stated in 90.1 as it does not apply to the safeguarding of persons or property.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

HICKMAN, P.: We do not necessarily agree with the panel statement.

1-78 Log #518 NEC-P01 **Final Action: Reject**
(110.25)

Submitter: James F. Williams, Fairmont, WV

Comment on Proposal No: 1-130

Recommendation: Revise text to read as follows:

110.25 Lockable Disconnecting Means. Where a disconnecting means is required to be lockable open, elsewhere in this *Code*, ~~it shall be capable of being locked in the open position. T~~ <u>t</u>he provisions for locking shall remain in place with or without the lock installed.

Substantiation: The deleted phrase is redundant and adds nothing to the section. Requiring something to be capable of meeting the requirement is overkill.

Panel Meeting Action: Reject

Panel Statement: The language proposed to be removed is not redundant. Rather, it is the central point of the Code provision. No substantiation has been provided to remove the concept and requirement for the disconnecting means being capable of being locked in the open position. There are disconnects that are incapable of being locked in the open position and are unacceptable for installation in conformance with this section.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

LABRAKE, JR., N.: The Comment could have been accepted in principle with the following text:

"Where a lockable disconnecting means is required to be <u>lockable open</u> elsewhere in this Code, it shall be capable of being locked in the open position. The provisions for locking shall remain in place with or without the lock installed."

This suggestion revises the original text from being too broad by removing the first comma in the original text of Proposal 1-130 and redundant text.

1-79 Log #979 NEC-P01 **Final Action: Reject**
(110.25 (New))

Submitter: Charles J. Palmieri, Town of Norwell
Comment on Proposal No: 1-131
Recommendation: The panel should continue to accept this proposal see my substantiation to Proposal 1-81 Log #1641 70-A2013-ROP below.
Substantiation: The installation of ground fault circuit interrupter and arc fault circuit interrupter type receptacles is expanding throughout this Code. The 2011 edition has introduced language-recognizing devices such as AFCI receptacles (see articles 210.12(B), and 406.4(D)(4)). It is important that these devices be located so their listing instructions requiring periodic testing may be performed without discouragement. During the 2011 renew process Code Panel 2 adopted language requiring GFCI type receptacles be readily accessible for the aforementioned testing. They did not include a similar requirement in 201.12(A), or (B) regarding the use of listed outlet type AFCI Receptacles. Note that the definition of the term “Equipment” in article 100 includes the word devices amongst the general terms included in that definition. The scope of Article 110 states in part, “This article covers general requirements for the examination and approval, installation and use, access to and spaces about electrical conductors and equipment”. Clearly it is appropriate to include a requirement in this article that equipment be readily accessible when the listing instructions require periodic testing.
Panel Meeting Action: Reject
Panel Statement: Specific accessibility requirements associated with ground-fault and arc-fault circuit interrupters should be located in specific sections that apply to these devices and not in Article 110. CMP 1 accepted comments to reject Proposal 1-131 submitted by Panels 2, 3,18 and 19.

(110.25)

Submitter: Alan Manche, Schneider Electric
Comment on Proposal No: 1-131
Recommendation: Continue to accept this proposal.
Substantiation: The committee’s decision to require a general accessibility requirement for AFCIs and GFCIs is an appropriate addition to support the use of these products in accordance with the Listing and markings found on these products. In order to test monthly, the device must be readily accessible. So one might infer that this requirement already exists as part of the listing and labeling of these protective devices, unfortunately they are often located where they cannot be reach to do the monthly test placing the protection for which there were designed at risk from improper maintenance.
The reason for this comment is to address the voting comments.
The HVAC roof-top unit which has s disconnect is required in accordance with 404.8 to be readily accessible, the same requirement exists where an overcurrent device is located with that HVAC unit, it must readily accessible in accordance with 240.24 so I would suggest that a receptacle located on the roof is also readily accessible. The GFCI protection can be relocated at grade level and feed the receptacle on the roof for monthly testing thereby enhanced worker safety by position the device where it can be periodically tested.
A thought conveyed by the voting comments is that accessibility should be addressed by each panel that has each location GFCI protection. I do not see any requirement in the code that would permit AFCI or GFCI protection to NOT be readily accessible and provide the occupant the appropriate installation to periodically test the devices in accordance with the Listing of the products. I would contend each code panel should be required to consider any location for permitting a device in a non-accessible location. This would be the reflected as an exception that would most likely be in direct conflict with the installation and operational instructions.
Once again this comment supports the code panel’s actions on this proposal establishing a general location requirement to facilitate monthly testing in accordance with the product Listing and marking.
Panel Meeting Action: Reject
Panel Statement: Specific accessibility requirements associated with ground-fault and arc-fault circuit interrupters should be located in specific sections that apply to these devices and not in Article 110. CMP 1 accepted comments to reject Proposal 1-131 submitted by Panels 2, 3,18 and 19.

(Table 110.26(A)(1))

Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 1-138
Recommendation: Continue to reject the Proposal.
Substantiation: A review and comparison of the present Table to the requirements of Table K-1 of OSHA 1926.403(i)(1)(i) shows the dimensions to be the same in both for the stated voltages. Changing Table 110.26(A)(1) will create a conflict between the two documents causing voltages above 600 Volts to be in violation of OSHA requirements. Further, there was no Proposal to change the title of Part II of Article 110 which would result in confusion. In addition, a Note within the OSHA document states that “If the electrical installation is made in accordance with the National Electrical Code ANSI/NFPA 70-1984, exclusive of Formal Interpretations and Tentative Interim Amendments, it will be deemed to be in compliance with 1926.403 through 1926.408, except for 1926.404(b)(1) and 1926.405(a)(2)(ii)(E), (F), (G), and (J).” This would further conflict with the proposed text without significant amendment.
Panel Meeting Action: Accept
Panel Statement: A joint task group appointed by the Correlating Committee consisting of representatives from HVTG, CMP 1 and CMP 8 reviewed proposals rejected by CMP 1 and CMP 8 related to replacing 600V to 1000V. The joint task group concluded that neither the joint task group nor the High Voltage Task Group has the necessary background research to further justify technical substantiation for the rejected proposals. Such substantiation would likely need to come from entities such as the manufacturers or the NFPA Research Foundation. The joint task group recommended that CMP 1 and CMP 8 not change the original actions taken during the 2014 proposal stage. In addition, the panel does not necessarily agree with all of all the substantiation for the comment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-85 Log #1008 NEC-P01 **Final Action: Reject**
(110.26(C))

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 1-145
Recommendation: Reject the proposal.
Substantiation: Requiring listed hardware makes no sense. I can have a door with no hardware at all and be as safe (if not safer) than a door with listed panic hardware. A door with no latch that utilizes a push/pull plate style hardware is safer than panic hardware as well. Furthermore, there was no substantiation that unlisted hardware is not safe.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action on proposal 1-145. The Code requires suitable hardware to facilitate egress. The requirement for listed hardware clarifies the expected performance and facilitates safe egress. In addition, this is consistent with the language used in the model building codes.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-86 Log #1172 NEC-P01 **Final Action: Reject**
(110.26(C)(1))

Submitter: Salvatore DiCristina, Rutgers University / Rep. NFPA Building Code Development Committee (BCDC)
Comment on Proposal No: 1-140
Recommendation: Accept the original proposal in principle and revise the text to read as follows:
110.26 C 1 Minimum Required. At least one entrance of sufficient area shall be provided to give access to and egress from working space about electrical equipment., and provide continuous and unobstructed travel between the entrance and the working space.
Substantiation: We agree with Panel members Anthony and Hickman that without this change, "none of the NEC rules for access and working space are practical if these spaces are crowded with obstructions" and that this concept would "enhance safety". As to the Panel's reference to "large equipment" in 110.26(C) (2) (a), already providing for this path, this section merely requires that if the single egress path is not continuous or obstructed (undefined by the way), then a second possibly obstructed path is required. No where does the NEC require a continuous unobstructed path.
Further, it is the intent to expand the requirement beyond equipment rated 1200A or more. Equipment of 1200A or greater is traditionally found in dedicated electrical equipment rooms. This proposal is precisely intended to address rooms and spaces containing unrelated equipment such as air handlers, piping, ductwork, etc, which is often given priority to location and routing and electrical equipment being secondary regardless of voltage or amperage. Reading the commentary for 110.26 (C) in the handbook, regarding Entrance to and Egress from Working Space, "This section was revised for the 2008 Code. The requirements are intended to provide access to electrical equipment. However, the primary intent is to provide egress from the area so that workers can escape if there is an arc flash incident". The hazard associated with arc flash does not begin at 1200A. This proposal seeks to provide direction to designers and contractors who continue to unnecessarily put mechanics at risk of well documented hazards by overcrowding spaces containing electrical equipment.
This also assists the first responder in attending to victims who may be incapable of evacuating the area after an incident.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided additional substantiation to justify a requirement that would apply to all equipment beyond "large equipment" in 110.26(C)(2)(a).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:
ANTHONY, M.: Many safety concepts are intuitively understood but lack technical substantiation sufficient for the committee. "Common sense", for example, is frequently difficult to substantiate
technically.
HICKMAN, P.: We reaffirm our negative vote and statement on Proposal 1-140.

1-87 Log #1595 NEC-P01 **Final Action: Reject**
(110.26(C)(2))

Submitter: Scott Cline, Monterey Park, CA
Comment on Proposal No: 1-143
Recommendation: Replace "1200 amperes" with "1000 kW" in the first paragraph: (2) Large Equipment. For equipment rated 1000 kW or more and over 1.8 m (6 ft) wide that contains overcurrent devices, switching devices, or control devices, there shall be one entrance to and egress from the required working space not less than 610 mm (24 in.) wide and 2.0 m (61/2 ft) high at each end of the working space.
Substantiation: The hazard addressed by this Section is long-term arc-burning of equipment trapping a worker. Power (voltage and amperage) is the measure of arc-flash hazard, not amperage alone. [With a reduction from 1200 Amps to 800 Amps, then the correct kW figure to use would be 666 kW.] Your Panel Statement says: "The industry normally rates the electrical equipment within 110.26(C)(2) in amperes and not in kW." I believe that is my point of the problem. For other sections/sub-sections, amperage is fine. But for this sub-section "amperes" ignores the reality of the physics hazard to be addressed by this rule – power, not amperage. An 800-amp 208Y/120-volt piece of equipment presents no where near the long-term arc-burning, electrician-killing hazard which an 800-amp 480Y/277-volt system does. Yet we treat them the same with the existing language. The switch to 1,000kW [or 666 kW] solves the discrepancy, and still leaves equivalent power capacity, lower-voltage systems (which can almost never sustain an arc-fault at all) fully protected.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original action on proposal 1-143. No additional substantiation has been provided to indicate that the proposed revision (changing amperes to kW) adds clarity or improves usability of this requirement. The equipment that this section applies to is rated in amperes not kW.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-88 Log #121 NEC-P01 **Final Action: Accept**
(110.26(D))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 9-14c
Recommendation: The Correlating Committee understands that the panel action in this proposal incorporates the modified definition of "Metal Enclosed Power Switchgear" to "Switchgear" in Proposal 9-7.
It was the action of the Correlating Committee that this proposal be referred to Code-Making Panel 1 for action.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-89 Log #768 NEC-P01 **Final Action: Reject**
(110.26(D))

Submitter: James Dorsey, Douglas County Electrical Inspector
Comment on Proposal No: 1-147
Recommendation: Revise text to read as follows:
110.26 (D) Illumination.
Illumination shall be provided for all working spaces about service equipment, switchboards, panelboards, or motor control centers installed ~~indoors~~ and shall not be controlled by automatic means only. (The remainder of the article left alone)
Substantiation: The original submitter requested a minimum of 10 foot candles of illumination. The panel rejected claiming that there is no substantiation of what amount of light is sufficient. OSHA standard for general construction is 5' & 10' candles for electrical equipment rooms, which I have attached. Without being too restrictive on how much illumination to require, the deletion of indoors would be a step in the right direction

standard 1926.56(a)
Requires 5 foot candles for General Construction & 10 foot candles for mechanical and electric rooms
Justifying the requirement for illumination outdoor as well as indoors could aid the rapidly growing requirements of labeling. The NEC requires labeling in many areas of the code, such as 240.86 series rating stickers, 230.2 placcarding for more than 1 service, 110.24 fault current calculation. 408.4 identification for Feeder panels. 705 interconnected systems, the list does go on, having the ability to read those labels would be a plus. For every electrician or homeowner that has the unfortunate task of servicing or resetting a breaker & having the ability to flip a switch and not have to have a flashlight under ones chin would be to their advantage.
Panel Meeting Action: Reject
Panel Statement: The submitter cites OSHA for a minimum illumination requirement,but it only applies to indoor installations. The proposed text is too restrictive to assume that all outdoor equipment needs to be serviced at night.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:
ANTHONY, M.: Electrical safety professionals who write the NEC should own this concept not OSHA.
HICKMAN, P.: We submit that the words "installed indoors" should have been the recommendation.
HITTINGER, D.: The Panel should have accepted the comment and the proposal. There was substantiation for the proposal. The Panel statement that the OSHA requirement is for indoor installations is not correct. It is applicable only to construction areas and does not differentiate indoor or outdoor. The submitter was providing a reference to the OSHA standard as a guide for the committee. Illumination for equipment that must be serviced is necessary regardless of where it is located.

1-91 Log #1308 NEC-P01 **Final Action: Reject**
(110.26(E)(1) Exception No. 2 (New))

Submitter: Mike Weitzel, Bechtel
Comment on Proposal No: 1-151
Recommendation: *Exception* ***1****: Control equipment that by its very nature or because of other rules of the Code must be adjacent to or within sight of its operating machinery shall be permitted in those locations.*
Add new text to read as follows:

Exception 2. Equipment such as switchboards, panelboards, industrial control panels, motor control centers, meter sockets, enclosed switches, transfer switches, power outlets, circuit breakers, adjustable speed drive systems, pullout switches, portable power distribution equipment, termination boxes, general-purpose transformers, fire pump controllers,and motor controllers rated not over 600 volts and installed in industrial installations shall not require dedicated space above the equipment where designed and listed for wiring methods to be installed bottom entry only.
Substantiation: Listed equipment installed in a new or upgraded industrial installations often face challenges to fit in electrical rooms or machinery spaces. Where designed and listed for the purpose, (and installed and used in accordance with the manufacturer's instructions), wiring methods will have the required space to enter and exit the equipment, and the objective of the *Code* will be met.

This Exception is proposed as limited to industrial locations only.

Requiring the equipment to be designed and listed is provided as justification for this new exception. This new language is offered as an alternative for "Engineered and constructed" language originally proposed, as a more palatable alternative to CMP 1, and adds enforceability for the AHJ. Some AHJ's are comfortable with making a determination based upon their experience. Other AHJ's or some federal regulators will not consider any exception or deviation from verbatim *Code* text. This Exception provides the verbatim text in the *Code*.

The substantiation supports the objective of the dedicated space requirements. The requirement for design, listing, (and AHJ approval per 90.4 – which any NEC section requires) is consistent with other permitted Exceptions in the *Code*. This Exception provides and recognizes the reality that sometimes in a new or replacement installation, it may be difficult to route cables, conduits, or other wiring methods into equipment from above the equipment. There are structural or space constraints that make it difficult or near impossible to comply with the *Code* verbatim. This exception provides a workable alternative in those situations. The proposal does not duplicate the requirements in Section 110.3(B). It simply provides a limited exception to an existing Code rule for space above equipment, that's all.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original action and statement on the proposal. The space for equipment is necessary in order to safely install, service, and replace that equipment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-92 Log #396 NEC-P01 **Final Action: Accept**
(110.27, Informational Note)

Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 1-157
Recommendation: Continue to reject the Proposal.
Substantiation: The present text of OSHA 1926.403(i) limits that paragraph to applications up to 600 Volts. 1926.403(i)(2)(i)(D) requires the same 8 ft as the present NEC text. Table K-3 of OSHA 1926.403(j)(3)(iii) shows the requirements in the present NEC text meet the requirements in the OSHA Table above 600 Volts. Changing the application of the text in 110.27(A)(4) will create a conflict between the two documents causing voltages from 601 to 1000 Volts to be in violation of OSHA requirements. In addition, a Note within the OSHA document states that "If the electrical installation is made in accordance with the National Electrical Code ANSI/NFPA 70-1984, exclusive of Formal Interpretations and Tentative Interim Amendments, it will be deemed to be in compliance with 1926.403 through 1926.408, except for 1926.404(b)(1) and 1926.405(a)(2)(ii)(E), (F), (G), and (J)." This would further conflict with the proposed text without significant amendment.
Panel Meeting Action: Accept
Panel Statement: A joint task group appointed by the Correlating Committee consisting of representatives from HVTG, CMP 1 and CMP 8 reviewed proposals rejected by CMP 1 and CMP 8 related to replacing 600V to 1000V. The joint task group concluded that neither the joint task group nor the High Voltage Task Group has the necessary background research to further justify technical substantiation for the rejected proposals. Such substantiation would likely need to come from entities such as the manufacturers or the NFPA Research Foundation. The joint task group recommended that CMP 1 and CMP 8 not change the original actions taken during the 2014 proposal stage. (110.27(A)(a))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 9-14b
Recommendation: Revise text to read as follows:
110.27 Spaces About Electrical Equipment.
(A) Working Space.
(a) ***Dead-Front Assemblies.*** Working space shall not be required in the back or sides of assemblies, such as dead-front switchboards, switchgear, or motor control centers, where all connections and all renewable or adjustable parts, such as fuses or switches, are accessible from locations other than the back or sides. Where rear or side access is required to work on nonelectrical parts on the back of enclosed equipment, a minimum horizontal working space of 762 mm (30 in.) shall be provided. **[ROP 9–14b]**
Substantiation: If we need to access it from the side we need working space.
Panel Meeting Action: Reject
Panel Statement: No technical substantiation has been provided to include "side access" in this provision.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-94 Log #864 NEC-P01 **Final Action: Accept**
(110.27(A)(4))

Submitter: C. Douglas White, Center Point Energy / Rep. Edison Electric Institute/Electric Light & Power Group
Comment on Proposal No: 1-158
Recommendation: The Panel action should have been to Accept in Principle the Proposal with the following changes:

By elevation ~~of 2.5 m (8 ft) or more~~ above the floor or other working surface as shown in (a) or (b) below:
(a) a minimum of 2.5 m (8 ft) for 50 - 300 Volts
(b) a minimum of 2.6 m (8-1/2 ft) for 301 to 600 Volts.
Substantiation: This is based on the negative ballot by Neil LaBrake in the ROP.

As stated in that ballot, "Clearances of any sort typically are composed of several components. One is some base number or reference height for the activity in the vicinity of the thing to be cleared. Section 230.24(B), for example, lists requirements for four different types of "activity" under overhead service conductors. The clearance is different for each activity.

Similarly, the voltage of the line or live part is another component; the higher the voltage, the larger the clearance required. Table 110.34(E) is an example of that requirement.
While the reference height for personnel is not explicitly stated in the NEC, it should be noted that 8 ft is often used as the assumed height of a person with arms extended over head. This, in fact, may also be where the 8 ft listed in NEC Section 110.27(A)(4) came from. But to just use only this reference value without consideration for the voltage involved would not be reasonable.

Considering the values shown in Table 110.34(E), it would be reasonable to infer that a median value for voltages under 600 Volts would be 0.5 ft.
The total then for all components would be 8-1/2 ft.

Lastly, Table 124-1 of the NESC does separate voltages of 300 (phase-to-phase) and below from those 301 to 600. 300 Volts and below is listed as "not specified" and for that reason the Panel could accept a similar separation."

The ballot statement also references and restates OSHA requirements and those are not repeated here for the sake of brevity.

(110, Part IV Title)

Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 1-180
Recommendation: Continue to reject the Proposal.
Substantiation: A review and comparison of the present text of Part IV of Article 110 with OSHA 1926 shows the OSHA document breaks at 600 Volts. Changing the title of Article 1I0, Part IV will create a conflict between the two documents causing voltages from 600 Volts to 1000 Volts to be in violation of OSHA requirements. Secondly, there was no Proposal to change the title of 110, Part II which would result in confusion. In addition, a Note within the OSHA document states that “If the electrical installation is made in accordance with the National Electrical Code ANSI/NFPA 70-1984, exclusive of Formal Interpretations and Tentative Interim Amendments, it will be deemed to be in compliance with 1926.403 through 1926.408, except for 1926.404(b)(1) and 1926.405(a)(2)(ii)(E), (F), (G), and (J).” This would further conflict with the proposed text without significant amendment.
Panel Meeting Action: Accept
Panel Statement: A joint task group appointed by the Correlating Committee consisting of representatives from HVTG, CMP 1 and CMP 8 reviewed proposals rejected by CMP 1 and CMP 8 related to replacing 600V to 1000V. The joint task group concluded that neither the joint task group nor the High Voltage Task Group has the necessary background research to further justify technical substantiation for the rejected proposals. Such substantiation would likely need to come from entities such as the manufacturers or the NFPA Research Foundation. The joint task group recommended that CMP 1 and CMP 8 not change the original actions taken during the 2014 proposal stage. In addition, the panel does not necessarily agree with all of all the substantiation for the comment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-107 Log #1520 NEC-P01 **Final Action: Reject**
(110.53)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 1-181
Recommendation: Revise text to read as follows:
110.53 Conductors. High-voltage conductors in tunnels shall be installed in metal conduit <u>(IMC or RMC)</u> or other metal raceway <u>(EMT or FMT)</u> , Type MC cable, or other approved multiconductor cable. Multiconductor portable cable shall be permitted to supply mobile equipment.
Substantiation: The list of metal conduit or other metal raceways suggested above may include those not suitable for high-voltage conductors in tunnels. If that is the case, then it should be pruned. This addresses the committee’s objection to listing only RMC.
Panel Meeting Action: Reject
Panel Statement: Submitter has not substantiated that FMC and LFMC are not suitable for carrying conductors rated above 600 V. In addition, other metal raceways, including Cellular Metal Floor Raceways (Article 374), Metal Wireways (Article 376) and Surface Metal Raceways (Article 386) are also permitted to carry conductors rated higher than 600 V.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

1-108 Log #1577 NEC-P01 **Final Action: Reject**
(110.74(A))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 9-28
Recommendation: Revise text to read as follows:
110.74 Conductor Installation.
(B) Over 600 Volts, Nominal. Conductors operating at over 600 volts shall be provided with bending space in accordance with <u>314.28</u>, 314.71(A) and (B), as applicable.
Substantiation: The voltage boundary in 110 is 600. The voltage boundary (changed by ROP 9-28) in 314 is 1000. The voltage span in 110.74(B) is included in both 314.28 and 314.71.
Panel Meeting Action: Reject
Panel Statement: The Panel 1 did not accept proposals or comments to change 600 volts to 1000 volts. The panel requests the Correlating Committee review these items for correlation with Panel 9.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 200 — USE AND IDENTIFICATION OF GROUNDED CONDUCTORS

5-7 Log #1145 NEC-P05 **Final Action: Reject**
(200.1 and 285.27)

Submitter: Paul Dobrowsky, American Chemistry Council
Comment on Proposal No: 5-27
Recommendation: The proposal should have been accepted.
Substantiation: The term Equipment Grounding Conductor needs to be replaced. Those opposed have no technical reason for their opposition or any other valid reason. It is not worth the effort and everyone understands what is meant are common responses.
It is very simple: Grounding electrode conductors are the connection to the earth and accomplish grounding. In the present NEC, Equipment Grounding Conductors and bonding jumpers provide a “path back” to the source. Both are always performing a bonding function. If the Grounding Electrode connection is removed or broken, the bonding function remains intact.
Section 250.4 does not permit the earth (ground) to be used as an effective ground fault current path but the term equipment grounding conductor inherently incorrectly contains the word “ground”.
Visualize equipment supplied by a portable generator. The generator frame is not required to be connected to the earth. The “green” wire in the flexible cord is not performing a grounding function but is performing a bonding function.
Visualize building one supplied by a service, having the grounded conductor connected to the grounding electrode system by a grounding electrode conductor. A feeder supplies a second building and a grounding electrode conductor is required for grounding any equipment in the second building. An

equipment grounding conductor is required to be installed from building 1 to building 2. Not for grounding, but for bonding, providing an effective fault current path.

Making this change has the added benefit of being more harmonized with other international standards and usage of terminology.

Experienced NEC users have to ignore other concepts in other definitions and requirements to use the existing term. This does not help the future NEC user or provide clarity in the existing NEC. Changing the term is the right thing to do and should be supported.

Panel Meeting Action: Reject

WILLIAMS, D.: See my negative vote substantiation written for Comment 5-1

Comment on Affirmative:

PORTER, C.: See my statement in comment 5-1.

5-8 Log #1304 NEC-P05 **Final Action: Reject**
(200.1)

Submitter: James M. Imlah, Hillsboro, OR

Comment on Proposal No: 1-178

Recommendation: Revise text to read as follows:

200.1 Scope.

This article provides requirements for the following:

(1) Identification of terminals

(2) Grounded conductors in premises wiring systems

(3) Identification of grounded conductors

Informational Note <u>No. 1:</u> See Article <u>100</u> for definitions of *Grounded Conductor, Equipment Grounding Conductor,* and *Grounding Electrode Conductor*.

<u>Informational Note No. 2: See 250.26 for when a grounded conductor is a neutral conductor.</u>

Substantiation: As noted in the negative comment there appears to be an inconsistency of the rejection of the new informational Note 2 in 200.1 and the actions to accept the change in 250.26 NEC (ROP 5-77). The informational note is important as 200.1 explains the scope of identification of a grounded conductor, and with the new Note 2 would clarify how the grounded conductor is to be installed as permitted in 250.26. Even the handbook commentary tries to explain the grounded conductor that may become a neutral conductor and conductor identification. This reference new Note 2 to 250.26 would enhance clarity, intent, and purpose for the AC systems. Please re-consider the action from reject as to accept the proposal as submitted.

Panel Meeting Action: Reject

Panel Statement: The correct reference is to proposal 5-26.
The addition of a reference to 250.26 is not needed. Whether a grounded conductor is a neutral or not is not relevant to the requirements of Article 200.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15 Negative: 1

Explanation of Negative:

MELLO, C.: The panel should have accepted the added informational note. The actions taken at the ROP stage on Proposal 5-77, not revised at the ROC stage, confirm the use of the term “neutral” in 250.26 for those systems having a neutral meeting the definitions in Article 100 of these terms. This is different than the broader “grounded conductor”. The panel statement is incorrect in stating that the conductor being a “grounded conductor” or a “neutral” is not relevant to the requirements in Article 200. The action taken by the panel on Comment 5-10 now utilizes the term “neutral” in the title of 200.4 as well as the requirements so why is the term “neutral” not relevant? The scope in 200.1 should be clear that for the purposes of Article 200 both “grounded conductors” and “neutral conductors” are included within the overall scope of Article 200.

5-9 Log #1322 NEC-P05 **Final Action: Reject**
(200.2(A))

Submitter: James F. Williams, Fairmont, WV

Comment on Proposal No: 5-28

Recommendation: Revise text to read as follows:

200.2 General.

(A) Insulation. The grounded conductor, if insulated, shall have insulation that is (1) suitable, other than color, for any ungrounded conductor of the same circuit for ~~systems of 1000 volts or less, or~~ impedance grounded neutral systems~~ of over 1000 volts~~, or (2) rated not less than 600 volts for solidly grounded neutral systems ~~of over 1000 volts as described in 250.184(A).~~ **[ROP 5–28]**

Substantiation: The reword is simpler, removes the insulation value inversion between 601 and 999 volts. It also matches the rules found in 250 II and X.

Panel Meeting Action: Reject

Panel Statement: This comment changes requirements without technical substantiation. There are distinctly different insulation requirements for 1000 Volt and below systems and those systems over 1000 Volts. The changes as accepted by the panel bring clarity and note the different requirements at the 1000 Volts change over point. The substantiation is incorrect that a void exists between 601 and 999 Volts.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-10 Log #280 NEC-P05 **Final Action: Accept in Principle**
(200.4)

Submitter: Code-Making Panel 2,

Comment on Proposal No: 5-29

Recommendation: Continue to Accept in Principle but add the following text to the Exception:

“<u>or if the conductors are identified at their terminations with numbered wire markers corresponding to the appropriate circuit number.</u>”

Substantiation: This additional text correlates the requirement with the action taken by CMP 2 on Proposal 2-19.

This comment was developed by a CMP-2 Task Group and balloted through the entire panel with the following ballot results:

11 Eligible to vote

7 Affirmative (See voting comments below)

3 Negative (See voting comments below)

1 Ballot Not Returned (R.E. Duren)

AFFIRMATIVE:

M.R. Hilbert: Although I do not agree with Proposal 5-29 in general, I voted with the panel as the “accept in principle” recommendation will at least allow recognition of other methods of circuit identification such as the long standing 200.6(D).

The grouping requirement in 210.4(D) is for a specific application at the point of supply where it is necessary to be able to identify the ungrounded conductors and associated neutral of a multi-wire circuit for safe disconnection. However, expanding the grouping requirements as proposed in 5-29 is overly restrictive, will be difficult to enforce and seems to be without good substantiation.

I do not agree that without the proposed language one would be in violation of 200.4 as stated in the substantiation. Section 200.4 states that a neutral conductor cannot be used for more than one branch circuit, multi-wire branch circuit or one set of feeder conductors unless permitted elsewhere in the Code. This section does not contain any grouping requirements and there was no other substantiation provided to justify the changes. In fact the neutral bus referred to in the substantiation is often located at the point of supply of the branch circuit which is already addressed by 210.4(D).

The proposed changes will be difficult for the enforcement community as all junction and splice points where there are multiple circuits with neutrals would have to be open for inspection of the grouping requirements and then an additional inspection will be required to assure all covers are in place. This will be extremely challenging where suspended ceilings are involved as it is common for the ceiling contractor to be on site waiting for the ceiling to be passed by the electrical inspector so he can drop tiles.

NEGATIVE:

F. COLUCCIO: Although not prohibited, the identification of conductors in multiwire branch circuits, to the extent recommended by the submitter, would be overly excessive for most installers. The requirements in 210.4(B) and (D) are sufficient to provide reasonable assurances that a multiwire branch circuit is present and proper connection is achieved.

D.M. King: Proposal 5-29: Continue to accept this proposal in principal. I disagree with the Panel action text. Identification at termination points alone should not be considered an effective means to replace grouping of conductors of a multiwire branch circuit. Positive identification of all conductors of a multi-wire branch circuit is critical to the safety of qualified persons who service these circuits and grouping provides a secure physical means of this identification that should not be compromised by less effective alternative methods.

R.G. Wilkinson: Too restrictive. Initial installation addresses grouping.

Panel Meeting Action: Accept in Principle

Revise 200.4 as follows:

200.4 <u>**Neutral Conductors.** Neutral conductors shall be installed in accordance with (A) and (B).</u>

<u>**(A) Installation.**</u> Neutral conductors shall not be used for more than one branch circuit, for more than one multiwire branch circuit, or for more than one set of ungrounded feeder conductors unless specifically permitted elsewhere in this Code.

<u>**(B) Multiple Circuits.** If more than one neutral conductor associated with different circuits is in an enclosure, grounded circuit conductors of each circuit shall be identified or grouped to correspond with the ungrounded circuit conductor(s) by wire markers, cable ties, or similar means in at least one location within the enclosure.</u>

<u>**Exception 1:** The requirement for grouping or identifying shall not apply if the branch circuit or feeder conductors enter from a cable or a raceway unique to the circuit that makes the grouping obvious.</u>

<u>**Exception 2:** The requirement for grouping or identifying shall not apply where branch circuit conductors pass though a box or conduit body without a loop as described in 314.16(B)(1) or without a splice or termination.</u>

Panel Statement: The concept for identifying the conductors with wire markers was incorporated into the positive text of 200.4 (B). Exception 2 was added to allow conductors to be pulled through a box without grouping or identification. Where no loop or coil (as provided in 314.16(B)(1)) is left for splices it is not necessary to group the circuit conductors.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-11 Log #938 NEC-P05 **Final Action: Accept in Principle**
(200.4(B) Exception)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 5-29
Recommendation: Revise text to read as follows:
200.4 Neutral Conductors.(B) Multiple Circuits. Where more than one neutral conductor associated with different circuits is in an enclosure, the ungrounded and grounded circuit conductors of each circuit shall be grouped by cable ties or similar means in at least one location within the enclosure.
~~*Exception: The requirement for grouping shall not apply if the circuit conductors enter from a cable or a raceway unique to the circuit that makes the grouping obvious.*~~
Exception: The requirement for grouping shall not apply if the circuit enters from a cable or raceway unique to the circuit that makes the grouping obvious or if the conductors are identified at their terminations with wire markers corresponding to the appropriate circuit.
Substantiation: The exception text is copied from 210.4(D) Exception: and since both exceptions describe the treatment of the same conductors treated as a circuit, the exception text should match.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-10.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

ARTICLE 210 — BRANCH CIRCUITS

2-3 Log #978 NEC-P02 **Final Action: Reject**
(210.2 (New))

Submitter: Charles J. Palmieri, Town of Norwell
Comment on Proposal No: 2-11
Recommendation: The panel should reconsider this opportunity to provide clarity to installers and inspectors alike by providing a definition of when renovations constitute a circuit modification that compels the installer to install AFCI Protection. I continue to suggest the following language. From the previous proposal. Relocate and renumber the existing language of 210.2 and install the following definition. New Definition as 210.02 Definitions.
Modifications (Circuits). For the purpose of this article the term modifications shall include changes to an existing structures branch circuit wiring installation, which results in the replacement, relocation or extension for the purpose of serving outlets or utilization equipment. The term modifications in this section shall not apply to short sections of spliced conductors consistent with panelboard, device or luminaire replacement.
Substantiation: I am submitting this comment on proposal 2-11 70-A2013 ROP to provide CMP 2 with another opportunity to clarify, under what conditions manipulation of existing circuitry during panel board and device replacement is it intended to require the addition of AFCI Protection.
Panel Meeting Action: Reject
Panel Statement: The panel continues to affirm that use of the term "modified" in Sec. 210.12(B) is a specific context that must be considered by the AHJ as to the extent of the changes being made to the branch circuit and the necessity for requiring AFCI protection. The panel also notes that the exception added to 210.12(B) during the proposal stage also addresses the submitters concern.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
HILBERT, M.: The NEC Style Manual prohibits a requirement from being placed in a definition so an exception was added to 210.12(B) during the proposal stage to address the submitters concern. See Proposal 2-115.

2-4 Log #1047 NEC-P02 **Final Action: Reject**
(210.4)

Submitter: George M. Stolz, II, Quicksilver Electrical Training
Comment on Proposal No: 2-13
Recommendation: Accept the proposal in principle as follows:
Exception: Simultaneous disconnection of ungrounded conductors of a dedicated multiwire branch circuit supplying a combination pump controller and alarm may be omitted if all supply conductors are contained within the same wiring method at the controller. A warning label shall be placed on the panelboard that clearly states that both phases supplying the pump and alarm require disconnection prior to maintenance or repair.
Substantiation: A pump controller featuring a 120V pump on the first line and a 120V alarm on the second line of a multiwire branch circuit with no stops in between should not pose a surprise to qualified personnel if all conductors are present and terminate within the same enclosure. A pump that trips the OCPD and inadvertently also trips the supply to the alarm defeats the entire purpose of having the alarm. The label was added as an afterthought to protect these wildly underqualified people we're so concerned about.
Panel Meeting Action: Reject
Panel Statement: The panel continues to affirm that the need for simultaneous disconnection of all ungrounded conductors in a multiwire branch circuit is to address the potential for an electric shock hazard, and that adding exceptions will introduce a potentially hazardous condition.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-5 Log #21 NEC-P02 **Final Action: Accept**
(210.4(C))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 2-17a
Recommendation: The Correlating Committee directs that the panel provide further clarification for the exact location of the Informational Note.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Identify the existing Informational Note following 210.4(A) as Informational Note No. 1.
Relocate the Informational Note proposed to follow 210.4(C) by Proposal 2-17a to follow the existing Informational Note in 210.4(A) and number it as Informational Note No. 2.
Panel Statement: The panel relocated the Informational Note to follow the existing Informational Note in 210.4(A) which is the proper location.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-6 Log #1202 NEC-P02 **Final Action: Reject**
(210.4(D))

Submitter: Michael L. Last, Na'Alehu, HI
Comment on Proposal No: 2-18
Recommendation: Revise text to read as follows:
(D) Grouping. The ungrounded and grounded circuit conductors of each multiwire branch circuit shall be grouped by cable ties or similar means and indicated as such in at least one location within the panelboard or other point of origination. The means of identification shall be permanent by tagging or similar methods.
Substantiation: The proposal should be reconsidered and accepted based on the fact that the submitter's substantiation identifies a significant problem with the existing requirement. The requirement set forth in the 2011 NEC does not accurately offer identification fr multiwire branch circuits. The grouping of conductors does not indicate the reason for such bundling (grouping). Nor does the exception address this same concern. The fact that the ungrounded and grounded circuit conductors are in some way grouped (bundled) does not in and of itself indicate they constitute a multiwire branch circuit. This proposal will quickly and easily indicate the reason for such grouping; as well as reduce the possibility of unintentional consequences caused by compromising the integrity of the grounded circuit conductor.
Panel Meeting Action: Reject
Panel Statement: The panel continues to affirm that the grouping requirement is sufficient to identify the grounded conductor that is associated with the ungrounded conductor(s) in a multiwire branch circuit.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-7 Log #1305 NEC-P02 **Final Action: Reject**
(210.4(D))

Submitter: James M. Imlah, Hillsboro, OR
Comment on Proposal No: 2-19
Recommendation: Delete text to read as follows:
210.4 Multiwire Branch Circuits.
A. Unchanged
B. Unchanged
C. Unchanged
D. **Grouping.** The ungrounded and grounded circuit conductors of each multiwire branch circuit shall be grouped by cable ties or similar means in at least one location within the panel board or other point of origination. Or if the conductors are identified at their terminations with numbered wire markers corresponding to the appropriate circuit.
Substantiation: Please reject this proposal as it does not enhance or add clarity to the existing exception. Numbered wire markers work well for a period of time, but over time and due to environmental conditions tags are usually found inside the bottom of the panel, un-readable, or altogether missing. The submitter has not provided clarity as to how a multiwire branch circuit with a common neutral (grounded conductor) shall be identified such as a circuit 2 &

4 and then you identify the neutral is it actually 2 & 4 or is that 24, grouping does provide one of the methods for assuring circuit groups. If this exception is allowed to be added, grouping by cable ties or other similar means is not done, only number marking would be acceptable which could be considered as overly restrictive. This would be an enforcement nightmare if a deficiency is cited for numbering only when the exception is applied. Identification is already allowed in the charging statement (similar means) and does not belong as another condition to the exception.

Panel Meeting Action: Reject

Panel Statement: The permission to use the alternate method of identifying conductors with wire markers is considered an acceptable and equivalent method of identifying these conductors.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

KING, D.: This comment should be accepted. The proposed text is vague and does not specifically address the need for the grounded conductor along with the ungrounded conductor to be clearly identified in lieu of grouping. Positive identification of all conductors of multiwire branch circuits is critical to the safety of qualified persons who service these circuits.

2-8 Log #1203 NEC-P02 **Final Action: Reject**
(210.4(E))

Submitter: Michael L. Last, Na'Alehu, HI

Comment on Proposal No: 2-20

Recommendation: Accept the proposal and add new text to read as follows:

(E) Identification of Ungrounded and Associated Grounded Conductors. At the locations indicated in 210.4(D), and at all other locations where it is permissible to interrupt the integrity of the grounded (neutral) conductor of a multiwire branch circuit, all the ungrounded (phase or line) and grounded circuit conductors of each multiwire branch circuit shall be individually grouped by cable ties or similar means and identified as such. At all locations where more than one multiwire branch circuit is present, each separate multiwire branch circuit shall be uniquely identified whereby each grounded conductor is readily identified with the corresponding ungrounded conductors of that particular multiwire branch circuit. The means of identification shall be permanent by tagging or similar methods.

Substantiation: The proposal should be reconsidered and accepted based on the fact that the submitter's substantiation identifies a significant problem with the existing requirement. The requirement set forth in the 2011 NEC® does not accurately offer identification of multiwire branch circuits. While 210.4(D) does provide some indication that a multiwire branch circuit possibly could exist, it is possible that the bundling of conductors could have been provided for some other reason. A readily identified tag (or other means) will definitely indicate the actual purpose of bundling, i.e. that of a multiwire branch circuit. The complete and proper identification of multiwire branch circuit(s) as proposed could not be considered overly excessive when it increases the margin of safety.

Panel Meeting Action: Reject

Panel Statement: The panel continues to affirm that the requirements in 210.4(B) and (D) are sufficient to provide reasonable assurances that a multiwire branch circuit is present and proper disconnection is achieved.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

KING, D.: The Submitter's substantiation accurately describes a safety concern encountered frequently by personnel. I disagree with the panel statement that "the requirements in 210.4(B) and (D) are sufficient to provide reasonable assurances that a multiwire branch circuit is present and proper disconnection is achieved." The additional requirements would implement a practical means to ensure proper identification of multiwire branch circuits thus minimizing the hazards to persons and property that exist with the use of these circuits.

2-9 Log #1274 NEC-P02 **Final Action: Reject**
(210.5(B), 215.6, and 215.12)

Submitter: Elliot Rappaport, Electro Technology Consultants

Comment on Proposal No: 2-21

Recommendation: Accept proposal.

Substantiation: The term "equipment grounding conductor" does not have a unique meaning since the words themselves do not express the purpose of that conductor. The term "equipment grounding conductor" has a definite purpose that is not uniquely expressed in the term, i.e. "bond the equipment to a terminal at the source of voltage". As a result, there is a misconception that "grounding", without bonding to the source, will make a system safe. On the contrary, connecting equipment to ground without providing the bonding connection back to the source can make equipment less safe by increasing the time to clear the fault.

The Panel statement that the equipment grounding conductor serves a dual purpose of providing a path to ground as well as a path for fault current does not place sufficient significance on the importance of bonding over grounding. Bonding provides sufficient ground fault current back to the source of voltage to operate an overcurrent device and clear the fault quickly. Connection to ground limits the voltage to ground on normally non-current-carrying parts during non-fault conditions. During fault conditions, the value of grounding is minimal since the primary safety concern is to remove the fault voltage as quickly as possible. A path to ground for fault current is not necessary since ground fault current must return to the source of voltage, not to ground.

Renaming this conductor as an "Equipment Bonding Conductor (EBC)" will clarify that the primary purpose of this conductor is to bond to the source in order to provide a known path for ground fault current that will facilitate rapid fault clearing.

It is recognized that the term "EGC" has been in use for a long time and that changing it to EBC will cause some concerns including changing written literature that uses the EGC term. After the initial period of understanding, users will correctly understand the purpose of this conductor and this will enhance the safety of personnel.

The fundamental purpose of this and companion proposals is to clearly state that "systems" are "grounded" and "equipment" is "bonded". The fact that the bonding conductor may be grounded also is secondary to the primary function of bonding.

Panel Meeting Action: Reject

Panel Statement: The panel continues to affirm that the term "equipment-grounding conductor" has a unique meaning and needs to remain in the NEC. The panel does not agree that renaming this conductor as an "Equipment Bonding Conductor" will provide additional clarity to the meaning or purpose for this conductor. As noted in the Informational Note to the existing definition, an equipment-grounding conductor serves a dual purpose of providing a path to ground (earth) as well as a bonding path for fault current.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 11 Negative: 2

Explanation of Negative:

BOYNTON, C.: The term "equipment grounding conductor" needs to be replaced with "equipment bonding conductor" throughout the NEC. Yes, the term equipment grounding conductor in Article 100 would need to be changed to the term equipment bonding conductor.

Some have argued that it is just a problem of education. Having the word "grounding" in a term describing conductor that is used primarily for a bonding function is not a problem to be solved by education.

The use of the term "equipment grounding conductor" is confusing both for those new to the electrical industry and even for some experienced users. The problem is compounded when dealing with other international standards.

No technical reason has been provided for not making the change. This conductor always provides a bonding function but does not always provide a grounding function such as in the case of a portable generator installed as a separately derived system.

MITCHEM, J.: The IEEE agrees with the submitter's substantiation. The comment should have been accepted because it is technically correct. The proposal improves the technical accuracy of the use of the terms "equipment grounding conductor" and "equipment bonding conductor". The IEEE has reviewed all the statements on this subject by various panels. The following represents the IEEE position on the issue of equipment grounding conductor or equipment bonding conductor. Similar proposals have been presented in the past and have been rejected. There is no justification for retaining an incorrect and potentially hazardous electrical installation just because this definition has been used in the NEC for many years. Not all electrical practitioners are knowledgeable in the main purpose of this conductor. The intent of the proposed change is to provide a descriptive name to a construction element that has resulted in much misunderstanding with possible hazardous operating conditions in electrical installations. The use of the term "grounding" implies that grounding is its principal function. Although grounding may be desirable, providing an effective fault current path (i.e. bonding) is and should be the emphasis. There are many who assert that a connection to a water pipe meets the needs of equipment grounding, however, this connection does not perform the necessary effective fault current path back to the source. There are two conductors described in the Code performing the same function but named differently. The "bonding jumper" is a short conductor that assures the electrical integrity of enclosure to raceway. The longer conductor, intended to provide a low impedance path to the source, is presently named a "grounding" conductor instead of its real function as a "bonding" conductor.

2-10 Log #22 NEC-P02 **Final Action: Accept**
(210.5(C))

Submitter: Technical Correlating Committee on National Electrical Code®

Comment on Proposal No: 2-23

Recommendation: The Correlating Committee directs that this proposal be reconsidered and correlated with the actions taken on Proposals 2-217, 4-262, 4-234, 4-375, 5-220, 5-221 and 13-33 with regard to the 50 volt/60 volt nominal level.

The Correlating Committee also directs that the word "and" in 210.5(C) be reviewed to see if "or" would be more applicable.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Revise 210.5 (C) as follows:

Identification of Ungrounded Conductors. Ungrounded conductors shall be identified in accordance with 210.5(C)(1) ~~and~~ or (2) as applicable.

In proposed 210.5(C)(2) replace 60 volts with 50 volts.

Panel Statement: The panel has reviewed 210.5(C) and agrees that changing the word "and" in 210.5(C) to "or" is more appropriate.

The change from 60 volts to 50 volts is to correlate with the CMP 13 action on Proposal 13-33.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

18-6 Log #23 NEC-P18 **Final Action: Accept**

(210.8)

Submitter: Technical Correlating Committee on National Electrical Code®

Comment on Proposal No: 2-29

Recommendation: It was the action of the Correlating Committee that this proposal be referred to Code-Making Panel 18 for action.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Panel Statement: Panel 18 supports the action by Panel 2 as Panel 18 also rejected a similar proposal 18-11 in the ROP stage as well.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

2-12 Log #24 NEC-P02 **Final Action: Accept**

(210.8)

Submitter: Technical Correlating Committee on National Electrical Code®

Comment on Proposal No: 2-31

Recommendation: The Correlating Committee directs that the action on this proposal be correlated with the action taken on Proposal 1-131.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Panel Statement: The panel accepts the direction from the Correlating Committee. The general rule accepted by Panel 1 in Proposal 1-131 is applicable to receptacle GFCIs only whereas the current code wording of 210.8 applies to all GFCI types. Therefore, the action on 2-31 needs to remain unchanged.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

2-13 Log #381 NEC-P02 **Final Action: Reject**

(210.8)

Submitter: Keith M. Whitesel, Whitesel Electric

Comment on Proposal No: 2-28

Recommendation: Proposal 2-28 Log #533 NEC–P02.

Reconsider this exception to the GFCI requirement.

While a sump pump, refrigerator or freezer will operate correctly when correctly connected to a GFCI if the GCFI device nuisance trips, and they still do, the basement could flood or the contents of the refrigerator or freezer could be lost.

This came home to me recently when during a lightning storm one of my GFCI's tripped and I lost $500.00 worth of food from my freezer. I live in an area where lightning storms are frequent and at least one of my seven GFCI devices trips almost every storm. It can be any one of my GFCI's. I have both GFCI breakers installed on some circuits and GFCI receptacles on other circuits. Any of them can trip during any storm. My house is also in a flood prone area. If my sump pumps were connected to GFCI's and they were to nuisance trip, my basement would flood and the potential damage could be thousands of dollars.

Substantiation: 90.1 clearly states that the purpose of the NEC is to protect both people and PROPERTY. Protecting ones home from flooding and from lose of food certainly should fall into this category of protection. These receptacles were formerly except from the GFCI requirement in past codes.

Panel Meeting Action: Reject

Panel Statement: No substantiation has been provided to show that listed GFCIs are not compatible with sump pumps or freezers.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

Comment on Affirmative:

HILBERT, M.: I agree with the panel action and statement. Section 240.15(B)(1) permits individual circuit breakers with identified handle ties to be used on multi-wire branch circuits that are serving on line-to-neutral loads. This application would address the submitter's concern with simultaneous disconnection of the alarm circuit by a fault in the pump circuit.

2-14 Log #1161 NEC-P02 **Final Action: Reject**

(210.8, Informational Note (New))

Submitter: Thomas A. Domitrovich, Eaton Corporation

Comment on Proposal No: 2-32

Recommendation: This proposal should have been accepted.

Substantiation: The Code panel rejected this proposal stating "The receptacle GFCI short circuit ratings are readily available from manufacturers of these devices if this information is necessary to comply with the requirements of 110.10."

However, the case of a GFCI receptacle is much different than most products in that many people are not even aware that these devices have a short circuit rating.

The UL 943 Standard requires a 2000A test for the typical device, and permits an Optional 10kA Short Circuit Current Test, but does NOT permit it to be marked 10kA. UL 943 States the following:

"SA3.1 A ground-fault circuit-interrupter that complies with SA2.1 and SA2.2 shall not be marked to indicate the ability to withstand a 10kA short circuit current as a result of these tests."

The rating information for these products, especially for the inspector reviewing the installation after these products have been installed, is often unchecked. This enables the misapplication of these life saving devices beyond their ratings. There are many areas where these devices are applied, especially in commercial and industrial environments, where the available fault currents may exceed the rating of the device.

This informational note is important for safety as it raises the awareness to installers and inspectors alike who are not aware of the short circuit capabilities of these devices. This will go a long way for ensuring these devices are applied within their rating.

Panel Meeting Action: Reject

Panel Statement: Short circuit ratings are available from manufacturers. The original proposal and this comment concentrates only on GFCIs and does not consider other parts of the wiring systems such as regular receptacles that are tested for only 1000 A withstand and switches which are not tested for withstand.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

2-15 Log #25 NEC-P02 **Final Action: Accept**

(210.8(A) Exception to (5))

Submitter: Technical Correlating Committee on National Electrical Code®

Comment on Proposal No: 2-36

Recommendation: The Correlating Committee requests that Panel 2 review the text contained in the Informational Note following the "Exception to (5)" and clarify if changes are warranted since the term "fire alarm" was removed in this proposal.

The Correlating Committee also directs that this proposal be sent to Code-Making Panel 3 for comment as to whether the Informational Note in 760.41(B) will still be applicable.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Panel Statement: The panel accepts the Correlating Committee direction to review the text in the Informational Note following the Exception to 5.

See Panel Action and Statement on Comment 2-16.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

2-16 Log #265 NEC-P02 **Final Action: Accept**

(210.8(A) Exception No. 5)

TCC Action: The Correlating Committee understands that this comment only rejects Proposal 2-36 and that the proposed revisions to 210.8(A) Exception 5 that are a part of the submitter's substantiation are not accepted.

Submitter: Code-Making Panel 3,

Comment on Proposal No: 2-36

Recommendation: Reject Proposal 2-36.

Substantiation: The Panel rejects the action of CMP 2. The exact wording that is found in 760.41(B) and 760.121(B) is provided below. This proposal should be an Accept. The allowance is that the power for fire alarm equipment not be supplied through either a ground-fault circuit interrupter or arc-fault circuit interrupters. The proposed text makes it clear that this is a requirement and not an option.

While burglar alarm systems are not addressed within Article 760, most if not all intrusion systems that are installed within single family dwellings do have at least one zone of protection connected to smoke detectors. The existing paragraph addressed both fire alarm and intrusion detection systems.

The existing language of 2108(A), Exception 5 should remain as follows:

760.41(B) This branch circuit shall not be supplied through ground-fault circuit interrupters or arc-fault circuit-interrupters.

760.121(B) This branch circuit shall not be supplied through ground-fault circuit interrupters or arc-fault circuit interrupters.

This comment was developed by a CMP-3 Task Group and balloted through the entire panel with the following ballot results:

15 Eligible to Vote
12 Affirmative
2 Ballots Not Returned (A.D. Corbin and D.T. Mills)
1 Negative (see comment below)

The following Negative Comment on Vote was received:

S.L. STENE: The action on Proposal 2-36 was the correct action to "accept in principle in part." The Panel 3 Comment should not have been a reject, since a total reject of the proposal would keep the text as previously stated in the 2011 NEC. The Panel 2 action on the proposal eliminated the fire alarm text and left burglar alarm panels to not require GFCI protection as a permissive statement. A burglar alarm without fire alarm function using Class 2 and 3 circuits is covered under Article 725. A dual function burglar/fire alarm is covered by 760.41(B) and 760.121(B). A burglar alarm panel with fire alarm capabilities is a combination fire and burglar alarm and could not be supplied by a GFCI protected circuit based on 760.41 and 760.121.

Panel Meeting Action: Accept

Panel Statement: The panel accepts this comment which Rejects Proposal 2-36.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

2-17 Log #1009 NEC-P02 **Final Action: Reject**

(210.8(A) Exception No. 5)

Submitter: Mike Holt, Mike Holt Enterprises

Comment on Proposal No: 2-36

Recommendation: Accept the proposal in principal by deleting the exception (and its informational note) altogether.

Substantiation: Over the last several Code cycles exceptions to GFCI protection have been removed due to the fact that equipment should not interfere with the operation of a GFCI device. A burglar alarm should work just fine with GFCI protection.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Comment 2-16 which reverts the text back to the 2011 edition and reinstates the exception to correlate with Article 760.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

2-18 Log #773 NEC-P02 **Final Action: Reject**

(210.8(A)(2))

Submitter: Richard H. Murray, S. Easton, MA

Comment on Proposal No: 2-37

Recommendation: Revise the second sentence in 210.8 to read as follows:

The ground-fault circuit-interruptor <u>test equipment</u> shall be installed in a readily accessible location.

Substantiation: I believe this will help solve some of the issues that evolved when this change was added to the 2011 NEC.

Panel Meeting Action: Reject

Panel Statement: The panel requests the submitter to clarify what specifically is intended to be readily accessible. GFCI test equipment is undefined in the NEC. The panel notes that the comment is not related to the proposal referenced.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

2-89 Log #255 NEC-P02 **Final Action: Accept**

(210.8(A)(5))

Submitter: Code-Making Panel 17,

Comment on Proposal No: 2-10

Recommendation: Continue to reject this proposal.

Substantiation: Relocating this definition to Article 100 will grant it global authority over unfinished areas of all occupancies. Currently it is limited to dwellings as defined in article 100 (see title to 210.8 (A). The impact of such a move has not been considered nor justified in the proposal. The existing definition is specifically framed to the installation of GFCI protected receptacles in basement areas of dwellings that are not intended as habitable rooms. The use of the term "unfinished basement" in articles 334.15 (C) and 382.12 (1) apply to the installation and protection of the physical wiring methods. The definition as used in article 210.8 (A) (5) applies to protecting occupants via use of Ground Fault Circuit Interrupters in those areas of dwellings which present an elevated risk of shock. This is not true in all occupancies. The submitter has not provided historical evidence indicating a conflict in the application of the term "unfinished basement" as used in article 334.15 (C) nor 382.12 (1). The current location of this definition in 210.8 (A) (5) has a reasonable history of success and lacking empirical evidence of a problem it should not be relocated. It is important to note that in the application of the language in 334 and 382 the term unfinished and basement is easily defined by use of standard dictionaries whereas the definition located in article 210 is specific for the application of GFCIs.

This comment was developed by a CMP-7 Task Group and balloted through the entire panel with the following ballot results:

14 Eligible to vote
11 Affirmative
2 Negative (See voting Comments below)
1 Ballot Not Returned (C.J. Fahrenhold)

The following Comments on Vote were received:

NEGATIVE:

C.K. HUNTER: We disagree with the stated CMP-7 reasoning. In reviewing the uses of the term in 334.15(C) and 382.12(1), the definition fits with the language and requirements in both of these sections. The proposal submitter was correct in pointing out that when a term is used multiple times in the NEC that the definition should appear in Article 100. Leaving it in Article 210 begs the question- what differentiates an unfinished basement in Article 210 from the use in Articles 334 and 382?

S.R. LaDART: Relocating this definition to Article 100 will grant it global authority over unfinished areas of all occupancies. Currently, it is limited to dwellings as defined in Article 100. The importance of such a move has not been considered nor justified in the proposal. Continue to Reject.

Panel Meeting Action: Accept

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

2-19 Log #1094 NEC-P02 **Final Action: Reject**

(210.8(A)(6))

Submitter: Ron B. Chilton, Rep. NC Code Clearing Committee

Comment on Proposal No: 2-39

Recommendation: The Code Panel should have "Accepted" this proposal.

Substantiation: This omission still leaves a gap, which seems unintentional by the previous Code Making Panels, where the kitchen sink is within 2 ft., of the end of the countertop and a receptacle may be less than a foot from the edge, on the wall adjacent to the countertop, or more often, directly on the opposite wall of a pass-through opening, not serving the countertop. This allows appliances to be set on the ledge of a pass-through directly over the sink and plugged into a receptacle not provided with GPCI protection. The Proposal only closes the gap to clarify that all receptacles located near sinks as close as 6 ft be GFCI protected. Surely all countertop receptacles in the kitchen are required to have GPCI protection, this evolved from the original 6 ft. rule. In the last few Code cycles emphasis has been placed on deleting the exceptions to requirements for GFCI protection in loose proximity, 6 ft., of all sinks in a dwelling. The Proposal is identical to other past proposals for sinks in a dwelling addressing the need for GFCI protection for receptacles near sinks. When the requirement for GFCI protection in bathrooms became effective, there was no reference to the countertop only, and the emphasis was placed on the receptacle being located in the proximity of all those potential water hazards.

Panel Meeting Action: Reject

Panel Statement: The proposed text of the proposal is not clear and appears to limit the requirement for GFCI protection to within 6 ft of a sink. The panel reaffirms that all receptacles serving the counter top shall have GFCI protection.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

2-20 Log #769 NEC-P02 **Final Action: Accept**

(210.8(A)(7))

TCC Action: The Correlating Committee directs that the term "located" be changed to "installed" for correlation.

Submitter: James Dorsey, Douglas County Electrical Inspector

Comment on Proposal No: 2-40

Recommendation: Delete the words "located in areas other than kitchens"

In the 2011 NEC:

(7) Sinks - ~~Located in areas other than kitchens~~ where receptacles are located within 1.8 m (6 ft) of the outside edge of the sink.

Proposed text should read:

(7) Sinks - <u>**W**</u>here receptacles are installed within 1.8 m (6 ft) of the outside edge of the sink.

Substantiation: Consistency; There is no difference in the ground-fault shock hazard between any appliances (especially with the trend of stainless steel) that are plugged into a 120v receptacle (refrigerators, dishwashers, trash compactors or garbage disposals) that is within 6' of a wet bar sink to the same type of appliance plugged into a 120v receptacle within 6' of the sink in a residential kitchen. The NEC has indicated that the presence of water and grounded or conductive surfaces can contribute to a hazardous environment. Since the NEC mandates that all receptacles within 6' of a wet bar sink must be gfci protected how can the panel not agree with the proposal to protect the same type of appliances in a residential kitchen where there is a ground-fault shock hazard because of the presence of water and grounded surfaces? The 6' rule with consistency would be a good start.

Many residences are built slab on grade so the kitchen is in contact with the earth just like wet bar sinks in basements. It is awkward, confusing and even embarrassing as an inspector (who must enforce the code by what is written in

the code) to tell a homeowner or contractor that one area must be gfci protected while the other area does not. Furthermore, it creates inconsistency among inspectors on how to enforce this article while also using common sense. Common sense would say, if it is ok not to require gfci protection in a kitchen for cord connected appliances within 6' of the sink than it should be ok not to enforce GFCI protection for the same type of appliances by a wet bar. Please reconsider your rejection or add an exception to the general 6' rule for consistency.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
HILBERT, M.: The action on Comment 2-20 was to accept however there are two recommendations in the comment. The submitter removes the reference to "other than kitchens" in the first recommendation and changes "location" to "installation" in the second recommendation under "The text should read." Changing "location" to "installation" would make 210.8(A)(7) consistent with the other subdivisions in 210.8(A).

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 2-44
Recommendation: Proposal 2-44 should be accepted.
Substantiation: The submitter is correct when he stated that the means of measurement needs to be defined and that it is not clearly understood. The shortest distance would be horizontal from the edge of the sink. We receive questions from the field pertaining to whether the measurement is horizontal or a combination of horizontal and vertical.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 2-22.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
HILBERT, M.: See my ballot comment on Comment 2-22.

2-22 Log #1544 NEC-P02 **Final Action: Reject**
(210.8(A)(7))

Submitter: Frederic P. Hartwell, Rep. Massachusetts Electrical Code Advisory Committee
Comment on Proposal No: 2-44
Recommendation: Accept the proposal in principle. Revise text to read as follows:
(7) Sinks — located in areas other than kitchens where receptacles are installed within <u>the zone</u> 1.8 m (6 ft) <u>measured horizontally from</u> ~~of~~ the outside edge of the sink <u>and extending from the floor to 1.8 m (6 ft) above the floor</u>.
Substantiation: The Advisory Committee agrees that the requirement should reach all receptacles within 6 ft of a sink. The proposal was always intended to do exactly that. If the rule is applied literally based on the current text, a receptacle at baseboard height and 6 ft 2 in. from the sink, measured in a straight line, is excluded because it would be over 6 ft from the outside edge of a sink that might well be perhaps two feet higher. This wording agrees with the proposal concept and more clearly conveys the intent. It is now apparent that both CMP 2 and the Advisory Committee are in agreement as to the intended scope of the requirement.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees with the submitter and notes that it is the intent of the panel that the 6 ft measurement is taken from the outside edge of the sink using the shortest possible path to the receptacle. Adding the term "zone" could be misconstrued and lead to additional concerns or misinterpretations.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
HILBERT, M.: The action could have been to accept this comment in principle and clarify the how the measurement is made. The panel statement accurately reflects the meeting discussion with regard to how the measurement is made. It would be beneficial to readers of the Code to have that language in 210.8 as many readers of the Code never see an ROP or ROC.
The submitter clarified how he intended the "zone" to apply which is appreciated. However, any panel discussion I can recall was clear the measurement was to be the shortest path between the nearest edge of the sink and the receptacle as opposed to the zone concept.
The Panel came close to including a new last sentence in the opening paragraph of 210.8 to clarify how the measurements are made. However, due to the lengthy discussions on measuring the shortest path, that opportunity was lost for this cycle.
From an enforcement standpoint there is only one practical way to measure the shortest path. That is the shortest path the cord of an appliance could take. Similar wording to what is already time tested in 680.22(A)(5) could be incorporated into 210.8 as a new subsection. The following wording would provide readers of the Code with clear and practical guidance on how the shortest path is measured:
210.8(X) Measurements: When determining the dimensions in this section addressing distances from receptacles, the distance shall be measured as the shortest path the cord of an appliance connected to the receptacle would follow without piercing a floor, wall, ceiling, doorway with hinged or sliding door, window opening or other effective barrier.

2-23 Log #865 NEC-P02 **Final Action: Reject**
(210.8(A)(9))

Submitter: C. Douglas White, Center Point Energy / Rep. Edison Electric Institute/Electric Light & Power Group
Comment on Proposal No: 2-47
Recommendation: Reject proposal 2-47.
Substantiation: The substantiation does not provide sufficient technical information to conclude that additional GFCI protection is required for all laundry area 125 volt, 15 and 20 ampere receptacles. The necessity of providing GFCI protection for the laundry area circuit was not quantified. There is no data provided in the substantiation regarding the number or frequency of electric shock incidents involving laundry area circuits. The substantiation is anecdotal at best. GFCI protection has been a requirement of the NEC for many years. The requirement has never existed for all laundry area circuits until proposal 2-47 was made for the 2014 NEC. If the proposal is an attempted resolution with a particular appliance problem, the manufacturers of the product have other avenues that may yield the desired result such as installing GFCI protection within their equipment.
Panel Meeting Action: Reject
Panel Statement: Laundry areas involve electrical appliances and water with a resulting increased risk of electric shock. The panel's action to require GFCI protection of receptacles in laundry areas addresses this increased risk and is consistent with the NEC requirements for GFCI protection of other receptacles in areas near water.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 2
Explanation of Negative:
DUREN, R.: The substantiation offered by the original proposal 2-47 indicated the incidence of electrical shocks related to consumer products has declined over time. The submitter offered no evidence to support the statement and no evidence to indicate that additional GFCI protection is needed.
The panel statement supporting the panel action on comment 2-23 indicates that because there is water and electricity in a laundry room a GFCI for each 120 volt outlet should be required.
The outlets within six feet of the sink are already required to be GFCI protected. The water in the laundry room would have to make a significant trip to exceed the six foot area around the edge of the sink. A reasonable question to ask is what is the length of the any cord connected appliances typically utilized in a laundry room?
The washing machine outlet may or may not be within six feet of a sink. However, protection for the washing machine could easily be provided by a plug style GFCI device. If the concern of the submitter is with regard to the washing machine then he should petition the Consumer Products Safety Commission to require GFCI protection for all new washing machines sold in the United States.
ORLOWSKI, S.: NAHB urges the members of the panel to Accept this comment seeking to reject proposal 2-47. As we stated in the ROC meeting, there was no substantiation provided by the original proponent to expand GFCI protection to laundry areas. No statistics or data were provided to the panel showing any injuries or deaths associated to electrical shock from laundry appliances. No proof was provided to support the committees assumption that there is an increased risk of electrical shock with these appliances. As we stated previously, the NEC should not be used as a tool to negate the due diligence of appliance manufacturers in designing consumer safe products.
Comment on Affirmative:
HILBERT, M.: I agree with expanding the requirements for GFCI protection to the laundry area as portable appliances such as an iron will likely be used in that area. However, I disagree with expanding this requirement due to failure of fixed appliance. See my ballot comment on 2-29.

2-24 Log #1048 NEC-P02 **Final Action: Reject**
(210.8(A)(9))

Submitter: George M. Stolz, II, Quicksilver Electrical Training
Comment on Proposal No: 2-47
Recommendation: Reject the proposal.
Substantiation: There was no substantiation provided to require GFCI in Laundry Areas, at all. As written, the substantiation should have been to a proposal to add "(9) Everywhere Else"! If the submitter has evidence that GE appliances are failing and killing people I would invite them to offer up this data. Also, this proposal could conflict with the beneficial change accepted to change required circuits to refer to the equipment, rather than an undefined area, in 210.11 and 210.52. With the 2011 change to require GFCI protection around all sinks, and then the 2014 proposal to require GFCI protection on all bathtubs, that about covers every laundry area/equipment receptacles. It is

unnecessary, and in most cases will require an extra line-side GFCI receptacle to protect the washer receptacle, based on the "readily accessible" requirement added in 2011.
Panel Meeting Action: Reject
Panel Statement: See the panel statement on comment 2-23.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 2
Explanation of Negative:
HILBERT, M.: The action should have been to accept this comment. Although I do not agree with all of the submitter's substantiation, Article 210 may not be the right location for GFCI or AFCI rules regarding fixed appliances. See my statement on Comment 2-29.
ORLOWSKI, S.: See my Explanation of Negative Vote on Comment 2-23.

HILBERT, M.: The action should have been to accept this comment in principle. See my ballot comment on Comment 2-22.

2-27 Log #1 NEC-P02 **Final Action: Accept in Principle**
(210.8(B)(8))

Submitter: Mike Weaver, C&M Enterprises
Comment on Proposal No: 2-49
Recommendation: Do not accept Proposal 2-49.
Substantiation: While the proposal, in and of itself has significant merit (as noted in the submitter's substantiation), for application to commercial garages and similar areas and occupancies, this subsection item (8), which was new for the 2011 cycle, currently has the ability to impact a broader range of occupancy areas than the language of 210.8(B)(8) infers on the surface. Existing text, which will be removed by the acceptance of Proposals 2-49 or 2-50, affords effective limitation to expanded, potentially unintended, application of 210.8(B)(8).
The text of 210.8(B)(8) incorporates the word "garag"' which is a defined term in Article 100. Careful review of this "garage" definition language reveals that the auto dealer showroom floor area (as just one example) meets the Article 100 definition of a garage. Potentially, the riding mower dealer showroom floor area also falls under the definition of "garage" (a vehicle is defined in Merriam-Webster's dictionary as a piece of mechanized equipment, and is undefined in the NEC). If the language modifications (deleted text) in Proposal 2-49 (or Proposal 2-50) are accepted into210.8(B)(8), then GFCI protection will be mandated for the receptacles noted within 210.8(B) for an automobile dealership's showroom floor area (as one example). This is NOT what the submitter was addressing in the proposal substantiation provided. This mandate for the (previous) example area, as well as other unintended "garage" occupancy areas become locations which are enforceable to the requirements of Section 210.8(B)(8). Encompassing other "garage" areas (such as the commercial-industrial facilities' fork-lift charging area. If the vehicles are staged there for other than during their charging process, which is quite typical for such areas) may have merit, while others (the dealer showroom floor area) may not. While the submitter's (CMP accepted) proposal has sound merit, it incorporates GFCI protection for areas where such protection may not be considered as necessary. Current 210.8(B)(8) language provides some limitations for such areas of question.
Limiting the board application of 210.8(B)(8) for areas which GFCI protection may not be considered necessary, requires new language, or carefully worded exceptions, or a revision to the Article 100 definition of "garage". Revisions which broaden the application of 210.8(B)(8) to encompass the submitter's noted (and CMP confirmed) concerns requires additional input from others who also recognize the added collateral damage from deletion of text noted in the original proposal. This comment submission, in conjunction with your rejection of Proposals 2-49 and 2-50, will allow the submitter and others to craft adequate language which addresses the submitter's concerns without producing potentially unwanted consequences. If this requires an additional revision cycle, it will be better than accepting the revisions as originally proposed, which paint 210.8(B)(8)'s requirements to areas and occupancies with quite a broad brush.
Please see my companion comment to Proposal 2-50.
Panel Meeting Action: Accept in Principle
Add the following text to the end of sentence 210.8(B)(8):."...other than vehicle exhibition halls and showrooms."
Panel Statement: The panel agrees with the submitter and has added text to 210.8(B)(8) to address his concerns.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-28 Log #2 NEC-P02 **Final Action: Accept in Principle**
(210.8(B)(8))

Submitter: Mike Weaver, C&M Enterprises
Comment on Proposal No: 2-50
Recommendation: Do not accept Proposal 2-50.
Substantiation: Please see substantiation to my comment on Proposal 2-49.
This is a companion comment to a previous comment addressed to Proposal 2-49.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Comment 2-27.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-29 Log #566 NEC-P02 **Final Action: Accept**
(210.8(D))

Note: When the ballot result does not confirm the TC action on a Proposal by a two-thirds affirmative vote, the Report on Proposals shall be published with a specific request for public comment on that Proposal. The Proposal is now being reconsidered by the TC as a public comment.
Submitter: Jay A. Broniak, GE Appliances & Lighting
Comment on Proposal No: 2-58
Recommendation: Revise text to read as follows:
This form proposal is for requiring ground-fault circuit-interrupt (GFCI) protection on the dishwasher circuit.
Section 210.8

(D) Kitchen Dishwasher branch circuit. GFCI protection shall be provided for outlets that supply dishwashers installed in dwelling unit locations.
Substantiation: As the requirement for ground-fault circuit-interrupters (GFCIs) has been expanded throughout the NEC code, the amount of electrical shock incidents related to consumer products have continued to decline over time. Increased usage of GFCls within branch circuits of residential homes is a highly effective means of further reducing the potential for electrical shocks. CMP-2 should require GFCI protection on the dishwasher circuit.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 9 Negative: 4
Explanation of Negative:
HILBERT, M.: The action should have been to accept this comment in principle. See my ballot comment on Comment 2-22.
This comment should have been rejected as it does not address the root cause. Most of the substantiation to provide to GFCI protection for dishwashers was related to concerns with an appliance. The submitter indicated the vast majority of failures have been related to either end of life component use, unexplained electronic circuitry error, or poor quality control as indicated by chafed wiring. There is no question to the fact that either AFCI or GFCI protection may have prevented many of these unfortunate events from happening in the first place, but they should not be used to address an appliance problem. If the manufacturing process remains unchanged it does nothing in the terms of safety for the existing dwellings in this country when it becomes time to replace appliances.
Article 210 contains rules for receptacle placement and due to the unlimited possibilities of cord-and-plug connected equipment that can be supplied from those receptacles the existing rules in 210.8(A) and (B) are appropriate. Understanding it would be unrealistic to address the many different types of portable appliances individually, it makes perfect sense to require GFCI protection for the 15 and 20 ampere, 125 volt, receptacles in areas where they most likely to be used. However, fixed appliances such as dishwashers, washing machines and the GFCI protection requirements for them may be more appropriately covered in Chapter Four. The GFCI protection rules for cord-and-plug connected vending machines and electric drinking fountains already exist in Article 422 along with leakage-current detector-interrupter (LCDI) or arc-fault circuit-interrupter (AFCI) rules for window air conditioners in Article 440. Boat hoists are also specific equipment so the GFCI rules for them may be more appropriately located in Article 422 or Article 610.
It seems that locating the GFCI requirements for specific equipment to Chapter Four or Six as appropriate would promote greater consistency in the NEC. It may be appropriate for a task group with members from CMP 2 and CMP 17 for possible proposals for the 2017 NEC.
MITCHEM, J.: This comment should have been rejected. The substantiation was based on the lack of protective functions within the equipment. The concern about product safety should be addressed through relevant product safety standards instead of depending on external means for safety of the users.
ORLOWSKI, S.: NAHB urges the members of the panel to reject this comment. As we stated in the ROC meeting, other than providing the panel with a presentation on how products fail over a period of time, there was no substantiation provided by the original proponent to expand GFCI protection to dishwashers. No statistics or data were provided to the panel showing any injuries or deaths associated to electrical shock from these appliances. No proof was provided to support the committees assumption that there is an increased risk of electrical shock with these appliances. As we stated previously, the NEC should not be used as a tool to negate the due diligence of appliance manufacturers in designing consumer safe products.
WILKINSON, R.: If you read the submitter's substantiation, one must believe that if a little good, more protection is great. There is no technical support to warrant additional protection for a dishwasher.

2-30 Log #866 NEC-P02 **Final Action: Reject**
(210.8(D))

Submitter: C. Douglas White, Center Point Energy / Rep. Edison Electric Institute/Electric Light & Power Group
Comment on Proposal No: 2-58
Recommendation: Continue to reject proposal 2-58.
Substantiation: The substantiation does not provide sufficient technical information to conclude that additional GFCI protection is required for a dishwasher outlet. The necessity of providing GFCI protection for the dishwasher outlet was not quantified in the substantiation. There is no data provided in the substantiation regarding the number or frequency of electric shock incidents involving the dishwasher. Rather, the substantiation presented is anecdotal. Furthermore, manufacturers of dishwashers have the capability of installing added protection within the internal wiring of their equipment.
Panel Meeting Action: Reject
Panel Statement: The submitter of the original proposal substantiates concerns that are valid. Dishwashers are appliances that utilize electricity and water with a resulting increased risk of electric shock.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 9 Negative: 4
Explanation of Negative:
DUREN, R.: The substantiation offered by the original proposal 2-58 indicated the incidence of electrical shocks related to consumer products has declined over time. The submitter offered no evidence to support the statement and no evidence to indicate that additional GFCI protection is needed.
HILBERT, M.: See my ballot comment on 2-29.
ORLOWSKI, S.: Panel should have accepted this proposal, see reason statement on Comment 2-29.
WILKINSON, R.: See my Explanation of Negative Vote on Comment 2-29.

2-31 Log #27 NEC-P02 **Final Action: Accept**
(210.9 Exception No. 3 (New))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 2-60
Recommendation: The Correlating Committee directs that Panel 2 reconsider this proposal and consider breaking the text into more than one sentence for the purpose of clarity.
It was the action of the Correlating Committee that this proposal be referred to Code-Making Panels 5 and 9 for comment.
This action will be considered as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the Correlating Committee direction to reconsider the proposal and has taken action on Comment 2-33. See the panel action on Comment 2-33.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-32 Log #275 NEC-P02 **Final Action: Reject**
(210.9 Exception No. 3 (New))

Submitter: Code-Making Panel 5,
Comment on Proposal No: 2-60
Recommendation: Code-Making Panel 5 recommends revising the text to read as follows:
The grounded conductor of a branch circuit supplied from a grounding autotransformer shall not be required to be connected to the grounded conductor of the system supplying the autotransformer if the autotransformer has less than 1.0% zero phase sequence on its load side and more than 30% zero phase sequence impedance on its line side.
Substantiation: The revised text is edited for clarity and compliance with the NEC Style Manual.
This comment was developed by a CMP-5 Task Group and balloted through the entire panel with the following ballot results:
16 Eligible to Vote
15 Affirmative
1 Ballot Note Returned (W.J. Helfrich)
The following AFFIRMATIVE comments on Vote were received:
T.N. BOWMER: I agree with the proposal to include the exemption and generally reword as suggested. However, it is unclear to me how an inspector can determine if the autotransformer meets the <1% zero phase sequence on its load side and > 30% zero phase sequence impedance on its load side. Should the 1st
"zero phase sequence" be "zero phase sequence impedance".
D. MOHLA: Add in Informational Note to 210.9, Exception 3 to read as follows:
"Informational Note: Inversion of the neutral may occur under abnormal conditions in Y-connected autotransformers with ungrounded neutrals resulting in high voltage on the neutral. Inversion of neutral can occur on power frequency voltage or on the transient voltage. Grounding the autotransformer neutral, use of a delta tertiary, and use of three-leg 3-phase cores all help to prevent inversion of neutral. See IEEE Standard 142-2007, IEEE Recommended Practice for Grounding of Industrial and Commercial Power Systems, for additional information."
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 2-33.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-33 Log #281 NEC-P02 **Final Action: Accept**
(210.9 Exception No. 3 (New))

Submitter: Code-Making Panel 9,
Comment on Proposal No: 2-60
Recommendation: This proposal should be Rejected to correlate with panel action on Proposal 9-142.
Substantiation: CMP 9 requested additional information to evaluate the technical merits of the proposal. If the submitter provides data as part of a public comment, CMP 9 committed to create a task group to further review the available information prior to the meeting on public comments. The panel is concerned that this requirement may create an opportunity for a proprietary product and the panel is concerned this may violate the NFPA Patent Policy. The submitter should provide information to NFPA that indicates that the NFPA Patent Policy is not violated.
This comment was developed by a CMP-9 Task Group and balloted through

the entire panel with the following ballot results:
12 Eligible to vote
11 Affirmative
1 Ballot Not Returned (J.M. Ferrara, Voting Alternate)
No Comments on Vote were received.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-34 Log #1275 NEC-P02 **Final Action: Accept**
(210.9 Exception No. 3)

Submitter: Elliot Rappaport, Electro Technology Consultants
Comment on Proposal No: 2-60
Recommendation: Reject the proposal.
Substantiation: Although the proposal may be appropriate, the substantiation is inadequate. The purpose of providing the grounded conductor from the grounded system supplying the autotransformer is to assure that the neutral point of the autotransformer will remain at (or near) ground potential during fault conditions. If that condition is not satisfied, then failure of equipment connected to the unfaulted phases can occur. The supporting material does not provide justification for why these specific phase sequence impedances provide for the desired voltage conditions during a fault.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-35 Log #1596 NEC-P02 **Final Action: Accept in Part**
(210.11(C)(1), (2), and (3))

Submitter: Scott Cline, Monterey Park, CA
Comment on Proposal No: 2-61
Recommendation: Add 120-volt, in front of “20-ampere” in (1), (2), and (3), -OR-
Add a reference to 210.52(D) in 210.11(C)(3).
Substantiation: 210.11, 220.10, and 210.11(C)(3), include circuits which are not 120-volt.
As now worded, a 20-amp, 240-volt circuit to a bathroom receptacle would satisfy the words of 210.11(C)(3), but this certainly is not the intent.
If adding “120-volt” to remove possible ambiguity seems inappropriate, then a reference in 210.11(C)(3) to 210.52(D) seem to be in order.
Panel Meeting Action: Accept in Part
In 210.11(C)(3), add “120-volt” between the words “one” and “20-ampere branch circuit.”
Reject the remainder of the recommendation.
Panel Statement: The revision addresses the submitters concern about 210.11(C)(3) not referencing the need for a 120V circuit. The remainder of the proposed changes is not needed because 210.52 already requires 120V branch circuits in those areas.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-36 Log #28 NEC-P02 **Final Action: Accept**
(210.11(C)(3) Exception, Informational Note)

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 2-62b
Recommendation: The Correlating Committee directs that the panel reconsider the location of the Informational Note.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Delete the Informational Note in 210.11(C)(3).
Add a new Informational Note No. 1 after 220.1 that reads: “Informational Note 1: See Examples in Informative Annex D”
Renumber the current informational Note in 220.1 as “Informational Note No. 2”
Panel Statement: The informational note is not needed in Article 210 since the chapter does not cover calculations. The panel has relocated the note to Article 220 as a more appropriate place to reference Annex.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-37 Log #520 NEC-P02 **Final Action: Accept in Principle**
(210.12)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 2-78
Recommendation: Revise text to read as follows:
210.12 Arc-Fault Circuit-Interrupter Protection.
(A) Dwelling Units. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets or devices installed in dwelling unit kitchens, family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, laundry areas, or similar rooms or areas shall be protected as described by (1), (2), (3), or (4).**[ROP 2–80, ROP 2–82a, ROP 2–85]**
For the purpose of this section dormitory units shall be considered dwelling units.
Substantiation: The NFPA, Fire Marshals and the Electrical Industry are in a massive campaign to extend the protection of AFCIs to dwelling units. The last several editions of the *NEC* have expanded the usage of AFCIs to extend more protection in dwelling units.
The causes of fire in dwelling units and in dormitories are nearly the same. Compare the statistics in http://www.nfpa.org/itemDetail.asp?categoryID=953&itemID=23071&URL=Research/Fire%20statistics/The%20U.S.%20fire%20problem for dwelling units and http://www.nfpa.org/assets/files//MbrSecurePDF/OS.Campus.PDF for dormitories. Also note that the dormitory statistics under-represent the problem:
“Many students live at home or in off-campus housing not owned by the university or by any fraternal organization. These numbers are not reflected in the statistics in this analysis. Further complicating the picture is the change in dormitory properties themselves. In the past, dormitories did not have kitchens in the individual units. Many of today’s dormitories more closely resemble apartment buildings with suite style apartments that include kitchens. The distinction between apartments and dormitory properties is now quite blurred.”
Surely our young men and women who live in dormitory settings should be afforded the same protection the *NEC* provisions for their home afford. Please support the addition of AFCI protection to dormitories and other congregate housing.
Panel Meeting Action: Accept in Principle
Add new (C) to read as follows:
(C) Dormitory Units. All 120-Volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dormitory unit bedrooms, living rooms, hallways, closets, and similar rooms shall be protected by a listed arc-fault circuit interrupter meeting the requirements of 210.12(A)(1) through (6) as appropriate.
Panel Statement: The panel accepts the expansion of AFCI protection to dormitory units but chose to add the text as a new (C) to 210.12(A).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 10 Negative: 2 Abstain: 1
Explanation of Negative:
MITCHEM, J.: This comment should have been rejected. The panel action requires AFCI protection of dormitories that are not dwelling units per Article 100. The panel action does not distinguish between rooms and dwelling units. The need for extending an AFCI requirement to non-dwelling unit dormitories has not been substantiated.
WILKINSON, R.: The only benefit to this addition of the code, Dormitory Units Shall Be Considered Dwelling Units, will be to add additional cost to student housing and place more hardship on students seeking higher education.
Explanation of Abstention:
ORLOWSKI, S.: See reason statement on Comment 2-43.
Comment on Affirmative:
KING, D.: The need for AFCI protection of branch circuits in dormitories is necessary. As the submitter pointed out in his substantiation these facilities serve as dwelling units to those who reside in them and the occupants should be afforded the same level of protection provided by AFCI Protection as those in dwelling units.

2-38 Log #526 NEC-P02 **Final Action: Reject**
(210.12)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 2-92
Recommendation: Revise text to read as follows:
210.12 Arc-Fault Circuit-Interrupter Protection.
(A) Dwelling Units.
(1) A listed combination type arc-fault circuit interrupter, installed to provide protection of the entire branch circuit.
(2) A listed outlet branch circuit type arc-fault circuit interrupter installed at the first outlet on the branch circuit where all of the following conditions are met:
a. The branch circuit over current protection device shall be a listed circuit breaker having an instantaneous trip not exceeding {1}~~300~~ 20 amperes
b. The {2}branch circuit wiring shall be continuous from the branch circuit overcurrent device to the outlet branch circuit arc-fault circuit interrupter.
c. The maximum length of the branch circuit wiring from the branch circuit overcurrent device to the
first outlet shall not exceed 15.2 m (50 ft) for a 14 AWG or 21.3 m (70 ft) for a 12 AWG conductor-.
~~d. The first outlet box in the branch circuit shall be~~ {3} ~~identified.~~
(3) A listed outlet branch circuit type arc-fault circuit interrupter installed at the first outlet on the branch circuit where the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet is installed using RMC, IMC, EMT, Type MC, ~~or~~ steel armored Type AC cables meeting the requirements of 250.118 {4} , metal wireways, or metal auxiliary gutters and using metal outlet and junction boxes.
(4) A listed outlet branch circuit type arc-fault circuit interrupter installed at the first outlet on the branch circuit where the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet is installed using a {5}

~~listed metal or~~ nonmetallic conduit or tubing encased in not less than 50 mm (2 in.) of concrete.

{6} ~~Exception No. 1: If RMC, IMC, EMT, Type MC, or steel armored Type AC cables meeting the requirements of 250.118, metal wireways, metal auxiliary gutters, and metal outlet and junction boxes are installed for the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet, it shall be permitted to install an outlet branch-circuit type AFCI at the first outlet to provide protection for the remaining portion of the branch circuit.~~

{7} ~~Exception No. 2: Where a listed metal or nonmetallic conduit or tubing or Type MC Cable is encased in not less than 50 mm (2 in.) of concrete for the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet, it shall be permitted to install an outlet branch-circuit type AFCI at the first outlet to provide protection for the remaining portion of the branch circuit.~~

{8} Exception ~~No. 3~~:

Substantiation: The last "conductor-." in 210.12(A)c. has a dash as a typo and should be removed. Legislative deletion format fails for deleting a dash.

{1} 210.12(A) applies to 15- and 20-ampere outlets and devices. Receptacles and lighting circuits would be required to have OCPDs of 15 or 20 ampere ratings. Not even the most extreme motor circuit would allow a 300A OCPD for a 20A FLA. I understand the 300A comes from the theoretical calculation for protection based on the #14 and #12 wire lengths. 90.1(A) Purpose. talks about the practical safeguarding, not the theoretical.

{2} 210.12(A)(2)b. requires "branch circuit wiring shall be continuous". I presume, but do not know if that means that the circuit will be without splice. I also assume that *continuous* does allow pig tailing the grounding conductor in any metallic junction boxes the circuit passes through, but I'm not sure. Or it may mean that it must be in a *continuous* cable or even in a continuous raceway (ENT perhaps). This need to be clarified. Possible text could be "wiring shall be ~~continuous~~ unspliced from" or " wiring shall be in a continuous sheath or wiring method from" depending on the meaning intended.

{3} 210.12(A)(2)d. requires the first outlet box to be *identified*. This is the only box in the entire text for 210.12 that has that requirement. Is this box somehow special? Is *identified* missing from the other box references?

Since 210.12(A)(2) specifies no wiring methods, I presume that all wiring methods are allowed.

It is my understanding that an exception alters the rule to which it applies AND imposes some additional condition(s).

{4} 210.12(A)(3) requires the use of RMC, IMC, EMT, Type MC, or steel armored type AC meeting the requirements of 250.118. Exception 1 merely adds "metal wireways, metal auxiliary gutters," without imposing any additional requirements. Folding exception 1 into 210.12(A)(3) imposes the same rules without the added text.

{5} 210.12(A)(4) allows the use of nonmetallic conduit if encased in 2 in. of concrete. The listing "metallic or" is unnecessary since 210.12(A)(3) already allows that whether or not it is encased in concrete.

{6} With the addition of the phrase in {4} above Exception No. 1 is now completely redundant and can be eliminated.

{7} Exception No. 2: allows the use of metal or nonmetallic conduit or tubing encased in 2 in. of concrete. This is already allowed in 210.12(A)(3) and (A)(4), as amended. Exception No. 2: also allows MC cable to be used if encased in 2 in. of concrete, but 210.12(A)(3) already allows that. Thus Exception 2 is now completely redundant and can be eliminated.

{8} Exception No. 3: is now the only exception left standing and now can be renamed "Exception:"

The exception text appears to reflect the piling of ROPs on this section.

Panel Meeting Action: Reject

Panel Statement: Circuit breakers are not available with instantaneous trip ratings of 20 A or less. Technical substantiation is not given for deletion of the requirement to identify the first outlet box in the branch circuit in (2)d. A specific recommendation is not made in (3).

Number Eligible to Vote: 13

Ballot Results: Affirmative: 11 Negative: 1 Abstain: 1

Explanation of Negative:

WOOD, T.: The acceptance of this Comment would simplify the use of outlet branch circuit type arc-fault circuit interrupters. It would improve ease of use allowing for additional use and safety, especially in older dwellings.

Explanation of Abstention:

ORLOWSKI, S.: See reason statement on Comment 2-43.

2-39 Log #824 NEC-P02 **Final Action: Reject**
(210.12)

Submitter: Robert Huddleston, Jr., RLH Engineering Consulting

Comment on Proposal No: 2-76

Recommendation: Delete wording as shown in the original proposal.

Substantiation: This proposal should have been accepted by the Panel. It was shown in the CD video that was sent to all Panel 2 members that combination-type AFCls do not trip under series arc fault conditions (loose connections, broken wires, damaged cord, or splice failures - all of which can burn a house down, and all of which are advertised as being protected against by combination-type AFCIs by the manufacturers). The panel's rejection statement does not address the submitter's concern - that the NEC should not mandate and require devices that do not work as advertised (advertising by the manufacturers was provided to the Panel that conclusively demonstrated that the devices are sold to the general public under the guise of tripping on series arc faults). The proposal asks that the wording "combination-type" be struck from the Code language, as well as adding the words "parallel arc fault" to describe the protection that standard AFCls will indeed provide, generally because of differential ground fault detection techniques.

The panel statement of "Replication of the experiments shown in the video shows that there is minimal actual arcing occurring" implies that there was low energy in the arcs. However, as shown in the video, there was a 1500 Watt heater in series with the load, which would be typical of a large 120V load in a residence. How can the Panel accept the claim that combination-type AFCls will trip when experiencing a series arc fault, when a real, live series arc fault (series because the load of the circuit - 1500W heater is in series with the arcing fault) will NOT trip the AFCI?

Recently, a representative of Cutler Hammer came to the city of Kingsport, Tennessee and met with the city officials. They showed them a magic "box" that supposedly demonstrated how well AFCIs will trip and protect a structure when a series arc fault is generated using carbon-arc rods in series with a load. The city of Kingsport and their inspectors shook their heads up and down and said that this is really great technology...members of panel 2, there is a serious credibility problem here. Testing done by the submitter of the proposal clearly showed that combination-type AFCI devices will never trip on series arc faults.

How can this Code Panel continue to support requiring technology that does not work as claimed? I look forward to the panel finally seeing the light on this issue and responding in a responsible manner by eliminating the requirement for combination-type AFCI devices.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Abstain: 1

Explanation of Abstention:

ORLOWSKI, S.: See reason statement on Comment 2-43.

2-40 Log #1160 NEC-P02 **Final Action: Accept in Principle**
(210.12)

Submitter: Thomas A. Domitrovich, American Circuit Breaker Manufacturers Association (ACBMA)

Comment on Proposal No: 2-92

Recommendation: Revise text to read as follows:

210.12 Arc-Fault Circuit-Interrupter Protection. Arc-fault circuit-interrupter protection shall be provided as required in 210.12(A) and (B). The arc-fault circuit interrupter shall be installed in a readily accessible location.

(A) Dwelling Units. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets or devices installed in dwelling unit kitchens, family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, laundry areas, or similar rooms or areas shall be protected by any of the means described in (1) through (6). ~~as described by (1), (2), (3), or (4).~~

(1) A listed combination type arc-fault circuit interrupter, installed to provide protection of the entire branch circuit.

~~(2) A listed outlet branch circuit type arc-fault circuit interrupter installed at the first outlet on the branch circuit where all of the following conditions are met:~~

~~a. The branch circuit over current protection device shall be a listed circuit breaker having an instantaneous trip not exceeding 300 amperes.~~

~~b. The branch circuit wiring shall be continuous from the branch circuit overcurrent device to the outlet branch circuit arc-fault circuit interrupter.~~

~~c. The maximum length of the branch circuit wiring from the branch circuit overcurrent device to the first outlet shall not exceed 15.2 m (50 ft) for a 14 AWG or 21.3 m (70 ft) for a 12 AWG conductor~~

~~d. The first outlet box in the branch circuit shall be identified.~~

(2) A listed branch/feeder type AFCI installed at the origin of the branch circuit in combination with a listed outlet branch circuit type arc-fault circuit interrupter installed at the first outlet box on the branch circuit. The first outlet box in the branch circuit shall be identified.

(3) A listed supplemental arc protection circuit breaker installed at the origin of the branch circuit in combination with a listed outlet branch circuit type arc-fault circuit interrupter installed at the first outlet box on the branch circuit where all of the following conditions are met:

(a) The branch circuit wiring shall be continuous from the branch circuit overcurrent device to the outlet branch circuit arc-fault circuit interrupter.

(b) The maximum length of the branch circuit wiring from the branch circuit overcurrent device to the first outlet shall not exceed 15.2 m (50 ft) for a 14 AWG or 21.3 m (70 ft) for a 12 AWG conductor.

(c) The first outlet box in the branch circuit shall be identified.

(4) A listed outlet branch circuit type arc-fault circuit interrupter installed at the first outlet box on the branch circuit in combination with a listed branch circuit overcurrent protective device where all of the following conditions are met:

(a) The branch circuit wiring shall be continuous from the branch circuit overcurrent device to the outlet branch circuit arc-fault circuit interrupter.

(b) The maximum length of the branch circuit wiring from the branch circuit overcurrent device to the first outlet shall not exceed 15.2 m (50 ft) for a 14 AWG or 21.3 m (70 ft) for a 12 AWG conductor.

(c) The first outlet box in the branch circuit shall be identified.
(d) The combination of the branch circuit overcurrent device and the outlet branch circuit AFCI is identified and the combination meets the requirements for a "System Combination" type AFCI and is listed as such.

(NOTE: It is understood that the Correlating Committee has directed the CMP to correlate the added text and its location in Proposals 2-102, 2-103, and 2-109 with the panel action on Proposal 2-92. There are no comments on those items.)

Informational Note No. 1: For information on ~~types of~~ combination type and branch/ feeder type arc-fault circuit interrupters, see UL 1699-~~2011~~, Standard for Arc-Fault Circuit Interrupters. For information on outlet branch circuit type arc-fault circuit interrupters see UL 1699A Outline of Investigation for Outlet Branch Circuit Arc-Fault Circuit-Interrupters. For information on system combination arc fault circuit interrupters see UL 1699C Outline of Investigation for System Combination Arc-Fault Circuit Interrupters.
Informational Note No. 2: See 29.6(5) of NFPA 72- 2010, National Fire Alarm and Signaling Code, for information related to secondary power supply requirements for smoke alarms installed in dwelling units.
Informational Note No. 3: See 760.41(B) and 760.121(B) for power-supply requirements for fire alarm systems.

Substantiation: In the panel statement to Proposal 2-92 the panel agreed with the principle of a systems approach for providing arc fault protection to the branch circuit. The protection system accepted by the Panel consisted of an installation including a branch circuit breaker having a specific instantaneous trip current and a branch circuit where the length of the wiring from the overcurrent protection to the first outlet is limited and the installation of a listed outlet branch circuit AFCI at the first outlet on the circuit.

The specific instantaneous trip current for the branch circuit breaker in the ROP specifies a level of 300A or less based on work done by UL but further work by UL has shown that number to be in error and notes that the instantaneous trip level must be 195A or less.

In the latest UL work UL notes there are variations in the instantaneous trip levels in different lots and styles of circuit breakers. UL notes that only one style of breaker from the samples they have looked at appears to have an instantaneous trip level close to the 195 number. It has further been pointed out by circuit breaker manufacturers that while that number was in the breakers UL purchased that is not a maximum level in existing breaker production as this is not a controlled parameter in a standard circuit breaker.

Manufacturers have pointed out that instantaneous trip levels are not verified in submittals or follow up and that these numbers can and do vary tremendously on existing product styles and could vary on circuit breakers that have not been designed to meet the arc mitigation requirements of UL 1699. Circuit breakers are intended and Listed to protect the conductors from a short circuit or overload condition and the qualification of the circuit breaker includes testing to verify that. The necessary instantaneous trip level required to protect the conductor from a short circuit or overload conditions is very different than the level required for arc mitigation however and the circuit breaker is not tested for that.

Standard circuit breakers are not Listed, nor are the parameters controlled, to provide any type of arc-fault protection. Without such Listing the standard circuit breaker is being driven to provide protection outside the parameters for which it has been listed and outside the claims of the manufacturer. This drives a Listed product to be used in an unintended manner for which it is designed and Listed. The continued UL testing has demonstrated that without appropriate control of operational parameters of the circuit breake
in conjunction with the outlet device, the circuit can be at risk from arc-fault protection which may not be provided.

It is agreed that a systems approach could be used to add additional ways to provide AFCI protection but any change to the NEC for AFCI protection needs to provide protection equal to the current requirements in UL 1699 and must be verified in the product or system certification.

This comment is to address the latest UL work and to identify all the known possible solutions to provide AFCI protection. The comment modifies the final wording from the ROP and is summarized as follows:

(1) The first solution is the existing combination AFCI and there is no change to this item.

(2) The second solution identifies the combination of a branch/feeder AFCI along with an outlet branch circuit AFCI. This solution allows an outlet branch circuit AFCI to be used with no restrictions on wiring methods or available current or conductor length.

(3) The third solution is similar to the additional requirements accepted in Proposal 2-92. The issue of the instantaneous trip level is addressed by a supplemental arc protection circuit breaker (SAPCB) instead of a standard thermal magnetic circuit breaker. This solution will allow an outlet branch circuit AFCI to be used with a SAPCB with the same restrictions currently in the ROP – i.e. b) that the conductor be continuous between the circuit breaker and the first outlet; c) that the length of the conductor be no more than 50 feet for a 15A 14 AWG conductor circuit or 70 feet for a 20A 12 AWG conductor circuit; and d) that the first outlet be identified. The supplemental arc protection circuit breaker supplements the protection provided by the outlet branch circuit AFCI by providing the protection from UL 1699 that the outlet devices do not provide in a circuit breaker that has been tested and certified to the requirements in a new Outline of Investigation.

(4) The fourth solution is a modification of the CMP action on 2-92 and allows the combination of the overcurrent protective device and the outlet branch circuit AFCI to be tested as a system and certified as providing equivalent protection to a combination AFCI. This modification will address the issue of instantaneous trip levels of the circuit breaker and the verification of these levels. Informational Note 1 is corrected to delete dates for editions and to show the correct reference of UL 1699A for the outlet branch circuit type arc-fault circuit interrupter and add UL 1699C for the system combination AFCI.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 2-52.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Abstain: 1
Explanation of Abstention:
ORLOWSKI, S.: See reason statement on Comment 2-43.
Comment on Affirmative:
WOOD, T.: While this is an improvement to the existing Code, it is cumbersome and restrictive. See my comment on 2-38.

2-41 Log #1226 NEC-P02 **Final Action: Accept in Principle**
(210.12)

Submitter: Tom Packard, Arc Fault Circuit Interrupter Joint Research and Development Consortium
Comment on Proposal No: 2-68
Recommendation: Proposal 2-68 should be ACCEPTED IN PRINCIPLE IN PART in place of the action taken on Proposal 2-92. Section 210.12(A) should be revised to read as follows:
210.12 Arc-Fault Circuit-Interrupter Protection.
(A) Dwelling Units. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreational rooms, closets, hallways, or similar or areas shall be protected by a listed arc-fault circuit interrupter, combination-type, installed to provide protection of the branch circuit. It shall be permitted to install a listed outlet branch-circuit-type arc-fault circuit interrupter to provide protection of the branch circuit where the length of branch-circuit wiring from the branch-circuit overcurrent device to the first outlet does not exceed 15.2 m (50 ft) for 14 AWG conductors and 21.3 m (70 ft) for 12 AWG conductors.
Informational Note No. 1: For information on types of arc-fault circuit interrupters, see ANSI/UL 1699-1999 2011, Standard for Arc-Fault Circuit Interrupters.
Informational Note No. 2: See 11.6.3(5) 29.6.3(5) of NFPA 72-2010, National Fire Alarm and Signaling Code, for information related to secondary power supply requirements for smoke alarms installed in dwelling units.
Informational Note No. 3: See 760.41(B) and 760.121(B) for power-supply requirements for fire alarm systems.
Exception No. 1: If RMC, IMC, EMT, Type MC, or steel armored Type AC cables meeting the requirements of 250.118 and metal outlet and junction boxes are installed for the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet, it shall be permitted to install an outlet branch-circuit-type AFCI at the first outlet to provide protection for the remaining portion of the branch circuit.
Exception No. 2: Where a listed metal or nonmetallic conduit or tubing is encased in not less than 50 mm (2 in.) of concrete for the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet, it shall be permitted to install an outlet branch-circuit-type AFCI at the first outlet to provide protection for the remaining portion of the branch circuit.
Exception No. 3: Where an individual branch circuit to a fire alarm system installed in accordance with 760.41(B) or 760.121(B) is installed in RMC, IMC, EMT, or steel-sheathed cable, Type AC or Type MC, meeting the requirements of 250.118, with metal outlet and junction boxes, AFCI protection shall be permitted to be omitted.

Substantiation: This comment is made on behalf of the Arc Fault Circuit Interrupter Wiring Device Joint Research and Development Consortium, the original submitter of Proposal 2-153 (Log #3485), Held along with associated Comment 2-68 (Log #1755) in the 2010 Annual Meeting National Electrical Code Committee Report. This Code Cycle's Proposal 2-68 (Log #22) was previously that Held Comment 2-68. The Consortium members are: Cooper Wiring Devices, Hubbell Incorporated (Delaware), Leviton Manufacturing Inc., Legrand/Pass & Seymour.

Accepting this comment here will promote increased installation of AFCI devices across the country thus increasing overall safety, as indicated in the original Parks study. The majority of CMP2 has indicated in previous votes that they are in favor of acceptance of an AFCI Receptacle without the home run metal conduit limitation. This new data from the Parks Associate Short Circuit Fault Current survey reinforces this majority opinion and specifically mitigates UL's concern about SCC availability. Some CMP2 members have asked for AFCI installation options. Acceptance of an OBC AFCI Receptacle will provide that option. As stated in proposal 2-68, "The Panel action on this Proposal allows for a more practical means of meeting the requirements of 210.12 and will extend this life saving technology to more branch circuit wiring than what is being protected by the present code text". Please consider all of the far reaching benefits of an AFCI Receptacle and accept this comment. Comment 2-68 from the 2011 Code Cycle (now Proposal 2-68 in the 2014 Code Cycle) is very effective in explaining the benefits of an AFCI Receptacle.

Arguments on upstream and downstream protection are also covered very well. Parallel arc faults upstream of the AFCI Receptacle on the home run from the panel has been the primary focus of concern, ignoring all of the other protection upstream and downstream provided by the AFCI receptacle. Proposal 2-68 again goes into all of this protection and added benefit. A primary argument has been the panel circuit breaker ability to trip in the presence of a parallel arc fault on the home run and the Short Circuit Current available at the panel. A recent UL report demonstrated that the higher the available short circuit current at the panel, the more effective the circuit breaker will be in clearing parallel arc faults. This relationship is reinforced by the equation that relates conductor length, available short circuit current and circuit breaker magnetic trip current found on page 3 of the UL report "Evaluation of Run Length and Available Current on Breaker Ability to Mitigate Parallel Arcing Faults". It has been argued in front of CMP2 that, in new construction, 500 amp SCC availability at the panel is prevalent. Attached is a Parks Associates Nationwide survey of SCC availability at the panel. This survey indicates there is a high probability that the current will be sufficient to trip a circuit breaker when a parallel arc fault occurs. This is a determining factor in accepting this comment on Proposal 2-68 and this comment provides the data that the panel requested during the proposal stage..

The equation in the UL report determines that the protection against parallel arcs in the home run provided by a circuit breaker is affected by a number of variables. However, the two most significant factors in establishing the level of parallel arc protection in the home run are the instantaneous trip of the circuit breaker and the available short circuit current at the panel. The information available in the UL report and the Parks study provide a basis for the distribution of these values. A statistical simulation of the equation in the UL report using the distribution of the circuit breaker instantaneous trip values and the available short circuit current values reveals that a high level of protection can be expected for a 50 ft (14 AWG), 70 ft (12AWG) length of home run. In fact, the statistical analysis indicates that under the least favorable conditions the confidence level for protection of a 50 ft/70 ft home run exceeds 97%. The conclusion of this statistical analysis closely correlates with the conclusion in the UL report for protection of the home run. Consequently the additional requirements introduced in Proposal 2-92 are unwarranted, and the Panel should ACCEPT IN PRINCIPLE IN PART Proposal 2-68 with the modification shown, in place of the action taken on Proposal 2-92.

The following items should be considered:

1. Available SCC is significantly greater than originally believed.
2. The UL report demonstrates a direct relationship of SCC availability to the ability of a circuit breaker to trip under a parallel arc fault condition.
3. The Parks study data supports parallel arc fault protection of a 50 ft home run as originally calculated by UL.

The revisions to the Informational Notes from what was presented in Proposal 2-68 are to reflect the 2011 NEC® changes from FPNs to Informational Notes and to reflect Panel action to ACCEPT Proposals 2-93, 2-94 and 2-95.

Background:

The Parts of this Code Cycle's Proposal 2-68 that are NOT carried forward for Acceptance In Principle are:

• The portion providing a definition for Arc-Fault Circuit Interrupter (AFCI) incorporated in Article 100 of the 2011 Code in accordance with panel action on Proposal 2-3 (Log #705) during the last Code Cycle

• The partial deletion of Exception No. 1, resulting from wording incorporated into the main portion of 210.12(A) above based upon new data explained below.

Proposal 2-68 appeared as Comment 2-68 (Log #1755) on Proposal 2-153 in the 2010 Annual Meeting National Electrical Code Committee Report on Proposals. This comment was held for further study during the processing of the 2011 NATIONAL ELECTRICAL CODE.

This present Comment on Proposal 2-68 from the 2014 Code Cycle Report on Proposals is to support this proposal as written and to support Proposal 2-153 from the 2011 Code Cycle as written.

Code Proposal 2-153 from the 2011 Code Cycle was written to remove the metal conduit restriction and allow for an Outlet Branch Circuit AFCI Receptacle in the first outlet. The Parks Associate Study demonstrated the increased safety benefits that would result in the widespread acceptance of an AFCI Receptacle. Code Making Panel 2 Accepted this proposal in Principle during the 2011 Code Cycle ROP meeting. CMP 2 put several Comments to this proposal on Hold during the 2011 Code Cycle ROC meeting.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Panel Statement: The panel accepts the concept of outlet branch circuit device and has incorporated its use in the action taken on Comment 2-52. The panel integrated the outlet branch circuit device into the listed system approach for AFCI protection.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 11 Negative: 1 Abstain: 1

Explanation of Negative:

KING, D.: This comment should have been accepted. The submitter adequately substantiated that practical safeguarding against parallel arcing faults within the homerun lengths as defined in the proposed text is provided by standard overcurrent devices. Accepting this comment would implement clear, prescriptive language for the inspection community to enforce and would provide a practical and affordable alternative for this life saving technology.

Explanation of Abstention:

ORLOWSKI, S.: See reason statement on Comment 2-43.

Comment on Affirmative:

LAROCCA, R.: See my affirmative comment on 2-42.

2-42 Log #1227 NEC-P02 **Final Action: Accept in Principle**
(210.12)

Submitter: Tom Packard, Arc Fault Circuit Interrupter Joint Research and Development Consortium

Comment on Proposal No: 2-92

Recommendation: Proposal 2-92 should be ACCEPTED IN PRINCIPLE IN PART. The wording of 210.12(A) should be revised to read as follows:

210.12 Arc-Fault Circuit-Interrupter Protection.

(A) Dwelling Units. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreational rooms, closets, hallways, or similar or areas shall be protected as described by (1), (2), (3) or (4):

(1) ~~a~~ A listed combination-type arc-fault circuit interrupter~~, combination-type,~~ installed to provide protection of the entire branch circuit.

(2) A listed outlet branch-circuit-type arc-fault circuit interrupter installed at the first outlet on the branch circuit if all of the following conditions are met:

(a) The ungrounded and grounded conductors of branch-circuit wiring shall be installed in continuous lengths without a splice or joint from the branch-circuit overcurrent device to the outlet branch-circuit arc-fault circuit interrupter.

(b) The length of branch-circuit wiring from the branch-circuit overcurrent device to the first outlet does not exceed 15.2 m (50 ft) for 14 AWG conductors and 21.3 m (70 ft) for 12 AWG conductors.

(c) The first outlet box in the branch circuit shall be identified.

(3) A listed outlet branch-circuit-type arc-fault circuit interrupter installed at the first outlet on the branch circuit where the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet is installed using RMC, IMC, EMT, Type MC, or steel armored Type AC cables meeting the requirements of 250.118 and using metal outlet and junction boxes.

(4) A listed outlet branch-circuit-type arc-fault circuit interrupter installed at the first outlet on the branch circuit where the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet is installed using listed metal or nonmetallic conduit or tubing encased in not less than 50 mm (2 in.) of concrete.

Informational Note No. 1: For information on types of arc-fault circuit interrupters, see ANSI/UL 1699-~~1999~~ 2011, *Standard for Arc-Fault Circuit Interrupters*.

Informational Note No. 2: See ~~11.6.3(5)~~ 29.6.3(5) of NFPA 72-2010, *National Fire Alarm and Signaling Code*, for information related to secondary power supply requirements for smoke alarms installed in dwelling units.

Informational Note No. 3: See 760.41(B) and 760.121(B) for power-supply requirements for fire alarm systems.

~~*Exception No. 1: If RMC, IMC, EMT, Type MC, or steel armored Type AC cables meeting the requirements of 250.118 and metal outlet and junction boxes are installed for the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet, it shall be permitted to install an outlet branch-circuit-type AFCI at the first outlet to provide protection for the remaining portion of the branch circuit.*~~

~~*Exception No. 2: Where a listed metal or nonmetallic conduit or tubing is encased in not less than 50 mm (2 in.) of concrete for the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet, it shall be permitted to install an outlet branch-circuit-type AFCI at the first outlet to provide protection for the remaining portion of the branch circuit.*~~

Exception ~~No. 3~~: Where an individual branch circuit to a fire alarm system installed in accordance with 760.41(B) or 760.121(B) is installed in RMC, IMC, EMT, or steel-sheathed cable, Type AC or Type MC, meeting the requirements of 250.118, with metal outlet and junction boxes, AFCI protection shall be permitted to be omitted.

Substantiation: This comment is made on behalf of the Arc Fault Circuit Interrupter Wiring Device Joint Research and Development Consortium. The Consortium members are: Cooper Wiring Devices, Hubbell Incorporated (Delaware), Leviton Manufacturing Inc., Legrand/Pass & Seymour.

Accepting this comment here will promote increased installation of AFCI devices across the country thus increasing overall safety, as indicated in the original Parks study. The majority of CMP2 has indicated in previous votes that they are in favor of acceptance of an AFCI Receptacle without the home run metal conduit limitation. This new data from the Parks Associate Short Circuit Fault Current survey reinforces this majority opinion and specifically mitigates UL's concern about SCC availability. Some CMP2 members have asked for AFCI installation options. Acceptance of an OBC AFCI Receptacle will provide that option. As stated in proposal 2-68, "The Panel action on this Proposal allows for a more practical means of meeting the requirements of 210.12 and will extend this life saving technology to more branch circuit wiring than what is being protected by the present code text". Please consider all of the far reaching benefits of an AFCI Receptacle and accept this comment.

Comment 2-68 from the 2011 Code Cycle (now Proposal 2-68 in the 2014 Code Cycle) is very effective in explaining the benefits of an AFCI Receptacle. Arguments on upstream and downstream protection are also covered very well. Parallel arc faults upstream of the AFCI Receptacle on the home run from the panel has been the primary focus of concern, ignoring all of the other protection upstream and downstream provided by the AFCI receptacle. Proposal 2-68 again goes into all of this protection and added benefit. A primary argument has been the panel circuit breaker ability to trip in the presence of a parallel arc fault on the home run and the Short Circuit Current available at the panel. A recent UL report demonstrated that the higher the available short circuit current at the panel, the more effective the circuit breaker will be in clearing parallel arc faults. This relationship is reinforced by the equation that relates conductor length, available short circuit current and circuit breaker magnetic trip current found on page 3 of the UL report "Evaluation of Run Length and Available Current on Breaker Ability to Mitigate Parallel Arcing Faults". It has been argued in front of CMP2 that, in new construction, 500 amp SCC availability at the panel is prevalent. The Parks Associates Nationwide survey of SCC availability at the panel, shows this number to be incorrect. This information was requested by the panel. This survey indicates there is a high probability that the current will be significantly higher and sufficient to trip a circuit breaker when a parallel arc fault occurs. This is a determining factor in accepting this comment on Proposal 2-92.

The equation in the UL report determines that the protection against parallel arcs in the home run provided by a circuit breaker is affected by a number of variables. However, the two most significant factors in establishing the level of parallel arc protection in the home run are the instantaneous trip of the circuit breaker and the available short circuit current at the panel. The information available in the UL report and the Parks study provide a basis for the distribution of these values. A statistical simulation of the equation in the UL report using the distribution of the circuit breaker instantaneous trip values and the available short circuit current values reveals that a high level of protection can be expected for a 50 ft (14 AWG), 70 ft (12AWG) length of home run. In fact, the statistical analysis indicates that under the least favorable conditions the confidence level for protection of a 50 ft/70 ft home run exceeds 97%. The conclusion of this statistical analysis closely correlates with the conclusion in the UL report for protection of the home run. Consequently the additional instantaneous trip current requirements introduced in Proposal 2-92 are unwarranted, and the Panel should ACCEPT IN PRINCIPLE IN PART Proposal 2-92 with the modifications shown.

The following items should be considered:

1. Available SCC is significantly greater than originally believed.
2. The UL report demonstrates a direct relationship of SCC availability to the ability of a circuit breaker to trip under a parallel arc fault condition.
3. The Parks study data supports parallel arc fault protection of a 50 ft home run as originally calculated by UL.

The revisions to the Informational Notes from what was presented in Proposal 2-92 are to reflect the 2011 NEC® changes from FPNs to Informational Notes and to reflect Panel action to ACCEPT Proposals 2-93, 2-94 and 2-95.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Panel Statement: The panel accepts the concept of outlet branch circuit device and has incorporated its use in the action taken on Comment 2-52. The panel integrated the outlet branch circuit device into the listed system approach for AFCI protection.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 11 Negative: 1 Abstain: 1

Explanation of Negative:

KING, D.: See my explanation of negative on Comment 2-41.

Explanation of Abstention:

ORLOWSKI, S.: See reason statement on Comment 2-43.

Comment on Affirmative:

LAROCCA, R.: The report of the Short Circuit Fault Current Study from Parks Associates as cited in the substantiation for the comment provided valuable information. However, it failed to bridge the gap between the average available current at the service panel found today and the minimum values for anticipated available current specified in UL1699. It also failed to take into account that the mean instantaneous tripping currents of the branch circuit breaker appear to be higher than that used for the Monte Carlo simulation. Expansion of the Monte Carlo analysis to include this wider spread of parameters is needed to be able to understand whether the confidence level is appropriate and what risk would be accepted by accepting this comment.

2-43 Log #1244 NEC-P02 **Final Action: Reject**
(210.12)

Submitter: John Masarick, Independent Electrical Contractors, Inc.

Comment on Proposal No: 2-82a

Recommendation: I ask the panel to reject this proposal.

Substantiation: IEC believes the AFCI is a very important product and has the potential to save lives and property; however, in a recent survey of installers, approximately 50% of responders reported having some sort of difficulty with nuisance tripping during installation of AFCI's. One in seven reported replacing the AFCI with a standard circuit breaker because the installation problems could not be resolved. A taskforce has been formed consisting of manufacturers and distributors to gather more information and to better understand the reasons for the installation problems. At the present time, IEC believes there is a need for more training, better test equipment and possibly the AFCI needs more testing. Until more information can be gathered the panel is encouraged not to expand the use of AFCI's in the industry.

While IEC continues to believe the AFCI is an important product, more information needs to be gathered.

Panel Meeting Action: Reject

Panel Statement: The panel believes that the incremental expansion of AFCI protection will provide additional safety and also allow for additional experience in the application of AFCIs to be obtained.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 11 Negative: 1 Abstain: 1

Explanation of Negative:

WILKINSON, R.: The panel believes that the expansion of AFCI protection will provide additional safety. My belief is that the expansion of AFCI protection will provide additional cost to the public.

Explanation of Abstention:

ORLOWSKI, S.: NAHB is abstaining on this comment, and several others, that would expand the use of AFCI protection in dwelling units. Despite repeated attempts by NAHB and several other affected parties to show that there have been no decreases in the number of electrical arcing fires (see substantiation in Proposal 2-81a), the NEC code making panel continues to expand AFCI protection incrementally, without providing any concrete evidence or supporting data that AFCI protection has resulted in any diverted fires

---

2-44 Log #1363 NEC-P02 **Final Action: Accept in Principle**
(210.12)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Comment on Proposal No: 2-92

Recommendation: Revise text to read as follows:

210.12 Arc-Fault Circuit-Interrupter Protection. Arc-fault circuit-interrupter protection shall be provided as required in 210.12(A) and (B). The arc-fault circuit interrupter shall be installed in a readily accessible location.

(A) Dwelling Units. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets or devices installed in dwelling unit kitchens, family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, laundry areas, or similar rooms or areas shall be protected <u>by any of the means described in (1) through (6).</u> ~~as described by (1), (2), (3), or (4).~~

(1) A listed combination type arc-fault circuit interrupter, installed to provide protection of the entire branch circuit.

~~(2) A listed outlet branch circuit type arc-fault circuit interrupter installed at the first outlet on the branch circuit where all of the following conditions are met:~~

~~a. The branch circuit over current protection device shall be a listed circuit breaker having an instantaneous trip not exceeding 300 amperes.~~

~~b. The branch circuit wiring shall be continuous from the branch circuit overcurrent device to the outlet branch circuit arc-fault circuit interrupter.~~

~~c. The maximum length of the branch circuit wiring from the branch circuit overcurrent device to the first outlet shall not exceed 15.2 m (50 ft) for a 14 AWG or 21.3 m (70 ft) for a 12 AWG conductor.~~

~~d. The first outlet box in the branch circuit shall be identified.~~

<u>(2) A listed branch/feeder type AFCI installed at the origin of the branch circuit in combination with a listed outlet branch circuit type arc-fault circuit interrupter installed at the first outlet box on the branch circuit. The first outlet box in the branch circuit shall be identified.</u>

<u>(3) A listed supplemental arc protection circuit breaker installed at the origin of the branch circuit in combination with a listed outlet branch circuit type arc-fault circuit interrupter installed at the first outlet box on the branch circuit where all of the following conditions are met:</u>

<u>(a) The branch circuit wiring shall be continuous from the branch circuit overcurrent device to the outlet branch circuit arc-fault circuit interrupter.</u>

<u>(b) The maximum length of the branch circuit wiring from the branch circuit overcurrent device to the first outlet shall not exceed 15.2 m (50 ft) for a 14 AWG or 21.3 m (70 ft) for a 12 AWG conductor.</u>

<u>(c) The first outlet box in the branch circuit shall be identified.</u>

<u>(4) A listed outlet branch circuit type arc-fault circuit interrupter installed at the first outlet box on the branch circuit in combination with a listed branch circuit overcurrent protective device where all of the following conditions are met:</u>

<u>(a) The branch circuit wiring shall be continuous from the branch circuit overcurrent device to the outlet branch circuit arc-fault circuit interrupter.</u>

<u>(b) The maximum length of the branch circuit wiring from the branch circuit overcurrent device to the first outlet shall not exceed 15.2 m (50 ft) for a 14 AWG or 21.3 m (70 ft) for a 12 AWG conductor.</u>

<u>(c) The first outlet box in the branch circuit shall be identified.</u>

<u>(d) The combination of the branch circuit overcurrent device and the outlet branch circuit AFCI is identified and the combination meets the requirements for a "System Combination" type AFCI and is listed as such.</u>

It is understood that the Correlating Committee has directed the CMP to correlate the added text and its location in Proposals 2-102, 2-103, and 2-109 with the panel action on Proposal 2-92. There are no comments on those items.

Informational Note No. 1: For information on types of <u>combination type and branch/ feeder type</u> arc-fault circuit interrupters, see UL 1699-2011, Standard

for Arc-Fault Circuit Interrupters. For information on outlet branch circuit type arc-fault circuit interrupters see UL 1699A Outline of Investigation for Outlet Branch Circuit Arc-Fault Circuit-Interrupters. For information on system combination arc fault circuit interrupters see UL 1699C Outline of Investigation for System Combination Arc-Fault Circuit Interrupters.
Informational Note No. 2: See 29.6(5) of NFPA 72- 2010, *National Fire Alarm and Signaling Code*, for information related to secondary power supply requirements for smoke alarms installed in dwelling units.
Informational Note No. 3: See 760.41(B) and 760.121(B) for power-supply requirements for fire alarm systems.
Substantiation: In the panel statement to Proposal 2-92 the panel agreed with the principle of a systems approach for providing arc fault protection to the branch circuit. The protection system accepted by the Panel consisted of an installation including a branch circuit breaker having a specific instantaneous trip current and a branch circuit where the length of the wiring from the overcurrent protection to the first outlet is limited and the installation of a listed outlet branch circuit AFCI at the first outlet on the circuit.

The specific instantaneous trip current for the branch circuit breaker in the ROP specifies a level of 300A or less based on work done by UL but further work by UL has shown that number to be in error and notes that the instantaneous trip level must be 195A or less.

In the latest UL work UL notes there are variations in the instantaneous trip levels in different lots and styles of circuit breakers. UL notes that only one style of breaker from the samples they have looked at appears to have an instantaneous trip level close to the 195 number. It has further been pointed out by circuit breaker manufacturers that while that number was in the breakers UL purchased that is not a maximum level in existing breaker production as this is not a controlled parameter in a standard circuit breaker.

Manufacturers have pointed out that instantaneous trip levels are not verified in submittals or follow up and that these numbers can and do vary tremendously on existing product styles and could vary on circuit breakers that have not been designed to meet the arc mitigation requirements of UL 1699. Circuit breakers are intended and Listed to protect the conductors from a short circuit or overload condition and the qualification of the circuit breaker includes testing to verify that. The necessary instantaneous trip level required to protect the conductor from a short circuit or overload conditions is very different than the level required for arc mitigation however and the circuit breaker is not tested for that.

Standard circuit breakers are not Listed, nor are the parameters controlled, to provide any type of arc-fault protection. Without such Listing the standard circuit breaker is being driven to provide protection outside the parameters for which it has been listed and outside the claims of the manufacturer. This drives a Listed product to be used in an unintended manner for which it is designed and Listed. The continued UL testing has demonstrated that without appropriate control of operational parameters of the circuit breaker in conjunction with the outlet device, the circuit can be at risk from arc-fault protection which may not be provided.

It is agreed that a systems approach could be used to add additional ways to provide AFCI protection but any change to the NEC for AFCI protection needs to provide protection equal to the current requirements in UL 1699 and must be verified in the product or system certification.

This comment is to address the latest UL work and to identify all the known possible solutions to provide AFCI protection. The comment modifies the final wording from the ROP and is summarized as follows:

(1) The first solution is the existing combination AFCI and there is no change to this item.

(2) The second solution identifies the combination of a branch/feeder AFCI along with an outlet branch circuit AFCI. This solution allows an outlet branch circuit AFCI to be used with no restrictions on wiring methods or available current or conductor length.

(3) The third solution is similar to the additional requirements accepted in Proposal 2-92. The issue of the instantaneous trip level is addressed by a supplemental arc protection circuit breaker (SAPCB) instead of a standard thermal magnetic circuit breaker. This solution will allow an outlet branch circuit AFCI to be used with a SAPCB with the same restrictions currently in the ROP – i.e. b) that the conductor be continuous between the circuit breaker and the fist outlet; c) that the length of the conductor be no more than 50 feet for a 15A 14 AWG conductor circuit or 70 feet for a 20A 12 AWG conductor circuit; and d) that the first outlet be identified.
The supplemental arc protection circuit breaker supplements the protection provided by the outlet branch circuit AFCI by providing the protection from UL 1699 that the outlet devices do not provide in a circuit breaker that has been tested and certified to the requirements in a new Outline of Investigation.

(4) The fourth solution is a modification of the CMP action on 2-92 and allows the combination of the overcurrent protective device and the outlet branch circuit AFCI to be tested as a system and certified as providing equivalent protection to a combination AFCI. This modification will address the issue of instantaneous trip levels of the circuit breaker and the verification of these levels.

Informational Note 1 is corrected to delete dates for editions and to show the correct reference of UL 1699A for the outlet branch circuit type arc-fault circuit interrupter and add UL 1699C for the system combination AFCI.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 2-52.

Ballot Results: Affirmative: 12 Abstain: 1
Explanation of Abstention:
ORLOWSKI, S.: See reason statement on Comment 2-43.

2-45 Log #1389 NEC-P02 **Final Action: Reject**
(210.12.Arc-Fault Circuit-Interrupter Protection)

Submitter: Joseph C. Engel, Monroeville, PA
Comment on Proposal No: 2-88
Recommendation: Revise text to read as follows:
210.12 Are-Fault Circuit-Interrupter Protection.
(A) Dwelling Units: All 125-volt, single-phase, 15- and 20- ampere branch circuits supplying outlets installed in dwelling unit family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, or similar rooms or areas shall be protected by a listed arc fault circuit interrupter combination-type, installed to provide protection of the branch circuit.
Substantiation: I believe the Panel MUST vote to Accept my proposal to remove the words “combination-type” from 210.12. A vote to Reject would force a consumer to purchase a more expensive product whose key performance claims the Panel argues are false. People could thus consider a vote to Reject to be unethical or worse (fraudulent?).

My reasoning is as follows.

The Panel now seems to agree that the claims made concerning the Combination AFCI are FALSE. Namely that 1) series arcing across a break in a cord’s conductor is a fire hazard and 2) a Combination AFCI will respond to such an event and trip. The Panel apparently conducted a test that proved claims false. From the Panel’s own Rejection Statement of my proposal:

“Replication of the experiments shown in the video shows that there is minimal actual arcing occurring. When arcing does occur, causing the sparking seen in the video, its duration is very short and the energy is three orders of magnitude below what is required to ignite the NM cable or surrounding materials. The waveform looks the same as when a wall switch is switched on and off. If the AFCI responded to this waveform it would increase the incidence of unwanted tripping while not contributing significantly to mitigating fire hazards.”
Panel Meeting Action: Reject
Panel Statement: Although no actual revision is shown, the panel understands that it is the submitter’s intent to delete the words “combination type” from 210.12A. A Combination Type AFCI is defined in UL1699 as an AFCI which complies with the requirements for both branch/feeder and outlet circuit AFCIs. It is intended to protect downstream branch circuit wiring and cord sets and power-supply cords.

Note also the following definitions from UL1699:

BRANCH/FEEDER ARC-FAULT CIRCUIT-INTERRUPTER – A device intended to be installed at the origin of a branch circuit or feeder, such as at a panelboard. It is intended to provide protection of the branch circuit wiring, feeder wiring, or both, against unwanted effects of arcing. This device also provides limited protection to branch circuit extension wiring. It may be a circuit-breaker type device or a device in its own enclosure mounted at or near a panelboard.

OUTLET CIRCUIT ARC-FAULT CIRCUIT-INTERRUPTER – A device intended to be installed at a branch circuit outlet, such as at an outlet box. It is intended to provide protection of cord sets and power-supply cords connected to it (when provided with receptacle outlets) against the unwanted effects of arcing. This device may provide feed-through protection of the cord sets and power-supply cords connected to downstream receptacles.

In the context of these definitions, and the required arcing tests for these types of AFCIs, the UL1699 Standard does not use the terms “series arc” or “parallel arc.” The standard, which is an ANSI standard, does include performance requirements to establish the required protection. The submitter of this proposal has not demonstrated that the AFCI devices which he has tested do not meet the performance requirements for combination type AFCIs as contained in the UL1699 standard.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Abstain: 1
Explanation of Abstention:
ORLOWSKI, S.: See reason statement on Comment 2-43.

2-46 Log #29 NEC-P02 **Final Action: Accept**
(210.12(A))

TCC Action: The Correlating Committee clarifies that Informational Note 4 will be removed from 210.12(A) since companion proposals and comments to add 410.9, 411.8 and 422.5 were not accepted.
Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 2-92
Recommendation: The Correlating Committee understands that the term “over current” should be the term “overcurrent” in 210.12(A)(2)(a).

The Correlating Committee directs that the panel correlate the actions on Proposals 2-96, 2-102, 2-103, 2-109, and 2-116, and clarify the use of the Exceptions.

In addition, the Correlating Committee understands that the panel actions on Proposals 2-79, 2-80, 2-82a, 2-85, 2-93, 2-94 and 2-95 modify the accepted text in Proposal 2-92, per their respective panel statements.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: 2-96: The panel accepts the addition of Informational Note 4 as accepted in Proposal 2-96. The panel understands that Informational Note 4 will modify the accepted text in 210.12.
2-102: The panel accepted the addition of “metal wireways” and “metal auxilary gutters” The panel understands the two additional wiring methods above will modify the accepted text of 210.12 (A)(3) as follows: If RMC, IMC, EMT, Type MC, or steel armored Type AC cables meeting the requirements of 250.118, metal wireways, metal auxiliary gutters and metal outlet and junction boxes are installed for the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet, it shall be permitted to install an outlet branch-circuit type AFCI at the first outlet to provide protection for the remaining portion of the branch circuit.
2-103: The panel accepted the addition of “Type MC Cable.” The panel understands the additional wiring method above will modify the accepted text of 210.12(A)(4) as follows: Where a listed metal or nonmetallic conduit or tubing or Type MC Cable is encased in not less than 50mm (2 in.) of concrete for the portion of the branch circuit between the branch circuit overcurrent device and the first outlet, it shall be permitted to install an outlet branch circuit type AFCI at the first outlet to provide protection for the remaining portion of the branch circuit.
2-109: The panel notes that due to the action on Proposal 2-92 “Exception No. 3” of 210.12 needs to be modified to “Exception.”
2-116: See panel action and Comment on 2-60. The panel notes that Exceptions 1 and 2 have been moved to positive language with the panel action on Proposal 2-92. The panel understands that the deletion of Exceptions 1 and 2 and the change of Exception 3 to exception will modify the accepted text of 210.12.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Abstain: 1
Explanation of Abstention:
ORLOWSKI, S.: See reason statement on Comment 2-43.

2-47 Log #452 NEC-P02 **Final Action: Reject**
(210.12(A))

Submitter: Robert G. Fahey, City of Janesville
Comment on Proposal No: 2-80
Recommendation: Revise text to read:
210.12(A) Dwelling Units. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets or devices installed in dwelling units, with <u>the exception of unfinished basements, garages and bathrooms</u> ~~kitchens, family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, laundry areas, or similar rooms or areas~~ shall be protected as described by (1), (2), (3), or (4).
Substantiation: The proposed language eliminates the laundry list provided in this Code section, therefore providing more clarity. This comment is not intended to change or eliminate the present or proposed locations where AFCI protection is required; this comment is meant only to make the Code language more concise.
Panel Meeting Action: Reject
Panel Statement: The submitter’s recommendation adds AFCI protection for outside circuits, attics and crawl spaces which were not areas contemplated at the ROP stage.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Abstain: 1
Explanation of Abstention:
ORLOWSKI, S.: See reason statement on Comment 2-43.
Comment on Affirmative:
HILBERT, M.: I support the expansion of the GFCI requirements to the laundry area due to the likely use of portable appliances such as an iron. However I agree with the submitter with regard to requiring GFCI protection for a branch circuit due to concerns with the appliance. See my comment of Comment 2-29

2-48 Log #867 NEC-P02 **Final Action: Reject**
(210.12(A))

Submitter: C. Douglas White, Center Point Energy / Rep. Edison Electric Institute/Electric Light & Power Group
Comment on Proposal No: 2-80
Recommendation: Reject proposal 2-80.
Substantiation: No substantiation has been provided to indicate that arcing faults within the wiring of laundry areas have caused the fires noted in the proposal. NFPA statistics provided in the report discussed in the substantiation are not specific to the segment of the wiring within a dwelling unit responsible for the fire.
Panel Meeting Action: Reject
Panel Statement: Data submitted to the panel over many previous code cycles indicated that there were arcing incidents occurring in residential branch circuits. The panel has taken an approach of incrementally expanding arc fault protection over several code cycles to provide increased safety by reducing the number of arcing events in dwellings. The panel action on this proposal continues with this approach.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 1 Abstain: 1
Explanation of Negative:
DUREN, R.: The submitter of proposal 2-80 sites the data from the NFPA annual fire study as evidence of the need for additional AFCI protection within the laundry area. One item unaccounted for in the NFPA annual fire study is the vintage of the dwellings in which the reported fires occurred.
The submitter failed to establish a link between the fires reported and the number of those fires caused by laundry area circuits.
Explanation of Abstention:
ORLOWSKI, S.: See reason statement on Comment 2-43.

2-49 Log #868 NEC-P02 **Final Action: Reject**
(210.12(A))

Submitter: C. Douglas White, Center Point Energy / Rep. Edison Electric Institute/Electric Light & Power Group
Comment on Proposal No: 2-85
Recommendation: Reject proposal 2-85.
Substantiation: The addition of “or devices” following “outlets” in the list found in 210.12(A) has greatly expanded the requirements for AFCI protection to all areas of a dwelling unit, but the substantiation only refers to bedroom areas. The substantiation supporting the proposed change is lacking technical merit and is anecdotal. It does not present any data indicating a problem exists with hard wired devices.
Panel Meeting Action: Reject
Panel Statement: Data submitted to the panel over many previous code cycles indicated that there were arcing incidents occurring in residential branch circuits. Including devices in the requirement ensures increased arc fault protection for the branch circuits that serve devices in the specified areas.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 1 Abstain: 1
Explanation of Negative:
DUREN, R.: The code change proposed in ROP 2-85 expands the requirements of AFCI protection without sufficient justification or substantiation.
Explanation of Abstention:
ORLOWSKI, S.: See reason statement on Comment 2-43.

2-50 Log #869 NEC-P02 **Final Action: Reject**
(210.12(A))

Submitter: C. Douglas White, Center Point Energy / Rep. Edison Electric Institute/Electric Light & Power Group
Comment on Proposal No: 2-90
Recommendation: Reject proposal 2-90.
Substantiation: The substantiation for this proposal does not cite any reference that validates an issue exists for dishwashers or the dishwasher circuit. A subsequent NFPA document [Hall, John R. Jr., Home Electrical Fires, National Fire Protection Association, January 2012] to the one cited in the substantiation does not list dishwashers as a cause of home electrical fires and there is no data listed that indicates the wiring of the dishwasher circuit is a cause of home fires.
Panel Meeting Action: Reject
Panel Statement: The panel has added kitchens to the locations that must have AFCI protection. Data submitted to the panel over many previous code cycles indicated that there were arcing incidents occurring in residential branch circuits. The panel has taken an approach of incrementally expanding arc fault protection over several code cycles to provide increased safety by reducing the number of arcing events in dwellings.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 1 Abstain: 1
Explanation of Negative:
DUREN, R.: The data referenced in the original proposal ROP 2-90 does not substantiate the request to include the dishwasher circuit in the list of AFCI protected circuits.
Explanation of Abstention:
ORLOWSKI, S.: See reason statement on Comment 2-43.

2-51 Log #1245 NEC-P02 **Final Action: Reject**
(210.12(A))

Submitter: John Masarick, Independent Electrical Contractors, Inc.
Comment on Proposal No: 2-89
Recommendation: This comment recommends the panel approve proposal 2-89 with the change shown below. The requested change would allow any <u>listed AFCI</u> to be used at the origin of the branch circuit and for the outlet AFCI.
(A) Dwelling Units. All 120-voIt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit family rooms, dining rooms. living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, or similar rooms or areas shall be protected by a listed

arcfault circuit interrupter, combination-type, installed to provide protection of the branch circuit.

Informational Note No. I: For information on types of arc-fault circuit interrupters, see UL 1699-1999, Standard for Arc-Fault Circuit Interrupters.

Informational Note No.2: See 11.6.3(5) of NFPA 72-2010, National Fire Alarm and Signaling Code, for information related to secondary power supply requirements for smoke alarms installed in dwelling units.

Informational Note No.3: Sec 760.41 (8) and 760.121 (8) for power-supply requirements for lire alarm systems.

Exception No. I: If RMC, [MC, EMT, Type MC, or steel armored Type AC cables meeting the requirements of 250.118 and metal outlet and junction boxes are installed for the portion of the branch circuit between the branchcircuit overcurrent device and the first outlet, it shall be permitted to install an outlet branch-circuit type AFCI at the first outlet to provide protection for the remaining portion of the branch circuit. <u>Home run circuits shall be clearly identified at all points of termination, connection, and splices. The means of identification shall be permitted by separate color coding. marking: tape, tagging, or other approved means.</u>

Exception No. 2: Where a listed metal or nonmetallic conduit or tubing is encased in not less than 50 mm (2 in.) of concrete for the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet, it shall be permitted to be installed an outlet branch-circuit type AFCI at the first outlet to provide protection for the remaining portion of the branch circuit. <u>Home run circuits shall be clearly identified at all points of termination. connection. and splices. The means of identification shall be permitted by separate color coding:. marking tape. tagging. or other approved means.</u>

Exception No. 3: Where an individual branch circuit to a fire alarm system installed in accordance with 760.41 (B) or 760.121 (B) is installed in RMC, IMC, EMT, or steel-sheathed cable, Type AC or Type MC, meeting the requirements of 250.118, with metal outlet and junction boxes, AFCI protection shall be permitted to be omitted.

(B) Branch Circuit Extensions or Modifications - Dwelling Units. In any of the areas specified in 21 0.12(A), where branch-circuit wiring is modified, replaced, or extended the branch circuit shall be protected by one of the following:

(I) A listed ~~combination type~~ AFCI located at the origin of the branch circuit

(2) A listed outlet branch-circuit type AFC[located at the first receptacle

Substantiation: IEC believes the AFCI is a very important product and has the potential to save lives and property; however, in a recent survey of installers, approximately 50% of responders reported having some sort of difficulty with nuisance tripping after installing AFCI's. One in seven reported replacing the AFCI with a standard circuit breaker because the installation problems could not be resolved. A taskforce has been formed consisting of manufacturers and distributors to gather more information and to better understand the reasons for the installation problems. At the present time, IEC believes there is a need for more training, better test equipment and possibly the AFCI needs more testing. Until more information can be gathered the panel is encouraged to allow the non combination type AFCI to be installed because it gives the contractor more flexibility to eliminate nuisance tripping during installation.

While IEC continues to believe the AFCI is an important product, more information needs to be gathered.

Panel Meeting Action: Reject

Panel Statement: The panel reaffirms that the substantiation for the original proposal recommended identifying the first outlet but did not provide technical substantiation for identifying the points of termination, connection, and splices. The comment has not provided the additional technical substantiation needed to accept the original proposal.

The panel reaffirms the intent to require the use of a Listed Combination Type AFCI at the origin of the branch circuit.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Abstain: 1

Explanation of Abstention:

ORLOWSKI, S.: See reason statement on Comment 2-43.

2-52 Log #1411 NEC-P02 **Final Action: Accept**

(210.12(A))

TCC Action: The Correlating Committee understands that 210.12(A)(5) and 210.12(A)(6) were accepted in two forms by Panel 2 through their actions on Comment 2-46 and 2-52. The Correlating Committee directs that 210.12(A)(5) and 210.12(A)(6) be modified by the panel action taken on Comment 2-46. In 210.12(A)(5) and 210.12(A)(6), the word "listed" is added in front of "outlet branch circuit type AFCI" by the Correlating Committee for correlation.

To correlate with the actions taken on Proposal 2-116, Comments 2-37, Proposal 2-85, Proposal 2-82a, Proposal 2-80, Comment 2-52, Comment 2-59, Comment 2-46, Proposal 2-102, Proposal 2-103, Proposal 2-93, Proposal 2-79, Proposal 2-94, Proposal 115, and the Correlating Committee Action on Comment 46, the Correlating Committee directs that the final text to read as follows:

210.12 Arc-Fault Circuit-Interrupter Protection. Arc-fault circuit-interrupter protection shall be provided as required in 210.12(A), (B) and (C). The arc-fault circuit interrupter shall be installed in a readily accessible location. [P2-116] [C2-37]

(A) Dwelling Units. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets or devices installed in dwelling unit kitchens, family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, laundry areas, or similar rooms or areas shall be protected by any of the means described in (1) through (6) [P2-85], [P2-82a], [P2-80] [C2-52]

(1) A listed combination type arc-fault circuit interrupter, installed to provide protection of the entire branch circuit.

(2) A listed branch/feeder type AFCI installed at the origin of the branch circuit in combination with a listed outlet branch circuit type arc-fault circuit interrupter installed at the first outlet box on the branch circuit. The first outlet box in the branch circuit shall be marked to indicate that it is the first outlet of the circuit. [C2-59]

(3) A listed supplemental arc protection circuit breaker installed at the origin of the branch circuit in combination with a listed outlet branch circuit type arc-fault circuit interrupter installed at the first outlet box on the branch circuit where all of the following conditions are met:

(a) The branch circuit wiring shall be continuous from the branch circuit overcurrent device to the outlet branch circuit arc-fault circuit interrupter.

(b) The maximum length of the branch circuit wiring from the branch circuit overcurrent device to the first outlet shall not exceed 15.2 m (50 ft) for a 14 AWG or 21.3 m (70 ft) for a 12 AWG conductor.

(c) The first outlet box in the branch circuit shall be marked to indicate that it is the first outlet of the circuit. [C2-59]

(4) A listed outlet branch circuit type arc-fault circuit interrupter installed at the first outlet on the branch circuit in combination with a listed branch circuit overcurrent protective device where all of the following conditions are met:

(a) The branch circuit wiring shall be continuous from the branch circuit overcurrent device to the outlet branch circuit arc-fault circuit interrupter.

(b) The maximum length of the branch circuit wiring from the branch circuit overcurrent device to the first outlet shall not exceed 15.2 m (50 ft) for a 14 AWG or 21.3 m (70 ft) for a 12 AWG conductor.

(c) The first outlet box in the branch circuit shall be marked to indicate that it is the first outlet of the circuit. [C2-59]

(d) The combination of the branch circuit overcurrent device and outlet branch circuit AFCI is identified as meeting the requirements for a "System Combination" type AFCI and is listed as such.

(5) If RMC, IMC, EMT, Type MC, or steel armored Type AC cables meeting the requirements of 250.118, metal wireways, metal auxiliary gutters and metal outlet and junction boxes are installed for the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet, it shall be permitted to install a listed outlet branch-circuit type AFCI at the first outlet to provide protection for the remaining portion of the branch circuit.

[C2-52] [C2-46] [P2-102]

(6) Where a listed metal or nonmetallic conduit or tubing or Type MC Cable is encased in not less than 50mm (2 in.) of concrete for the portion of the branch circuit between the branch circuit overcurrent device and the first outlet, it shall be permitted to install a listed outlet branch circuit type AFCI at the first outlet to provide protection for the remaining portion of the branch circuit [C2-46][P2-103]

Exception. Where an individual branch circuit to a fire alarm system installed in accordance with 760.41(B) or 760.121(B) is installed in RMC, IMC, EMT, or steel-sheathed cable, Type AC or Type MC, meeting the requirements of 250.118, with metal outlet and junction boxes, AFCI protection shall be permitted to be omitted.

Informational Note No. 1: For information on combination type and branch/feeder type arc-fault circuit interrupters, see ANSI/UL 1699-2011, Standard for Arc-Fault Circuit Interrupters. For information on outlet branch circuit type arc-fault circuit interrupters see UL Subject 1699A Outline of Investigation for Outlet Branch Circuit Arc-Fault Circuit-Interrupters. For information on System Combination AFCIs see UL Subject 1699C Outline of Investigation for System Combination Arc Fault Circuit Interrupters. [P2-93]

Informational Note No. 2: See 29.6.3(5) of NFPA 72- 2010, National Fire Alarm and Signaling Code, for information related to secondary power supply requirements for smoke alarms installed in dwelling units. [P2-79] [P2-94]

Informational Note No. 3: See 760.41(B) and 760.121(B) for power-supply requirements for fire alarm systems.

(B) Branch Circuit Extensions or Modifications-Dwelling Units

In any of the areas specified in 210.12(A), where branch-circuit wiring is modified, replaced, or extended, the branch circuit shall be protected by one of the following:

(1) A listed combination-type AFCI located at the origin of the branch circuit

(2) A listed outlet branch-circuit type AFCI located at the first receptacle outlet of the existing branch-circuit

Exception: AFCI protection shall not be required where the extension of the existing conductors is not more than 1.8 m (6 ft.) and does not include any additional outlets or devices. [P2-115]

(C) Dormitory Units. All 120-Volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dormitory unit bedrooms, living rooms, hallways, closets, and similar rooms shall be protected by a

listed arc-fault circuit interrupter meeting the requirements of 210.12(A)(1) through (6) as appropriate. [C2-37]
Submitter: Robert L. LaRocca, UL LLC
Comment on Proposal No: 2-92
Recommendation: Continue to accept 2-92 in principle but revise the CMP 2's action as follows:

210.12 Arc-Fault Circuit-Interrupter Protection.

(A) Dwelling Units. All 120-volt, single phase, 15- and 20-ampere branch circuits supplying outlets installed in dwelling unit family rooms, dining rooms, living rooms, parlors, libraries, dens, bedrooms, sunrooms, recreation rooms, closets, hallways, or similar rooms or areas shall be protected ~~as described by (1), (2), (3) or (4)~~ by any of the means described in (1) through (6):

(1) A listed combination type arc-fault circuit interrupter, installed to provide protection of the entire branch circuit.

~~(2) A listed outlet branch circuit type arc-fault circuit interrupter installed at the first outlet on the branch circuit where all of the following conditions are met:~~
~~(a) The branch circuit over current protection device shall be a listed circuit breaker having an instantaneous trip not exceeding 300 amperes.~~
~~(b) The branch circuit wiring shall be continuous from the branch circuit overcurrent device to the outlet branch circuit arc-fault circuit interrupter.~~
~~(c) The maximum length of the branch circuit wiring from the branch circuit overcurrent device to the first outlet shall not exceed 15.2 m (50 ft) for a 14 AWG or 21.3 m (70 ft) for a 12 AWG conductor.~~
~~(d) The first outlet box in the branch circuit shall be identified.~~

(2) A listed branch/feeder type AFCI installed at the origin of the branch circuit in combination with a listed outlet branch circuit type arc-fault circuit interrupter installed at the first outlet box on the branch circuit. The first outlet box in the branch circuit shall be identified.

(3) A listed supplemental arc protection circuit breaker installed at the origin of the branch circuit in combination with a listed outlet branch circuit type arc-fault circuit interrupter installed at the first outlet box on the branch circuit where all of the following conditions are met:
(a) The branch circuit wiring shall be continuous from the branch circuit overcurrent device to the outlet branch circuit arc-fault circuit interrupter.
(b) The maximum length of the branch circuit wiring from the branch circuit overcurrent device to the first outlet shall not exceed 15.2 m (50 ft) for a 14 AWG or 21.3 m (70 ft) for a 12 AWG conductor.
(c) The first outlet box in the branch circuit shall be identified.

(4) A listed outlet branch circuit type arc-fault circuit interrupter installed at the first outlet on the branch circuit in combination with a listed branch circuit over current protective device where all of the following conditions are met:
(a) The branch circuit wiring shall be continuous from the branch circuit overcurrent device to the outlet branch circuit arc-fault circuit interrupter.
(b) The maximum length of the branch circuit wiring from the branch circuit overcurrent device to the first outlet shall not exceed 15.2 m (50 ft) for a 14 AWG or 21.3 m (70 ft) for a 12 AWG conductor.z
(c) The first outlet box in the branch circuit shall be identified.
(d) The combination of the branch circuit overcurrent device and outlet branch circuit AFCI is identified as meeting the requirements for a "System Combination" type AFCI and is listed as such.

~~(3)~~(5) A listed outlet branch circuit type arc-fault circuit interrupter installed at the first outlet on the branch circuit where the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet is installed using RMC, IMC, EMT, Type MC, or steel armored Type AC cables meeting the requirements of 250.118 and using metal outlet and junction boxes.

~~(4)~~(6) A listed outlet branch circuit type arc-fault circuit interrupter installed at the first outlet on the branch circuit where the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet is installed using a listed metal or nonmetallic conduit or tubing encased in not less than 50 mm (2 in.) of concrete.

Delete Exceptions 1 and 2 of the existing text

~~Exception 3~~ Exception: Where an individual branch circuit to a fire alarm system installed in accordance with 760.41(B) or 760.121(B) is installed in RMC, IMC, EMT, or steel-sheathed cable, Type AC or Type MC, meeting the requirements of 250.118, with metal outlet and junction boxes, AFCI protection shall be permitted to be omitted.

Informational Note No. 1: For information on ~~types of~~ combination type and branch/feeder type arc-fault circuit interrupters, see UL 1699~~-1999~~, Standard for Arc-Fault Circuit-Interrupters. For information on outlet branch circuit type arc-fault circuit interrupters see UL Subject 1699A Outline of Investigation for Outlet Branch Circuit Arc-Fault Circuit-Interrupters. For information on System Combination AFCIs see UL Subject 1699C Outline of Investigation for System Combination Arc Fault Circuit Interrupters.

Informational Note No. 2: See 11.6.3(5) of NFPA 72- 2010, National Fire Alarm and Signaling Code, for information related to secondary power supply requirements for smoke alarms installed in dwelling units.

Informational Note No. 3: See 760.41(B) and 760.121(B) for power-supply requirements for fire alarm systems.

Substantiation: This comment was developed in conjunction with the manufacturers of circuit breakers and outlet branch circuit AFCIs.

The level of protection of the branch circuit against the effects of arcing faults needs to be equivalent to that currently defined for Combination Type AFCIs meeting the requirements of UL 1699. Both the proposal 2-92 and CMP 2's action on it at the ROP were based on information in the UL Report - *Effectiveness of Circuit Breakers in Mitigating Parallel Faults in the Home Run*. This report was issued on September 30, 2011 and revised on January 11, 2012. Since that time, UL has continued with additional research testing. Continued testing conducted by UL shows that the effectiveness of the protection of the home run afforded by a branch circuit breaker is affected by the current available at the panel, the instantaneous trip setting of the branch circuit breaker, and the length and size of the branch circuit conductors. The current available at the panel can vary from installation to installation based on the local distribution system, distance from the supply transformer and size of the service entrance conductors. The branch circuit lengths cited in the original report and accepted by CMP 2 are valid only if the current available at the panel is relatively high and the circuit breaker instantaneous trip rating is controlled to a known value. UL 1699, however, assumes that the current at the panel can be as low as 500A based on previous research work. Discussions with some utilities confirm that a value this low is a possibility for some installations. The instantaneous trip performance of the circuit breaker is not defined by UL requirements and recent testing shows that there can be variations of this parameter from batch to batch.

The results of testing reported in a new UL report - *Evaluation of Run Length and Available Current on Breaker Ability to Mitigate Parallel Arcing Faults*, Part 1 dated July, 2012, and Part 2 dated October, 2012, show that for an installation with 500 A available at the panel, the lengths of home run conductors cited in the panel action require a branch circuit breaker having an instantaneous trip current of less than 200A rather than the 300 A accepted in the panel action. Only some residential breakers currently available in the market place have demonstrated instantaneous trip levels this low and variations from batch to batch have been noted in testing by UL. Additionally, the instantaneous trip response may vary with the ambient temperature of the installation.

The Report mentioned above is available from the UL.Com website using this link to the appropriate page: http://lms.ulknowledgeservices.com/common/ncsresponse.aspx?rendertext=randdthoughtleadership

The revisions to the CMP's action on 2-92 in the comment above are intended to give the installer choices among systems of protection devices that provide protection of the branch circuit that is equivalent to the protection currently provide by a combination type AFCI meeting the requirements of UL 1699. A number of viable options for systems providing this protection have been suggested by the testing conducted by UL and collaborative work with the involved industries.

Option 1 is the current requirement for a listed combination type AFCI installed at the origin of the branch circuit and is unchanged.

Option 2 combines a listed branch feeder type AFCI installed at the origin of the branch circuit with a listed outlet branch circuit AFCI installed at the first outlet. The branch feeder type device provides protection against faults in parallel with the supply for the home run up to the terminals of the outlet branch circuit device. The outlet branch circuit device provides protection against arcing faults in series with the load for the upstream and downstream circuit conductors. Both devices can mitigate the effects arcing faults in parallel with the supply on the load side of the outlet branch circuit device. Since both devices are listed and in compliance with UL 1699, they have been tested assuming only 500 A available short circuit current at the panel, and there is no restriction on the length or size of the branch circuit conductors in the home run.

Option 3 introduces a special supplemental arc protection circuit breaker to be used in combination with an outlet branch circuit AFCI. The supplemental arc protection circuit breaker concept is being developed by the circuit breaker industry specifically for this application. An outline containing certification requirements is being developed jointly by the industry and UL. This type of circuit breaker will be investigated to provide the required arc fault protection of the home run when installed in a systems with an outlet branch circuit device and a home run of the specified length and AWG. Investigation of the circuit breaker will be based on selected requirements from UL 1699 and will assume a 500A current capability at the panel. UL's certification of this breaker will include specific surveillance components to verify the effectiveness of the arc mitigation of production samples.

Option 4 modifies option 2 of the CMP's action based on the additional research testing performed by UL. It introduces the concept of certifying a branch circuit overcurrent device and outlet branch circuit AFCI in specific system combinations that have been tested and certified to comply with the requirements of UL 1699 using a new outline of investigation. This outline will be published as UL Subject 1699C after being developed jointly by UL and the circuit breaker and wiring device industries. UL's certification of the combination will include specific surveillance components to verify the effectiveness of the arc mitigation of production samples in combination.

Options 5 and 6 are options 3 and 4 from the panel's action, renumbered.

Exceptions 1 and 2 of the existing code text should have been deleted by the CMP since the exceptions were turned into positive language in options 3 and 4 of the panel's action.

Informational Note 1 is revised to delete references to specific issue dates for the referenced documents and also adds references to the outlines of investigation for the outlet branch circuit device and for the system combination.

Each of the options above provides protection of the entire branch circuit in a manner that is equivalent to the current UL 1699 protection levels and controls the important parameters of the arc fault protection. Since testing is conducted in accordance with UL 1699 or requirements derived from UL 1699, the effect

of temperature variations on performance is addressed as well.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Abstain: 1
Explanation of Abstention:
ORLOWSKI, S.: See reason statement on Comment 2-43.
Comment on Affirmative:
KING, D.: Although I support Comment 2-41, I support an affirmative vote on this comment as it will allow for the expanded use of listed outlet branch circuit arc fault circuit interrupter devices and will provide a practical alternative for many installations.
WOOD, T.: See my comment on 2-40.

2-53 Log #1502 NEC-P02 **Final Action: Reject**
(210.12(A))

Submitter: Alan Manche, Schneider Electric
Comment on Proposal No: 2-92
Recommendation: Revise the proposed language in 210.12(A)(2) to include a minimum available fault current value.
(e)The available fault current at the branch circuit overcurrent device shall not be less than 500A.
Substantiation: The available fault current at the branch circuit overcurrent device plays a significant role in the operation parameters for protection. We often think of single family residence and concerns in rural areas where the fault current is known to be below this value. Even more significant concerns are found in multi-family dwellings where the Transformer sits in a central location of a multi-building complex, the Multi-meter equipment serves as the service disconnect on the end of each building may be 100ft of conductor from the transformer to the meter main and then the feeder conductor from the service meter main may be 200 ft long in a three or four story complex and those conductors are feeding a panel in the far end of the multi-family building. A quick point-to-point calculation will demonstrate that you easily drop below 500A at the panel where the branch circuit devices are located, creating an issue for this protection system of standard breaker and AFCI receptacle. This comment seeks to ensure we have the appropriate parameters in place to ensure the configuration is providing protection.
Panel Meeting Action: Reject
Panel Statement: Information regarding the magnitude of the available fault current at the branch circuit over current protective device is not readily available for most installations where AFCI protection is required, making enforcement impossible. The evaluation of listed AFCI's to UL1699 will take into account the effect of the available short circuit current on the capability of the AFCI to mitigate faults

(210.12(A) Exception No. 1)

Submitter: Robert G. Wilkinson, IEC Texas Gulf Coast
Comment on Proposal No: 2-101
Recommendation: Accept proposal 2-101.
Substantiation: CMP2 rejected my proposal 2-101 with the panel statement "Section 90.4 permits new products that may not be available at the time the Code is adopted". This provision was added to the 90.4 in the 1984 NEC and it was never intended to be applied to products that don't exist. The first electronic GFCI was developed in 1961 and the first requirement for GFCI protection in the NEC was in the 1968 edition and it was limited to protection of underwater lighting in swimming pools. Imagine what would have happened if the 1959 NEC required GFCI protection in light of the fact that the first circuit breaker type GFCI was not introduced until 1968 and the first receptacle type GFCI was not introduced until 1972. It is a disservice to the public to require a product that is not available to fulfill a requirement in the NEC. To continue to go down this path is to put the NEC in jeopardy of not being adopted. The credibility of the NEC is compromised by requiring products that do now exist. To take this matter to be ridiculous, I propose for the NEC to require a receptacle that I plan to develop that will provide AFCI, GFCI, ALCI, ELCI, IDCI, and LCDI protection. This receptacle will also be tamper resistant, weather resistant, and have the ability to change color to match the wall color. Since 90.4 permits requiring new products that may not be available at the time the Code is adopted, I'm sure my proposed magic receptacle will be accepted.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms that 90.4 permits requiring new products that may not be available at the time the code is adopted. The panel notes that one manufacturer has announced the availability of the Outlet Branch Circuit device as of the end of October.

(210.12(A) Exception No. 2)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 2-105
Recommendation: Revise text to read as follows:
210.12 Arc-Fault Circuit-Interrupter Protection. (A) Dwelling Units.
Exception No. 2: Where a listed ~~metal or~~ nonmetallic conduit (PVC or RTRC) or tubing (ENT) ~~or Type MC Cable~~ is encased in not less than 50 mm (2 in.) of concrete for the portion of the branch circuit between the branch-circuit overcurrent device and the first outlet, it shall be permitted to install an outlet branch-circuit type AFCI at the first outlet to provide protection for the remaining portion of the branch circuit.
Substantiation: Exception No 1. allows listed metallic conduit and tubing to be used. It is not necessary to list it again "encased in concrete".
Exception No 1. allows MC cable.. It is not necessary to list it again "encased in concrete".
The objection to limiting the non-metallic conduits to PVC is addressed by the changes.
HDPE and NUCC were omitted from the list since they are not to be used in a building. I understand that encased in concrete places them "outside" the building.
Panel Meeting Action: Reject
Panel Statement: The use of wiring methods in Exception No. 1 includes additional requirements not included in Exception No. 2. There is insufficient substantiation to limit the nonmetallic conduit or tubing as recommended in the comment.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Abstain: 1
Explanation of Abstention:

(210.13 (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-125
Recommendation: Reject the proposal.
Substantiation: It is unlikely that the circuit described in the substantiation would actually have the status of a branch circuit. The secondary conductors from the transformer would be classified as a tap in Section 240.21(C) and require overcurrent protection at some point on the supply side of the transformer. If of sufficient size the GFPE rules in Section 215.10 would apply. The Code does not require a change to address this.
Panel Meeting Action: Reject

Panel Statement: The panel disagrees with the submitter in that there are applications where this can be applied and avoid confusion where the overcurrent protection is functioning as a branch circuit overcurrent device directly supplying a load.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
HILBERT, M.: The submitter is correct the conductors described in the proposal are transformer secondary conductors and by definition in Article 100 they are feeder conductors. Although the cases where the conductors would be defined as branch circuit conductors are likely to be few and far between, it is not impossible. An example would be where GFPE was not included for the distribution equipment due to a continuous industrial process and a large branch circuit was run to equipment where an orderly shutdown was not a concern.

Submitter: Ryan Jackson, West Valley City, UT
Comment on Proposal No: 2-128a
Recommendation: Please substantiate the change.
Substantiation: The "substantiation" proved by the panel wasn't substantiation at all. Perhaps the substantiation was supposed to be the panel statement? I don't mind this change, but those of us who teach and/or write books about the Code need to know why this change occurred. Is it based on the typical load of this type of equipment? Was there a task group involved? Thank you.
Panel Meeting Action: Reject
Panel Statement: The comment does not make a recommendation relative to specific code text as is required by section 4.3.3(c) of the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-66 Log #1049 NEC-P02 **Final Action: Reject**
(210.17)

Submitter: George M. Stolz, II, Quicksilver Electrical Training
Comment on Proposal No: 2-128a
Recommendation: Reject the proposal.
Substantiation: Panel 2 is once again venturing into design considerations without minding the impositions of vague and unenforceable language on both installers and inspectors trying to comply with the Code, and without evidence of a problem relating to safety or fire hazard. The panel is creating a problem where the installer may claim a receptacle is for a blender and the inspector claims it looks like an EV-charging location. This is a design consideration based on equipment that may not have even been invented yet. See the panel's more appropriate responses to proposals 2-63 and 2-64. There may be instances where the designer finds it beneficial to group an EV receptacle with other loads for other purposes. Barring a fire or a death to prohibit that, it should remain in the hands of the designer.
Panel Meeting Action: Reject
Panel Statement: The panel notes that there is no requirement to install an EV charging receptacle, but it is important that where one is installed that no other outlets be installed on that circuit. The requirement will help to ensure that EV charging can be completed safely.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-67 Log #6 NEC-P02 **Final Action: Reject**
(210.19, Informational Note 5)

Submitter: Peter Skweres, Minnesota Department of Transportation
Comment on Proposal No: 2-132
Recommendation: Add text as follows:
Informational Note 5. On dedicated lighting circuits that only employ LED luminaires the acceptable maximum voltage drop on both feeders and branch circuits shall not exceed 10 percent.
Substantiation: Voltage drop requirements for exclusive lighting circuits that employ LED luminaires are too stringent. New LED luminaires have power supplies that operate on an input voltage range from 277 - 105 V AC (nns). RehL'(ing the voltage drop requirement when LED luminaires are used will not reduce the efficiency of this type of luminaire. LED luminaires are specifically designed to operate over this very wide input voltage range. There is a linear relationship between the stated power consumed and the current required and the voltage applied.
Panel Meeting Action: Reject
Panel Statement: The proposed informational note states a requirement which is prohibited in Informational notes. The panel notes that a specific voltage drop is not required in Article 210. The existing Informational notes are not requirements of the code.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-68 Log #32 NEC-P02 **Final Action: Accept**
(210.19(A)(1))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 2-131
Recommendation: It was the action of the Correlating Committee that this proposal be reconsidered and correlated with the actions taken on Proposals 2-201 and 2-202.
The Correlating Committee directs that the panel clarify whether the 125 percent is applied before or after the correction factors for consistency.
The Correlating Committee also directs that this proposal be submitted to Code-Making Panel 6 for comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel continues to accept the text as revised in the Report on Proposals. The text accepted by CMP-2 at the ROP stage is accurate. By splitting the requirement a condition is created where the conductor must be the larger of (a) or (b). Condition (a) requires that the conductor have an allowable ampacity of 125% of the continuous load plus the non continuous load. Condition (b) requires that the conductor have an allowable ampacity to carry the maximum load served after the conductor ampacity has had any correction or adjustment factors applied. Once the two calculations are completed, the larger of the two must be used.
There is no correlation issues with 215.2 since Exceptions 2 and 3 have been proposed for feeders only.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-69 Log #257 NEC-P02 **Final Action: Reject**
(210.19(A)(1))

Submitter: Code-Making Panel 6,
Comment on Proposal No: 2-131
Recommendation: Edit the wording of 210.19(A)(1), 2011 Code version, as follows:
(1) General. After the application of any ampacity adjustment or correction factors, branch-circuit conductors shall have an ampacity not less than the maximum combined load to be served. Within 1.22 m (4 ft) of termination equipment, the combined load of each connected conductor shall be 100 percent of the noncontinuous load plus 125 percent of the continuous load, unless the termination equipment is listed for operation at 100 percent of its rating. ~~Where a branch circuit supplies continuous loads or any combination of continuous and noncontinuous loads, the minimum branch-circuit conductor size, before the application of any adjustment or correction factors, shall have an allowable ampacity not less than the noncontinuous load plus 125 percent of the continuous load.~~
Delete the Exception and add new Informational Note:
Informational Note No. 5: Not all conductors of a circuit are necessarily connected tot he same termination equipment (circuit breaker, bus-bar lug, device, etc.). For instance, grounded conductors might not need the extra 25 percent of the continuous load added tot he combined load, where ungrounded conductors connected to a circuit breaker might.
Substantiation: The submitter is correctly concerned that the needed information to size the conductors is not clear. The part which is certain is that the ampacity must be at least the size of the load. However, the conductors within the 4 foot test length for equipment must have continuous loads considered (also noted in 2014 Proposal 2-202). If the equipment is 100% rated, then there is no adjustment needed, but if it is not 100% rated, then an additional 25% of the continuous load must be added.
Further Discussion:
The determination of conductor ampacity already includes any required adjustment or correction factors, but the added opening phrase reminding users that ampacity adjustment or correction factors may change the ampacity of a conductor might be worthwhile.
Phrasing the requirement in positive language allows the Exception to be deleted, as per Style Manual preference. The added Info Note clarifies that there might be different requirements for each end of each conductor of a circuit due the equipment it is terminated to.
The first sentence establishes the basic rule, including a reminder regarding ampacity factors. A second sentence to establish that at least four feet of each individual conductor connected to a standard non-100% rated equipment must have the possibility of an extra 25 percent continuous load considered. An information note to help clarify the concept of evaluating each conductor separately based on the equipment's listed rating. This then establishes the minimum load ampacity for the conductors. The conductor ampacity is then determined by 110.14(C) and any other applicable ampacity sections, usually those in Article 310.
The term "equipment" is a Code defined term which covers all the various types of termination methods.
We do not consider that the language inclusive of the 4 foot limitation is a new subject since it correlates to the necessary considerations for the conductor

ampacity for non-!00% rated equipment situations. Should your panel consider it new, then you could consider this alternate for the second sentence:

"The combined load of each connected conductor shall be 100 percent of the noncontinuous load plus 125 percent of the continuous load, unless the termination equipment is listed for operation at 100 percent of its rating." This wording still separates one conductor from another.

It appears to be true that the current 2011 wording of 210.19(A)(1) is a problem due to the syntax of the word "before." It appears that a #12 THHN copper could be allowed a rating of 20 for its 210.19(A)(1) based ("before the application of any adjustment or correction factors,") load ampacity, even though it might have correction factors which then limit it to an inadequate level.

Similar general logic will apply to Proposal 2-201 and 2-202 regarding feeders.

This Comment was developed before the results of the ROP were published, and therefore, could not reflect or consider any changes approved during the ROP process.

This comment was developed by a CMP-6 Task Group and balloted through the entire panel with the following ballot results:

10 Eligible to Vote

7 Affirmative (See voting comments below)

3 Negative (See voting comments below)

The following Comments on Vote were received:

AFFIRMATIVE:

S. CLINE: For the Informational Notes only, of 210.19(A)(1) [P2-131], and 215.2(A)(1) [P2-201 and P2-202], the words "a circuit breaker" might better be "an overcurrent device" for equal treatment.

P.R. PICARD: The use of a 4 foot length requires more substantiation than Mr. Hartwell's statement in ROP 2-202 that "the four-foot limit is based on prior conversations with UL personnel relative to how much conductor length is actually effective in performing that function."

NEGATIVE:

S. B. FRIEDMAN: The proposed language changes do not add clarity, and in fact adds confusion to the requirements when trying to incorporate the 4 ft. exception into existing text in proposal 2-131 and 2-201. Additionally, adding the 4 foot rule in the manner proposed for Proposal 2-202 goes beyond that indicated and substantiated in proposal and accepted by CMP-2.

NEMA should support the actions taken by CMP-2 with no further changes.

NEMA recommends an affirmative vote on panel 6 comments 6-4 and 6-5 on code proposals 8-191 and 8-192 respectively.

R.L. HUDDLESTON, Jr.: The comment as submitted by Panel 6 as written on the "Form for Comment" contains language that would leave the reader with the impression that the installation described is "typical", does not add clarity to the Code, but rather adds confusion, and is also technically unsubstantiated. The 4 ft. length of conductors came from Mr. Hartwell's proposal (2-202) and apparently was something that was based on some undocumented conversation with UL personnel.

Code requirements should never be based on hearsay, but on technical substantiation. The comments suggests that typically within 4' of terminations that are not listed for 100% rating, a cable will be sized one way, and then outside of the 4' length it will be sized another way. I contend that this will be very much the exception to the way branch circuit installations will normally take place. I, for one, would much prefer to run a longer length of copper conductor of a certain size than to splice on both ends and run a smaller size in the middle, as splices are an obvious and proven weak point in the conductive path. If it can be technically demonstrated that 4' is the proper length to use, then this wording should appear as an exception rather than the rule. Also, Mr. Hartwell proposed the 4' rule for feeders in Article 215, and this comment from Panel 6 has merged that thinking into branch circuits in Article 210, where it was never intended to be utilized.

The substantiation (further discussion) page of Comment 6-1 gives alternate text for the 2nd sentence: "The combined load of each connected conductor shall be 100 percent of the noncontinuous load plus 125 percent of the continuous load, unless the termination equipment is listed for operation at 100 percent of its rating." If this wording was used instead of that shown on the "Form for Comment", I would support it.

M. XERRI: The proposed language changes do not add clarity to the proposals. By adding the 4 ft. exception into the proposals it is actually making the statement confusing. Additionally, adding the 4 foot rule in the manner proposed for proposal 2-202 goes beyond that indicated and substantiated in proposal and accepted by CMP-2.

Panel Meeting Action: Reject

Panel Statement: The wording provided in the proposal would apply the adjustment factors on top of the 125% sizing for continuous loads which is exactly the situation that CMP-2 intends to avoid. The wording as accepted by CMP-2 more clearly states the separation of the two calculations.

The panel does not agree with integrating the language regarding 4 feet of conductor into the text as it is unclear whether it will be acceptable in all cases.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

(210.19(A)(1))

Submitter: Charles R. Miller, Charles R. Miller Electrical Education and Training

Comment on Proposal No: 2-131

Recommendation: Accept the following text as revised by Code-Making Panel 2:

(1) General. Branch-circuit conductors shall have an ampacity not less than the maximum load to be served. Conductors shall be sized to carry not less than the larger of (a) or (b).

(a) Where a branch circuit supplies continuous loads or any combination of continuous and noncontinuous loads, the minimum branch-circuit conductor size shall have an allowable ampacity not less than the noncontinuous load plus 125 percent of the continuous load.

(b) The minimum branch-circuit conductor size shall have an allowable ampacity not less than the maximum load to be served after the application of any adjustment or correction factors.

Substantiation: Because of the new wording, this section is now easy to understand.

Panel Meeting Action: Accept

Panel Statement: The panel notes that there are no changes to the ROP text by accepting this comment.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

2-71 Log #852 NEC-P02 **Final Action: Reject**
(210.19(A)(2))

Submitter: Travis Lindsey, Travis Lindsey Consulting Services

Comment on Proposal No: 2-133

Recommendation: Add new text to read as follows:

<u>Conductors for branch circuits as defined in Article 100 shall be sized to prevent a voltage drop exceeding 3 percent at the farthest outlet, and where the maximum total voltage drop on both feeders and branch circuits to the farthest outlet does not exceed 5 percent. Voltage drop for a branch circuit is to be calculated or measured by utilizing a resistive load that represents 80% of the ampacity rating of the branch circuit.</u>

<u>Informational Note: See 215.2(A)(5) for voltage drop on feeder conductors.</u>

Substantiation: The code panel has chosen not accept this proposal citing prior consensus. Prior surveys of inspectors, contractors and electricians have shown an overwhelming majority of these professionals consider excessive voltage drop to be a safety issue as well as an economic issue. Failures of fire alarm systems and smoke evacuation systems can be attributed to failure to adjust for circuit losses yet these circuits are not required to be adjusted for voltage drop. Circuit operating voltages have been responsible for many equipment losses. A number of these equipment losses have in the past caused large monetary losses especially in process systems such as factories. Cost should not be a factor when this conflicts with increasing safety.

Panel Meeting Action: Reject

Panel Statement: It is not substantiated that voltage drop is a safety issue. According to the submitter's comment, there may be special cases where voltage drop is a safety issue. The voltage drop limitation should not apply to all installations.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

2-72 Log #974 NEC-P02 **Final Action: Reject**
(210.19(A)(2) (New))

Submitter: David Brender, Copper Development Assn. Inc.

Comment on Proposal No: 2-133

Recommendation: Add text to read as follows:

<u>(2) Voltage Drop. Conductors for branch circuits as defined in Article 100, shall be sized to prevent a voltage drop exceeding 3 percent at the farthest outlet, and where the maximum total voltage drop on both feeders and branch circuits to the farthest outlet does not exceed 5 percent. Voltage drop for a branch circuit is to be calculated or measured by utilizing a resistive load that represents 80% of the ampacity rating of the branch circuit.</u>

<u>Informational Note: See 215.2(A)(5) for voltage drop on feeder conductors.</u>

Substantiation: Voltage drop on critical circuits (such as fire stairwell pressurization) has been identified as a safety concern, not just a convenience concern, or "reasonable efficiency of operation" concern 210.19(A) Informational Note 4 is not enforceable, and the above change would move the voltage drop requirement to enforceable language.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Comment 2-71.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

(210.21(B)(1))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-121
Recommendation: Accept the proposal in principle. Reformat the recommended text as a separate numbered paragraph as follows:
(5) Receptacles on Individual Branch Circuits. A receptacle outlet installed to comply with a requirement for an individual branch circuit shall contain a single receptacle, or a multiple receptacle if, and then only to the extent that, the supplied equipment includes multiple supply cord connections.
Substantiation: CMP 2 objected to this proposal on the grounds that it was placed in a paragraph now reserved to the rating of the receptacle. Fair enough. This comment addresses that problem. The substantiation regarding field controversies and the IAEI Section Meeting discussions remain valid.
Panel Meeting Action: Reject
Panel Statement: The panel continues to maintain its position that a circuit can be limited to a single piece of utilization equipment through means other than a single receptacle such as the restricted location of the receptacle.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
HILBERT, M.: The panel agreed that more than one receptacle is permitted where a single piece of utilization equipment had multiple supply cords. This comment could have been accepted in principle and revised to clarify that more than one receptacle is permitted in certain applications. The additional clarity would benefit readers of the NEC.
The proposed text could have modified to read:
(5) Receptacles on Individual Branch Circuits. A receptacle outlet installed to comply with a requirement for an individual branch circuit shall be permitted to contain a single receptacle or multiple receptacles when the supplied equipment includes multiple supply cord connections.

2-74 Log #243 NEC-P02 **Final Action: Reject**
(210.23)

Submitter: Jim Lally, Detailed Inspection Service, Inc.
Comment on Proposal No: N/A
Recommendation: Add new text to read as follows:
New 210.23(E) In other than dwellings there should be no more than a maximum of (13) duplex receptacles installed on a 20 amp. branch circuit.
Substantiation: This would compliment and clarify the reasoning in 220.14(l) and 220.14(L).
180va X 13= 2340va so since 120volts X 20 amps = 2400va
This would be the maximum allowed on a 20 amp. branch circuit.
Panel Meeting Action: Reject
Panel Statement: Section 210.23 refers to branch circuit permissible loads and not he number of receptacles on a circuit. This requirement is contained in existing 220.14(I).
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-75 Log #1549 NEC-P02 **Final Action: Reject**
(210.52(A))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-148
Recommendation: Accept the proposal.
Substantiation: The panel statement is not responsive. What the panel intends should never have been intended. Kitchen counter receptacles are not now, never have been, and can never be reserved for appliance use. In a space adjacent to a counter, the NEC now allows a receptacle 5½ ft above the floor to count as a perimeter receptacle in that space; it is frankly absurd to disallow a receptacle at the end of the counter some 4 ft above the floor to count for the same purpose. It is absurd to begin requiring 210.52(A) receptacle placements in stove and refrigerator cutouts because the adjacent countertop receptacles no longer count. And it greatly diminishes safety to reduce, in some cases to the vanishing point, receptacles in other rooms designed with built-in cabinetry. It also diminishes safety to, however inadvertently, effectively allow peninsular countertops of indefinite length with only a single receptacle outlet placement. The proposal that started us down this road to unintended consequences was never adequately substantiated. CMP 2 should revisit the exhaustive substantiation provided with the proposal, which need not be repeated here, and step on this before it gets any worse.
Panel Meeting Action: Reject
Panel Statement: The panel disagrees with the submitter and reiterates that it is intended that countertop receptacles serve the countertop and not adjacent wall space.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
HILBERT, M.: I agree with the submitter the kitchen counter receptacles can never be reserved completely for the countertop. I have often used the kitchen counter receptacles when vacuuming the kitchen area. On the other hand, limiting the intended coverage of countertop receptacles to only the countertop areas does have merit when you think of all that actually does get plugged in on the countertop these days.
If there is no requirement for a receptacle to be in the 36 inch wall space between the end of the kitchen countertop and the entrance to the room because of a receptacle located over the countertop, it is more likely the cord from the floor lamp or the desk lamp will be using one of the countertop receptacles.
I have not run into this situation in the past but, as an enforcer, I would not want to have to approve an installation that had a 30 inch wide countertop between the floor model gas range and the refrigerator with only one duplex receptacle that qualified for the countertop and the wall spaces for the refrigerator and the floor model gas range (the economy package).

2-76 Log #560 NEC-P02 **Final Action: Reject**
(210.52(A)(1))

Note: When the ballot result does not confirm the TC action on a Proposal by a two-thirds affirmative vote, the Report on Proposals shall be published with a specific request for public comment on that Proposal. The Proposal is now being reconsidered by the TC as a public comment.
Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 2-149
Recommendation: Revise text to read as follows:
210.52(A)(1)
(1) Spacing. Receptacles shall be installed such that no point measured horizontally along the floor line in any wall space is more than ~~1.8 m (6 ft)~~ 1.2m (4 ft) from a receptacle outlet.
Substantiation: Current Requirement: In previous editions of the NEC Handbook (e.g. 1981) it has been stated, "Receptacles are to be located so that no point in any wall space is more than 6 ft from a receptacle. This rule intends that an appliance or lamp with a flexible cord attached may be placed anywhere in the room and be within 6 ft of a receptacle, thus eliminating the need for extension cords."
Problem: Since **most cord connected equipment will have cords that are less than 6 ft long**, based on the UL standards requirements for these products, it is unlikely that the receptacle spacing requirement now in the NEC will allow the cord on any single product to reach a receptacle from any point on the wall without the use of an extension cord, even if the cord attached product is sitting at the same height as the receptacle. **Should the cord connected equipment (a Lamp for instance) be elevated beyond the height of the receptacle, even a cord length of 6 ft would no longer accommodate the need**. Generally, receptacles are mounted at approximately 18" above floor height. The average height of a bedside table is approximately 28". By triangulating the cord requirement based on the difference in heights and the distance travel, the lamp cord would now have to be greater than 6 ft **,** if the cord remains flush to the wall. If the cord is angled away from the wall by 8 inches, e.g., a lamp on a table, a cord of more than 6 ft in length would be stretched taught to reach the receptacle. Often location of furniture precludes the relocation of the appliance closer to the outlet.
Need for More Receptacles: Additionally, this requirement did not anticipate the **extraordinary increase in the availability and use of cord connected equipment** in the home, ie, Televisions, DVD Players, Stereo Systems, Lamps, Cordless Phones, Cell Phone Chargers, Video Gaming Systems, Computers, Printers, Fax Machines, Cameras, Cell Phone Chargers, I-Pods, I-Pads, Electronic Readers (Kindle, Nook), Electric Toys, Chargers for Battery Powered Tools, etc. All of which are generally available in multiples throughout the average home, and few of which were available when this code was originally developed. Due to this ever expanding list of cord connected products that may be used in any room of a home, all available receptacles within reach of a cord can easily be in use. This results in increased usage of extension cords to reach available receptacles, remotely located in other areas of the household. The increased use of cord connected equipment results in the same condition that the 6 ft spacing rule was intended to prevent, and it is evident that **the number of receptacles required 50 years ago is no longer adequate for today's home**. Reducing the required spacing will have the effect of making more receptacles available for the increased number of cord connected products now in the home.
Should the spacing requirement between receptacles not be reduced to accommodate the aforementioned increase in demand, improper use of **extension cords ~~use~~ will continue to proliferate ~~and the~~ with hazardous results ~~of their use will multiply~~**. Electrical cord fires are one of the **leading causes of the total number of residential fires in the United States**. The U.S. Consumer Product Safety Commission (CPSC) estimates that 3300 residential fires originate in extension cords each year, killing 50 persons.
Additionally, recent CPSC statistics (CPSC Document # 16 - http://www.cpsc.gov/cpscpub/pubs/16.html) also indicate that there are over 4,000 injuries associated with electrical extension cords that result in treatment in hospital emergency rooms annually. Half of these injuries involve fractures, lacerations, contusions or strains from people tripping over extension cords. Thirteen percent of the injuries involve children under the age of 5.
Increasing the number of available receptacles will reduced the improper use of extension cords that lead to the incidents described in the CPSC reports. When more receptacles are available, the improper use of extension cords installed

under carpets and rugs, run though doorways and in walkways will be reduced.
Summary: As the number of cord connected household electrical / electronic products continues to grow, the lack of a sufficient number of available receptacle outlets leads the homeowner to the use of extension cords. The NEC has long recognized the hazards presented by the use of extension cords, ~~especially~~ where they are used in place of permanent wiring. Reducing the spacing between receptacles as recommended in this proposal will help to ensure that there are an adequate number of receptacles available for connection of the growing number of cord connected appliances being used in the typical dwelling. Since 1956, the receptacle spacing requirements in 210.52 (A) (1), and the resulting number of receptacles installed has remained unchanged.
Panel Meeting Action: Reject
Panel Statement: The panel reiterates its previous panel statement that a dramatic move from twelve foot wall spacing to eight foot wall spacing has not been substantiated.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 9 Negative: 4
Explanation of Negative:
KING, D.: The UL product standards list many cord connected pieces of equipment with shorter than 6' cords Therefore the 6' receptacle spacing is inadequate and leads to the use of extension cords.
The CPSC statistics indicate over 4,000 injuries and 3300 fires resulting in 50 fatalities each year are associated with the use of extension cords. Changing the spacing to the suggested 4' will significantly reduce the numbers of these incidents.
LAROCCA, R.: The current receptacle spacing requirements have not been changed since the 1950s. In that time the number of electrical utilization appliances proliferated, without an increase in the receptacles available to power them. The length of the power supply cords of these products has also been reduced to less than 6 feet. This has led to the use of relocatable power taps and extension cords to serve these products. Relocatable power taps may be hidden under or behind furniture leading to damage and overheating. Extension cords may be run under carpets and rugs and may be damaged creating a potential fire or shock hazard, or create a tripping hazard if left exposed. Requiring additional wall receptacles would help prevent these potentially hazardous conditions.
PAULEY, J.: NEMA supports the revision to the receptacle spacing in residential locations. It has been decades since this rule has been written and it is currently out of date with the significant numbers of electronic equipment that are in use in dwellings. The revision would better address this increased need to access a receptacle for plug-in devices.
WOOD, T.: This revision should be accepted. The submitters substantiation is valid.

2-77 Log #805 NEC-P02 **Final Action: Reject**
(210.52(A)(1))

2-78 Log #1550 NEC-P02 **Final Action: Accept**
(210.52(A)(1))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 2-149
Recommendation: Continue to reject the proposal.
Substantiation: The most disturbing thing about the panel action on this proposal is that it actually received more than one or two affirmative votes. The proposal is extremely disturbing in that it would overturn NEC provisions that have served us well for many decades in order to ratify multiple product standards that somehow allow listed cord- and plug-connected appliances in 210.52(A) (residential) environments to be equipped with cords that are too short. This submitter has now decided to submit a proposal (public input? – new procedures) to CMP 17 (Article 422) in the 2017 cycle to require a minimum cord length of 6 ft for such equipment. If the NEC Committee doesn't get a handle on this soon, the tail will surely wag the dog. Where will this trend end? If the rule drops to four feet, will we see appliance cords drop to 4 feet? Perhaps one meter? An important reason NEMA and UL have representatives on all code making panels is supposed to be to assure that the equipment they manufacture and list will perform properly in locations governed by NEC provisions. It was never supposed to be the case that the installation code would instead do the reverse, and bow to the product standard.
CMP 2 members might be interested to know that they are not the only panel subjected to this sort of proposal. CMP 9 just overwhelmingly rejected a proposal (9-97, vote 10-2) to unravel settled NEC provisions in 402.8(C) going back two cycles because the NEC is inconsistent with the product standard. And so it is; it was put in the NEC expressly to compel a change in the product standard because of field installation issues. Now it seems that in order to avoid a file review the manufacturers involved are attempting to undo the prior change. Enough is enough. Proposals such as these must be resoundingly rejected. At best, the proposal substantiation provides some arguments for making changes in product standards that increase the length of cords supplied with appliances, floor lamps, etc. This electrician, when installing new cords on such equipment, always makes them even a little longer than 6 ft for the same reasons.
Panel Meeting Action: Accept
Number Eligible to Vote: 13

Explanation of Negative:
KING, D.: See my explanation of negative on comment 2-76.
LAROCCA, R.: See my statement of negative on 2-76.

2-79 Log #408 NEC-P02 **Final Action: Accept in Principle**
(210.52(A)(3))

Submitter: Russel LeBlanc, The Peterson School of Engineering
Comment on Proposal No: 2-154
Recommendation: This proposal should have been accepted.
Substantiation: The panel's statement is incorrect. The present "literal" wording does not address a receptacle outlet mounted ON the floor. While the INTENT of the present wording may be to include it, the LITERAL wording does not. There is a difference between an outlet box installed IN a floor and one installed ON a floor. The proposed wording makes it clear that either location is acceptable. If this difference is not clear then let us use this funny analogy. The next time you need to use the toilet, will you be sitting ON the bowl or IN the bowl? You'll probably notice that there is quite a difference!
Panel Meeting Action: Accept in Principle
Revise text to read as follows: "Receptacle outlets in or on floors shall not be counted...".
Panel Statement: The panel has accepted the text but without parenthesis being used.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-90 Log #772 NEC-P02 **Final Action: Reject**
(210.52(C)(2))

Submitter: Eric Bunce, Rmh Group Inc.
Comment on Proposal No: 2-161
Recommendation: Revise text to read as follows:
Island Counter Spaces. At least one receptacle shall be installed at each island countertop space with a long dimension of 600 mm (24 in.) or greater and a short dimension of 300 mm (12 in.) or greater. <u>Island counter tops that exceed 1200 mm (48 in.) in length shall have one additional receptacle outlet installed for each 1200 mm (48 in.) of counter top or fraction thereof.</u> ~~Additional receptacle outlets required by this section shall be equally spaced along the length of the counter top measured in the long dimension.~~
Substantiation: The submitter of this idea has presented a valid solution for a real problem in the NEC. Insufficient receptacles on counter top islands result in the dangerous use of extension cords. This problem would be avoided if the panel would accept the proposed solution with the exception of removing the restrictive requirement for equally spacing receptacles. The code making panel's response that "...it is likely that additional receptacles a installed by the installer for the convenience of the owner." is very presumptive by the code making panel. Everyone's naturally inclined to do as little work as possible and home builders and owners do not want to incur additional costs if they can avoid it. I recommend that the code making panel add the proposed text above which mirrors the intent of article 210.62 for showroom windows and gives the installer a clear direction instead of assuming good will or common sense will prevail. Alternatively 210.62 could be modified to require one receptacle to mirror 210.52(C)(2) and we could depend on the contractor to just do the right thing.
Panel Meeting Action: Reject
Panel Statement: The configurations of various islands can make it impossible to install receptacles using the submitter's recommendation. The panel notes that this was similar to the rule that existed a number of code cycles ago and after much consideration of proposals and comments, the panel arrived at the consensus that a single receptacle to cover the designated island space is sufficient.

(210.52(G))

TCC Action: The Correlating Committee understands that the Panel Statement to Comment 2-67 was intended to state: "The proposed informational note states a requirement which is not permitted in Informational notes."
Submitter: Donald R. Offerdahl, Bismarck, ND
Comment on Proposal No: 2-179
Recommendation: Revise text to read as follows:
(G) Basements, Garages, and Accessory Buildings. For a one-family dwelling, the following provisions shall apply:
(1) At least one receptacle outlet, in addition to those for specific equipment, shall be installed in each basement.
(2) At least one receptacle outlet shall be installed for each car space in each attached garage and in each detached garage.
(3) At least one receptacle outlet shall be installed in each accessory building with electric power.
Substantiation: The panel statement states "The submitter has not substantiated requiring that the number of receptacles." The substantiation that the panel wants has been witnessed by myself and if the panel asks any electrical inspectors if there is a misuse of extension cords when inspecting the residential homes, the panel will have the substantiation they are asking for by the information obtained from electrical inspectors throughout the United States.
Panel Meeting Action: Accept in Principle in Part
Revise 210.52(G)(1) as revised in Proposal 2-178a of the ROP as follows:
(1) Garages. In each attached garage and in each detached garage with electric power. The branch circuit supplying this receptacle(s) shall not supply outlets outside of the garage. <u>At least one receptacle outlet shall be installed for each car space.</u>
Panel Statement: The panel revises (G)(1) only which affects garages and maintains the ROP requirements for basements and accessory buildings. The panel rejects the remainder of the proposal. The submitter's substantiation dealt only with receptacles for garages and did not substantiate the changes proposed for basements or accessory buildings.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 2
Explanation of Negative:
ORLOWSKI, S.: NAHB urges the members of the code making panel to reject this proposal. As NAHB stated at the meeting, no hazard was identified to justify the requirement of an electrical outlet being required for each car space. The submitter has failed, again, to justify the need for an additional outlet based on the number of car spaces in the garage and how adding a receptacle for each car space will reduce the unknown hazard that the submitter alluded too. In addition, as long as homeowners have the ability to purchase extensions cords, they will continue to be used and possibly misused. Misuse of extensions cords can only be addressed through the proper education of the use by the end user.
WILKINSON, R.: Two duplex receptacles could furnish this requirement for a four car garage and you would still not solve the problem. The NEC is not a design manual.
Comment on Affirmative:
HILBERT, M.: Continue to accept the comment. Expanding the number of receptacles in garages will go a long way with reducing the use of extension cords in general while supporting the move to EVs. However, in looking at the action it may have been better to use the term "vehicle space" as opposed to "car space." This question is bound to surface so the term "car space" is intended to include other types of vehicles such as a pickup truck.

2-83 Log #806 NEC-P02 **Final Action: Accept in Principle**
(210.52(G)(1))

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 2-181
Recommendation: Proposal 2-181 should be accepted.
Substantiation: Builders do not always locate the receptacle in a "convenient" location in the garage. Many larger garages have extra bays for lawn equipment and other supplies. These extra bays are in placed because detached barns are not always allowed in all housing developments. In addition, it is not always "convenient" to move a car with a dead battery to receptacle so that a battery charger can be connected. Garage floors can have standing water on the floor from rain and melted snow. This could become a safety hazard when extension cords used.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 2-82. The revision in Comment 2-82 will require a receptacle for each garage space, which addresses the submitter's concern.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 2
Explanation of Negative:
ORLOWSKI, S.: See reason statement on Comment 2-82.
WILKINSON, R.: See my Explanation of Negative Vote on Comment 2-82.

2-84 Log #1000 NEC-P02 **Final Action: Accept**
(210.52(G)(1))

Submitter: David Clements, International Association of Electrical Inspectors
Comment on Proposal No: 2-180
Recommendation: Reject the proposal and restore to the 2011 NEC language.
(G) ~~Outlets in~~ Basements, Garages, and Accessory Buildings. For a one-family dwelling, the following provisions shall apply:
(1) At least one receptacle outlet, in addition to those for specific equipment, shall be installed in each basement, in each attached garage, and in each detached garage or accessory building with electric power. ~~For receptacles outlets inside of attached and detached garages, branch circuits(s) supplying receptacle outlets not installed for specific equipment shall have no other outlets.~~
Substantiation: The correct substantiation to reject proposal 2-180 should be NEC **90.1 Purpose. (B) Adequacy.** "but not necessarily efficient, convenient, or adequate for good service or **future expansion** of electrical use." This proposal is in conflict with NEC 90.1(B).
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 11 Negative: 2
Explanation of Negative:
KING, D.: The Panel should continue to support the original Proposal. The increased usage of these circuits warrants them being confined to the garage.
PAULEY, J.: NEMA disagrees with the panel action on this comment. With the advent of plug-in electric vehicles, the change to limit the garage outlets to their own circuit is a very simple way to
accommodate a Level 1 EV charger within the basic electrical infrastructure. The panel action at the ROP stage to limit the branch circuit to the garage was a positive change and
should be maintained.

2-85 Log #1050 NEC-P02 **Final Action: Reject**
(210.64)

Submitter: George M. Stolz, II, Quicksilver Electrical Training
Comment on Proposal No: 2-191
Recommendation: Reject the proposal.
Substantiation: Considering that possibly 1% of all services installed on the planet have data recording equipment attached to them once in their lives for a temporary period of time, this proposal is woefully under-substantiated. There are cord-set GFCI protection devices to protect against half of the submitter's concern. Many services can even be temporarily modified to service a 120V

receptacle for the task at hand as well.
Panel Meeting Action: Reject
Panel Statement: The panel maintains its position from the proposal stage that the requirement for a receptacles in the vicinity of the service equipment has been substantiated and will enhance safety.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-86 Log #1247 NEC-P02 **Final Action: Accept**
(210.64)

Submitter: John Masarick, Independent Electrical Contractors, Inc.
Comment on Proposal No: 2-191
Recommendation: I recommend the panel continue to accept in Principal proposal 2-191 as stated in the panel's statement below.
"210.64 Electrical Service Areas. At least one 125 volt single phase 15 or 20 ampere rated receptacle outlet shall be installed within 15 m (50 ft) of the electrical service equipment.
Exception: The receptacle outlet shall not be required to be installed in one and two family dwellings.
Substantiation: Test equipment is frequently needed for monitoring and servicing electrical equipment in service areas. If a receptacle is not available near the service equipment, an extension cord is often used. The extension cord often must travel down hallways and across rooms. The extension cord will present a slip, trip, or fall hazard.
Panel Meeting Action: Accept
Number Eligible to Vote: 13

(210.70(C))

Submitter: Russel LeBlanc, The Peterson School of Engineering
Comment on Proposal No: 2-198
Recommendation: This proposal should have been accepted.
Substantiation: Presently illumination is not required for equipment in a dark utility room. That is simply not safe. The proposal will make it safer to service equipment needing servicing. While I agree with the panel statement "The determination of whether a space in buildings or structures other than a dwelling unit is used for a utility room or basement must be decided by the AHJ on a case-by-case basis", that statement does not explain why the panel feels the equipment in those spaces does not need illumination. Yes the AHJ needs to make the decision on what name to call the space (e.g. utility room or basement etc.), but no matter what name you give the space, the hazards at the equipment remain the same if there is no illumination provided. Dark is dark not matter whether it is in an attic, underfloor space, utility room or basement of a dwelling or a non-dwelling. Lighting is needed in all of these locations, regardless of what the name of the space is if there is equipment that needs servicing.
Panel Meeting Action: Reject
Panel Statement: The panel reiterates its previous panel statement that the determination of whether a space in buildings or structures other than a dwelling unit is used as a utility room or basement must be decided by the AHJ on a case-by-case basis.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
KING, D.: This Comment should be accepted. I agree with the submitter's substantiation. The added safety benefit afforded by adequate illumination in all areas where equipment is located that may require servicing should be given further consideration by the Panel.

2-87 Log #352 NEC-P02 **Final Action: Reject**
(210.71 (New))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 2-198a
Recommendation: Add text to read as follows:
<u>210.71 Meeting Rooms.</u>
<u>In other than dwelling units, portions of buildings or structures of up to 70 m2 (760 ft2) that are designed or intended for the gathering of seated occupants for such purposes as conferences, deliberations, or similar purposes, where electronic equipment such as computers, projectors, or similar equipment is likely to be used, shall have 125-volt, 15- and 20-ampere receptacle outlets installed as specified in 210.71(A) and (B).</u>
<u>(A) Receptacles in Walls. In meeting rooms having a floor area of 70 m2 (760 ft2) or less, receptacles shall be installed such that no point measured horizontally along the floor line of any fixed wall is more than 1.2m (4 ft) from a receptacle.</u>
<u>(B) Floor Receptacles. A meeting room that is at least 3.6 m (12 ft) wide and has a floor area of at least 21 m2 (225 ft2) and not more than 70 m2 (760 ft2) shall have at least one duplex receptacle located in the floor at a distance not less than 1.8 m (6 ft) from any fixed wall.</u>
<u>Informational Note 1: See Section 314.27 for floor boxes used for receptacles located in the floor.</u>
<u>Informational note 2: See Article 518 for Assembly Occupancies designed for 100 or more persons.</u>
Substantiation: NEMA respectfully requests the code panel reconsider its action on the subject proposal.
The panel considers the installation of receptacles in meeting rooms to be a design consideration. It is readily apparent by observation of the receptacle installation in meetings rooms that the current design practice for providing receptacles in these rooms results in a shortage of available receptacles. A typical meeting room is significantly underserved by the limited number of receptacles available for cord and plug connected products. This leads to the conditions described in the proposal substantiation of daisy chained temporary power strips and the potentially hazardous use of extension cords.
The panel statement that the proposal would require receptacle outlets in moveable walls is incorrect. The proposal requires wall receptacle outlets only in fixed walls.
The panel also expressed concern with the varying configurations of meeting rooms. The proposal clearly defines the function and dimensions of the meeting rooms that will be affected. The size of the meeting room described in the proposal is very unlikely to be of a configuration that would make compliance with the requirement difficult. Meetings rooms of this size are typically rectangular in shape.
Panel Meeting Action: Reject
Panel Statement: The panel reiterates its previous panel statement that there are too many variations in meeting room configurations to create a specific rule. Requiring a receptacle for each 760 sq ft of meeting room space will not necessarily eliminate or shorten any extension cords depending on the configuration.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 10 Negative: 3
Explanation of Negative:
KING, D.: The Comment should be accepted. I agree with the submitter that there is a shortage of available receptacles to serve areas for which these rooms are designed for. The excessive use of extension cords across traffic areas to provide power to the center floor space has been noted over several code cycles. The Panel should reconsider this comment.
LAROCCA, R.: In meeting rooms such as found in office buildings, hotels, and motels it has become common practice to run multiple extension cords from the limited receptacle outlets in the perimeter of the room to the center of the room to accommodate the wide spread use of projectors, PCs, and other information technology equipment. Cords used in such a manner are often run under carpets and rugs or are taped to the floor. The cords used in this way may run hotter due to restricted air flow, may be damaged creating a potential fire or shock hazard, or may result in a tripping hazard if left exposed and loose. Requiring additional wall receptacles and a listed floor box and receptacle in these rooms would help prevent these potentially hazardous conditions.
PAULEY, J.: NEMA continues to support the need for additional outlets in meeting rooms. At every business meeting in these rooms, the evidence of additional outlets is shown through the extensive use of extension cords and the misuse of relocatable power taps.

ARTICLE 215 — FEEDERS

2-91 Log #258 NEC-P02 **Final Action: Reject**
(215.2(A)(1))

Submitter: Code-Making Panel 6,
Comment on Proposal No: 2-201
Recommendation: The wording proposed in the action needs to be changed. Edit the wording of 210.19(A)(1), 2011 Code version, as follows:
(1) General. <u>After the application of any ampacity adjustment or correction</u>

factors, feeder conductors shall have an ampacity not less than required to supply the combined load as calculated in Parts III, IV, and V of Article 220. Within 1.22 m (4 ft) of termination equipment, the combined load of each connected conductor shall be 100 percent of the noncontinuous load plus 125 percent of the continuous load, unless the termination equipment is listed for operation at 100 percent of its rating. ~~The minimum feeder-circuit conductor size, before the application of any adjustment or correction factors, shall have an allowable ampacity not less than the noncontinuous load plus 125 percent of the continuous load.~~

(Delete Exceptions #1 and #2, add new Info note.)

Informational Note: Not all conductors of a circuit are necessarily connected to the same termination equipment (circuit breaker, bus-bar lug, device, etc). For instance, grounded conductors might not need the extra 25 percent of the continuous load added to the combined load, where ungrounded conductors connected to a circuit breaker might.

215.2(A)(1) 2014 NEC Proposal 2-201

Further discussion:

The determination of conductor ampacity already includes any required adjustment or correction factors, but the added opening phrase reminding users that ampacity adjustment or correction factors may change the ampacity of a conductor might be worthwhile.

The two exceptions are deleted. The sub-section would then read:

(1) General. After the application of any ampacity adjustment or correction factors, feeder conductors shall have an ampacity not less than required to supply the combined load as calculated in Parts III, IV, and V of Article 220. Within 1.22 m (4 ft) of termination equipment, the combined load of each connected conductor shall be 100 percent of the noncontinuous load plus 125 percent of the continuous load, unless the termination equipment is listed for operation at 100 percent of its rating.

Informational Note: Not all conductors of a circuit are necessarily connected to the same termination equipment (circuit breaker, bus-bar lug, device, etc). For instance, grounded conductors might not need the extra 25 percent of the continuous load added to the combined load, where ungrounded conductors connected to a circuit breaker might.

Phrasing the requirements in positive language allows the Exceptions to be deleted, as per Style Manual preference. The added Info Note clarifies that there might be different requirements for the different conductors of a circuit due to the equipment they are terminated to.

The first sentence establishes the basic rule, including a reminder regarding ampacity factors. A second sentence to establish that at least four feet of each individual conductor connected to a standard non-100% rated equipment must have the possibility of an extra 25 percent continuous load considered. An information note to help clarify the concept of evaluating each conductor separately based on the equipment's listed rating. This then establishes the minimum load ampacity for the conductors. The conductor ampacity is then determined by 110.14(C) and any other applicable ampacity sections, usually those in Article 310.

The term "equipment" is a Code defined term which covers all the various types of termination methods.

It appears to be true that the current 2011 wording of 215.2(A)(1) is a problem. It appears that a #3/0 THHN copper could be allowed a rating of 225 for its 215.2(A)(1) based ("before the application of any adjustment or correction factors,") load ampacity, even though it might have correction factors which then limit it to an inadequate level.

As an example, if the load consists of 100 amps of non-continuous, and 70 amps of continuous load, the "before the application" of any adjustment or correction factors allowable ampacity must be 187.5. By 215.2(A)(1), a typical #3/0 THHN copper is satisfactory. However, if that #3/0 is required by conditions of installation to be derated by 50% (for any of a variety of reasons), its Section 310 ampacity is only 113. The suggested wording of this comment would simply require the circuit conductors to have an installed minimum ampacity of 187.5.

The addition of the words " Within 1.22 m (4 ft) of equipment,... " addresses the concerns of Mr. Hartwell's Proposal 2-202.

The suggested wording is identical to the Comment for Proposal 202.

This Comment was developed before the results of the ROP were published, and therefore could not reflect or consider any changes approved during the ROP process.

Substantiation: The submitter is correctly concerned that the needed information to size the conductors is not clear. The fact that any required adjustment or correction factors for the conductor ampacity must result in a conductor ampacity at least as large as the load is not clear. However, the conductors within the 4 foot conductor test length for equipment must have continuous loads considered. If the equipment is 100% rated, then there is no load adjustment needed, but if it is not 100% rated, then an additional 25% of the continuous load must be added. Please see further discussion on page 2.

This comment was developed by a CMP-6 Task Group and balloted through the entire panel with the following ballot results:

10 Eligible to Vote

7 Affirmative (See voting comments below)

3 Negative (See voting comments below)

The following Comments on Vote were received:

AFFIRMATIVE:

S. CLINE: For the Informational Notes only, of 210.19(A)(1) [P2-131], and 215.2(A)(1) [P2-201 and P2-202], the words "a circuit breaker" might better be "an overcurrent device" for equal treatment.

P.R. PICARD: The use of a 4 foot length requires more substantiation than Mr. Hartwell's statement in ROP 2-202 that "the four-foot limit is based on prior conversations with UL personnel relative to how much conductor length is actually effective in performing that function."

NEGATIVE:

S. B. FRIEDMAN: The proposed language changes do not add clarity, and in fact adds confusion to the requirements when trying to incorporate the 4 ft. exception into existing text in proposal 2-131 and 2-201. Additionally, adding the 4 foot rule in the manner proposed for Proposal 2-202 goes beyond that indicated and substantiated in proposal and accepted by CMP-2.

NEMA should support the actions taken by CMP-2 with no further changes.

NEMA recommends an affirmative vote on panel 6 comments 6-4 and 6-5 on code proposals 8-191 and 8-192 respectively.

R.L. HUDDLESTON, Jr.: The comment as submitted by Panel 6 as written on the "Form for comment" contains language that would leave the reader with the impression that the installation described is "typical", does not add clarity to the Code but rather adds confusion, and is also technically unsubstantiated. The 4 ft. length of conductors came from Mr. Hartwell's proposal (2-202) and apparently was something that was based on some undocumented conversation with UL personnel. Code requirements should never be based on hearsay, but on technical substantiation. The Comment suggests that typically within 4' of terminations that are not listed for 100% rating, a cable will be sized one way, and then outside of the 4' length it will be sized another way. I contend that this will be very much the exception to the way feeder installations will normally take place. I, for one, would much prefer to run a longer length of copper conductor of a certain size than to splice on both ends and run a smaller size in the middle, as splices are an obvious and proven weak point in the conductive path. If it can be technically demonstrated that 4' is the proper length to use, then this wording should appear as an exception rather than the rule.

M. XERRI: The proposed language changes do not add clarity to the proposals. By adding the 4 ft. exception into the proposals it is actually making the statement confusing. Additionally, adding the 4 foot rule in the manner proposed for proposal 2-202 goes beyond that indicated and substantiated in proposal and accepted by CMP-2.

Panel Meeting Action: Reject

Panel Statement: The wording provided in the proposal would apply the adjustment factors on top of the 125% sizing for continuous loads which is exactly the situation that CMP-2 intends to avoid. The wording as accepted by CMP-2 more clearly states the separation of the two calculations.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

2-92 Log #259 NEC-P02 **Final Action: Reject**
(215.2(A)(1))

Submitter: Code-Making Panel 6,

Comment on Proposal No: 2-202

Recommendation: The effective action on proposal 2-202 needs to be: Accept in Principle in Part. The wording proposed in the action needs to be changed. Edit the wording of 210.19(A)(1), 2011 Code version, as follows:

(1) General. After the application of any ampacity adjustment or correction factors, feeder conductors shall have an ampacity not less than required to supply the combined load as calculated in Parts III, IV, and V of Article 220. Within 1.22 m (4 ft) of termination equipment, the combined load of each connected conductor shall be 100 percent of the noncontinuous load plus 125 percent of the continuous load, unless the termination equipment is listed for operation at 100 percent of its rating. ~~The minimum feeder-circuit conductor size, before the application of any adjustment or correction factors, shall have an allowable ampacity not less than the noncontinuous load plus 125 percent of the continuous load.~~

(Delete Ex #1 and 2, and add new Info note.)

Informational Note: Not all conductors of a circuit are necessarily connected to the same termination equipment (circuit breaker, bus-bar lug, device, etc). For instance, grounded conductors might not need the extra 25 percent of the continuous load added to the combined load, where ungrounded conductors connected to a circuit breaker might.

Substantiation: Proposal 2-202 correctly points out that the conductor within 4 feet of a non-100% rated piece of equipment might need to be a larger size than one further away in order to achieve its tested heat-sink effect. The provisions of ampacity evaluation allow for different sections of a circuit to be arrived at independently, with the lowest ampacity being the final determinate. This wording would allow the conductor within 4 feet to be one size, and the rest of the circuit to be another size.

Further discussion:

However, it is critical that conductors connected to terminals which are not 100 percent rated must have the 25% added to their load value. Hartwell's wording seems to bypass this requirement (this is the Part not Accepted), this suggested wording would not. The balance of the wording changes are to correlate with the Comment on Proposal 2-201.

The two exceptions are deleted. The sub-section would then read:

(1) General. After the application of any ampacity adjustment or correction factors, feeder conductors shall have an ampacity not less than required to supply the combined load as calculated in Parts III, IV, and V of Article 220. Within 1.22 m (4 ft) of termination equipment, the combined load of each

connected conductor shall be 100 percent of the noncontinuous load plus 125 percent of the continuous load, unless the termination equipment is listed for operation at 100 percent of its rating.

Informational Note: Not all conductors of a circuit are necessarily connected to the same termination equipment (circuit breaker, bus-bar lug, device, etc). For instance, grounded conductors might not need the extra 25 percent of the continuous load added to the combined load, where ungrounded conductors connected to a circuit breaker might.

This portion of the edited wording addresses the concerns of this Proposal: "Within 1.22 m (4 ft) of termination equipment, ..."

The term "equipment" is a Code defined term which covers all the various types of termination methods.

The balance of the wording changes are to correlate with the Comment on Proposal 2-201.

The suggested wording is identical to the Comment for Proposal 201.

This Comment was developed before the results of the ROP were published, and therefore could not reflect or consider any changes approved during the ROP process.

This comment was developed by a CMP-6 Task Group and balloted through the entire panel with the following ballot results:

AFFIRMATIVE:

S. CLINE: For the Informational Notes only, of 210.19(A)(1) [P2-131], and 215.2(A)(1) [P2-201 and P2-202], the words "a circuit breaker" might better be "an overcurrent device" for equal treatment.

P.R. PICARD: The use of a 4 foot length requires more substantiation than Mr. Hartwell's statement in ROP 2-202 that "the four-foot limit is based on prior conversations with UL personnel relative to how much conductor length is actually effective in performing that function."

NEGATIVE:

S. B. FRIEDMAN: The proposed language changes do not add clarity, and in fact adds confusion to the requirements when trying to incorporate the 4 ft. exception into existing text in proposal 2-131 and 2-201. Additionally, adding the 4 foot rule in the manner proposed for Proposal 2-202 goes beyond that indicated and substantiated in proposal and accepted by CMP-2.

NEMA should support the actions taken by CMP-2 with no further changes.

NEMA recommends an affirmative vote on panel 6 comments 6-4 and 6-5 on code proposals 8-191 and 8-192 respectively.

R.L. HUDDLESTON, Jr.: The comment as submitted by Panel 6 as written on the "Form for comment" contains language that would leave the reader with the impression that the installation described is "typical", does not add clarity to the Code but rather adds confusion, and is also technically unsubstantiated. The 4 ft. length of conductors came from Mr. Hartwell's proposal (2-202) and apparently was something that was based on some undocumented conversation with UL personnel. Code requirements should never be based on hearsay, but on technical substantiation. The Comment suggests that typically within 4' of terminations that are not listed for 100% rating, a cable will be sized one way, and then outside of the 4' length it will be sized another way. I contend that this will be very much the exception to the way feeder installations will normally take place. I, for one, would much prefer to run a longer length of copper conductor of a certain size than to splice on both ends and run a smaller size in the middle, as splices are an obvious and proven weak point in the conductive path. If it can be technically demonstrated that 4' is the proper length to use, then this wording should appear as an exception rather than the rule.

M. XERRI: The proposed language changes do not add clarity to the proposals. By adding the 4 ft. exception into the proposals it is actually making the statement confusing. Additionally, adding the 4 foot rule in the manner proposed for proposal 2-202 goes beyond that indicated and substantiated in proposal and accepted by CMP-2.

Panel Meeting Action: Reject

(215.2(A)(1) Exception No. 2 (New))

Submitter: Technical Correlating Committee on National Electrical Code®

Comment on Proposal No: 2-202

Recommendation: The Correlating Committee requests that this proposal be reconsidered.

The phrase "that are not terminated at either end" and its use in the sentence are unclear.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Panel Statement: See panel action on Comment 2-94.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

2-94 Log #1431 NEC-P02 **Final Action: Accept**

(215.2(A)(1) Exception No. 2 (New))

Submitter: Christel K. Hunter, Alcan Cable, a General Cable Company

Comment on Proposal No: 2-202

Recommendation: Reject this proposed new Exception.

Substantiation: The first part of this exception is already allowed by code. The installation of smaller conductors that are then spliced to larger conductors in order to comply with the temperature limitations of equipment is certainly allowed by code as long as each section of the circuit complies with the applicable ampacity and connection requirements. There is no need to give further specific allowance for this installation method.

Additionally, there was no technical substantiation submitted for the four foot length. Although the submitter states that he has had conversations with UL, there was no submission of testing or research that would support that four feet is required or that even four feet is enough. Until valid technical substantiation is submitted, this proposal should be rejected.

Panel Meeting Action: Accept

Ballot Results: Affirmative: 13

2-95 Log #1551 NEC-P02 **Final Action: Reject**

(215.2(A)(1) Exception No. 2 (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.

Comment on Proposal No: 2-202

Recommendation: Accept the proposal in principle. Revise text to read as follows:

Exception No. 2: Feeder conductors that are connected at both their supply and load ends to separately installed pressure connectors as covered in 110.14(C)(2) shall be permitted to have an allowable ampacity, after the application of any required adjustment or correction factors, not less than the sum of the continuous load plus the noncontinuous load. This exception shall not apply within 1.2 m (4 ft), as measured along the length of the conductors, of an overcurrent device.

Substantiation: This editorial revision of the accepted proposal recasts the exception in affirmative text and addresses the concerns of the Correlating Committee. It also clarifies how the 4-ft distance is to be measured. The point is to assure adequate heat sinking capabilities of the portion of the feeder that actually lands on an overcurrent device.

Panel Meeting Action: Reject

Panel Statement: See panel statement on Comment 2-94.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

2-96 Log #853 NEC-P02 **Final Action: Reject**

(215.2(A)(5))

Submitter: Travis Lindsey, Travis Lindsey Consulting Services

Comment on Proposal No: 2-213

Recommendation: Add new text to read as follows:

Conductors for branch circuits as defined in Article 100 shall be sized to prevent a voltage drop exceeding 3 percent at the farthest outlet, and where the maximum total voltage drop on both feeders and branch circuits to the farthest outlet does not exceed 5 percent. Voltage drop for a branch circuit is to be calculated or measured by utilizing a resistive load that represents 80% of the ampacity rating of the branch circuit.

Informational Note: See 215.2(A)(5) for voltage drop on feeder conductors.

Substantiation: The code panel has chosen not accept this proposal citing prior consensus. Prior surveys of inspectors, contractors and electricians have shown an overwhelming majority of these professionals consider excessive voltage drop to be a safety issue as well as an economic issue. Failures of fire alarm systems and smoke evacuation systems can be attributed to failure to adjust for circuit losses yet these circuits are not required to be adjusted for voltage drop. Circuit operating voltages have been responsible for many equipment losses. A number of these equipment losses have in the past caused large monetary losses especially in process systems such as factories. Cost should not be a factor when this conflicts with increasing safety.

Panel Meeting Action: Reject

Panel Statement: It is not substantiated that voltage drop is a safety issue. According to the submitter's comment, there may be special cases where voltage drop is a safety issue. The voltage drop limitation should not apply to all installations.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

2-97 Log #975 NEC-P02 **Final Action: Reject**
(215.2(A)(5))

Submitter: David Brender, Copper Development Assn. Inc.
Comment on Proposal No: 2-213
Recommendation: Add text to read as follows:
<u>(5) Voltage Drop. Conductors for feeder circuits as defined in Article 100, shall be sized to prevent a voltage drop exceeding 3 percent at the farthest outlet, and where the maximum total voltage drop on both feeders and branch circuits to the farthest outlet does not exceed 5 percent. Voltage drop for a feeder circuit is to be calculated or measured by utilizing a resistive load that represents 80% of the ampacity rating of the branch circuit.</u>
<u>Informational Note: See 215.2(A)(5) for voltage drop on feeder conductors.</u>
Substantiation: Voltage drop on critical circuits (such as fire stairwell pressurization) has been identified as a safety concern, not just a convenience concern, or "reasonable efficiency of operation" concern. 215.(A)(4) Informational Note 2 is not enforceable, and under a section that applies to dwelling units. The above change would move the voltage drop requirement to enforceable language for all occupancies.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 2-96.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

(215.12)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 2-127
Recommendation: Revise text to read as follows:
215.12 Identification for Feeders.
(C) Ungrounded Conductors.
(2) Feeders Supplied From Direct Current Systems. Where a feeder is supplied from a dc system operating at more than 60 volts, each ungrounded conductor of 4 AWG or larger shall be identified by polarity at all termination, connection, and splice points by marking tape, tagging, or other approved means; each ungrounded conductor of 6 AWG or smaller shall be identified by polarity at all termination, connection, and splice points in compliance with ~~215.12~~<u>210.5</u>(C)(2)(a) and (b). The identification methods utilized for conductors originating within each feeder panelboard or similar feeder distribution equipment shall be documented in a manner that is readily available or shall be permanently posted at each feeder panelboard or similar feeder distribution equipment
~~(a) *Positive Polarity, Sizes 6 AWG or smaller.* Where the positive polarity of a dc system does not serve as the connection for the grounded conductor, each positive ungrounded conductor shall be identified by one of the following means:~~
~~(1) A continuous red outer finish.~~
~~(2) A continuous red stripe durably marked along the conductor's entire length on insulation of a color other than green, white, gray, or black.~~
~~(3) Imprinted plus signs "+" or the word "POSITIVE" or "POS" durably marked on insulation of a color other than green, white, gray, or black, and repeated at intervals not exceeding 610 mm (24 in.) in accordance with 310.120(B).~~
~~(b) *Negative Polarity, Sizes 6 AWG or smaller.* Where the negative polarity of a dc system does not serve as the connection for the grounded conductor, each negative ungrounded conductor shall be identified by one of the following means:~~
~~(1) A continuous black outer finish.~~
~~(2) A continuous black stripe durably marked along the conductor's entire length on insulation of a color other than green, white, gray, or red.~~
~~(3) Imprinted minus signs "–" or the word "NEGATIVE" or "NEG" durably marked on insulation of a color other than green, white, gray, or red, and repeated at intervals not exceeding 610 mm (24 in.) in accordance with 310.120(B).~~
Substantiation: Define the marking requirements for ungrounded DC conductors in a single place just as the marking for grounded and grounding conductors is handled. There is no reason to replicate that complex text.
Panel Meeting Action: Reject
Panel Statement: Proposal 2-217 was developed by a dc task group which also developed Proposal 2-23. The repetition causes no confusion and may be useful.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-100 Log #36 NEC-P02 **Final Action: Accept**
(215.12(C))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 2-217
Recommendation: The Correlating Committee directs that this proposal be reconsidered and correlated with the actions taken on Proposals 2-23, 4-234, 4-262, 4-375, 5-220, 5-221 and 13-33 with regard to the 50 volt/60 volt nominal level.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise 215.12(C) as follows:
Identification of Ungrounded Conductors. Ungrounded conductors shall be identified in accordance with 215.12(C)(1) ~~and~~ <u>or</u> (2) as applicable.
In proposed 215.12(C)(2) replace 60 volts with 50 volts.
Panel Statement: The panel has reviewed 215.12(C) and agrees that changing the word "and" in 215.12(C) to "or" is more appropriate.
The change from 60 volts to 50 volts is to correlate with the CMP 13 action on Proposal 13-33.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 220 — BRANCH-CIRCUIT, FEEDER, AND SERVICE CALCULATIONS

2-101 Log #844 NEC-P02 **Final Action: Reject**
(220.6)

Submitter: Joe Goodwater, University of Nebraska Lincoln
Comment on Proposal No: 2-220
Recommendation: Modify the original proposal as shown below:
<u>**220.6 Expert agencies**. Information about the historical electrical demand of an occupancy class that is provided by an ANSI-accredited standards developer and approved by the Authority Having Jurisdiction, shall be permitted to be used as a basis for all load calculation methods in this Article.</u>
<u>Informational Note: An example of an ANSI accredited standards developer is the Institute of Electrical and Electronic Engineers whose recommended practices such as ANSI/IEEE Std. 241, *Recommended Practice for Electric Power Systems in Commercial Buildings,*</u>
Substantiation: For the convenience of the committee, the substantiation for the original rejection of our proposal is reproduced below:
"Panel Statement: The proposal does not define the requirements of the "third party agency" in any detail. 90.4 allows the AHJ to waive specific requirements by establishing and maintaining effective safety."
Our response:
Rather than use the term, "third party" or "expert agency" it might be better to simply identify the IEEE since electrical engineers are more likely to be closer to load data than fire protection professionals. There is precedent for this already in Section 430.26: It is unlikely that most AHJs will approve any reduction of the requirements. Referring to the IEEE would make the AHJ job easier as they would not have to make the final decision on whether to allow the reduced requirements.
430.26 Feeder Demand Factor. Where reduced heating of the conductors results from motors operating on duty-cycle, intermittently, or from all motors not operating at one time, the authority having jurisdiction may grant permission for feeder conductors to have an ampacity less than specified in <u>430.24</u>, provided the conductors have sufficient ampacity for the maximum load determined in accordance with the sizes and number of motors supplied and the character of their loads and duties.
Informational Note: Demand factors determined in the design of new facilities can often be validated against actual historical experience from similar installations. Refer to ANSI/IEEE Std. 141, *IEEE Recommended Practice for Electric Power Distribution for Industrial Plants,* and ANSI/IEEE Std. 241, *Recommended Practice for Electric Power Systems in Commercial Buildings,* for information on the calculation of loads and demand factor.
The energy conservation space continues to move quickly and NEC committees do not need to be perceived as being too slow to adapt to rapidly falling load densities. Moving too slowly is also unsafe as we have argued that over-sized transformers pose more of a flash hazard risk than overload fire risk. It is best to start reaching out to solid organizations such as the IEEE to revisit the prescriptive requirements of this article.
As for Section 90.4: that is "general purpose" language that is unhelpful for Authorities Having Jurisdiction who fear becoming a large target for lawsuits when they take exception to any part of the NEC. Clear, bright-line language

preferred – especially when the changes we seek are relatively easy and backed up by convincing data.
Panel Meeting Action: Reject
Panel Statement: The suggestion to allow ANSI accredited agencies to size loads is too broad for all of the situations involved in Article 220. The panel recognizes that in buildings designed to comply with energy codes, the lighting load can be calculated and monitored as defined in Proposal 2-228.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-102 Log #838 NEC-P02 **Final Action: Accept**
(Table 220.12)

Submitter: Brent Baumer, Ball State University
Comment on Proposal No: 2-228
Recommendation: Ball State University supports the acceptance of Proposal 2-228 that permits an exception to the prescriptive unit load lighting requirements of Table 220.12 and urge the technical committee to continue its acceptance in principle.
Substantiation: In my experience at Ball State University calculating lighting load per the tables in Art. 220 contributes to greatly over sizing services, feeders and transformers. This unnecessarily adds costs increasing the financial burden on the student and the taxpayer and increases the amount of available fault current and arc flash energy thereby decreasing safety. Many states adopt ASHRAE 90.1 which requires lighting load be much less than is required by Art. 220. In our buildings constructed under the rules of 90.1 I have not seen a great increase in the use of task lighting, desk lamps, table lamps, under cabinet lighting etc. to supplement the general room lighting. In fact, very few persons request or utilize supplemental lighting. With LED lighting rapidly replacing traditional fluorescent lighting, I see this gap between Art. 220 and reality only widening and the use of supplemental lighting becoming closer to negligible than it already is.
Panel Meeting Action: Accept
Panel Statement: The panel understands that this comment supports the action on Proposal 2-228.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-103 Log #842 NEC-P02 **Final Action: Reject**
(220.12 and Table 220.12)

Submitter: Jared Friesen, Morrissey Engineering
Comment on Proposal No: 2-228
Recommendation: Reword the exception to 220.12 approved in Proposal 2-228 and revise to provide three separate positive language paths for lighting load calculation as shown below:
220.12 Lighting Load ~~for Specified Occupancies~~. A unit load of not less than that calculated in 220.12 (A), (B) or (C) ~~specified in~~ Table 220.12 ~~for occupancies specified therein~~ shall constitute the minimum lighting load. The floor area for each floor, where used in the minimum lighting load calculation, shall be calculated from the outside dimensions of the building, dwelling unit, or other area involved. For dwelling units, the calculated floor area shall not include open porches, garages, or unused or unfinished spaces not adaptable for future use of dwelling units.
(A) **For Specified Occupancies**. A unit load of not less than that specified in Table 220.12 for occupancies specified therein shall constitute the minimum lighting load.
Informational Note: *The unit values herein are based on minimum load conditions and 100 percent power factor and may not provide sufficient capacity for the installation contemplated.*
(B) **Energy Restricted Occupancies**. Where the building is required to comply with the prescriptive lighting power requirements of an energy code adopted by the local authority, the maximum lighting power density values specified in that energy code may be used.
(C) **Monitored Lighting Loads In Non-Dwelling Units**. Where monitoring of the volt-amp or amp load dedicated to and including all permanently connected lighting is available to personnel who are qualified to maintain or modify the lighting system, the load may be calculated based on the maximum volt-ampere rating of the equipment and lamps for which the luminaire(s) is rated.
Substantiation: The modification to the accepted Proposal 2-228 incorporates the concerns of Morrissey Engineering and the specifying-engineer community at large who will be tasked with interpreting and applying the accepted proposal. Morrissey Engineering is involved in all phases of design, construction, and remodel/modification of each type of occupancy who's lighting density, and therefore load, is to be calculated by use of section 220.12 and table 220.12.

First, the re-formatted text repeats the same intent of accepted Proposal 2-228 but phrases with positive language over exceptions as the NFPA Manual of Style encourages.

Second, the new text clarifies that the calculation using the adopted energy code should be based on the more conservative maximum lighting power density, and not the connected (as defined by the applicable energy code) lighting power. The maximum lighting power density represents the maximum lighting power that is allowed to be used, not the lighting power that is designed for. Furthermore, the text now allows use of this energy code maximum lighting power density to stand alone from use of a power monitoring system. This change should be approved because it recognizes the legally mandated limits placed on the lighting system by other code writing panels when an energy code is adopted. Note that application of the energy code maximum power density calculation is essentially the same as application of table 220.12, but with values that are legal limits and are provided by other code writing panels who are engaged in the collection and interpretation of lighting power data by recognized authorities in the lighting industry.

Finally, the revised text provides for a third lighting load calculation method with the same intent of accepted Proposal 2-228. This method has been revised to 1) use the volt-ampere rating of the connected luminaire(s) that is to be monitored and 2) Be restricted to branch circuits serving only lighting in non-dwelling units and 3) ensure that data needed to monitor the system is available to those who are expected to need it and not be inaccessible. Based on the experience of many professional engineers in the consulting-specify industry, these revisions are expected to be sufficiently restrictive to be safe. They both require circuits to be sufficiently sized for a load with a definable demand when the branch circuit is dedicated to lighting, and allow for future expansion based on operational peak demand information accessible to the personnel who would need it.
Panel Meeting Action: Reject
Panel Statement: The panel allows the use of energy codes for lighting loads with the restrictions in Proposal 2-228. The allowance and restrictions are exceptions to the basic lighting loads by occupancy in Table 220-12.
The submitter's revisions modify the limitations placed on applying the values from the adopted energy code. These restrictions are required if a variance is allowed from the values in Table 220.12
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-104 Log #843 NEC-P02 **Final Action: Accept**
(Table 220.12)

Submitter: Joe Goodwater, University of Nebraska Lincoln
Comment on Proposal No: 2-228
Recommendation: The University of Nebraska supports the acceptance of Proposal 2-228 that permits an exception to the prescriptive unit load lighting requirements of Table 220.12 and urge the technical committee to approve it for inclusion into the 2014 National Electrical Code
Substantiation: Over the last 33 years UNL has tracked the demand on our building transformers. Our average demand is less than 40% of transformer rating and average load is well below that. I can only think of two instances in those 33 years that a transformer was fully loaded. In both of those cases, energy management systems have reduced the load to well under the original demand. On Love Library demand went from over 1000 kw to less than 500 Kw.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
ORLOWSKI, S.: See reason statement on Comment 2-108.

2-105 Log #845 NEC-P02 **Final Action: Reject**
(Table 220.12)

Submitter: Jerry Jimenez, University of California Berkeley
Comment on Proposal No: 2-228
Recommendation: The University of California Berkeley supports the acceptance of Proposal 2-228 that permits an exception to the prescriptive unit load lighting requirements of Table 220.12 and urge the technical committee to approve it for inclusion into the 2014 National Electrical Code but with the following modifications:
Exception: **In other than residential single-family and multifamily dwelling units**, where the building is designed and constructed to comply with an energy code adopted by the local authority, the lighting load shall be permitted to be calculated at the values specified in the energy code where the following conditions are met
a. A power monitoring system is installed that will provide ~~continuous~~ **historical** information regarding the total ~~general lighting~~ load of the building.
b. The power monitoring system will be set with alarm values **to** alert the building owner or manager if the ~~lighting~~ **total** load exceeds **the capacity of the service equipment** ~~values set by the energy code.~~
c. The demand factors specified in 220.42 are not applied to the general lighting load.
Substantiation: This is how we would like the new language to appear in the 2014 NEC:
Exception: In other than residential single-family and multi-family dwelling units, where the building is designed and constructed to comply with an energy code adopted by the local authority, the lighting load shall be permitted to be calculated at the values specified in the energy code where the following conditions are met
a. A power monitoring system is installed that will provide historical information regarding the total load of the building.
b. The power monitoring system will be set with alarm values to alert the building owner or manager if the total load exceeds the capacity of the service

equipment
c. The demand factors specified in 220.42 are not applied to the general lighting load.
This modification will permit the "power monitoring system" to be more basic in function and it will eliminate the need to install such equipment in single-family and multi-family dwelling units.
In the spirit of producing evidence that most distribution transformers are over-sized, we present the following:
At UC Berkeley, twelve transformers representative of typical building use (labs, classrooms, offices) were monitored with permanently installed real time meters for one year. The transformers are all 12 kV primary and either 480/277 v or 208/120 v secondary. They range in size from 500 kVA to 3,000 kVA. The average load over a period of one year was in the range of 7.5% to 38.7%. The peak load over that same period ranged from 17.8 % to 58.1 %. This means that in all cases, the transformers are too large by at least 50%. This causes several problems:
1) The no load losses over time are much higher than needed. This wastes energy and money.
2) The downstream switchgear is of higher ampacity than it needs to be. This wastes money.
3) The downstream switchgear is of higher short circuit rating than it needs to be. This wastes money.
4) The upstream infrastructure, which is based on connected kVA, is not loaded as heavily as it could be. This causes additional circuits to be constructed when perhaps they are not really required. This wastes money.
5) The fault currents downstream from these transformers is larger than it would be if the transformers were properly sized. This poses risk to electricians and others who might be in the vicinity of switchgear when a fault occurs. This presents a larger hazard than what would exist if the transformers were properly sized.
Panel Meeting Action: Reject
Panel Statement: Proposal 2-228 applies to the lighting load of a building as defined in Table 220-12 with an exception for monitoring the lighting load if it is designed according to an energy code. Comment 2-105 concerns the total load of the building which is not addressed in Proposal 2-228.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
ORLOWSKI, S.: See reason statement on Comment 2-108.

2-106 Log #846 NEC-P02 **Final Action: Accept**
(Table 220.12)

Submitter: Glenn T. Keates, Dymax Engineering
Comment on Proposal No: 2-228
Recommendation: Dymax Engineering supports the acceptance of Proposal 2-228 that permits an exception to the prescriptive unit load lighting requirements of Table 220.12 and urge the technical committee to approve it for inclusion into the 2014 National Electrical Code.
Substantiation: With lighting becoming more efficient and moving toward high efficiency ballasts, LED's, etc., it is time to recognize the importance of intelligently engineering a lighting system. This provision would allow that to occur, lowering the wasted "kVA" that exists in our present day electrical systems. It has been our experience and I'm sure others, as consulting engineers for a variety of campuses, to typically find that these facilities are, for lack of a better term, "over-transformered" to the extent that power factors are adversely affected, the units are underutilized and that the capital dollars are not be wisely used, as these more efficient systems come into reality.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1

ORLOWSKI, S.: See reason statement on Comment 2-108.

2-107 Log #847 NEC-P02 **Final Action: Accept**
(Table 220.12)

Submitter: Paul A. Kempf, University of Notre Dame
Comment on Proposal No: 2-228
Recommendation: The University of Notre Dame supports the acceptance of Proposal 2-228 that permits an exception to the prescriptive unit load lighting requirements of Table 220.12 and urges the technical committee to approve it for inclusion into the 2014 National Electrical Code.
Substantiation: The University of Notre Dame has vast experience with the design and operation of campus facilities as well as its own electrical distribution network system. Our experience includes the loading of service transformers across a wide array of building types including residential, research, office, large assembly and food service to name a few.
Our considerable historical data of service demands indicates that under-loaded transformers are the norm for our facilities. We attribute this under loading to the service load calculations which overestimate the true load demands.
We support this proposal as we seek to reduce incident energy levels, gain sustainability through the conservation of energy and natural resources and lower the capital expense of purchasing equipment through more appropriately sized transformers. As safety and sustainability are key drivers for our industry and we believe this proposal supports these efforts in a responsible manner.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
ORLOWSKI, S.: See reason statement on Comment 2-108.

2-108 Log #848 NEC-P02 **Final Action: Reject**
(Table 220.12)

Submitter: Jose Meijer, Peter Basso Associates, Inc.
Comment on Proposal No: 2-228
Recommendation: We support the acceptance of Proposal 2-228 that permits an exception to the prescriptive unit load lighting requirements of Table 220.12 and urge the technical committee to continue its acceptance but with the following modification:
Exception: <u>**In other than dwelling units**</u>, where the building is designed and constructed to comply with an energy code adopted by the local authority, the lighting load shall be permitted to be calculated at the values specified in the energy code ~~where the following conditions are met~~
~~a. A power monitoring system is installed that will provide continuous information regarding the total general lighting load of the building.~~
~~b. A power monitoring system will be set with alarm values~~ <u>**to**</u> ~~alert the building owner or manager if the lighting load exceeds values set by the energy code.~~
~~c. The demand factors specified in 220.42 are not applied to the general lighting load.~~
Substantiation: There is a widening gap between the unit load requirements of Table 220.12 and energy codes (such as <u>ASHRAE 90.1</u> and the <u>International Energy Conservation Code</u>) both of which reference *Illuminating Engineering Society* lighting power densities.
A power monitoring system is not necessary because if there are overloads – even in continuously energized mixed outlet and lighting supply circuits – overcurrent devices will safely de-energize the circuit.
We recommend removal of dwelling from the scope of this exception because such circuits are covered under local residential building and energy codes which are also driving down permissible lighting power densities.
Panel Meeting Action: Reject
Panel Statement: The submitter recommends that the monitoring provision of Proposal 2-228 be deleted. It is the intent of the panel that the lighting load be monitored to prevent overloads or alarm the building manager if an overload occurs.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
ORLOWSKI, S.: NAHB recognizes the legitimacy in allowing for a reduction in the lighting load, based on proponents substantiation. However, NAHB does not support the requirements for continuous monitoring in dwelling units, as it does not add any improvement on the practical safeguarding of people or property under the provisions of NEC. The proponent is correct that this is being addressed at the state and local level through energy conservation codes. Monitor and alarm devices are not required anywhere else in the NEC on any other branch circuit suppling electricity and should not be a requirement for the lighting load in dwelling units.

2-109 Log #850 NEC-P02 **Final Action: Reject**
(Table 220.12)

Submitter: Kathy Richards, Northern Michigan University
Comment on Proposal No: 2-228
Recommendation: Continue to accept this proposal but revise the description of the "power monitoring system" so that the system is more generic and does not necessarily require a new capital expenditure but can use an existing building control system.:
Exception: Where the building is designed and constructed to comply with an energy code adopted by the local authority, the lighting load shall be permitted to be calculated at the values specified in the energy code where the following conditions are met:
a. A ~~power monitoring~~ system is installed that will provide ~~continuous~~ information regarding the ~~total~~ general lighting load of the building.
b. The ~~power monitoring~~ system will be set with alarm values to alert the building owner or manager if the lighting load exceeds the values set by the energy code.
~~c. The demand factors specified in 220.42 are not applied to the general lighting load.~~
Substantiation: The lighting load for alteration and new buildings is being driven downward so aggressively by energy codes that it may not even be necessary to require a power monitoring system; an existing facility management system may be sufficient. The majority of the buildings on Northern Michigan University's campus are fed from a main switchboard in the central steam plant through an underground power distribution system. Each building has a dedicated electric meter that is connected to the building's facility management system which is centrally monitored by Facilities Department staff. The facility management system has trending and alarm capabilities that could be utilized for monitoring the building electrical load.

Lighting load is usually only about 25% of a building's electrical load. Overloads due to lighting are extremely unlikely and when they are present they will be taken out by overcurrent devices therefore Condition (c) may be deleted.
Panel Meeting Action: Reject
Panel Statement: The submitter does not justify changing the "power monitoring system" required in Proposal 2-228 to a more general monitoring system. The purpose of the power monitoring system is to provide continuous information about the lighting load of the building.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-110 Log #910 NEC-P02 **Final Action: Accept**
(Table 220.12)

Submitter: Brooks H. Baker, III, University of Alabama at Birmingham
Comment on Proposal No: 2-228
Recommendation: The University of Alabama at Birmingham supports the acceptance of Proposal 2-228 that permits an exception to the prescriptive unit load lighting requirements of Table 220.12 and urge the technical committee to approve it for inclusion into the 2014 National Electrical Code.
Substantiation: When undertaking a design of a project and the load data is submitted to the utility company for transformer sizing, they typically undersize the transformer based on their historical data. Oversizing a transformer as currently required has a downstream affect on the overall design of a project in that it could increase the size requirement of the room, which then impacts the overall project budget and can impact the sizing of program space.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
ORLOWSKI, S.: See reason statement on Comment 2-108.

2-111 Log #911 NEC-P02 **Final Action: Accept**
(Table 220.12)

Submitter: Kevin Folsom, Dallas Theological Seminary
Comment on Proposal No: 2-228
Recommendation: Dallas Theological Seminary supports the acceptance of Proposal 2-228 that permits an exception to the prescriptive unit load lighting requirements of Table 220.12 and urge the technical committee to approve it for inclusion into the 2014 National Electrical Code.
Substantiation: For the past 50 years we have had a utility-owned oil-filled transformer that is installed in the basement of one building with feeders running out to 5 other other adjacent buildings at 480 volts. When it was installed in 1972 it was 70% underloaded. Today, it is 30% underloaded based upon their ambient ratings. (They could be driven up to 150% of rated kVA for very short periods of time). There are several problems with this:1. Even though the utility owns this transformer a large amount of un-used and unnecessary electrical energy has been present in the building that typically presents a proportional unnecessary flash risk to any electrician
2. This transformer has dumped unnecessary waste heat into the building for a half century and has raised our cooling costs
3. Now the aging transformers are failing and there is no way to get them out safely and quickly.
While utilities are not bound to NEC rules for calculating electrical load within the building, this installation demonstrates how prospective load assumptions for the other 5 buildings that are built into Chapter 2 calculation methods are not keeping pace with changes in energy codes that are driving power densities downward. While Proposal 2-228 may well create capital expenditure in terms of power monitoring systems, it is a significant step in the right direction.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
ORLOWSKI, S.: See reason statement on Comment 2-108.

2-119a Log #841 NEC-P02 **Final Action: Accept**
(220.12 (New))

Submitter: Gaylan Bishop, The University of North Carolina - Chapter Hill
Comment on Proposal No: 2-228
Recommendation: Continue to accept Proposal 2-228.
Substantiation: The University of North Carolina supports the effort by the education facilities industry, represented by APPA.ORG's Standards Council, to bring the 2014 NEC in step with rapidly evolving energy codes by reducing the size of building services which have shown themselves to be significantly oversized for decades. National energy codes are moving very quickly and confirm the wisdom of the committee's acceptance of this proposal.
Two pages from Addendum BH of ASHRAE 90.1 (the dominant energy code in the US) which asserts lower lighting power densities for a variety of spaces. Much of it is derived from Illuminating Engineering Society studies and is far more granular than Table 220.12 but a few samples where "unit load" and "lighting power densities" (measured in VA/sqft and watts/sqft. Respectively) confirm the need to continue to accept this proposal.
For Banks: Table 220.12 requires 3.5 VA/sqft but ASHRAE 90.1 requires 1.01 watts/sq ft.
For Schools: Table 220.12 requires 3.0 VA/sqft but ASHRAE 90.1 requires 1.34 watts/sq ft.
For Offices: Table 220.12 requires 3.5 VA/sqft but ASHRAE 90.1 requires 1.1 watts/sq ft.
For Assembly Halls: Table 220.12 requires 1.0 VA/sqft but ASHRAE 90.1 requires 0.63 watts/sq ft.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept

2-119b Log #1068 NEC-P02 **Final Action: Accept**
(220.12 (New))

Submitter: Michael A. Anthony, University of Michigan / Rep. APPA.ORG Standards and Codes Council
Comment on Proposal No: 2-228
Recommendation: Continue to accept Proposal 2-228.
Substantiation: Much more could be accomplished to reduce incident energy and to avoid energy loss and material waste. Coordinated changes to Table 220.42, Articles 230, 450 and 490 in the 2017 NEC revision by a Task Group appointed by the Technical Correlating Committee would be welcomed. For the moment, Proposal 2-228 -- derived from many safety concepts presented by many others in the past four NEC cycles, supported with significant technical substantiation accumulated by APPA.ORG's Standards Council in the proposal stage -- is a step in the right direction.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
ORLOWSKI, S.: See reason statement on Comment 2-108.
Comment on Affirmative:
KING, D.: See my comments on 2-119C.

2-119c Log #1069 NEC-P02 **Final Action: Reject**
(220.12 (New))

Submitter: Michael A. Anthony, University of Michigan / Rep. APPA.ORG Standards and Codes Council0
Comment on Proposal No: 2-228
Recommendation: Modify the Proposal 2-228 acceptance as follows:*Exception* ***1***: ***In other than dwelling occupancies,*** ~~*W*~~*where the building is designed and constructed to comply with an energy code adopted by the local authority, the lighting load shall be permitted to be calculated at the values specified in the energy code where the following conditions are met*
a. A power monitoring system is installed that will provide continuous information regarding the total general lighting load of the building.
b. The power monitoring system will be set with alarm values ***to*** *alert the building owner or manager if the lighting load exceeds the values set by the energy code.*
c. The demand factors specified in 220.42 are not applied to the general lighting load.
Exception 2. *In dwelling occupancies, lighting load shall be permitted to be calculated at the values specified in the energy code adopted by the local jurisdiction*
Exception 3. *If the lighting branch circuit in any of the occupancy types of Table 220.12 is supplied through a device that limits its current, the load shall be permitted to be calculated based on the rating of the device used to limit the current.*
Substantiation: Admittedly, this comment presents a fairly cumbersome set of exceptions to permit NEC-adopting jurisdictions to reconcile competing priorities of safety and economy.
The committee member representing the National Association of Homebuilders makes a fair point about the requirement for power monitoring in dwelling occupancies, however. There may be a simpler way to partition the applicability of this exception but at least this modification places an exception- within-an-exception for the committee to consider and changes the accepted language the least. This is the concept underlying Exception 2.
For the convenience of the committee, some of the lighting power densities, using the IES 'space-by-space' method, and referenced into ASHRAE 90.1 Addendum BH, are reproduced below:
Corridors: 0.66 VA/sqft
Food preparation areas: 1.21 VA/sqft
Laundry areas: 0.60 VA/sqft.
Lounges: 0.73 VA/sqft
Restrooms: 0.98 VA/sqft
Note the trend toward more granular identification of use-types within occupancies in the IES/ASHRAE documents. Table 220.12 specifies 3 VA/sqft for dwelling units with no further granularity. While ASHRAE 90.1 may only

deal with everything but 'Low-Rise Residential Buildings' it does offer insight into a trend in energy codes applicable to high-rise residential buildings, with space use roughly similar.

The concern by one of the negative votes that fixed lighting load will be transferred to task lighting is noteworthy but can be discussed in light of the following:1. Regarding: *"Energy code calculations immediately require the end user to supplement general lighting with additional task lighting"* Response: Even task lighting "bulbing" and controls are being driven downward by innovations in illumination technology.

2. Transformers for dwelling occupancies are typically remote (i.e. exterior) and owned by the utility. Branch circuit overloading is instantly removed with overcurrent and short circuit devices that minimizes fire hazard.

Exception 3 captures the concept underlying Proposal 2-335 Log #148 that CMP-2 Accepted in Principle during the last NEC revision cycle. That concept now appears as an exception in 220.43(B) and widens the practical application of this exception to the more common case in which a transformer supplies both lighting and receptacle loads. Dedicated panelboards or intelligent circuit breakers would not be required.

Much could be accomplished to reduce incident energy and avoid energy loss and material waste by making coordinated changes to Table 220.42 in the 2017 NEC revision cycle. For the moment, Proposal 2-228 -- derived from many safety concepts presented by others in the past 4 NEC cycles -- is a step in the right direction.

Panel Meeting Action: Reject

Panel Statement: The submitter adds two additional exceptions to a proposal for 220.12 but references 230.201 (New). The new Exception 2 removes the need for monitoring the lighting load in dwelling occupancies but without sufficient justification. The substantiation describes various VA/sqft loads in areas of buildings in other codes or documents. Further granularity in the lighting load for building corridors, lounges, and other non-dwelling areas of buildings is considered in Table 220.12.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

ORLOWSKI, S.: See reason statement on Comment 2-108.

Comment on Affirmative:

KING, D.: I support the comment on ROP 2-228 with the emphasis on the resultant safety to workers that would occur with appropriate sizing and design of electrical equipment and systems. The potential reduced short circuit current and hence incident energy level reduce the significant risk to qualified persons working on those systems.

2-112 Log #37 NEC-P02 **Final Action: Accept**
(220.14(B))

Submitter: Technical Correlating Committee on National Electrical Code®

Comment on Proposal No: 2-232

Recommendation: The Correlating Committee directs the panel to (1) clarify the action on Proposal 2-232 in regard to the appropriateness of the new heading for 220.55, (2) clarify and correlate with the action taken on Proposal 2-245, and (3) clarify the Heading of 220.14(B).

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Revise the title of 220.14(B) to read as follows: "Electric Dryers and Electric Cooking Appliances in Dwellings and Household Cooking Appliances used in Instructional Programs."

Panel Statement: The panel accept the Correlating Committee directive and acknowledges that the revision made in Proposal 2-232 should have been to revise the title in 220.14(B). The revision to 220.55 is covered by Proposal 2-245.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

2-113 Log #851 NEC-P02 **Final Action: Reject**
(220.42)

Submitter: Kathy Richards, Northern Michigan University

Comment on Proposal No: 2-254

Recommendation: Relocate language originally proposed in Proposal 2-254 as a new exception after existing Section 220.42

220.42 General Lighting. The demand factors specified in Table 220.42 shall apply to that portion of the total branch-circuit load calculated for general illumination. They shall not be applied in determining the number of branch circuits for general illumination.

Exception: As an alternative to the lighting load demand factors of Table 220.42 general lighting demand factors for new or existing loads shall be permitted to be based upon lighting power densities specified in an energy code provided the lighting load demand factor is determined by a registered professional engineer.

Substantiation: Table 220.42 needs a significant update – or needs to be removed entirely -- because the occupancy classes it contains is not granular enough for all the occupancy classes now identified in lighting energy codes.

The attachment to this comment (filed with NFPA Staff) is a listing of the various occupancy classes that have been modeled by the Illumination Engineering Society (IES) and ASHRAE 90.1 Addendum BH. Table 220.42 has four occupancy classes PLUS "everything else". The lighting power densities of the 10th Edition of the IES has about 40 different occupancy types. This proposal is a broadening of the applicability of Section 645.25 that was written into the 2011 NEC. It closes the gap between what this section requires for fire safety and what the actual lighting load will be as LED lighting technology.

The oversizing of transformers that results from the design-prescriptive requirements of Article 220 causes us to bring in far more energy into a building than is necessary. Across 40 medium voltage services that supply over 3 million square feet of a variety of occupancy classes typical in a campus setting in the upper peninsula of Michigan, the average demand on a typical service at Northern Michigan University is 21.2 percent of the ambient rating of the transformer. The average watt per square foot load across the Northern Michigan University campus is 1.53 watts per square foot. This loading data is typical for facilities in our industry. Technological innovation has driven down the power requirements of end-use equipment for many years now. An explicit exception to the Article 220 requirement will help our industry and others reduce flash hazard as well as contribute significantly our industry's sustainability objectives.

In light of this, Northern Michigan University supports the effort by the APPA. ORG Standards Council to bring the 2014 NEC in step with rapidly evolving energy codes and to reduce flash hazard by reducing the size of building services. We urge the NEC Technical Correlating Committee to assign a Task Force to discover ways of accomplishing this goal. We urge the NFPA Fire Protection Research Foundation to develop a research project to support the Task Force. In both cases, we would be happy to turn over our electrical demand information for further study.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject

Panel Statement: The suggestion to allow professional engineers to determine the demand factors for lighting loads is too broad for all of the situations involved in Table 220.42. The panel recognizes that in buildings designed to comply with energy codes, the lighting load can be calculated and monitored as defined in Proposal 2-228 allowing an exception to 220.12. In the exception to 220.12, the demand factors in Table 220.42 cannot be used.

2-114 Log #1051 NEC-P02 **Final Action: Reject**
(220.58)

Submitter: George M. Stolz, II, Quicksilver Electrical Training

Comment on Proposal No: 2-247

Recommendation: Accept the proposal in part: substitute 83% where this proposal calls for a 88% reduction, per the action taken on Proposal 6-49a, and force the deletion of 310.15(B)(7).

Substantiation: CMP-2 appears to be unaware that CMP-6 has been effectively reducing the "calculated load" for 30 years with 2011's 310.15(B)(7). Since the reasoning behind 310.15(B)(7) is that dwelling units have a decreased LOAD due to the use of the occupancy, this concept should be moved to Article 220 and be a part of the actual LOAD CALCULATION. The substantiation for this proposal is the presence of 310.15(B)(7) in the 2011 NEC. And the acceptance of Proposal 6-49a in the 2014 cycle. 310.15(B)(7) should be deleted, and normal wire sizing rules should govern over the diverse LOAD.

If Article 220 takes this concept over, then Article 310 can focus on what to do with the load once it's been calculated.

Panel Meeting Action: Reject

Panel Statement: It appears that the submitter is taking aim at 310.15 to delete provisions of that article. However, there is no substantiation to change the way feeder and service conductor loads are computed for dwelling units.

(220.86 (New))

Submitter: Jose Meijer, Peter Basso Associates, Inc.
Comment on Proposal No: 2-252
Recommendation: Accept Proposal 2-252 as written:
220.86+(NEW) Engineering Supervision. As an alternative to the feeder and service load calculations required by Parts III and IV of Article 220, feeder and service load calculations for new or existing loads shall be permitted to be used if performed by qualified persons under engineering supervision.
Substantiation: We would like to respond to the panel's statement point by point:
Claim 1: "*The submitter's substantiation does not justify how a qualified person under engineering supervision could improve upon the rules for calculations in Article 220."*
Response: We believe that a great deal of improvement is possible. From the standpoint of safety, the reduction in transformer kVA that will likely result from the application of informed professional judgment will – in all but a few cases – result in greater electrician safety. Four other committees were presented with significant data that spanned a range of occupancy classes to prove, overwhelmingly, that the prescriptive requirements in Article 220 results in power delivery apparatus that is at least 50 percent over-sized. As consulting engineers we see this every day.
Claim 2: *"The panel does not agree with allowing historical demand as the singular basis for determination of load under the NEC. Historical demand is an indicator of how a particular building is performing, but it is not necessarily providing all of the necessary information for another building in the future."*
Response: If the panel does not agree with allowing historical demand as the singular basis then how did the rules in Article 220 come to be in the first place? Where did the demand values originate from? We believe they were formulated from rules of thumb the better part of 50 years ago when the characteristics of end-use equipment was very different and when the US economy grew at a rate when "building extra capacity" was more likely to be cost-effective. In the economy in which we now live, however, it is more cost effective to wait until an expansion covers the cost of adding to supply service equipment rather than build the service with 50 percent more capacity assuming that the load will grow. The loads are not growing to justify the overcapacity built into the prescriptive requirements of this chapter.
Claim 3: *" The panel takes the position that if the Article 220 calculations are incorrect and arriving at oversized feeders and services (at peaks and not just averages), then proponents should complete a credible study noting how the current calculations are inaccurate and how they should be changed (e.g. lower lighting loading va/sq.ft. etc.)."*
Response: We did provide data in our original proposal. There are over 15 proposals submitted to this committee with similar data that tells the same story. Perhaps not everyone saw the data that accompanied these proposals since the data was contained in the accompanying "reference material" to committee members on a CD.
Finally, the committee should recognize precedent set in other parts of the Code where an engineer's judgment is permitted – Section 430.26 and Section 645.25. For the convenience of the committee those passages are reproduced below:
430.26 Feeder Demand Factor. Where reduced heating of the conductors results from motors operating on duty-cycle, intermittently, or from all motors not operating at one time, the authority having jurisdiction may grant permission for feeder conductors to have an ampacity less than specified in 430.24, provided the conductors have sufficient ampacity for the maximum load determined in accordance with the sizes and number of motors supplied and the character of their loads and duties.
Informational Note: *Demand factors determined in the design of new facilities can often be validated against actual historical experience from similar installations. Refer to ANSI/IEEE Std. 141, IEEE Recommended Practice for Electric Power Distribution for Industrial Plants, and ANSI/IEEE Std. 241, Recommended Practice for Electric Power Systems in Commercial Buildings, for information on the calculation of loads and demand factor.*
Another example:
645.25 Engineering Supervision. As an alternative to the feeder and service load calculations required by Parts III and IV of Article 220, feeder and service load calculations for new or existing loads shall be permitted to be used if performed by qualified persons under engineering supervision.
Panel Meeting Action: Reject
Panel Statement: The submitter points out that special circumstances allow the loads to be calculated to the satisfaction of the AHJ (430.26) or by qualified persons under engineering supervision (645.25). However, there is no substantiation for all load calculations required by Parts III and IV of Article 220 to be modified even if by a qualified person.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-117 Log #1342 NEC-P02 **Final Action: Reject**
(220.87)

Submitter: James E. Degnan, Sparling
Comment on Proposal No: 2-257
Recommendation: Revise text to read as follows:
220.~~87~~ ~~Determining Existing Loads. The calculation of a feeder or service load for existing installations shall be permitted to be determined use the actual maximum demand to determine the existing load under all of the following conditions:~~
~~(1) The maximum demand data is available for a 1 year period.~~
Exception: … ~~*If the maximum demand data for a 1 year period is not available, the calculated load shall be permitted to be based on the maximum demand (measure of average power demand over a 15 minute period) continuously recorded over a minimum 30 day period using a recording ammeter or power meter connected to the highest loaded phase of the feeder or service, based on the initial loading at the start of the recording. The recording shall reflect the maximum demand of the feeder or service by being taken when the building or space is occupied and shall include by measurement or calculation the larger of the heating or equipment load and other loads that may be periodic in nature due to seasonal or similar conditions.*~~
~~(2) The maximum demand at 125 percent plus the new load does not exceed the ampacity of the feeder or rating of the service.~~
~~(3) The feeder has overcurrent protection in accordance with 240.4 and the service has overload protection in accordance with 230.90.~~
220.87 **Existing Loads.** The existing load shall be permitted to be calculated in accordance with 220.87(A) under all of the conditions of either 220.87(B) or 220.87(C).
(A) Calculation. The feeder or service load shall be measured as the average power or current demand over a 15 minute periods, and continuously recorded. The calculated existing load shall be determined from the maximum demand load after adjustment for :
(1) Variations in occupancy
(2) The larger of the seasonal space heating or cooling load
(3) Variations in process or production
(4) Similar factors affecting the measured load
Adjustments shall be based on previous or projected: occupancy, process demand, or seasonal environment.
(B) General Metering
(1) The calculated existing load at 125 percent, plus the feeder calculations for any new load does not exceed the ampacity of the feeder or rating of the service.
(2) The service has overload protection in accordance with 230.90
(3) The metering is in place for a minimum of 30 days.
(4) The metered load is measured on the highest loaded phase after an initial measurement at the start of the recording.
(C) Permanent Metering on Feeders or Services Rated Over 1000 Amperes
(1)The maximum demand at 115 percent plus the feeder calculations for any new load does not exceed the ampacity of the feeder or rating of the service.
(2) The service has overload protection in accordance with 230.90
(3) The overcurrent protective device assembly for the feeder or service is larger than 1000 amperes and is listed for operation at 100% of its rating.
(4) The metering is permanent, has been in place for a minimum of one year and will remain in place, measures the current on each phase, and complies with one of the following:
a. The meter is the utility service meter and the service is being measured.
b. The metering is an integral part of the feeder or service overcurrent protective device. Metering data is displayed or exported to a data base that can be read at the facility.
c. The metering transducer is secured to the interior of the panelboard or switchboard, is mounted in a dedicated space, and labeled according to the associated feeder or service. Metering data is displayed or exported to a data base that can be read at the facility.
(5) The distribution system loading is regularly monitored and controlled by a Qualified Person.
(6) At the point where the load is measured the circuit conductors exceed 250 volts to ground.
Substantiation: The panel is encouraged to take another look at proposal 2-257. The above text is the nearly the same as the original text, except:
1. The amount of 110% has been increased to 115%.
2. (C)(6) has been added
3. "accessible" has been edited out for compatibility with the NEC definition of the word, and other minor editing.
In rejecting the proposal the panel seeks substantiation for reducing the safety margin from 125 to 110%. Many provisions of the NEC are written based on judgment and experience without a specific link to analysis that clarifies why one number was chosen as opposed to another number that might be different by a moderate amount. The new proposal of 115% is a reasonable choice, especially with the addition of provision (C)(6). We have to start somewhere!
Substantiation is as follows:
The present version of 220.87 has a safety margin that includes allowances for:
1. Power factor, if only kw is measured,
2. Phase unbalance, if the unbalance is not indicated at the initial measurement.
3. The extent that a load may actually have a substantial component that exists

for more than three hours, requiring derating as a continuous load, but is not revealed by 15 minute windows.

Requiring permanently fixed in place, 3 phase metering will eliminate the portion of the existing safety factor that exists for items 1 & 2. Requiring 100% rated circuit breakers will eliminate the portion of the safety factor that exists for item 3. The submitter maintains that this combined portion of the safety factor should justify the original reduction from 125% to 110%. However recognizing the NEC need for safety, this comment changes the reduction to 115% and adds an additional safety directive that it apply only to loads with a voltage to ground above 250 volts.

At 208 volts, a 100 amp feeder requires a 25% safety margin, yielding about (1.73*208*100*.25=) 9kVA. Applying the same safety margin to a 1000 amp, 208 volt feeder yields (1.73*208*1000*.25=) 90 kVA. It is much more likely for a 9 kVA load to appear after detailed load monitoring and exceed the capacity of a 100 amp system than it is for a 90 kVA load to appear and exceed the capacity of a 1000amp system (or even ten 9kVA loads to appear). Hence the justification for only allowing the reduced safety margin to apply to systems over 1000 amps. Still, the need for caution with a new code development is understood. With the addition of the requirement for the feeder to exceed 250 volts to ground the kVA safety margin will improve substantially over what the code would accept for 208 volt systems. In the preceding example, if the 1000 amp feeder is 480 volts instead of 208, the kVA safety margin increases to over 200kVA. . Reducing this to a 15% margin constitutes a load of 120kVA. Clearly in a facility that has permanently fixed in place metering, with Qualified Personnel, a load of this magnitude will not appear on the system without due consideration. The logic and benefits increase with even higher voltages.

This provision of the code will help to encourage permanent metering which will support more efficient use and safer electrical systems.

Panel Meeting Action: Reject

Panel Statement: The submitter had not provided data to show that the Code requirement for maximum demand plus 25% is excessive when adding loads to existing installations.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

ARTICLE 225 — OUTSIDE BRANCH CIRCUITS AND FEEDERS

4-2 Log #1248 NEC-P04 **Final Action: Reject**
(225.1)

Submitter: John Masarick, Independent Electrical Contractors, Inc.

Comment on Proposal No: 4-11

Recommendation: Reject this proposal which would change 600 volts to 1000 volts.

Substantiation: Replacing 600 volts with 1000 volts will have a major impact on installers, component manufacturers, and industry standards. Increased spacing must be considered when going from 600 volts to 1000 volts. Personal safety must also be considered.

Because the proposer has not provided enough information to the public to justify and understand all the ramifications of the proposal, the committee should continue to reject the submitter's proposal.

Panel Meeting Action: Reject

Panel Statement: The acceptance of the original proposal does not mandate that all equipment and systems be operated at the elevated voltage but rather allows the operation at a higher level if necessary. This change is necessary to keep pace with changes in technology.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

STAFFORD, T.: See comment on 4-3.

ZINNANTE, V.: While I recognize that certain systems operate above 600V and the High Voltage Task Group wanted to increase the low voltage threshold from 600V to 1000V throughout the Code, I do not feel that adequate technical substantiation was ever provided to support this wholesale change. There was never any substantiation presented that increasing the voltage level from 600V to 1000V would not affect equipment and terminal spacing, arc /blast effects on overcurrent devices,or working clearances, to name a few. Without this information, I believe we ignore the basic tenet of the NEC as outlined in 90.1(A).

4-3 Log #622 NEC-P04 **Final Action: Accept**
(225.1, Informational Note)

Submitter: James T. Dollard, Jr., IBEW Local 98

Comment on Proposal No: 4-11

Recommendation: Continue to Accept in Principle.

Substantiation: This comment is submitted by a single individual and does not represent the work or input of the high voltage task group (HVTG). This comment attempts to address concerns stated in the negative. Safety of all electrical workers must be the first consideration when the technical committee considers raising the voltage threshold. This submitter greatly appreciates the technical committee members concern for the safety of all electrical workers. I have reviewed the impact on worker safety in each of these proposals. As the safety coordinator for IBEW Local 98 in Philadelphia, I could not support raising the voltage threshold if I felt there was a safety concern that we could not address. If there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.

The work of the high voltage task group was very broad in nature. It is widely recognized and understood that emerging technologies such as small wind and PV are breaking the 600-volt threshold making these alternative energy sources more efficient. The HVTG was directed to review this issue and to submit proposals to generate a shift in NEC requirements to specifically address these new system voltages. The HVTG submitted proposals to the technical committees with specific expertise to let each individual CMP make the decision on raising the voltage threshold. We needed a placeholder in all locations. Any CMP that felt there was a safety issue rejected the proposal. The HVTG supported those rejections in each case. The final decision lies with the technical committee.

It is important to note that if this technical committee raises the voltage threshold from 600 to 1000-volts in the NEC, the only change is the " voltage threshold level" of the installation requirement. This change in the voltage threshold level does not permit conductors and equipment rated at 600-volts to be used at 1000-volts. That would require the conductors and equipment to be tested and listed for such use. See NFPA 70 110.3(B). There are many products that are already listed and marked for this use.

NFPA 70E requires that all employees who face a risk of electrical hazard that is not reduced to a safe level by the applicable electrical installation requirements be trained to understand the specific hazards they face. See 70E 110.2. Qualified persons are required. Energized work is only permitted where justified. See 130.2. Personal Protective equipment, including but not limited to voltage rated gloves and arc rated clothing are readily available. Training programs for electrical safe work practices for voltages over 600-volts are readily available.

There are meters and other test instruments readily available for use today at 1000-volts. It should be noted that NFPA 70E 110.4 requires all test instruments to be properly rated and used only by qualified persons. NFPA 70E 110.2(D)(1)(4)(e) requires the qualified person be trained on the proper use and limitations of the test instrument. A quick Google search revealed the following, there are more:

Fluke 77IV, general purpose digital meter, 1000-vac, 1000-vdc

Ideal 490, general-purpose digital meter, 1000-vac, 1000-vdc

In closing, I would like to repeat that if there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

STAFFORD, T.: Making a universal change for increasing the voltage level allowed on conductors and equipment will present different working parameters into which electrical workers will be exposed. Additional information is needed by this panel member as to: how working spaces will be required to change, arc fault/blast clearances that will be updated, testing and utilization equipment used by electrical workers, terminal clearances, etc.

It is agreed by this panel member that renewable energy installations are seeking higher thresholds for efficiency. At the same time it is recognized by this panel member that allowance of 1000 volt systems is going to present unique challenges and introduce confusion due to misinformation. For example, a PV (or other renewable system) could have been installed in 2010 (600 volt) and an additional system to be installed in 2015 (1000 volt) such that two different voltage threshold systems may be installed on the same premises. There is no indication to the electrician that two different systems are present, at different working voltages. This will lead to improper protective equipment, metering devices, conductor insulation types being installed. The list is long and does reflect concerns into the safety integrity of the system, as well as to the electrical worker.

Without a method required to verify and mandate safety by all listing, testing and verification agencies, this will lead to mistakes in the field resulting in damage to equipment or personnel safety. It is agreed that training and qualified workers are to be performing all work on all systems. NFPA 70E does require that all persons who face a risk of electrical hazard to understand the hazards in place. This panel members concern is that not all electrical workers will be aware of ALL hazards involved including an increased voltage level for which they do not have the proper equipment, or PPE to satisfy the voltage level. This will not be due to lack of knowledge but rather confusion into a system level of which they will be exposed without knowledge.

ZINNANTE, V.: See my Explanation of Negative Vote on 4-2.

4-4 Log #659 NEC-P04 **Final Action: Accept**
(225.1, Informational Note)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 4-11
Recommendation: Continue to Accept in Principle.
Substantiation: This comment is submitted on behalf of the high voltage task group to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

4-7 Log #1099 NEC-P04 **Final Action: Reject**
(225.4 Exception)

Submitter: John Sigmund, American Chemical Council

Comment on Proposal No: 4-16

Recommendation: Revise text to read as follows:

225.4

Exception: Equipment ~~grounding~~ bonding conductors and grounded circuit conductors shall be permitted to be bare or covered as specifically permitted elsewhere in this code.

Substantiation: The term Equipment Grounding Conductor needs to be replaced. Those opposed have no technical reason for their opposition or any other valid reason. It is not worth the effort and everyone understands what is meant are common responses.

It is very simple: Grounding electrode conductors are the connection to the earth and accomplish grounding. In the present NEC, Equipment Grounding Conductors and bonding jumpers provide a “path back” to the source. Both are always performing a bonding function. If the Grounding Electrode connection is removed or broken, the bonding function remains intact.

Section 250.4 does not permit the earth (ground) to be used as an effective ground fault current path but the term equipment grounding conductor inherently incorrectly contains the word “ground”.

Visualize equipment supplied by a portable generator. The generator frame is not required to be connected to the earth.

The “green” wire in the flexible cord is not performing a grounding function but is performing a bonding function.

Visualize building one supplied by a service, having the grounded conductor connected to the grounding electrode system by a grounding electrode conductor. A feeder supplies a second building and a grounding electrode conductor is required for grounding any equipment in the second building. An equipment grounding conductor is required to be installed from building 1 to building 2. Not for grounding, but for bonding, providing an effective fault current path.

Making this change has the added benefit of being more harmonized with other international standards and usage of terminology.

Experienced NEC users have to ignore other concepts in other definitions and requirements to use the existing term.

This does not help the future NEC user or provide clarity in the existing NEC. Changing the term is the right thing to do and should be supported.

Panel Meeting Action: Reject

Panel Statement: The term, equipment grounding conductor (EGC), is used throughout the code and is well understood. Making this change in 225.4 will conflict with the use of EGC throughout the code.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

GIBBS, M.: The panel should accept the original proposal. The proposal improves the technical accuracy of the use of the terms “equipment grounding conductor” and “equipment bonding conductor”. The IEEE has reviewed all the statements on this subject by various panels. The following represents the IEEE position on the issue of equipment grounding conductor or equipment bonding conductor. Similar proposals have been presented in the past and have been rejected. Reasons given often relate to cost, significant changes in documentation required, or the fact that knowledgeable people understand the use of this conductor. There is no justification for retaining an incorrect and potentially hazardous electrical installation just because this definition has been used in the NEC for many years. Costs associated with documentation changes should never be an argument where safety is concerned. Further, not all electrical practitioners are knowledgeable in the main intent of this conductor. The intent of the proposed change is to provide a descriptive name to a construction element that has resulted in much misunderstanding with possible hazardous operating conditions in electrical installations. The use of the term “grounding” implies that grounding is its principal function. Although grounding may be desirable, providing an effective fault current path (i.e. bonding) is and should be the emphasis. There are many who assert that a connection to a water pipe meets the needs of equipment grounding, however, this connection does not perform the necessary effective fault current path back to the source. There are two conductors described in the Code performing the same function but named differently. The “bonding jumper” is a short conductor that assures the electrical integrity of enclosure to raceway. The longer conductor, intended to provide a low impedance path to the source, is presently named a “grounding” conductor instead of its real function as a “bonding” conductor. Technically, the definition in Article 100 may be adequate for Panel members and those that teach. Practically, the definition is confusing if the terminology does not fit the function performed. The equipment bonding conductor, as it should be called, provides its primary function whether or not it is grounded. For a grounded system, it is grounded because the system is grounded. For an ungrounded system, it is grounded to limit the voltage due to a lightning strike or contact with a higher voltage system. Changing the name will assist in educating users of the Code as to why they are installing a conductor that needs to be continuous all of the way back to the source.

SIGMUND, J.: The term “equipment grounding conductor” needs to be replaced with “equipment bonding conductor” throughout the NEC. Yes, the term equipment grounding conductor in Article 100 would need to be changed to the term equipment bonding conductor.

Some have argued that it is just a problem of education. Having the word “grounding” in a term describing conductor that is used primarily for a bonding function is not a problem to be solved by education.

The use of the term “equipment grounding conductor” is confusing both for those new to the electrical industry and even for some experienced users. The problem is compounded when dealing with other international standards.

No technical reason has been provided for not making the change. This conductor always provides a bonding function but does not always provide a grounding function such as in the case of a portable generator installed as a separately derived system.

Comment on Affirmative:

ROGERS, J.: In reality this is a dual purpose conductor, under normal conditions the submitter is correct and this conductor simply serves to bond various metallic parts together thus limiting any potential differences. However, under fault conditions this conductor serves as the “effective ground fault current return path” and in essence is at that time an extension of the ground connection. The main issue is not what the conductor is called but rather the proper training of personnel that install or service electrical installations so that they clearly understand the importance of this conductive path and how it should be installed. The NEC cannot serve as a training guide and it is not intended to do so all the NEC can do is define proper installation techniques and the language in 225.4 Exception doesn’t define the term “equipment grounding conductor” it simply uses the term to address the fact that these conductors could be bare when part of a branch circuit or feeder. If Panel 5 chose to rename this conductor then I am sure that Panel 4 would accept that renaming and make the appropriate change in any of the Articles that are under the purview of Panel 4.

4-8 Log #1277 NEC-P04 **Final Action: Reject**
(225.4 Exception)

Submitter: Elliot Rappaport, Electro Technology Consultants

Comment on Proposal No: 4-16

Recommendation: Accept proposal.

Substantiation: The term “equipment grounding conductor” is not well understood as evidenced by the number of questions raised at inspectors’ code sessions and code classes

The term “equipment grounding conductor” has a definite purpose that is not uniquely expressed in the term, i.e. “bond the equipment to a terminal at the source of voltage”. As a result, there is a misconception that “grounding”, without bonding to the source, will make a system safe. On the contrary, connecting equipment to ground without providing the bonding connection back to the source can make equipment less safe by increasing the time to clear the fault.

There is generally insufficient significance placed on the importance of bonding over grounding. Bonding provides sufficient ground fault current back to the source of voltage to operate an overcurrent device and clear the fault quickly. Connection to ground limits the voltage to ground on normally non-current-carrying parts during non-fault conditions. During fault conditions, the value of grounding is minimal since the primary safety concern is to remove the fault voltage as quickly as possible. A path to ground for fault current is not necessary since ground fault current must return to the source of voltage, not to ground.

Renaming this conductor as an "Equipment Bonding Conductor (EBC)" will clarify that the primary purpose of this conductor is to bond to the source in order to provide a known path for ground fault current that will facilitate rapid fault clearing.

It is recognized that the term "EGC" has been in use for a long time and that changing it to EBC will cause some concerns including changing written literature that uses the EGC term. After the initial period of understanding, users will correctly understand the purpose of this conductor and this will enhance the safety of personnel.

The fundamental purpose of this and companion proposals is to clearly state that "systems" are "grounded" and "equipment" is "bonded". The fact that the bonding conductor may be grounded also is secondary to the primary function of bonding.

Panel Meeting Action: Reject

Panel Statement: The term, equipment grounding conductor (EGC), is used throughout the code and is well understood. Making this change in 225.4 will conflict with the use of EGC throughout the code.

4-10 Log #661 NEC-P04 **Final Action: Accept**

(225.8)

Submitter: James T. Dollard, Jr., IBEW Local 98

Comment on Proposal No: 4-18

Recommendation: Continue to Accept in Principle.

Substantiation: This comment is submitted on behalf of the high voltage task group to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

4-11 Log #625 NEC-P04 **Final Action: Accept**

(225.10)

Submitter: James T. Dollard, Jr., IBEW Local 98

Comment on Proposal No: 4-19

Recommendation: Continue to Accept in Principle.

Substantiation: This comment is submitted by a single individual and does not represent the work or input of the high voltage task group (HVTG). This comment attempts to address concerns stated in the negative. Safety of all electrical workers must be the first consideration when the technical committee considers raising the voltage threshold. This submitter greatly appreciates the technical committee members concern for the safety of all electrical workers. I have reviewed the impact on worker safety in each of these proposals. As the safety coordinator for IBEW Local 98 in Philadelphia, I could not support raising the voltage threshold if I felt there was a safety concern that we could not address. If there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.

The work of the high voltage task group was very broad in nature. It is widely recognized and understood that emerging technologies such as small wind and PV are breaking the 600-volt threshold making these alternative energy sources more efficient. The HVTG was directed to review this issue and to submit proposals to generate a shift in NEC requirements to specifically address these new system voltages. The HVTG submitted proposals to the technical committees with specific expertise to let each individual CMP make the decision on raising the voltage threshold. We needed a placeholder in all locations. Any CMP that felt there was a safety issue rejected the proposal. The HVTG supported those rejections in each case. The final decision lies with the technical committee.

It is important to note that if this technical committee raises the voltage threshold from 600 to 1000-volts in the NEC, the only change is the " voltage threshold level" of the installation requirement. This change in the voltage threshold level does not permit conductors and equipment rated at 600-volts to be used at 1000-volts. That would require the conductors and equipment to be tested and listed for such use. See NFPA 70 110.3(B). There are many products that are already listed and marked for this use.

NFPA 70E requires that all employees who face a risk of electrical hazard that is not reduced to a safe level by the applicable electrical installation requirements be trained to understand the specific hazards they face. See 70E 110.2. Qualified persons are required. Energized work is only permitted where justified. See 130.2. Personal Protective equipment, including but not limited to voltage rated gloves and arc rated clothing are readily available. Training programs for electrical safe work practices for voltages over 600-volts are readily available.

There are meters and other test instruments readily available for use to day at 1000-volts. It should be noted that NFPA 70E 110.4 requires all test instruments to be properly rated and used only by qualified persons. NFPA 70E 110.2(D)(1)(4)(e) requires the qualified person be trained on the proper use and limitations of the test instrument. A quick Google search revealed the following, there are more:

Fluke 77IV, general purpose digital meter, 1000-vac, 1000-vdc

Ideal 490, general-purpose digital meter, 1000-vac, 1000-vdc

In closing, I would like to repeat that if there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.

This comment attempts to address concerns stated in the negative. Safety of all electrical workers must be the first consideration when the technical committee considers raising the voltage threshold. This submitter greatly appreciates the technical committee members concern for the safety of all electrical workers. I have reviewed the impact on worker safety in each of these proposals. As the safety coordinator for IBEW Local 98 in Philadelphia, I could not support raising the voltage threshold if I felt there was a safety concern that we could not address. If there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.

The work of the high voltage task group was very broad in nature. It is widely recognized and understood that emerging technologies such as small wind and PV are breaking the 600-volt threshold making these alternative energy sources more efficient. The HVTG was directed to review this issue and to submit proposals to generate a shift in NEC requirements to specifically address these new system voltages. The HVTG submitted proposals to the technical committees with specific expertise to let each individual CMP make the decision on raising the voltage threshold. We needed a placeholder in all locations. Any CMP that felt there was a safety issue rejected the proposal. The HVTG supported those rejections in each case. The final decision lies with the technical committee.

It is important to note that if this technical committee raises the voltage threshold from 600 to 1000-volts in the NEC, the only change is the " voltage threshold level" of the installation requirement. This change in the voltage threshold level does not permit conductors and equipment rated at 600-volts to be used at 1000-volts. That would require the conductors and equipment to be tested and listed for such use. See NFPA 70 110.3(B). There are many products that are already listed and marked for this use.

NFPA 70E requires that all employees who face a risk of electrical hazard that is not reduced to a safe level by the applicable electrical installation requirements be trained to understand the specific hazards they face. See 70E 110.2. Qualified persons are required. Energized work is only permitted where justified. See 130.2. Personal Protective equipment, including but not limited to voltage rated gloves and arc rated clothing are readily available. Training programs for electrical safe work practices for voltages over 600-volts are readily available.

There are meters and other test instruments readily available for use to day at 1000-volts. It should be noted that NFPA 70E 110.4 requires all test instruments to be properly rated and used only by qualified persons. NFPA 70E 110.2(D)(1)(4)(e) requires the qualified person be trained on the proper use and limitations of the test instrument. A quick Google search revealed the following, there are more:

Fluke 77IV, general purpose digital meter, 1000-vac, 1000-vdc
Ideal 490, general-purpose digital meter, 1000-vac, 1000-vdc

In closing, I would like to repeat that if there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.

4-20 Log #665 NEC-P04 **Final Action: Accept**
(225.19)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 4-32
Recommendation: Continue to Accept in Principle.
Substantiation: This comment is submitted on behalf of the high voltage task group to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

4-21 Log #510 NEC-P04 **Final Action: Reject**
(225.22)

Submitter: Robert A. Jones, IEC Texas Gulf Coast
Comment on Proposal No: 4-36
Recommendation: Accept proposal 4-36.
Substantiation: Please explain the meaning of "suitable for wet locations". According to the UL White Book 2012 "Electrical Equipment for use in Ordinary Locations" there are four definitions: dry location, damp location, wet location, and outdoor use. Under the heading "Enclosure Types" are the terms raintight, rainproof, and watertight and these terms are also defined in Article 100. I submitted proposal 1-66 to define the phrase "suitable for wet locations" as an effort to establish the criterion that an exterior installation would be required to meet. I do not know of any listing as "suitable for wet locations". I have tried to find a technical paper or report about condensation within a conduit and I cannot locate such a document. Since the panel statement refers to condensation I assume there must be a technical report or study to support that statement and I respectfully request Panel 4 to direct me to that study or report.
I still contend that if the installation is in compliance with all NEC requirements, the interior of a raceway that is raintight will not have anything to drain.
Panel Meeting Action: Reject
Panel Statement: Condensation in raceways is a real problem. Provisions are necessary to drain and/or prevent condensation from filling the raceway system and possibly infiltrating equipment to which the raceway is connected.

(225.30(F) (New))

Submitter: Jim Yancey, NC State Construction Office
Comment on Proposal No: 4-47
Recommendation: Clarifying proposal: Proposal was to allow additional generators at a building not paralleling generators which is what the committee addressed.
Substantiation: Same as submitted: I would like the committee to address as written above not from a parallel generator stand point which was not the intention. That was just an exception not the main request.
Panel Meeting Action: Reject
Panel Statement: Multiple generators are permitted by 225.30(A), (B), (C), and (D).
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
ROGERS, J.: It is unclear why you believe that 230.2 needs to be used to address this issue when the same allowances exist in 225.30. You are correct that these are feeders and not services and 225 should be used. It is also unclear if the use of the generators in question is cogeneration, load shedding or alternative power sources for either optional or required standby systems. Any of the allowances listed in 225.30 A through E permit the installation of more than one feeder to a building for these purposes. The language in the original proposal would not meet the requirements found in the NEC Manual of Style as it doesn't make a complete concise requirement.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

Panel Meeting Action: Accept

ZINNANTE, V.: See my Explanation of Negative vote on Comment 4-2.

4-31 Log #130 NEC-P04 **Final Action: Accept**
(225.51 Exception)

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 9-14l
Recommendation: The Correlating Committee understands that the panel action in this proposal incorporates the modified definition of “Metal Enclosed Power Switchgear” to “Switchgear” in Proposal 9-7.

It was the action of the Correlating Committee that this proposal be referred to Code-Making Panel 4 for action.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-32 Log #1552 NEC-P04 **Final Action: Accept**
(225.52(A))

TCC Action: The Correlating Committee directs 225.52(A) be revised to comply with the NEC Style Manual as follows:
“A building or structure disconnecting means shall be located in accordance with 225.32, or, if not readily accessible, it shall be operable by mechanical linkage from a readily accessible point. For multibuilding industrial installations under single management, it shall be permitted to be electrically operated by a located readily accessible remote-control device in a separate building or structure...”
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-69
Recommendation: Accept the proposal.
Substantiation: The proposal does address the location of the disconnecting means, just as surely as 230.205(A) does the same for medium voltage service disconnecting means. For campus-style industrial occupancies, a pole-mounted disconnect will often be placed in an outdoor feeder and not in conductors supplied directly by the utility. The safety concerns will be identical to those that prompted CMP 4 to previously accept a proposal by this submitter and place the parallel language in the service article.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-33 Log #247 NEC-P04 **Final Action: Accept**
(225.52(C))

Submitter: Edward G. Kroth, Verona, WI
Comment on Proposal No: 4-74
Recommendation: Proposal 4-74 should have been “Accepted in Principle.”
Substantiation: Proposals 4-73 and 4-74 both address 225.52(C) and both are reported as accepted. Since these two proposals have slightly different wordings, but the same intent, one of these should have been reported as accepted in principle. Proposal 4-73 from the task group is the one that should be accepted as it aligns with similar proposals that have been accepted by other CMPs and would therefore provide consistency with these other sections which was one of the intentions of the task group and my individual proposal.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-34 Log #1579 NEC-P04 **Final Action: Reject**
(225.52(F))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 4-79
Recommendation: Revise text to read as follows:
225.52 Disconnecting Means.
(F) Identification. Where a building or structure has any combination of feeders, branch circuits, or services passing through or supplying it, a permanent plaque or directory shall be installed at each feeder and branch-circuit disconnect location that denotes all other services, feeders, or branch circuits supplying that building or structure or passing through that building or structure and the area served by each. <u>If the building or structure is not required to have disconnects, the permanent plaque or directory as required above shall be installed at each point the circuits passing through enter.</u>
Substantiation: Let us start with the purpose of 225.51(F). I believe it is to protect electricians working on circuits in the building or structure and to protect firemen in the case they need to enter the building under emergency conditions.
The most extreme case is a building or structure that has no electrical equipment but has circuits feeding through it.
Panel Meeting Action: Reject
Panel Statement: All feeder and branch circuit conductors that either enter or pass through a building are already required to have a disconnect.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

9-9 Log #47 NEC-P09 **Final Action: Accept**
(225.70)

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 4-86
Recommendation: The Correlating Committee directs that Panel 4 reconsider the panel action accepting the words “shall include consideration of the following” as the wording is not enforceable and consider changing the text to “shall include the following” or similar wording.

The Correlating Committee clarifies that Code-Making Panel 4 has accepted Proposal 4-89 to transfer the text in 225.70 for substations to Article 490 covering equipment over 600 volts. By this transfer of text, the jurisdiction of the definition of “substation” is now assigned to Code-Making Panel 9 and the existing text in 225.70 is transferred to a new section in Article 490.

The Correlating Committee directs that this proposal be forwarded to Code-Making Panel 9 for action.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Accept the assignment of jurisdiction from the Correlating Committee over the technical content of Proposal 4-86. Accept the underlying proposal in principle. Revise the version of new 490.48 as accepted under Proposal 9-179 to incorporate the concepts presented in Proposal 4-86, and the corrections offered under Comments 9-78 and 9-79, as follows:

490.48. Substation Design, Documentation, and Required Diagram.

(A) Design and Documentation. Substations shall be designed by a qualified licensed professional engineer. Where components or the entirety of the substation are listed by a qualified electrical testing laboratory, documentation of internal design features subject to the listing investigation shall not be required. The design shall address but not be limited to the following topics and the documentation of this design shall be made available to the authority having jurisdiction.
1. Clearances and exits
2. Electrical enclosures
3. Securing and support of electrical equipment
4. Fire protection
5. Safety ground connection provisions
6. Guarding live parts
7. Transformers and voltage regulation equipment

8. Conductor insulation, electrical and mechanical protection, isolation, and terminations
9. Application, arrangement, and disconnection of circuit breakers, switches, and fuses
10. Provisions for oil filled equipment
11. Switchgear
12. Surge arrestors

(B) Diagram. A permanent single-line diagram of the switchgear shall be provided in a readily visible location within the same room or enclosed area with the switchgear and this diagram shall clearly identify interlocks, isolation means, and all possible sources of voltage to the installation under normal or emergency conditions, and the marking on the switchgear shall cross-reference the diagram.

Exception: Where the equipment consists solely of a single cubicle or metal-enclosed unit substation containing only one set of high-voltage switching devices, diagrams shall not be required.

Panel Statement: CMP 9 has generally adhered to the concepts presented in Proposal 4-86, but with some reorganization leading to improved list formatting. The change in sentence structure addresses the Correlating Committee reservation relative to enforceable text. CMP 9 has removed the phrase “engaged primarily in the design of substations” because engineers who make this topic their primary occupational focus are extremely unusual; CMP 9 prefers to rely on the word “qualified” which should be used to exclude engineers without experience performing this design work. Legal constraints strongly discourage unqualified engineering work and CMP 9 prefers to rely on those constraints and not overly burden the design process. CMP 9 has also incorporated a design exclusion for the internal detail of listed equipment, in accordance with the general code principles set forth in 90.7. CMP 9 modified the topics from those accepted under Proposal 4-86 as follows:

1. The “General” heading has been removed and the constituent parts divided under other topics. The “rooms and spaces” and the “exits” topics are combined into “clearances and exits” in order to confine the coverage to electrical issues covered in the NEC and avoid purely architectural subjects.
2. “Protective Grounding” is changed to terminology used in 490.47 and to avoid confusion with equipment and system grounding topics covered in Article 250.
3. The “fire extinguishing equipment” topic is broadened to “fire protection” to encompass fire separations and sprinkler provisions addressed in Article 450.
4. “Guarding Live Parts” is unchanged.
5. “Transformers and Regulators” becomes “Transformers and voltage regulation equipment if provided” to clarify the intent because the term “regulator” is undefined in the NEC.
6. The “Conductors” topic is rearranged to read as a simple list item.
7. The “Circuit Breakers, Switches, and Fuses” topic is rearranged to read as a simple list item; “Devices containing oil” is changed to “Provisions for oil-filled equipment” in a separate list item because other components should be included, such as capacitors.
8. The “Switchgear Assemblies” item is simplified to “Switchgear”; all switchgear is assembled from constituent parts and sub-assemblies.
9. “Metal-Enclosed Bus” is deleted because the topic is completely addressed in Article 368.
10. “Surge Arrestors” is unchanged.

CMP 9 believes that all topics addressed in this comment have had full public review because the changes made are either editorial, or where technical the changes reduce and do not exceed the reach of the requirements proposed in Proposal 4-86. The qualifications of the designing engineer are in the wording but reduced in degree from the original proposal. The proposal required documentation of the design by a qualified person; this wording requires the design to be done by a qualified person (clearly implied but not expressly stated in Proposal 4-86) and then addresses the required documentation and who will have access to it.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1
Ballot Not Returned: 1 Coghill, P.
Explanation of Negative:

YOUNG, R.: The requirement “Substations shall be designed by a qualified licensed professional engineer” is overly restrictive. It should at least be changed to “Substations should be designed by a competent engineer” The word “competent” is well defined in dictionaries. The requirement for the designing engineer to have a PE should be left to each state or area to decide. Another option would be to state that “Substations shall be designed by qualified persons knowledgeable about the design, selection of equipment and materials and installation of them”. The over all list should be changed to appear as an informational note as to what should be considered in the design. In part (B), the word “current” should be used in lieu of the word “permanent”.

Comment on Affirmative:

BREITKREUTZ, B.: I agree to accept the comment and jurisdiction but proposal 4-86 should be rejected. State laws cover requirements for engineering and architectural documents to be by licensed professionals or not. State and local laws cover requirements for submittals of engineering and architectural documents for construction permits. Requiring submittal of engineering documents to the AHJ may conflict with law. Requirements for fire protection are covered by other codes and fire protection engineering is a separate discipline.

TCC Action: The Correlating Committee directs that comment 3-31 and Proposal 3-94 be reported as accept to ensure that warning labels are adequately addressed in Article 300.
Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 4-87
Recommendation: The Correlating Committee understands that Code-Making Panel 4 has accepted Proposal 4-89 to transfer the text in 225.70 for substations to Article 490 covering equipment over 600 volts. By this transfer of text, the jurisdiction of the definition of “substation” is now assigned to Code-Making Panel 9 and the existing text in 225.70 is transferred to a new section in Article 490.

The Correlating Committee directs that this proposal be forwarded to Code-Making Panel 9 for action.

This action will be considered as a public comment by Code-Making Panel 9.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

CMP 9 accepts jurisdiction over the topic presented in Proposal 4-87 and rejects the proposal.

Panel Statement: CMP 9 accepts jurisdiction over the topic presented in Proposal 4-87 and rejects the proposal.

CMP 9 agrees with the substantiation presented in proposal 4-88, which sets forth the locations where this topic is already covered in the NEC. With respect to conductors, CMP 9 finds the topic is better covered in Part II of Article 300. CMP 9 notes with concern that CMP 3 rejected the correlating Proposal 3-94, and requests the Correlating Committee review the Final Action by CMP 3 on this topic, as addressed by Comment 3-31.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Coghill, P.
Comment on Affirmative:

HARTWELL, F.: The Correlating Committee should strongly consider reporting Comment 3-31 as “Accept” in order to avoid a technical requirement from disappearing from the NEC without substantiation. The CMP 3 action on the underlying Proposal 3-94 was at least in part the result of circular reasoning, in that it relied on the existence of 225.80. Not all points of access to conductors are addressed in 314.72(E) and 490.53.

(225.80 and 225.81 (New))

TCC Action: The Correlating Committee advises that articles, article scopes, numbers, titles, and assignment of articles within Chapters are the responsibility of the Correlating Committee and the Correlating Committee rejects the panel action. Outdoor overhead conductors over 600 volts are considered a wiring method much the same as the articles in Chapter 3 and belongs with Panel 7. This action correlates with the Panel 7 action of reject on Proposal 7-83 and Comment 7-18.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-95
Recommendation: Continue to accept the proposal in the form accepted by CMP 4 at the ROP meeting.
Substantiation: This is a companion comment to one submitted to remove Article 399 from the NEC. The Correlating Committee should allow this relocation to move forward in the best interests of the NEC. Article 399 does not describe a wiring method; it describes how to engineer outdoor overhead medium voltage wiring. As such it does not belong in Chapter 3. In addition, it should not be a stand-alone article due to the nature of the coverage; it fits perfectly in Part III of Article 225. This portion of the NEC already overhead conductor clearances above open areas (225.60) and above buildings (225.61). This location not only fits editorially within an article entitled "Outdoor Feeders and Branch Circuits", it also assures the subject matter will be addressed by the most qualified panel to tackle the subject. The wiring employed for overhead medium voltage construction does not employ cable constructions and it would be necessary to provide additional personnel within CMP 7 to duplicate the expertise already present in CMP 4 in order to address this topic properly. Any one of these three reasons would be sufficient to justify the relocation; the three of them together make a solid case in terms of sound of code administration.
Panel Meeting Action: Accept
Panel Statement: CMP 4 respects the opinion of the Correlating Committee on Proposal 4-95, that is the subject of this comment. However, CMP 4 agrees with the submitter that these requirements are more appropriate for both the installer and the enforcer in Article 225. These installations are becoming more prevalent throughout the country and the majority of them meet the description

of a feeder. CMP 4 respectfully requests the Correlating Committee review their actions on this proposal.

ARTICLE 230 — SERVICES

4-36 Log #632 NEC-P04 **Final Action: Accept**
(Figure 230.1)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 4-96
Recommendation: Continue to Accept in Principle.
Substantiation: This comment is submitted by a single individual and does not represent the work or input of the high voltage task group (HVTG). This comment attempts to address concerns stated in the negative. Safety of all electrical workers must be the first consideration when the technical committee considers raising the voltage threshold. This submitter greatly appreciates the technical committee members concern for the safety of all electrical workers. I have reviewed the impact on worker safety in each of these proposals. As the safety coordinator for IBEW Local 98 in Philadelphia, I could not support raising the voltage threshold if I felt there was a safety concern that we could not address. If there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.

The work of the high voltage task group was very broad in nature. It is widely recognized and understood that emerging technologies such as small wind and PV are breaking the 600-volt threshold making these alternative energy sources more efficient. The HVTG was directed to review this issue and to submit proposals to generate a shift in NEC requirements to specifically address these new system voltages. The HVTG submitted proposals to the technical committees with specific expertise to let each individual CMP make the decision on raising the voltage threshold. We needed a placeholder in all locations. Any CMP that felt there was a safety issue rejected the proposal. The HVTG supported those rejections in each case. The final decision lies with the technical committee.

It is important to note that if this technical committee raises the voltage threshold from 600 to 1000-volts in the NEC, the only change is the " voltage threshold level" of the installation requirement. This change in the voltage threshold level does not permit conductors and equipment rated at 600-volts to be used at 1000-volts. That would require the conductors and equipment to be tested and listed for such use. See NFPA 70 110.3(B). There are many products that are already listed and marked for this use.

NFPA 70E requires that all employees who face a risk of electrical hazard that is not reduced to a safe level by the applicable electrical installation requirements be trained to understand the specific hazards they face. See 70E 110.2. Qualified persons are required. Energized work is only permitted where justified. See 130.2. Personal Protective equipment, including but not limited to voltage rated gloves and arc rated clothing are readily available. Training programs for electrical safe work practices for voltages over 600-volts are readily available.

There are meters and other test instruments readily available for use today at 1000-volts. It should be noted that NFPA 70E 110.4 requires all test instruments to be properly rated and used only by qualified persons. NFPA 70E 110.2(D)(1)(4)(e) requires the qualified person be trained on the proper use and limitations of the test instrument. A quick Google search revealed the following, there are more:

Fluke 77IV, general purpose digital meter, 1000-vac, 1000-vdc

Ideal 490, general-purpose digital meter, 1000-vac, 1000-vdc

In closing, I would like to repeat that if there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.

4-37 Log #669 NEC-P04 **Final Action: Accept**
(Figure 230.1)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 4-96
Recommendation: Continue to Accept in Principle.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

4-38 Log #633 NEC-P04 **Final Action: Accept**
(230.2(C))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 4-98
Recommendation: Continue to Accept in Principle.
Substantiation: This comment is submitted by a single individual and does not represent the work or input of the high voltage task group (HVTG). This comment attempts to address concerns stated in the negative. Safety of all electrical workers must be the first consideration when the technical committee considers raising the voltage threshold. This submitter greatly appreciates the technical committee members concern for the safety of all electrical workers. I have reviewed the impact on worker safety in each of these proposals. As the safety coordinator for IBEW Local 98 in Philadelphia, I could not support raising the voltage threshold if I felt there was a safety concern that we could not address. If there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.

The work of the high voltage task group was very broad in nature. It is widely recognized and understood that emerging technologies such as small wind and PV are breaking the 600-volt threshold making these alternative energy sources more efficient. The HVTG was directed to review this issue and to submit proposals to generate a shift in NEC requirements to specifically address these new system voltages. The HVTG submitted proposals to the technical committees with specific expertise to let each individual CMP make the decision on raising the voltage threshold. We needed a placeholder in all locations. Any CMP that felt there was a safety issue rejected the proposal. The HVTG supported those rejections in each case. The final decision lies with the technical committee.

It is important to note that if this technical committee raises the voltage threshold from 600 to 1000-volts in the NEC, the only change is the " voltage threshold level" of the installation requirement. This change in the voltage threshold level does not permit conductors and equipment rated at 600-volts to be used at 1000-volts. That would require the conductors and equipment to be tested and listed for such use. See NFPA 70 110.3(B). There are many products that are already listed and marked for this use.

NFPA 70E requires that all employees who face a risk of electrical hazard that is not reduced to a safe level by the applicable electrical installation requirements be trained to understand the specific hazards they face. See 70E 110.2. Qualified persons are required. Energized work is only permitted where justified. See 130.2. Personal Protective equipment, including but not limited to voltage rated gloves and arc rated clothing are readily available. Training programs for electrical safe work practices for voltages over 600-volts are readily available.

There are meters and other test instruments readily available for use today at 1000-volts. It should be noted that NFPA 70E 110.4 requires all test instruments to be properly rated and used only by qualified persons. NFPA 70E 110.2(D)(1)(4)(e) requires the qualified person be trained on the proper use and limitations of the test instrument. A quick Google search revealed the following, there are more:

Fluke 77IV, general purpose digital meter, 1000-vac, 1000-vdc

Ideal 490, general-purpose digital meter, 1000-vac, 1000-vdc

In closing, I would like to repeat that if there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.

2-118 Log #56 NEC-P02 **Final Action: Accept**
(230.2(F) (New))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 4-101
Recommendation: The Correlating Committee directs that this proposal be referred to Code-Making Panel 2 for action in 220.87.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
The Panel 2 action on Proposal 4-101 is reject.
Panel Statement: The panel accepts the Correlating Committee directive to act on Proposal 4-101. The suggestion to allow professional engineers to determine the demand factors for lighting loads is too broad for all of the situations involved in Article 220.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

2-119 Log #57 NEC-P02 **Final Action: Accept**
(230.2(F) (New))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 4-102
Recommendation: The Correlating Committee directs that this proposal be referred to Code-Making Panel 2 for action in 220.87.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
The Panel 2 action on Proposal 4-102 is Reject.
Panel Statement: The panel accepts the Correlating Committee directive to act on Proposal 4-102. The suggestion to allow third party agencies to determine the demand factors for lighting loads is too broad for all of the situations involved in Article 220.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

4-57 Log #582 NEC-P04 **Final Action: Accept**
(230.7(D) (New))

Submitter: Trevor N. Bowmer, Telcordia Technologies / Rep. Alliance for Telecommunications Industry Solutions (ATIS)
Comment on Proposal No: 4-106
Recommendation: Continue to reject this proposal as per Panel 4 action.
Substantiation: The Panel acted correctly in rejecting the proposed action. The function of the Intersystem Bonding Termination (IBT) should not be confused with a service disconnecting means.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-41 Log #402 NEC-P04 **Final Action: Reject**
(230.24)

Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 4-108
Recommendation: This Proposal should be rejected.
Substantiation: The present text of OSHA 1926.403(i) limits the requirements in that paragraph to applications up to 600 Volts. Changing the application of the text in 230.24 will create a conflict between the two documents causing voltages from 601 to 1000 Volts to be in violation of OSHA requirements. In addition, a Note within the OSHA document states that “If the electrical installation is made in accordance with the National Electrical Code ANSI/NFPA 70-1984, exclusive of Formal Interpretations and Tentative Interim

Amendments, it will be deemed to be in compliance with 1926.403 through 1926.408, except for 1926.404(b)(1) and 1926.405(a)(2)(ii)(E), (F), (G), and (J).” This would further conflict with the proposed text without significant amendment.

Panel Meeting Action: Reject

Panel Statement: This proposal addresses electrical installations and OSHA addresses electrical safety in the workplace. Although OSHA utilizes the NEC, it is not intended to harmonize the NEC with OSHA requirements.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 2

Explanation of Negative:

MCDANIEL, R.: It is recognized that increasing the voltage from 600 to 1000 volts may be applicable to specific installations. However, the change in these sections will create a conflict between the NEC and OSHA 1926.403(i).

ZINNANTE, V.: See my Explanation of Negative Vote on 4-2.

4-42 Log #634 NEC-P04 **Final Action: Accept**

4-43 Log #671 NEC-P04 **Final Action: Accept**
(230.24)

Submitter: James T. Dollard, Jr., IBEW Local 98

Comment on Proposal No: 4-108

Recommendation: Continue to Accept in Principle.

Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

Submitter: Technical Correlating Committee on National Electrical Code®

Comment on Proposal No: 4-115

Recommendation: The Correlating Committee directs that the panel review all wiring methods in Chapter 3 for possible inclusion, as necessary.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Panel Statement: A CMP 4 task group reviewed the wiring methods as per the Correlating Committee recommendations. Their report was that no further wiring methods be included at this time.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

4-45 Log #1432 NEC-P04 **Final Action: Accept**
(230.30)

Submitter: Christel K. Hunter, Alcan Cable, a General Cable Company
Comment on Proposal No: 4-115
Recommendation: Add text to read as follows:
<u>(8) Type USE conductors or cables</u>
Substantiation: It would clarify the language to add "conductors or", since both single conductor USE and multiconductor USE cables are listed for direct burial and acceptable for use as service conductors.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-46 Log #1601 NEC-P04 **Final Action: Reject**
(230.40)

Submitter: Susan Newman Searce, Halls, TN
Comment on Proposal No: 4-118
Recommendation: Revise text to read as follows:
Exception No. 3: A single-family dwelling unit<u>,</u> ~~and~~ its accessory structures and <u>two-family dwellings</u> shall be permitted to have one set of service-entrance conductors run to each from a single service drop, set of overhead service conductors, set of underground service conductors, or service lateral.
Exception No. 4: ~~Two-family dwellings,~~ multifamily dwellings, and multiple occupancy buildings shall be permitted to have one set of service-entrance conductors installed to supply the circuits covered in Section 210.25.
Substantiation: The panel's statement refers to allowing multiple sets of mains for the purpose of supplying common loads as area lighting, alarms and other common loads. This proposal is intended to apply to one and two family dwellings only. There is a need for a limit to the number of "sets" applied to a one and two family dwelling for fire safety and the safety of the occupant loads. The task of meeting the panel's concerns for area lighting, alarms and other common loads can be accomplished by eliminating the "multiple" sets and allowing a single set of mains.
As an inspector, seeing 6 SETS of mains on a single family (or two family dwelling) is of my opinion a fire and life safety hazard that has been abused far too long. Under present code, two-family dwellings can have multiple sets of mains in various locations creating a hazard for occupants and safety.
Panel Meeting Action: Reject
Panel Statement: The existing language is intended to allow more than one set of service entrance conductors in order to comply with 210.25. Section 210.25 mandates the source of supply that is independent of any occupancy for the purpose of supplying common area lighting, alarms and other common loads.
Neither the panel statement nor the current NEC requirements allow multiple sets of service entrance conductors to be installed in a two family dwelling. The language allows one set of service entrance conductors to supply loads required by 210.25 in addition to those allowed for dwelling unit normal power.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-47 Log #1092 NEC-P04 **Final Action: Accept**
(230.40 Exception No. 1)

Submitter: Ron B. Chilton, Rep. NC Code Clearing Committee
Comment on Proposal No: 4-119
Recommendation: The Proposal should continue to be rejected, based on the Panel Statement.
Substantiation: The wording in the 2002 NEC permitted multiple services by *Exception No. 1* based on what 230.2(D) provided for services with different characteristics. The improper reference of being "defined" in 230.2 was also stated, for which there is no definition. In other words, there were stipulations placed on allowing other services.
A Proposal for the 2005 NEC submitted by Phil Simmons would have deleted the *Exception* as not needed since Section 230.2(D) already permitted additional services based on the conditions of that Section. The Code Making Panel rejected the proposal stating the *Exception* was needed for services of different characteristics for more than one occupancy, still using the 230.2(D) language of "different characteristics".
During the Comments meeting for the 2005 NEC, the Code Making Panel "Accepted in Principle" the Proposal and deleted the reference to different characteristics and left out the reference to 230.2(D) also, the (D) was deleted. Whether or not this was intended, it opened the door to suggest that for multiple-occupancy buildings any number of service laterals could be installed simply due to being a group of occupancies and for services as defined in 230.2, again with no definition. 230.2(D) is still present in the 2011 NEC, however since no reference is explained in 230.40, *Exception No. 1*, it seemed to suggest that for any building with multiple-occupancies, for any reason, any number of service laterals may be installed with no regard to size of the building or the other conditions set forth in 230.2 allowing additional services other than the ONE, as the main rule. Also lacking were considerations that disconnects be grouped when any number of laterals were installed from the same Utility transformer.
The Panel Statement reference that the allowances described in 230.40 and exceptions are intended to allow a separate set of service entrance conductors to each occupancy for "each classification" of service,......provided they are supplied by only one service drop or service lateral, clarifies that the provisions in Sections 230.2(A) through (D) do apply. There should be less confusion as to grouping of disconnects being required when meeting these requirements.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

4-48 Log #1478 NEC-P04 **Final Action: Accept**
(230.42(A))

Submitter: Charles R. Miller, Charles R. Miller Electrical Education and Training
Comment on Proposal No: 4-120
Recommendation: Accept this proposal with the following changes:
(A) General. The ampacity of service-entrance conductors shall not be less than either 230.42(A)(1), (A)(2) or (A)(3). Loads shall be determined in accordance with Part III, IV, or V of Article 220, as applicable. Ampacity shall be determined from 310.15. The maximum allowable current of busways shall be that value for which the busway has been listed or labeled.
(1) The sum of the noncontinuous loads plus 1125 percent of continuous loads
Exception: Grounded conductors that are not connected to an overcurrent device shall be permitted to be sized at 100 percent of the continuous and noncontinuous load.
(2) The sum of the noncontinuous load plus the continuous load after ~~conditions of use have been applied~~ <u>the application of any adjustment or correction factors</u>.
(3) The sum of the noncontinuous load plus the continuous load if the service-entrance conductors terminate in an overcurrent device where both the overcurrent device and its assembly are listed for operation at 100 percent of their rating
Substantiation: A similar proposal was submitted to reword the text in 210.19(A)(1) and 215.2(A)(1). The proposals were accepted in principal. The current text is not clear. Section 230.42(A) is specifying to multiply continuous loads by 125 percent and then apply the correction and/or adjustment factors. This is not how it is taught at NFPA seminars. It is also not the way example D(3)(a) is calculated in Informative Annex D. These are two different and separate calculations. One calculation considers continuous loads without considering the correction and/or adjustment factors. The other calculation considers correction and/or adjustment factors with all loads (continuous and noncontinuous) calculated at 100 percent.
Even the panel's statement on proposal 4-120 is vague... "The current text is clear that conditions of use must be considered in addition to continuous loading." Does this mean to multiply continuous loads by 125 percent and then apply the correction and/or adjustment factors, or does this mean to perform two separate calculations?

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 4-121
Recommendation: Continue to Accept in Principle.
Substantiation: This comment is submitted by a single individual and does not represent the work or input of the high voltage task group (HVTG). This comment attempts to address concerns stated in the negative. Safety of all electrical workers must be the first consideration when the technical committee considers raising the voltage threshold. This submitter greatly appreciates the technical committee members concern for the safety of all electrical workers. I have reviewed the impact on worker safety in each of these proposals. As the safety coordinator for IBEW Local 98 in Philadelphia, I could not support raising the voltage threshold if I felt there was a safety concern that we could not address. If there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.
The work of the high voltage task group was very broad in nature. It is widely recognized and understood that emerging technologies such as small wind and PV are breaking the 600-volt threshold making these alternative energy sources more efficient. The HVTG was directed to review this issue and to submit proposals to generate a shift in NEC requirements to specifically address these new system voltages. The HVTG submitted proposals to the technical committees with specific expertise to let each individual CMP make the decision on raising the voltage threshold. We needed a placeholder in all locations. Any CMP that felt there was a safety issue rejected the proposal. The HVTG supported those rejections in each case. The final decision lies with the technical committee.
It is important to note that if this technical committee raises the voltage threshold from 600 to 1000-volts in the NEC, the only change is the " voltage threshold level" of the installation requirement. This change in the voltage

threshold level does not permit conductors and equipment rated at 600-volts to be used at 1000-volts. That would require the conductors and equipment to be tested and listed for such use. See NFPA 70 110.3(B). There are many products that are already listed and marked for this use.

NFPA 70E requires that all employees who face a risk of electrical hazard that is not reduced to a safe level by the applicable electrical installation requirements be trained to understand the specific hazards they face. See 70E 110.2. Qualified persons are required. Energized work is only permitted where justified. See 130.2. Personal Protective equipment, including but not limited to voltage rated gloves and arc rated clothing are readily available. Training programs for electrical safe work practices for voltages over 600-volts are readily available.

There are meters and other test instruments readily available for use today at 1000-volts. It should be noted that NFPA 70E 110.4 requires all test instruments to be properly rated and used only by qualified persons. NFPA 70E 110.2(D)(1)(4)(e) requires the qualified person be trained on the proper use and limitations of the test instrument. A quick Google search revealed the following, there are more:

Fluke 77IV, general purpose digital meter, 1000-vac, 1000-vdc

Ideal 490, general-purpose digital meter, 1000-vac, 1000-vdc

In closing, I would like to repeat that if there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.

4-50 Log #672 NEC-P04 **Final Action: Accept**

(230.43)

Submitter: James T. Dollard, Jr., IBEW Local 98

Comment on Proposal No: 4-121

Recommendation: Continue to Accept in Principle.

Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

4-51 Log #800 NEC-P04 **Final Action: Reject**

(230.44)

Submitter: John Sigmund, American Chemical Council

Comment on Proposal No: 4-133

Recommendation: Add new text as follows:

Such cable trays shall be identified with permanently affixed labels with the wording “Service-Entrance Conductors”. The labels shall be located so as to be visible after installation and placed with a spacing not to exceed 3 m (10 ft) so that the service-entrance conductors are able to be readily traced through the entire length of the cable tray.

<u>*Exception: Where not accessible (as applied to equipment), in industrial establishments where the conditions of maintenance supervision ensure that only qualified persons service the installation, cable tray system warning notices which include “Service Entrance Conductors” shall be located where necessary for the installation to assure safe maintenance and operation.*</u>

Substantiation: The requirement to placard all cable tray installations with warning notices every 3 m (10 ft) is not practical and should address the readability and potential hazards. Some cable tray installations may be at elevated locations in which it would not be practical to install and see warning notices. Some cable tray installations may extend thousands of feet and having to post a notice is not a reasonable requirement. This exception was approved in the ROP (Proposal 8-182) by Panel 8 for section 392.18(H), and the exception should be included in 230.44 to correlate with 392.18(H).

Panel Meeting Action: Reject

Panel Statement: Warning signs are not there to identify hazards solely for maintenance personnel but for all persons. Electrical system cable trays may be in close proximity to other mechanical or piping tray systems. This requirement will help non-electrically qualified personnel identify above ground tray systems that support medium voltage electrical cables.

When service cables enter a building using cable trays indication of that is essential to those that might service the installation. The fact that these installations are in industrial locations does not minimize the safety issues involved. The lengths of these would be limited by the requirements for the location of the disconnecting means and thus the labeling would be limited in nature to those lengths anyway.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 11 Negative: 1

Explanation of Negative:

SIGMUND, J.: The requirement to placard all cable tray installations with warning notices every 3 m (10 ft) is not practical and should address the readability and potential hazards. Some cable tray installations may be at elevated locations in which it would not be practical to install and see warning notices. Some cable tray installations may extend thousands of feet and having to post a notice is not a reasonable requirement. This exception was approved in the ROP (Proposal 8-182) by Panel 8 for section 392.18(H), and the exception should be included in 230.44 to correlate with 392.18(H). The Technical Correlating committee should resolve the new exception in 392.18(H) with this labeling required in 230.44

(230.62(C) (New))

Submitter: Technical Correlating Committee on National Electrical Code®

Comment on Proposal No: 4-139

Recommendation: The Correlating Committee directs that this proposal be sent to Code-Making Panel 13 for action in Article 700.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Revise 700.16 as follows:

700.16 Emergency Illumination. Emergency illumination shall include all required means of egress lighting, illuminated exit signs, and all other lights specified as necessary to provide required illumination.

Emergency lighting systems shall be designed and installed so that the failure of any individual lighting element, such as the burning out of a lamp, cannot leave in total darkness any space that requires emergency illumination.

Where high-intensity discharge lighting such as high and low-pressure sodium, mercury vapor, and metal halide is used as the sole source of normal illumination, the emergency lighting system shall be required to operate until normal illumination has been restored.

<u>Where an emergency system is installed, emergency illumination shall be provided in the area of the disconnecting means required by 225.31 and 230.70, as applicable, where the disconnecting means are installed indoors.</u>

Exception: Alternative means that ensure emergency lighting illumination level is maintained shall be permitted.

CMP 13 rejects the remainder of Proposal 4-139.

Panel Statement: CMP 13 accepts the direction of the correlating committee to take action on Proposal 4-139. CMP 13 accepts in principle in part Proposal 4-139.

CMP-13 agrees that normal supply equipment, at the point it enters a building or structure, should be provided with emergency illumination in buildings or structures with an emergency system.

CMP- 13 rejects the remainder of the proposal because it is under the purview of CMP-4.

CMP-13 does not agree with all of the submitter's substantiation.

4-54 Log #1263 NEC-P04 **Final Action: Reject**

(230.62(C) (New))

Submitter: Donald A. Ganiere, Ottawa, IL

Comment on Proposal No: 4-140

Recommendation: This proposal should be accepted.

Substantiation: While this rule may belong in the product standards, the NEC has a history of using code rules to influence the development of product standards. The acceptance of the proposal would result in changes in the product standards.

While an electrician may be able to safely perform work in a service panel without the proposed line side barrier with the use of appropriate PPE, there is no permission to do such work in the OSHA rules. It would be a very very rare case where the electrical safe work rules would permit work in the service panel with the line side energized in a dwelling unit or commercial occupancy. The only permitted method of doing this work would be to have the utility disconnect the service conductors before working in the enclosure that contains the service disconnect.

The lack of the proposed line side barrier makes it impossible, in most cases, to comply with the electrical safe work rules when working in an enclosure that contains the service disconnect.

4-58 Log #1053 NEC-P04 **Final Action: Reject**
(230.70)

Submitter: George M. Stolz, II, Quicksilver Electrical Training
Comment on Proposal No: 4-144
Recommendation: Accept the proposal, in whole, principle or part.
Substantiation: To rebut each of the panel's excuses:

1. All service disconnects I have seen have a means for locking the disconnect closed with a padlock, which is permissible by code. To claim that there is a security risk involved is misleading. Security and communication equipment often have means for continued use after power loss; security systems have battery backup, and POTS does not require local power to operate.
2. An exception can be added if the panel feels that inner city environments would be adversely affected by this change.
3. An exception can be added for services over 1000V.
4. An exception can be added to allow Special Permission.
5. Data was presented to the panel in the last code cycle (Proposal 4-132 2010 ROP) detailing two separate incidents which resulted in property damage explicitly
because the service disconnects were allowed inside. It was remarkable in both incidents that there were no loss of life.
6. In the cases mentioned in item #5 above, no covers were removed by unqualified personnel - but covers were removed by arc blasts that could have claimed the lives of several people.
7. 240.24(D) already prohibits overcurrent devices from installation in corrosive environments, and this section does nothing to add to that concept.

Billions will be spent on AFCI breakers that may or may not make an impact on electrical safety. This proposal has no appreciable cost impact yet would make an indelible difference in safety to both workers and occupants. The panel should reconsider it's decision.

This proposal focused on the disconnecting safety aspect of the problem, but having conduits piped into structures connected to utility transformers full of combustible
oil is another reason to keep disconnects outside.
Panel Meeting Action: Reject

Panel Statement: This comment does not comply with Section 4.4.5(c) of the NFPA Regulations Governing Committee Projects in that it does not provide text of the comment, including the wording to be added, revised (and how revised), or deleted.

The NEC permits installation of outdoor main disconnects. Requiring an outdoor main disconnect will cause issues for security and space conflicts in inner city environments. The decision on whether to place a service disconnect inside or outside belongs to the building owner and designer unless there is a duly authorized utility company requirement.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 12

Comment on Affirmative:

ROGERS, J.: Emergency responders are not required to enter a building to shut off the service disconnect and they should not do so. One of the reasons that CMP 4 has held fast to allowing the service to a building being supplied by only one service lateral or drop, is that this allows for the building to be disconnected by the utility company at the service point or prior to. There are far too many cases of arc flash incidents in any given year, however, the location of the service disconnect cannot be factually contributed to the cause of these incidents. There are many good reasons to install a service disconnect either outside or inside a building and the NEC should not mandate only one such location. The anecdotal evidence submitted is clearly not sufficient to justify such a draconian change. If the submitter has access to hard factual data that quantifies a link between the location of a service disconnect and arc flash incidents that should be submitted for review by Panel 4 during the next code change cycle.

Submitter: James T. Dollard, Jr., IBEW Local 98

Comment on Proposal No: 4-154

Recommendation: Continue to Accept in Principle.

Substantiation: This comment is submitted by a single individual and does not represent the work or input of the high voltage task group (HVTG). This comment attempts to address concerns stated in the negative. Safety of all electrical workers must be the first consideration when the technical committee considers raising the voltage threshold. This submitter greatly appreciates the technical committee members concern for the safety of all electrical workers. I have reviewed the impact on worker safety in each of these proposals. As the safety coordinator for IBEW Local 98 in Philadelphia, I could not support raising the voltage threshold if I felt there was a safety concern that we could not address. If there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.

The work of the high voltage task group was very broad in nature. It is widely recognized and understood that emerging technologies such as small wind and PV are breaking the 600-volt threshold making these alternative energy sources more efficient. The HVTG was directed to review this issue and to submit proposals to generate a shift in NEC requirements to specifically address these new system voltages. The HVTG submitted proposals to the technical committees with specific expertise to let each individual CMP make the decision on raising the voltage threshold. We needed a placeholder in all locations. Any CMP that felt there was a safety issue rejected the proposal. The HVTG supported those rejections in each case. The final decision lies with the technical committee.

It is important to note that if this technical committee raises the voltage threshold from 600 to 1000-volts in the NEC, the only change is the " voltage threshold level" of the installation requirement. This change in the voltage threshold level does not permit conductors and equipment rated at 600-volts to be used at 1000-volts. That would require the conductors and equipment to be tested and listed for such use. See NFPA 70 110.3(B). There are many products that are already listed and marked for this use.

NFPA 70E requires that all employees who face a risk of electrical hazard that is not reduced to a safe level by the applicable electrical installation requirements be trained to understand the specific hazards they face. See 70E 110.2. Qualified persons are required. Energized work is only permitted where justified. See 130.2. Personal Protective equipment, including but not limited to voltage rated gloves and arc rated clothing are readily available. Training programs for electrical safe work practices for voltages over 600-volts are readily available.

There are meters and other test instruments readily available for use today at 1000-volts. It should be noted that NFPA 70E 110.4 requires all test instruments to be properly rated and used only by qualified persons. NFPA 70E 110.2(D)(1)(4)(e) requires the qualified person be trained on the proper use and limitations of the test instrument. A quick Google search revealed the following, there are more:

Fluke 77IV, general purpose digital meter, 1000-vac, 1000-vdc

Ideal 490, general-purpose digital meter, 1000-vac, 1000-vdc

In closing, I would like to repeat that if there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.

4-62 Log #675 NEC-P04 **Final Action: Accept**
(230.82)

Submitter: James T. Dollard, Jr., IBEW Local 98

Comment on Proposal No: 4-154

Recommendation: Continue to Accept in Principle.

Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

4-64 Log #1554 NEC-P04 **Final Action: Accept**
(230.82(3))

TCC Action: The Correlating Committee directs that the word "substantially" be deleted since it is vague and not enforceable and does not comply with Table 3.2.1 of the NEC Style Manual as follows: "….load served. A meter disconnect shall be legibly field marked on its exterior in a manner suitable for the environment as follows: ..."
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-156
Recommendation: Accept the proposal.
Substantiation: Although it is certainly true that the service disconnect will always be marked as such, it is equally true that the meter disconnect switch, given its justified ratings, will generally qualify in terms of its equipment characteristics as a service disconnect. One of the most important areas of concern within code administration and enforcement is making sure that all parties (owner, contractor, and enforcer) are on the same page as to where, exactly, the service disconnect is located. This label sends a very clear message to look elsewhere. It has solved numerous disagreements and provoked many educational, productive, and even at times entertaining discussions in Massachusetts where it has been required for many cycles at this point. The comment in the voting is very much on point.
Panel Meeting Action: Accept

4-69 Log #840 NEC-P04 **Final Action: Reject**
(230.201 (New))

Submitter: Gaylan Bishop, The University of North Carolina - Chapter Hill
Comment on Proposal No: 4-161
Recommendation: Accept the proposal as written except with a clarification of our original intent with the use of the "plus (+)" symbol in the original proposal.
(NEW) "230.201 Service Capacity" As an alternative to the feeder and service load calculations required by Parts III and IV of Article 220, service transformer and switchgear capacity for medium voltage services covered by this code shall be permitted to be based upon the method of Section 220.87 if the determination of capacity is made by a registered professional engineer or an individual under their supervision.
The proposed language now fits between 230.200 and 230.202.
Substantiation: The University of North Carolina supports the effort by the education facilities industry, represented by APPA.ORG's Standards Council, to bring the 2014 NEC in step with rapidly evolving energy codes by reducing the size of building services which have shown themselves to be significantly oversized for decades.
We repeat our recommendation that the *NFPA Research Foundation* fund an investigation into the degree to which oversized transformers – based upon outdated power density requirements and assumptions about electric load growth – increases hazards to electricians and wastes energy and materials. This concept cuts across several NEC committees and a Task Force is needed to help these committees move in the same direction.
We would like the Article 230 committee to permit open-ended engineering methods to "right-size" transformers and related service switchgear in the interest of reconciling the competing objectives of fire safety, flash hazard reduction, and energy conservation. We believe that trusting trained and licensed professional engineering consultants with open-ended approaches made available in Article 230 will be quicker to the goal.
We disagree with the panel statement: *"Article 220 already provides alternative calculation methods and in some cases the use of existing load use for these calculations. This proposal would be more appropriate for Article 220 and is addressed in 220.87."*
On the contrary: we believe that medium voltage services are handled differently than low voltage services; thus, we have edited our original proposed language to include an explicit reference to 220.87 in Part VIII of Article 230 which deals with "Services Exceeding 600Volts, Nominal". It might be a bad idea to take a step in this direction now, in anticipation that service voltage classifications will be raised to a new cut-off of 1000V in the near future.
Panel Meeting Action: Reject
Panel Statement: Application of Article 220 in the initial sizing of electrical systems has had a successful history in providing sufficient system ampacity to serve facilities for decades. Section 220.87 allows alternate load calculation methods.

(230.208(B))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 4-164
Recommendation: Continue to Accept in Principle.
Substantiation: This comment is submitted by a single individual and does not represent the work or input of the high voltage task group (HVTG). This comment attempts to address concerns stated in the negative. Safety of all electrical workers must be the first consideration when the technical committee considers raising the voltage threshold. This submitter greatly appreciates the technical committee members concern for the safety of all electrical workers. I have reviewed the impact on worker safety in each of these proposals. As the safety coordinator for IBEW Local 98 in Philadelphia, I could not support raising the voltage threshold if I felt there was a safety concern that we could not address. If there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.
The work of the high voltage task group was very broad in nature. It is widely recognized and understood that emerging technologies such as small wind and PV are breaking the 600-volt threshold making these alternative energy sources more efficient. The HVTG was directed to review this issue and to submit proposals to generate a shift in NEC requirements to specifically address these new system voltages. The HVTG submitted proposals to the technical committees with specific expertise to let each individual CMP make the decision on raising the voltage threshold. We needed a placeholder in all locations. Any CMP that felt there was a safety issue rejected the proposal. The HVTG supported those rejections in each case. The final decision lies with the technical committee.
It is important to note that if this technical committee raises the voltage threshold from 600 to 1000-volts in the NEC, the only change is the " voltage threshold level" of the installation requirement. This change in the voltage threshold level does not permit conductors and equipment rated at 600-volts to be used at 1000-volts. That would require the conductors and equipment to be tested and listed for such use. See NFPA 70 110.3(B). There are many products that are already listed and marked for this use.
NFPA 70E requires that all employees who face a risk of electrical hazard that is not reduced to a safe level by the applicable electrical installation requirements be trained to understand the specific hazards they face. See 70E 110.2. Qualified persons are required. Energized work is only permitted where justified. See 130.2. Personal Protective equipment, including but not limited to voltage rated gloves and arc rated clothing are readily available. Training programs for electrical safe work practices for voltages over 600-volts are readily available.
There are meters and other test instruments readily available for use today at 1000-volts. It should be noted that NFPA 70E 110.4 requires all test instruments to be properly rated and used only by qualified persons. NFPA 70E 110.2(D)(1)(4)(e) requires the qualified person be trained on the proper use and limitations of the test instrument. A quick Google search revealed the following, there are more:
Fluke 77IV, general purpose digital meter, 1000-vac, 1000-vdc
Ideal 490, general-purpose digital meter, 1000-vac, 1000-vdc
In closing, I would like to repeat that if there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.

4-76 Log #678 NEC-P04 **Final Action: Accept**
(230.208(B))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 4-164
Recommendation: Continue to Accept in Principle.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.
The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC

systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

(240.4)

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 10-18
Recommendation: Reject the proposal.
Substantiation: This proposal didn't include any examples of real-world problems. The substantiation claims that "Persons could look at the conductor size and install larger overcurrent protection." While this is indeed true, we can't start making Code rules based on this logic. If we were to accept all of the proposals that contain this type of anecdotal substantiation we would have a three thousand page Code book in a matter of 6 years.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KAUER, R.: There is an issue when conductors are increased in size and the reason for the increase is not readily apparent due to the conductors being concealed. It makes it very difficult to determine the correct overcurrent protective device for future repairs and replacements when these conditions exist. Labeling of the conductors, when oversized, with the maximum overcurrent protective device size will help future repairs and replacements be made in a safe and code compliant manner.

Comment on Proposal No: 10-18
Recommendation: Reject the proposal.
Substantiation: The submitter has provided no substantiation that a problem exists and the proposed change places an undue burden on the installer.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
KAUER, R.: See my explanation of negative vote on Comment 10-9.

10-10 Log #1420 NEC-P10 **Final Action: Accept**
(240.4)

Submitter: Keith Fager, Bayer CropScience
Comment on Proposal No: 10-18
Recommendation: The panel action should have been Reject and the proposed Section 240.11 should be deleted.
Substantiation: It is not practical to document the electrical design by adding field labels and tags to the equipment and conductors. If half of the conductors originating in a fully utilized 42 pole panel are derated for temperature, each of the 21 circuits would have to be tagged at the panel. The exact location of the tags is not specified in the proposed section, but it would seem they would have to be located inside the panel and attached to the respective conductors. Inside the panel, they should only be accessible by qualified persons. As pointed out by R. Sobel, a qualified person would not assume there is spare capacity on an oversized conductor.
Panel Meeting Action: Accept

Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.
The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. Section 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 and 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.
Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.
Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.
If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.
Panel Meeting Action: Accept

10-19 Log #739 NEC-P10 **Final Action: Accept**
(240.83)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 10-51
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task group to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. Section 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 and 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. (240.87)

TCC Action: The Correlating Committee understands that the text of 240.87 was changed by the Panel Action on Comment 10-24.
Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 10-53a
Recommendation: Revise text to read as follows:
240.87 ~~Noninstantaneous Trip~~ Arc Energy Reduction.
The remaining text is unchanged from that accepted in the Panel Action on Proposal 10-53a.
Substantiation: NEMA supports the Panel Action to "Accept in Principle" Proposal 10-53a. We also recommend that the title should additionally be changed to "Arc Energy Reduction" as it better reflects the true intent of this requirement.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-21 Log #451 NEC-P10 **Final Action: Reject**
(240.87)

Submitter: Carl Fredericks, American Chemistry Council
Comment on Proposal No: 10-57
Recommendation: Accept Proposal 10-57.
Substantiation: Application of 240.87 should not be required for Supervised Industrial Installations where work practices and available PPE protect the workers from potential arc flash hazards. As a minimum and as commented in my explanation of negative vote to the panel action, an exception should be allowed for Supervised Industrial Installations where a non-orderly shutdown will introduce additional or increased hazards, similar to the exemption from GFPE requirements that is provided in 240.13. An energy-reducing switch introduces the possibility of a false trip whenever it is engaged, not just when an arc flash occurs. Alternative allowed protection means such as zone-selective interlocking do not extend past the equipment in question and so do not cover feeder breakers.
Panel Meeting Action: Reject
Panel Statement: CMP-10 continues to support the rejection of Proposal 10-57 with the same statement: The arc-flash hazards mitigated by the requirements of 240.87 are just as real and just as serious in a supervised industrial installation as they are in all other installations.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

DARLING, D.: The Panel should have accepted the comment. The IEEE agrees with the commenter's substantiation that a non-orderly shutdown due to a false trip or unplanned event can add to the hazards, which may not be solely electrical in nature. A risk analysis needs to be performed to determine what is necessary for effective mitigation of injury to personnel from the hazards of arc flash.

FREDERICKS, C.: I'm voting negative on the panel action; the panel action should have been to Accept. As in the ROP stage, the panel statement has not responded at all to the technical substantiation provided with this comment, or to the substantiation that was provided with Proposal 10-57, or my explanation of negative vote on Proposal 10-57.

The panel's statement that arc flash hazards are as serious in Supervised Industrial Installations was never disputed. But even so, many Supervised Industrial Installations have significantly better safety records than general commercial and industry installations, and have successfully managed the associated hazards much better than national averages. There are also hazards that must be addressed in addition to arc flash in some Supervised Industrial Installations, which the requirements of 240.87 are not compatible with and this comment was intended to address.

10-22 Log #763 NEC-P10 **Final Action: Accept in Principle**
(240.87)

Submitter: Rob Redfoot, Eaton Corp.
Comment on Proposal No: 10-54
Recommendation: Revise text to read as follows:

~~Non-instantaneous Trip~~ Arc Energy Reduction: Where a circuit breaker without an instantaneous trip rated for, or can be adjusted to 1000 Amperes or more is utilized, one of the following or approved equivalent means shall be provided:

(1) Zone-selective interlocking
(2) Differential relaying
(3) Energy-reducing maintenance switching with local status indicator

Substantiation: The panel acknowledges that arc flash hazards may increase if circuit breaker does not have instantaneous trip. The problem is that even though a breaker has instantaneous trip, it does no good if the arcing fault current is not in the range of the instantaneous trip. IEEE estimates arcing faults currents to be 30% - 50% of bolted fault currents. At these fault levels the instantaneous protection will often not come into play even when the breaker is equipped with instantaneous protection. The goal of the submitter is to get the circuit breaker to trip instantaneously during a fault event to minimize the hazard. This is a worthy goal and seems to be the intent of this article.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 10-24.
Number Eligible to Vote: 12

10-23 Log #946 NEC-P10 **Final Action: Accept in Part**
(240.87)

Submitter: Ed Larsen, Schneider Electric USA
Comment on Proposal No: 10-53a
Recommendation: Revise text to read as follows:
240.87 ~~Noninstantaneous Trip~~Arc Energy Reduction. Where a circuit breaker:
~~(1) Utilizes short time delay and~~
(~~2~~1) Does not have an adjustable instantaneous trip function ~~engaged and~~ set below the arcing current or
(~~3~~2) Does not have an instantaneous override or the instantaneous override setting is above the arcing current then (A) and (B) shall apply.
(A) Documentation. Documentation shall be available to those authorized to design, install, operate, or inspect the installation as to the location of the circuit breaker(s).
(B) Method to Reduce Clearing Time. One of the following means shall be provided:
(1) Zone-selective interlocking or
(2) Differential relaying or
(3) Energy-reducing maintenance switching with local status indicator or
(4) Energy-reducing active arc flash mitigation system or
(5) An approved equivalent means
Substantiation: Arc energy reduction is the subject of this section. The Panel should have accepted the part of ROP 10-54 that proposed changing the title of the section.
The concern of the Panel appears to be having an instantaneous trip or some other clearing time reduction method set below the level of arcing current. If this is the case, as indeed it should be, then the presence or absence of a short time delay function has nothing to do with it and should be deleted. Further, the Panel's concern for the instantaneous override setting should be extended to the adjustable instantaneous setting as well.
The insertion of "or" in (B)(4) corrects what seems to be an oversight.
Panel Meeting Action: Accept in Part
CMP-10 accepts the revision to the section title.
CMP-10 rejects the remainder of the proposed revision.
Panel Statement: CMP-10 rejects the proposed revisions to the list items because they have been deleted in the action on Comment 10-24.
Number Eligible to Vote: 12

DARLING, D.: See my negative statement for comment 10-24.

10-24 Log #1180 NEC-P10 **Final Action: Accept in Principle in Part**
(240.87)

Submitter: Christopher G. Walker, Eaton Corporation
Comment on Proposal No: 10-53a
Recommendation: Revise text to read as follows:
240.87 ~~Noninstantaneous Trip~~ Arc Energy Reduction. Where a circuit breaker:
(1) ~~Utilizes short time delay~~ Rated 1,000Amps and above and
(2) Does not have an adjustable instantaneous trip function engaged ~~and~~
~~(3) Does not have an instantaneous override or the instantaneous override setting is above the arcing current~~ then (A) and (B) shall apply.
(A) Documentation. Documentation shall be available to those authorized to design, install, operate, or inspect the installation as to the location of the circuit breaker(s).
(B) Method to Reduce Clearing Time. One of the following means shall be provided:
(1) Zone-selective interlocking or
(2) Differential relaying or
(3) Energy-reducing maintenance switching with local status indicator or
(4) Energy-reducing active arc flash mitigation system
(5) An approved equivalent means
Informational Note No. 1: An energy-reducing maintenance switch allows a worker to set a circuit breaker trip unit to "no intentional delay" to reduce the clearing time while the worker is working within an arc-flash boundary as defined in NFPA 70E-2009, Standard for Electrical Safety in the Workplace, and then to set the trip unit back to a normal setting after the potentially hazardous work is complete.
Informational Note No. 2: An energy-reducing active arc flash mitigation system helps in reducing arcing duration in the electrical distribution system. No change in circuit breaker or the settings of other devices is required during maintenance when a worker is working within an arc-flash boundary as defined in NFPA 70E-2012, Standard for Electrical Safety in the Workplace.
Substantiation: The first change is to correct the title to "Arc Energy Reduction" as that is the intent of this section. This aligns with the NEMA affirmative comment by Mr. A. Manche.
The language accepted at the ROP meetings could extend the interpretation of this requirement to apply to many smaller molded case circuit breakers which were not originally intended to be addressed, (down to a 225A frame based upon products available from at least one manufacturer).
The ROP accepted language also makes it extremely difficult for the AHJ to enforce as they must now determine arcing currents for each circuit breaker being inspected.
In the panel statement to the rejection of Proposal 10-54, it is understood that the 1000A level is not the sole criteria for increasing arc flash hazards, but recognizes that not having an instantaneous trip affects it too. This comment proposes that BOTH 1000A AND the instantaneous trip engagement be used as the determining factor. This removes the requirement from the smaller molded case breakers which were not originally intended to be addressed. It also makes the applicability of this requirement clear and enforceable by the AHJ.
Panel Meeting Action: Accept in Principle in Part
Revise comment to read as follows:
240.87 Arc Energy Reduction. Where the highest continuous current trip setting for which the actual overcurrent device installed in a circuit breaker is rated or can be adjusted is 1200 amperes or higher then (A) and (B) shall apply.
(A) Documentation. Documentation shall be available to those authorized to design, install, operate, or inspect the installation as to the location of the circuit breaker(s).
(B) Method to Reduce Clearing Time. One of the following or approved equivalent means shall be provided:
(1) Zone-selective interlocking or
(2) Differential relaying or
(3) Energy-reducing maintenance switching with local status indicator or
(4) Energy-reducing active arc flash mitigation system or
(5) An approved equivalent means
Informational Note No. 1: (no change)
Informational Note No. 2: An energy-reducing active arc flash mitigation system helps in reducing arcing duration in the electrical distribution system. No change in circuit breaker or the settings of other devices is required during maintenance when a worker is working within an arc-flash boundary as defined in NFPA 70E-2012, *Standard for Electrical Safety in the Workplace*.
Panel Statement: CMP-10 accepts the title change to better reflect the subject. The panel rejected the proposed revisions to items (2) and (3) because the panel has deleted those list items to provide clarity for this requirement. The panel increased 1000 to 1200 amperes to limit the number of circuit breakers affected.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 3
Explanation of Negative:
DARLING, D.: The following is a quote from the ROP on Proposal 10-54: "Panel Statement: Arc-flash hazards are not increased simply because the ampere rating of a circuit breaker equals or exceeds 1000 amperes. Arc-flash hazards however may be increased when the circuit breaker does not have an instantaneous trip capability." The Panel action on this Comment contradicted the earlier panel statement. The Panel offered no technical substantiation for including these requirements for all breakers 1200A and above and did not explain in the panel statement the ramifications of deleting lines two and three. The comment as revised by the Panel expanded the requirement to include breakers with instantaneous trip which the original proposal continued to exclude. The panel discussion indicates that instantaneous trip is a useful criteria for limiting arc flash hazard but this should be made clear in the code language itself. The comment should be revised to continue to exclude breakers with instantaneous trip. A risk analysis needs to be performed to determine what is necessary for effective mitigation of injury to personnel from the hazards of arc flash.
FREDERICKS, C.: I disagree with the panel action; the panel should have accepted the title change only. There was no substantiation provided that breakers rated at and above either 1000 or 1200 amperes have increased arc flash hazards just based on their size, as the panel correctly stated at the ROP stage. The comment and the accepted code text do not even contain an arc flash energy level target, so will result in an unnecessary requirement for some installations and could give an unwarranted belief about safety for others.
Also I believe the panel action in deleting item (2) from the existing 240.87 text is a significant error, because the code text no longer acknowledges that that a breaker instantaneous function could meet the intent of the 240.87 requirement. If the breaker has an instantaneous function engaged that is responsive to the minimum arcing current, then no energy reduction below that is possible, even with an additional maintenance switch or any other additional provision.
The change in deleting item (2) from the existing 240.87 text was not requested by the submitter and was not substantiated in the panel statement, so I believe that is a further reason this part of the panel action is in error. If this part of the panel action remains in place after the written ballot, I believe it should be reviewed by the Correlating Committee.
An additional editorial problem in the accepted text is that (B)(5) is redundant to text in (B); I believe this should be corrected editorially regardless.
Please see also my explanations of negative vote provided for Comments 10-21 and 10-28.
VARTANIAN, J.: At the review of the comments for this proposal, the changes made removed a key part of 240.87. Removal of the instantaneous trip function removes a significant part the limitation of an arc-flash hazard, using the circuit breaker rating of 1200 amps does not take the place of limiting the arc-flash hazard. Additional clarity is needed in the text to address limiting the arc-flash hazard. Comment 10-24 along with proposal 10-53a must be rejected and the language returned to the 2011 language until acceptable language can be developed and supported by the industry.

Comment on Affirmative:

KAUER, R.: Code Panel 10 did not make it clear that the instantaneous breaker should be accepted as a means to mitigate arc flash energy. If the instantaneous function is permitted as an alternative means to mitigate the arc energy, than it should have been added to the list of solutions.

Because it is not spelled out in the code language, the authority having jurisdiction in one part of the country may accept the instantaneous function as an alternative method and an inspector in another part may not. I don't believe that the way it is written now, that we have good code language that is enforceable. I know that it does not say that instantaneous function cannot be used but it does not say that it can.

10-25 Log #1181 NEC-P10 **Final Action: Accept in Principle**
(240.87)

Submitter: Christopher G. Walker, Eaton Corporation
Comment on Proposal No: 10-54
Recommendation: This proposal should have been accepted.
Substantiation: The language accepted at the ROP meetings could extend the interpretation of this requirement to apply to many smaller molded case circuit breakers which were not originally intended to be addressed, (down to a 225A frame based upon products available from at least one manufacturer).

The ROP accepted language also makes it extremely difficult for the AHJ to enforce as they must now determine arcing currents for each circuit breaker being inspected. This proposal makes the applicability of this requirement clear and enforceable by the AHJ.

Comment on Proposal No: 10-53a
Recommendation: Accept the ROP text except change the word "utilizes" in the second line to "uses."
Substantiation: The NEC Style Manual Section 3.3.4 indicates that the word "use" should be used rather than "utilized". The use of "utilized" is not clear in this context.
Panel Meeting Action: Reject
Panel Statement: CMP-10 rejects the proposed revision to the list item because it has been deleted in the action on Comment 10-24.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

10-27 Log #1394 NEC-P10 **Final Action: Reject**
(240.87)

Submitter: Dennis Darling, Stantec Consulting Ltd.
Comment on Proposal No: 10-53a
Recommendation: Accept the ROP text with the following new Informational Note No. 1 and increment the numbers of the other two Informational Notes by one.

New Informational Note No. 1: It should be understood that even with the application of any mitigation techniques, the arc flash hazard may still be above that which is suitable for personnel protection. Specific use of a protective function without corresponding engineering analysis may not lead to improved safety.

Substantiation: The first step for any worker should be to establish an electrically safe work condition as defined in NFPA 70E. Subsequent work on any energized equipment should only be performed after evaluating the risks and suitable mitigation methods. The language as written implies that it is safe to work if the mitigation techniques in (A) or (B) are employed. As written, it would be almost required to employ one of the techniques in section (B). In addition, it should be understood that even with the application of mitigation techniques the arc flash hazard may still be above that is suitable for personnel protection.
Panel Meeting Action: Reject
Panel Statement: The NEC is an installation code. The proposed informational note references "work practices" which are covered in NFPA 70E, *Standard for Electrical Safety in the Workplace*.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:

DARLING, D.: The panel should have accepted the comment. The language proposed did not mention work practices included in the panel statement as the basis for rejection. This new Informational Note is intended to enhance personnel safety by informing users that simply complying with the requirements of the Code without performing any risk analysis may not provide the necessary protection for personnel.

10-28 Log #586 NEC-P10 **Final Action: Reject**
(240.87 Exception (New))

Submitter: Charles L. Powell, Eastman Chemical Company
Comment on Proposal No: 10-59
Recommendation: Add the following new text:
<u>Exception: If the load served is a chemical (or other potentially hazardous material) manufacturing plant where sudden loss of electrical power may result in an increased hazard, and the available incident energy level when short-time protection is utilized is within manageable levels of commonly available personal protective equipment, the additional requirements of 240.87 (1), (2) or (3) are not required.</u>
Substantiation: Based on the ROP panel statement, I feel additional comment regarding original substantiation is warranted.

70E does not require that I modify a system to lower arc flash values when energized. It does require that I place it in a safe work condition (de-energize) unless de-energization creates a greater hazard or is infeasible, or is less than 50 V. (70E Article 130 – 2012). If the equipment is justified to work energized an energized electrical work permit is required which includes several requirements regarding identification or hazards, and an appropriate work plan to protect personnel from the hazards including appropriate protective equipment. It does not require that I reduce the calculated arc-flash energy.

The panel statement in the ROP seems to indicate that the panel understands that use of a maintenance mode defeats selective coordination. However, I did not state in my substantiation, that defeating of selective coordination by a maintenance switch was the only reason that the likelihood of a larger scale interruption was increase by the requirements of 240.87. Therefore, I must comment and specify how each of the accepted methods specified in 240.87 increases the likelihood of a larger scale service interruption that could result in additional hazards.

(1) Zone selective interlocking – This technology works by "restraint". The downstream breaker restrains the instantaneous function of the upstream breaker. In the case of a unit substation, the feeder breakers restrain the main breaker. This restraint is dependent on the communication link between the breakers and/or relays. Since it operates on restraint rather than permissive, if the communication link is compromised, the main breaker is not restrained. The loss of communication between trip units may not be rapidly recognized. If a fault occurs downstream of a feeder breaker, and the communication link is compromised, the main breaker does not receive the restraint signal and opens, clearing the bus not because of a failure of the feeder breaker, but because of the failure of a communication link. This would shut down all loads fed from this bus. This scenario can happen at any time, not just when maintenance is occurring.

(2) Differential relaying – Most low voltage substations utilize trip units rather than relays with the CTs mounted on the draw-out breaker stabs. Additional differential relays would be required which in turn would require additional CTs. Looking at the design of the typical currently available low voltage substation, it seems these CTs would have to be mounted in the outgoing sections, probably downstream of the outgoing connections such that the outgoing cables would have to pass through them. This would put the cable connection to the runbacks (a common failure point in LV substations) within the differential zone. A fault at this location is typically cleared by the feeder breaker, but being in the differential zone would now additionally be cleared by the differential relay operating and opening every breaker on the bus. This would shut down all loads fed from this bus. This scenario can happen at any time, not just when maintenance is occurring.

(3) Maintenance mode switching – Reduces AF hazard when placed in this mode by compromising the selective coordination. The panel ROP statement seems to indicate that the panel recognizes this situation.

I continue to contend that all three of the allowed methods increases the likelihood of larger scale unplanned interruptions. These unplanned interruptions can cause serious non-electrical hazards if the load served is a chemical or other hazardous manufacturing facility. If energy levels without these methods are within limits of which electrical workers can be protected with commonly available PPE the exception should be allowed. I am strongly committed to making every job as safe as possible. I believe that not allowing the exception I proposed detracts from, rather than enhances the overall safety of the installations the proposal targets.

I request the panel re-consider their decision to reject the original proposal.
Panel Meeting Action: Reject
Panel Statement: The determination of arc-flash energy and requirements for personal protective equipment for persons within an arc-flash boundary is under the purview of the NFPA 70E committee. The methods outlined in 240.87 to reduce the arc-flash hazard(s) are compatible with the selective coordination that is necessary for chemical (or other potentially hazardous material) manufacturing plants. Arc-flash hazard levels should be limited as much as possible, not just limited if above subjective high levels.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

DARLING, D.: Refer to my statement on comment 10-21.

FREDERICKS, C.: I'm voting negative on the panel action; the panel action should have been to Accept. The panel statement that the 240.87 requirements are compatible with selective coordination is not correct. See the detailed substantiation provided by the submitter.

10-32 Log #740 NEC-P10 **Final Action: Accept**
(240, Part IX)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 10-60
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task group to provide additional substantiation as directed by the Correlating Committee.
The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.
The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. Section 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 and 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.
Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.
Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.
If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.
Panel Meeting Action: Accept

ARTICLE 250 — GROUNDING AND BONDING

5-12 Log #90 NEC-P05 **Final Action: Accept in Principle**
(250 and Table 250.102(C))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 5-42
Recommendation: The Correlating Committee directs that the panel clarify the panel action on this proposal relative to the Informational Note with conductor sizes "18 AWG through 4/0 AWG."
This action will be considered as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 5-56.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-13 Log #1146 NEC-P05 **Final Action: Reject**
(250, Parts I, II, III, IV, and V)

Submitter: Paul Dobrowsky, American Chemistry Council
Comment on Proposal No: 5-44
Recommendation: The proposal should have been accepted.
Substantiation: The term Equipment Grounding Conductor needs to be replaced. Those opposed have no technical reason for their opposition or any other valid reason. It is not worth the effort and everyone understands what is

meant are common responses.

It is very simple: Grounding electrode conductors are the connection to the earth and accomplish grounding. In the present NEC, Equipment Grounding Conductors and bonding jumpers provide a "path back" to the source. Both are always performing a bonding function. If the Grounding Electrode connection is removed or broken, the bonding function remains intact.

Section 250.4 does not permit the earth (ground) to be used as an effective ground fault current path but the term equipment grounding conductor inherently incorrectly contains the word "ground".

Visualize equipment supplied by a portable generator. The generator frame is not required to be connected to the earth. The "green" wire in the flexible cord is not performing a grounding function but is performing a bonding function.

Visualize building one supplied by a service, having the grounded conductor connected to the grounding electrode system by a grounding electrode conductor. A feeder supplies a second building and a grounding electrode conductor is required for grounding any equipment in the second building. An equipment grounding conductor is required to be installed from building 1 to building 2. Not for grounding, but for bonding, providing an effective fault current path.

Making this change has the added benefit of being more harmonized with other international standards and usage of terminology.

Experienced NEC users have to ignore other concepts in other definitions and requirements to use the existing term. This does not help the future NEC user or provide clarity in the existing NEC. Changing the term is the right thing to do and should be supported.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Comment 5-1.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 13 Negative: 3

Explanation of Negative:

PORTER, C.: See my statement in comment 5-1.

5-14 Log #532 NEC-P05 **Final Action: Accept**
(250.2.Effective Ground-Fault Current Path)

Submitter: James F. Williams, Fairmont, WV

Comment on Proposal No: 5-46

Recommendation: Revise text to read as follows:

100 Definitions.

Effective Ground-Fault Current Path. An intentionally constructed, low-impedance electrically conductive path designed and intended to carry current under ground-fault conditions from the point of a ground fault on a wiring system to the electrical supply source and that facilitates the operation of the overcurrent protective device or ground-fault detectors. **[ROP 5–6]**

250.2 Definitions~~.~~

~~**Effective Ground-Fault Current Path.** An intentionally constructed, low-impedance electrically conductive path designed and intended to carry current under ground-fault conditions from the point of a ground fault on a wiring system to the electrical supply source and that facilitates the operation of the overcurrent protective device or ground-fault detectors.~~ **[ROP 5–46] [ROP 5–13, ROP 5–14]**

Substantiation: In 100 insert a space between *under* and *ground-fault*

In 250 delete the definition. 100 definitions apply to 250. Duplicating the definition – word-for-word – serves no purpose.

Panel Meeting Action: Accept

Panel Statement: The action on Proposal 5-46 is correct in the ROP. The panel action in the proposal stage was to revise this definition and to relocate it to Article 100. To clarify, the panel action is to remove this definition from 250.2 and the definition as revised is to remain in Article 100.

Number Eligible to Vote: 16

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Comment 5-1.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 13 Negative: 3

Explanation of Negative:

DOBROWSKY, P.: See my negative ballot comment on 5-1.

MOHLA, D.: The comment should be accepted.

The Panel Comment is not applicable to Proposal 5-49. The Proposal merely separates the functions of grounding of systems from bonding of equipment. It is here where the User of the Code is directed to the idea that grounding of equipment will make equipment safer. The paragraph to be deleted indicates that grounding of non-current-carrying materials will "limit the voltage to ground". That this is not true is evident when one considers the voltage drop along the "grounded" "equipment grounding conductor" during a fault. Because the bonding conductor, per Table 250.122, is substantially smaller than the phase conductor, most of the voltage drop, during a fault, occurs across the "bonding" conductor. Thus the voltage at the faulted material is elevated to near the supply voltage with respect to ground and not to ground or earth potential. The installation is "safer" due to faster operation of overcurrent device because this bonding conductor is an intentionally constructed, low-impedance electrically conductive path designed and intended to carry current under fault conditions from the point of a fault on a wiring system to the electrical supply source and that facilitates the operation of the overcurrent protective device. This is the primary purpose of this conductor and calling it an equipment bonding conductor will convey its primary purpose

Deleting this section and using the deletion as a teaching tool will go a long way to making it clear to the users of the National Electrical Code as to why it is necessary and essential we bond equipment to the source rather than ground it.

5-18 Log #1125 NEC-P05 **Final Action: Reject**
(250.24(A)(4))

Submitter: Phil Simmons, Copper Development Association, Inc.
Comment on Proposal No: 5-72
Recommendation: Accept the Proposal.
Substantiation: The general requirement in 250.24(A)(1) is that the grounding electrode conductor be connected to the grounded conductor at any accessible location on the load side of the service drop or service lateral up to the terminal bar in the service equipment. Making a connection on the load side of the neutral terminal bar is in essence a violation of 250.64(C) as it would constitute a splice in the grounding electrode conductor.

Section 250.24(A)(4) acts as an exception to the general requirement for where the grounding electrode connection is required to be made but is permitted only if the main bonding jumper is a wire or a bus bar. The grounding electrode conductor is required to be connected directly to the grounded service conductor at the service equipment if the main bonding jumper is a screw or strap.
Panel Meeting Action: Reject
Panel Statement: The connection of the grounding electrode conductor to the equipment grounding terminal bar is permitted where there is a properly installed wire or bus main bonding jumper. The main bonding jumper is required to be connected to the grounded conductor (neutral) on the supply side of the neutral disconnect link that is the point defining the supply or load side of the neutral bus. The option connection of the grounding electrode conductor has been in the NEC since the 1981 edition. The change made then as new exception 5 to 250-23 has not been substantially changed since that time. There has been no evidence of failures or of unsafe conditions from the application of this optional connection. As for the equipment grounding bar possibly being undersized, 408.3 and 409.60 both specifically state the equipment grounding bar is to be sized per Table 250.122 while the grounded conductor and grounding electrode conductor are sized to Table 250.66, so the installation in question is actually in accordance with Code provisions. An analysis of actual construction, considering standard bus bar sizes, has been completed and in no case would the equipment grounding busbar in a dead front switchboard be sized smaller than the required grounding electrode conductor. (See Table below)

Service Switchboard Rating	Service Entrance Cond (Cu)	Equivalent	GEC (NEC T250.66)	Equip Gnd Cond (NEC)	Equip Gnd Cond (UL 891	Std Gnd Busbar		MBJ (NEC)	MBJ (UL 891)
400	500 Kcmil	500 Kcmil	1/0	3 AWG	3 AWG	1/4 x 7/8	>4/0	1/0	1/0
600	3-350 Kcmil	700 Kcmil	2/0	1 AWG	1 AWG	1/4 x 7/8	>4/0	2/0	2/0
800	2-500 Kcmil	1000 Kcmil	2/0	1/0	1/0	1/4 x 7/8	>4/0	2/0	2/0
1200	3-600 Kcmil	1800 Kcmil	3/0	3/0	3/0	1/4 x 11/2	>350 <400	250	250

Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-19 Log #273 NEC-P05 **Final Action: Accept**
(250.26(6) (New))

Submitter: Code-Making Panel 12,
Comment on Proposal No: 5-78
Recommendation: No change to the current NEC is required. Continue to Reject the proposal.
Substantiation: NEC Code-Making Panel 12 agrees with Code-Making Panel 5 on the Rejection of Proposal 5-78. The submitter's substantiation for the proposal is incorrect because the current language in 250.26(2) correlates with the language of 647.3, 647.6, 250.30, and the definitions in Article 100 of "Neutral Conductor" and "Grounded Conductor."

This comment was developed by the CMP-12 Chair and balloted through the entire panel with the following ballot results:

18 Eligible to vote

14 Affirmative

4 Ballots Not Returned (K.M. Cunningham, A.E. Schlueter, Jr., R.G. Ward, and K. White)

The following Affirmative Comments on Vote were received:

T.R. Brown: It is understood that the technical equipment ground is a noncurrent carrying part during normal operation. It is also understood that the center tap of the secondary winding of the supply transformer for sensitive electronic equipment supply is to be grounded in accordance with 250.30.

J.L. HOLMES: Continue to Reject this Proposal. 90.3 of the NEC states that Chapter 6 will supplement or modify Chapters 1-4. The reference in 647.6(A) does that. The addition to 250.26 is not needed.

R.E. JOHNSON: There is no problem calling the center tab a neutral even though it has no other function than as a ground point.
Panel Meeting Action: Accept

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 5-80
Recommendation: Revise text to read as follows:
250.28 Main Bonding Jumper and System Bonding Jumper.
(D)(1) General. Main bonding jumpers and system bonding jumpers shall not be smaller than specified in Table 250.102(C)-.
250.30 Grounding Separately Derived Alternating-Current Systems.
(A)(3)(a) *Sizing for a Single Raceway.* The grounded conductor shall not be smaller than specified in Table 250.102(C)-.
250.52 Grounding Electrodes.
(A)(3) Metallic components shall be encased by at least 50 mm (2 in.) of concrete and shall be located horizontally within that portion of a concrete foundation or footing that is in direct contact with the earth or within vertical foundations or structural components or members that are in direct contact with the earth.
250.52 Grounding Electrodes.
(A)(7) Plate Electrodes. Each plate electrode shall expose not less than 0.186 m2 (2 ft2) of surface to exterior soil. Electrodes
of bare or ~~conductively~~ <u>electrically conductive</u> coated iron or steel plates shall be at least 6.4 mm (1/4 in.) in thickness.
250.64 Grounding Electrode Conductor Installation.
(B) Securing and Protection Against Physical Damage.
Grounding electrode conductors smaller than 6 AWG shall be protected in ~~(~~RMC~~)~~, IMC, PVC-, RTRC, ~~(~~EMT~~)~~, or cable armor.
Substantiation: 250.28(D)(1) delete space between (C) and period
250.30(A)(3)(a) delete space between (C) and period
250.52(A)(3) <para 2> delete space between wi and thin
250.52(A)(7) use the same terminology for the same thing (see 250.52(A)(3)(1))
250.64(B) delete parens in this sentence, delete space between PVC and comma
Panel Meeting Action: Accept in Part
Revise 250.52(A)(7) to read as follows:
(A)(7) Plate Electrodes. Each plate electrode shall expose not less than 0.186 m2 (2 ft2) of surface to exterior soil. Electrodes of bare or electrically conductive coated iron or steel plates shall be at least 6.4 mm (1/4 in.) in thickness.
Panel Statement: The panel accepts the change to 250.52(A)(7). The panel rejects the rest of the proposed changes which are from errors in ROP draft. The ROP text is correct.

(250.30)

Submitter: Raymond J. Dezik, 400 Hz Repair
Comment on Proposal No: 5-81
Recommendation: We ask that the secondary of the transformer be allowed to have the neutral tied to ground through a capacitor, thus preventing arc when static grounding.
Substantiation: A feeding transformer feeding an aircraft has to be grounded as stated in Section 350.30. This conflicts with the 400 Hz system when they ground the aircraft separately. That second ground carries neutral current and causes and arc when connecting or disconnecting that static ground. We ask that the secondary of the transformer be allowed to have the neutral tied to ground through a capacitor, thus preventing arc when static grounding. This prevents the arc and offers other protection. Boeing has been implanting this procedure for 30 years.
Panel Meeting Action: Reject
Panel Statement: The submitted comment provides no specific text on how the proposed addition should be written as required by 4.4.5(c) of the Regulations Governing Committee Projects.

Ballot Results: Affirmative: 16

5-25 Log #1150 NEC-P05 **Final Action: Reject**
(250.32(A) Exception)

Submitter: Paul Dobrowsky, American Chemistry Council
Comment on Proposal No: 5-94
Recommendation: The proposal should have been accepted.
Substantiation: The term Equipment Grounding Conductor needs to be replaced. Those opposed have no technical reason for their opposition or any other valid reason. It is not worth the effort and everyone understands what is meant are common responses.

It is very simple: Grounding electrode conductors are the connection to the earth and accomplish grounding. In the present NEC, Equipment Grounding Conductors and bonding jumpers provide a “path back” to the source. Both are always performing a bonding function. If the Grounding Electrode connection is removed or broken, the bonding function remains intact.

Section 250.4 does not permit the earth (ground) to be used as an effective ground fault current path but the term equipment grounding conductor inherently incorrectly contains the word “ground”.

Visualize equipment supplied by a portable generator. The generator frame is not required to be connected to the earth. The “green” wire in the flexible cord is not performing a grounding function but is performing a bonding function.

Visualize building one supplied by a service, having the grounded conductor connected to the grounding electrode system by a grounding electrode conductor. A feeder supplies a second building and a grounding electrode conductor is required for grounding any equipment in the second building. An equipment grounding conductor is required to be installed from building 1 to building 2. Not for grounding, but for bonding, providing an effective fault current path.

Making this change has the added benefit of being more harmonized with other international standards and usage of terminology.

Experienced NEC users have to ignore other concepts in other definitions and requirements to use the existing term. This does not help the future NEC user or provide clarity in the existing NEC. Changing the term is the right thing to do and should be supported.

5-26 Log #1300 NEC-P05 **Final Action: Accept**
(250.34)

Submitter: James Jongkind, American Honda Motor Co., Inc.
Comment on Proposal No: 5-95
Recommendation: Please reject the proposal.
Substantiation: Most of the portable generators that Honda has sold for the past 40 years are of the floating neutral design and are used safely everyday by millions of consumers. To require that all newly produced portable generators be bonded is not only unjustified by the lack of incident data, but it would also introduce a safety risk where one did not previously exist. The output on these floating neutral generators is isolated so there is no path back to the source through which users can be shocked. This is a well established and proven safety strategy for this type of product and should not be arbitrarily eliminated.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 12 Negative: 4
Explanation of Negative:
BRENDER, D.: The Comment should have been rejected. The text in 250.34(C) of the present and many previous editions of the NEC have required the conductor that is required to be grounded in 250.26 to be bonded to the generator frame. This is not a new requirement.
Confusion may have existed in the past by not recognizing that stand-alone portable and vehicle-mounted generators are a separately derived system. The generator may be connected as a separately derived system or a non-separately derived system when connecting to a premises wiring system.
A path for ground-fault current to return to the source does not exist if the grounded conductor is not bonded to the frame to complete the circuit to the equipment grounding conductor. This is an unsafe practice for “floating neutral” generator systems.

DOBROWSKY, P.: Section 250.34 was revised based on proposal 5-95 to improve the clarity and usability - not for making any technical changes. At the comment meeting CMP 5 accepted comments to reject the proposal - based on technical reasons. Generator manufacturers and others did not want to bond the grounded conductor to the generator frame. But that is not a new requirement. The result of rejecting proposal 5-95 now causes the language to revert back to that of the 2011 NEC. Section 250.34(C) of the 2011 NEC requires that generators connected as separately derived systems have any required grounded conductors connected to the generator frame.
The concern is that that the commenters now believe that bonding is not required when it is if the generator is used as a separately derived system described in 250.34(C).

MELLO, C.: The panel should have rejected the comment. Proposal 5-95 reorganized requirements that have been in the NEC for well over 40 years. No new requirements were created as incorrectly stated in the various substantiations in Comments 5-26 to 5-32. The fact that some manufacturers have produced a product that does not comply with minimum adopted safety standard is not just cause to reverse the requirement. It was interesting to note that these same manufacturers produce a Code compliant product for the construction industry to meet NEC section 590.6. No independently corroborated evidence was provided to back-up the statements in the substantiation that a floating neutral generator is “safe” or “safer” than ones with a bonded neutral in compliance with present Code.
The real issue seems to be that these manufacturers want to produce a single product that can serve two functions that may be mutually exclusive. As a stand-alone system the bonding of the neutral provides for a low impedance path for any ground fault current from utilization equipment to return to the source and cause the overcurrent device to trip meeting the performance requirements of 250.4(A). The other use is to supply alternate power for a building or structure in the event of a normal service power outage. With the bonded neutral configuration this would require a transfer switch that switches the neutral to correctly maintain the generator as a separately derived system. The argument that there are not transfer switches to accomplish this is incorrect. There are many manufacturers that produce listed 3 pole automatic transfer switches rated as low as 50 Amps. . While most of the automatic transfer switches are set up for 3-phase type systems, these same manufacturers have alternate control packages for single phase use that could be employed. Other manufacturers produce 3-pole manual transfer switches that would also meet the needs
In addition to be in violation of section 250.34(C) of the present Code, these generators are in violation of section 250.20(B)(1) where it is required that any AC energy source that can be “grounded” so the voltage from any ungrounded conductor to ground does not exceed 150 Volts shall be grounded. There is no exception there for portable generators. What 250.34 allows specifically for portable and vehicle mounted generators is not to have to be connected to one of the grounding electrodes specified in Part III of Article 250. For this application the generator frame serves as the reference point.
If the premise that a floating neutral is safe for these portable generators up to 15 KW, then why is it unsafe to have a floating neutral any a 15 KVA 240/120 Volt transformer in a building? Following the premise in the substantiation, then 3-prong receptacles and 3-conductor cords are not necessary from portable and vehicle mounted generators to utilization equipment. If the substantiation is to be believed, then 2-prong receptacles and 2-conductor cords are “safer”. Lastly, section 250.34 applies to all portable and vehicle mounted generators with ratings up to and including 1000 KW, or more, and voltages from the 120 Volts or 240/120 Volts, being discussed in the substantiation, 480/277 Volts and even up to medium voltage systems. To blanket allow any of these generators to now have a floating neutral to satisfy a specific small group of manufactures was not substantiated.

WILLIAMS, D.: The requirement to bond the neutral to the generator was required before the changes made to this section and the actions of the panel does not change that requirement.
Comment on Affirmative:
HARDING, J.: Although Proposal 5-95 was accepted at the ROP stage, it became apparent during the ROC meeting that many panel members were unaware of the full implications of the proposal and the major disruption it will cause to industry, since 50% of the portable generators sold in the U.S.A. annually would have to change in design for no demonstrated safety reason. Instead, there is the potential to create negative safety implications. Most panel members agreed and therefore accepted this comment to reject the original proposal. It is clear that there is no consensus on this issue within CMP-5. This issue should therefore be resolved during the next code cycle.

5-27 Log #1464 NEC-P05 **Final Action: Accept**
(250.34)

Submitter: Michael O. Flegel, Reliance Controls Corporation
Comment on Proposal No: 5-95
Recommendation: Reject the proposal.
Substantiation: There has been no substantiation of a safety problem even though both floating neutral and bonded neutral generators are being used safely every day in many applications.
Floating-neutral generators in stand-alone use allow a level of safety from ground faults through isolation of the electrical system from ground where bonded neutral generators take one step closer to ground faults by connecting an electrical conductor to the generator frame. Floating neutral generators have a proven safety record and should not be eliminated just because they do not duplicate a utility premises wiring system. Utility systems have to be bonded and grounded for reasons that do not apply to most portable generators applications. Further, floating-neutral generators are allowed to be part of a non-separately derived system in other parts of the code and represent the best and most popular way to connect generator power to a premises wiring system. It is by far the most widely used method in practice today with no reported

safety issues.

Our company manufactures manual transfer switches for use with portable generators for both separately and non-separately derived systems. In the last twelve months, 99.5% of our unit sales have been for non-separately derived systems and.5% for separately derived systems. We are in most major retailers so our market share is very representative of the total market so these percentages are a good estimate of the market as a whole and backs up my statement as to how wide spread the use of non-separately derived systems are. The installed base is very similar so when a person replaces his floating neutral generator with a bonded neutral generator, he may also have to install a different transfer switch. This could be justified if it was proven that non-separately derived systems are unsafe but they are not. They have been around as long as the code has allowed them, which is before I can remember. Does the panel think users would install a new transfer switch or would they modify the installation to make it work but then not comply with the NEC?

So let's talk about a real safety issue, getting people to use a transfer switch as required by the NEC instead of back feeding which is extremely dangerous and has many reported injuries and deaths. Based on published sales of portable generators and knowing our transfer switch sales and market share, I know many

applications do not use a transfer switch. We know that back-feeding is a problem and requiring a product that is more expensive to purchase and install because it has to switch the neutral conductor will make this situation worse.

UL is driven to have this change made because they are unhappy with the team of experts they have put together to develop a national portable generator standard. This panel, STP2201, has told them there is nothing unsafe about floating neutral generators, either in stand-alone use or when connected to a premises wiring system. UL disagrees but offers no proof except through misinterpretations of the NEC. They want to get the code changed to persuade the panel they are wrong. As a matter of fact, a senior UL executive was not even aware that floating-neutral generators were being made when in fact it represents 50% of portable generator sales according to the Portable Generator Manufacturers Association (PGMA). If the panel examines past practices and the electrical safety records, you will find that there is no need to make this change. Why put an entire industry in turmoil for no sound reason especially when there are technical arguments supporting current practices?

Panel Meeting Action: Accept

Panel Statement: The panel does not agree with the entire substantiation.

5-28 Log #1495 NEC-P05 **Final Action: Accept**
(250.34)

Submitter: Jeff Baldwin, JPB Design and Engineering LLC

Comment on Proposal No: 5-95

Recommendation: Please reject this proposal.

Substantiation: When a generator, portable or otherwise, is used as a standby power source it is allowed by article 702 of the NEC to be installed as a non-separately derived system. In a non-separately derived system, the generator cannot have a neutral that is bonded to the frame (Article 702). The bonding is done at the household service entrance. A bond at the generator would create multiple bonding points. Non-separately derived is currently the second most common method of connecting a generator to a residence for standby power. (Back feeding is number one.) Non-separately derived installation is popular because it is simple, safe, and can be done with low-cost commercially available products that are UL-Listed.

A generator with a neutral that is bonded to the frame must be installed as a separately derived system (Article 702). This is a much more complicated installation that requires expensive switches (3-pole instead of 2-pole) that are not currently available at major homecenters. The resulting separately derived installation with a bonded generator is no safer than a non-separately derived system with an unbonded generator. Both these installation methods are allowed by the NEC, and both bonded and unbonded generators are currently available commercially. This should be continued.

Panel Meeting Action: Accept

Number Eligible to Vote: 16

Ballot Results: Affirmative: 12 Negative: 4

Explanation of Negative:

BRENDER, D.: See my Statement in Comment 5-26. Article 702 does not regulate whether a generator is connected as a separately derived or non-separately derived system. This is usually a choice to be made by the installer

(250.34(A), (B), and (C))

Submitter: Richard E. Loyd, Sun Lakes, AZ

Comment on Proposal No: 5-95

Recommendation: This action should be rejected.

Substantiation: I agree with the negative voting comments of Steinman and Harding on proposal 5-95. There has been no substantiation of a safety problem even though both the floating neutral and the bonded types of generators are being used every day in many applications. Based on the ECOA/IBEW study both types can be safe or not so safe based on the conditions of use.

Placing the GFCI nearest to likely fault (tool or personnel) and using double insulated tools provides the greatest safety. Nothing in the study indicates the bonded type is safer.

In 1997 the construction safety association of Ontario (ECAO) in conjunction with the IBEW, with the assistance of Kubota Canada completed a in-depth study on the use of GFCIs on portable generators. They tested both types the following are the analysis and conclusions of that study:

Analysis: It is clear that when generators of the floating-neutral or bonded-neutral type sit on dry surfaces in dry environments, they behave similarly In both cases, the GFCIs failed to trip In addition, the reading of little or no current on the multimeter indicated that there was not enough electricity leaking to ground to constitute a hazard In both cases, the GFCI did not trip when there was only one ground fault in the system. When effective grounding was established, GFCIs performed as expected Testing also proved that wet surfaces can create grounding for bonded-neutral generators When a bonded-neutral generator was placed on wet ground, the GFCI tripped under the prescribed current leakage

However, testing also showed that grounding can vary from one place to another, even when both are relatively close In one test, a variation in ground elevation yielded different results When the screwdriver was inserted in wet ground, the GFCI tripped When the screwdriver was moved 100 feet to a slope that had better drainage, the GFCI did not trip

The second series of tests showed that the placement of the GFCI in the circuit is critical to a floating-neutral system.

When the GFCI was plugged directly to the generator, the GFCI failed to detect any imbalance in the current As a result, it did not trip even when the current leak reached a higher than acceptable level When the GFCI was placed at the tool, however, it tripped at the prescribed level

Conclusions: Since the GFCI test button functioned regardless of the generator's grounding property, GFCI test buttons cannot and should not be used to test the effectiveness of GFCIs as personnel protection or the grounding of portable generators The test button should only be used to test GFCIs after grounding has been established

Portable generators with established ground must be treated the same way as any grounded utility system Workers must be protected by GFCIs to prevent electrocution by ground fault Ground should be established and verified only by competent workers trained to do so and using specialized instruments

Generators with established ground allow a GFCI mounted at the generator outlet to work effectively When there is a current leak, the current goes to ground to complete the circuit This creates an imbalance, causing the GFCI to trip When generators with established ground are being used, GFCIs should be located closest to the generator, protecting all workers from ground faults, not just the generator user

Construction people complain that GFCIs trip unnecessarily, especially with extension cords As a result, personnel often consider GFCIs a nuisance and don't use them But GFCIs trip for a reason These trips should be treated as a warning that there is a ground fault in the system When a GFCI trips, tools, cords, and plugs should be inspected for defects and, where necessary, replaced before work continues

When the electrical system does not have reference to ground, GFCIs mounted on the generator do not work With one fault, not enough current leaks to ground to be considered a hazard

Thus, in a floating-neutral circuit, workers are not endangered by electrocution from current going to ground as long as there is only ONE fault in the system

However, with two faults in the system, one on the neutral and one on the hot side, it is possible that the floating-neutral system can become grounded In that case, workers without properly located GFCIs can be electrocuted Two faults can be produced by a defective generator, poorly insulated or defective extension cord, defective tool, or defective plug, to name just a few causes Other conditions such as wet ground, rain, or high humidity can increase the risk that the electrical system will become grounded

Testing showed that in a two-fault system, the placement of the GFCI is critical The GFCI must be placed between the two faults in order to function Since the likely locations for faults are tool cord, tool plug, and extension cord, the GFCI should be placed closest to the tool

Last but not least, the hazards of electrocution can be minimized by using only double-insulated tools in good working order and well-insulated cords

Panel Meeting Action: Accept

Number Eligible to Vote: 16

Ballot Results: Affirmative: 12 Negative: 4
Explanation of Negative:
BRENDER, D.: See my statement in Comment 5-26. It seems the proposer is making a case for requiring the frame of portable and vehicle-mounted generators to be connected to a grounding electrode prior to energizing the generator. While doing so may or may not be practicable, installing a grounding electrode will allow GFCIs to recognize an imbalance of load current caused by leakage current returning to the source outside the detector circuit.

5-30 Log #1294 NEC-P05 **Final Action: Accept**
(250.34(A), (B), and (C))

Submitter: Joseph Harding, Portable Generator Manufacturers Association
Comment on Proposal No: 5-95
Recommendation: The text in 250.34 in NEC 2014 should remain the same as it is in NEC 2011.
Substantiation: Proposal 5-95 should have been rejected since it introduces an electrical shock hazard that currently does not exist.
According to a recent PGMA survey, approximately 50% of all portable generators sold in the U.S. are the isolated output type, with no connection of the neutral conductor to the generator frame. Portable generators that are used in “stand alone” mode are not normally connected to a grounding electrode (as allowed in 250.34(A)). In this configuration, isolated output generators pose no risk of a shock hazard because there is no path back to the source (please refer to the presentation and videos associated with this comment). It is also the experience of the portable generator industry that because of this, there have been no reported incidents of electrical shock associated with these generators over at least the last five years for which data is readily available. Requiring the neutral conductor to be connected to the portable generator frame only serves to increase the risk of electrical shock (again please refer to the presentation and videos associated with this comment).
Additionally, if isolated output generators are no longer allowed, then all generators used for backup power during power outages would need to be connected as separately derived systems. This is required because not doing so would result in the system having two points where the neutral is bonded to the grounding electrode (the main bonding jumper and the generator). The dual bonding points allow neutral current to flow on equipment bonding conductors under normal conditions, resulting in nuisance tripping of GFCIs, etc. Connecting a generator as a separately derived system requires the use of an extra pole in the transfer switch in order to switch the neutral conductor. According to industry sources, 99% or more of portable generators used for home backup power are connected as non-separately derived systems by using single or dual pole transfer switches. If this proposal is accepted, it will then force those owners who subsequently replace their portable generator to also replace their current transfer switch at considerable expense and without any real-world safety benefit. If the owner chooses to operate a new portable generator with the existing transfer switch, the system will not be in compliance with the NEC. Considering the significant expense of replacing a transfer switch, it is the belief of PGMA members that some owners would then attempt to modity their new generator or their existing transfer switch and this would then pose significant safety risks where one would not otherwise exist. It is finally noted that the Code currently has a provision for connecting generators as non-separately derived systems (250.30 Informational Note 1).
PGMA members represent a significant majority of the portable generator industry. Our member companies include:
- American Honda Motor Co.
- Briggs & Stratton Home Power Products
- Champion Power Equipment
- Generac Power Systems
- Pramac America
- Subaru Industrial Power
- Techtronic Industries North America
- Wacker Neuson Production
- Yamaha Motor Corp USA

(250.34(A), (B), and (C))

Submitter: Richard Torine, BR Forbes
Comment on Proposal No: 5-95
Recommendation: Do not include this proposal in the NEC.
Substantiation: This proposal has far-reaching and dangerous consequences for most common users of portable generators. Nearly all the small generators (2500 watts and less) currently produced (by Honda and many others) are not bonded. These small generators are extremely popular for camping and many other applications, (Just visit a campground in the summer and count the Honda 2000 watt generators,) The electrical safety record of these generators is perfect, because they are not bonded, Bonding of the neutral and ground allows ground faults that are not possible in an unbonded circuit.
A portable generator is not the same as a household circuit where the neutral is always grounded at the service entrance, Bonding a portable generator will create safety problems that otherwise do not exist because it is not required to be grounded. A household service entrance is. Allowing a small generator to remain unbonded is the safest scenario, and the lack of any known electrical safety issues with the generators that are currently available supports this.

5-33 Log #1151 NEC-P05 **Final Action: Reject**
(250.36(F))

Submitter: Paul Dobrowsky, American Chemistry Council
Comment on Proposal No: 5-100
Recommendation: The proposal should have been accepted.
Substantiation: The term Equipment Grounding Conductor needs to be replaced. Those opposed have no technical reason for their opposition or any other valid reason. It is not worth the effort and everyone understands what is meant are common responses.
It is very simple: Grounding electrode conductors are the connection to the earth and accomplish grounding. In the present NEC, Equipment Grounding Conductors and bonding jumpers provide a “path back” to the source. Both are always performing a bonding function. If the Grounding Electrode connection

is removed or broken, the bonding function remains intact.

Section 250.4 does not permit the earth (ground) to be used as an effective ground fault current path but the term equipment grounding conductor inherently incorrectly contains the word "ground".

Visualize equipment supplied by a portable generator. The generator frame is not required to be connected to the earth. The "green" wire in the flexible cord is not performing a grounding function but is performing a bonding function.

Visualize building one supplied by a service, having the grounded conductor connected to the grounding electrode system by a grounding electrode conductor. A feeder supplies a second building and a grounding electrode conductor is required for grounding any equipment in the second building. An equipment grounding conductor is required to be installed from building 1 to building 2. Not for grounding, but for bonding, providing an effective fault current path.

Making this change has the added benefit of being more harmonized with other international standards and usage of terminology.

Experienced NEC users have to ignore other concepts in other definitions and requirements to use the existing term. This does not help the future NEC user or provide clarity in the existing NEC. Changing the term is the right thing to do and should be supported.

KING, D.: See my comments on 2-119C.

5-35 Log #1129 NEC-P05 **Final Action: Reject**
(250.52(A)(2))

Submitter: Phil Simmons, Copper Development Association, Inc.

Comment on Proposal No: 5-105

Recommendation: Revise the existing text of the 2011 NEC as follows:

(2) Metal Frame of the Building or Structure. The metal frame of the building or structure that is connected to the earth by <u>having</u> ~~one or more of the following methods:~~

~~(1) A~~ at least one structural metal member that is in direct contact with the earth for 3.0 m (10 ft) or more, with or without concrete encasement.

~~(2) Hold-down bolts securing the structural steel column that are connected to a concrete-encased electrode that complies with 250.52(A)(3) and is located in the support footing or foundation. The hold-down bolts shall be connected to the concrete-encased electrode by welding, exothermic welding, the usual steel tie wires, or other approved means.~~

Substantiation: This proposed change, if accepted, would bring the description of a grounding electrode consisting of the metal frame of a building or structure into harmony with the definition of "Grounding Electrode" in Article 100. As defined by CMP-5, the grounding electrode is the conductive object that makes direct connection to the earth.

The present provision for making connection to earth through the concrete-encased grounding electrode creates a conflict in this section with the definition of "Grounding Electrode" as approved by CMP-5. The Panel improved the definition from the previous editions by revisions made to this section in the 2011 NEC. However, the present provision of creating a metal structure grounding electrode by connection to a concrete encased electrode should be deleted. If this is done, the definition of a metal frame grounding electrode will stand alone like the other descriptions of grounding electrodes in 250.52(A).

In reality, if the metal frame of a building or structure does not itself make an earth connection, it is acting as a grounding electrode conductor or a bonding conductor but not a grounding electrode.

Panel Meeting Action: Reject

Panel Statement: The hold down bolts embedded in the concrete meeting the specified requirements for connection to the rebar in the concrete footing are a grounding electrode. That is what is being defined by this part of the section. If this comment is accepted then the only electrode that can be created under this section is a driven piling or casing without any technical justification. The structural metal above the slab, that is connected to these hold down bolts, now extends the earth grounding connection above the slab which is correct per 250.68(C). For a vast majority of structural metal installations, the hold down bolts installed as specified are the earth connection and there has been no technical substantiation provided that this has been inadequate. To disallow this long standing means of achieving a very suitable grounding electrode or part of a grounding electrode system due to semantics is not acceptable.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15 Negative: 1

Explanation of Negative:

BRENDER, D.: This Comment should have been Accepted. This proposed change, if accepted, would bring the description of a grounding electrode consisting of the metal frame of a building or structure into harmony with the definition of "Grounding Electrode" in Article 100.

5-36 Log #533 NEC-P05 **Final Action: Accept**
(250.52(A)(3)(2))

Submitter: James F. Williams, Fairmont, WV

Comment on Proposal No: 5-107

Recommendation: Revise text to read as follows:

250.52 Grounding Electrodes.

(A)(3)(2) Bare copper conductor not smaller than 4 AWG

Metallic components shall be encased by at least 50 mm (2 in.) of concrete and shall be located horizontally within that portion of a concrete foundation or footing that is in direct contact with the earth or wi-thin vertical foundation or structural components or members that are in direct contact with the earth.

Substantiation: Delete the space in the word "within".

Panel Meeting Action: Accept

Panel Statement: This corrects an error in the ROP draft. The panel action as documented in proposal 5-107 is correct.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-37 Log #1130 NEC-P05 **Final Action: Accept**
(250.52(A)(3)(2))

Comment on Proposal No: 5-108

Recommendation: Continue to Reject the Proposal.

Substantiation: The submitter has failed to provide sufficient technical justification for the Proposal. A fact finding report that demonstrates that this product is suitable for the proposed application has not been provided. There is no indication how one would determine whether the conductor is 30% or 40% conductivity material. In addition, there is no indication that terminals on equipment are designed, tested and suitable for terminating copper-clad steel conductors.

Panel Meeting Action: Accept

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-38 Log #872 NEC-P05 **Final Action: Reject**
(250.52(A)(9))

Submitter: C. Douglas White, Center Point Energy / Rep. Edison Electric Institute/Electric Light & Power Group

Comment on Proposal No: 5-111

Recommendation: This Proposal should have been Accepted in Principle. The text should be relocated to 250.52(A)(8) and modified as follows:

250.52(A)(8) Other Local Metal Underground Systems or Structures.

Other local metal underground systems or structures such as <u>engineered grounding grids,</u> piping systems, underground tanks, and underground metal well casings that are not bonded to a metal water pipe.

<u>Informational note: Refer to IEEE 80-2000 for information on the design and installation of engineered grounding grids.</u>

Substantiation: The increased use of grounding grids necessitates a change in the NEC to establish requirements that promote their safe and consistent application. While all agree that engineering supervision and the use of IEEE

80 works well for this application, it is not always followed. Adding the grounding grid as an acceptable ground electrode in 250.52(A)(8) will meet this need and increase the safety of substations and similar installations.
Panel Meeting Action: Reject
Panel Statement: No substantiation was provided to require all grounding grids to be engineered; other grounding electrodes in 250.52 are not required to be engineered. Also see the panel statement on Comment 5-39.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-39 Log #1338 NEC-P05 **Final Action: Reject**
(250.52(A)(9) (New))

Submitter: Paul Dobrowsky, Holley, NY
Comment on Proposal No: 5-111
Recommendation: Revise text to read as follows:
250.52(A)(9) Grounding Grid
A system of horizontal interconnected bare copper conductors, a minimum 2 AWG, buried in the earth a minimum depth of 30 inches. The grid shall have an area not less than 3 m (10 feet) square and shall extend a minimum of 1 m (36 in) horizontally in all directions beyond the outer perimeter of the equipment served. The minimum spacing between parallel conductors shall be 2 feet and the conductors shall be bonded at each crossover point. Alternate designs shall be permitted under engineering supervision.

Informational Note. A grounding grid might not provide protection from step and touch potentials unless specifically designed for that purpose. See IEEE 80-2000 for information on the design and installation of grounding grids.
Substantiation: The proposal should have been accepted in principle. Ground Rings are presently permitted as grounding electrodes if they encircle a building or structure with much less detail than is provided in the proposed new "grounding grid" electrode. A grounding grid should be an optional method as it will not exist unless installed.
Panel Meeting Action: Reject
Panel Statement: No substantiation was provided for the specific details proposed for grounding grids, such as the 2 ft spacing and for the grid to extend 3 ft beyond the equipment served. A "square" ring is presently permitted by 250.52(A)(4) with or without cross members.

(250.64(C))

Submitter: Gregory J. Steinman, Thomas & Betts Corporation
Comment on Proposal No: 5-119
Recommendation: Continue to reject this proposal.
Substantiation: This proposal reduces the integrity of the grounding electrode conductor by allowing mechanical connections in a splicing application. Mechanical connectors
can loosen due to environmental conditions such as vibration. When these mechanical connectors are used at the termination points, they are easily inspected. This explains why the existing installation is busbars is allowed. If these mechanical connections are used anywhere along the GEC as a splice, it will be impossible to inspect these and detect a loosened connection. There is a reason why we specify the description "irreversible" as an adjective to describe the compression connectors allowed. Mechanical connectors are not irreversible.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-44 Log #998 NEC-P05 **Final Action: Accept in Principle**
(250.64(E) (New))

Submitter: Richard A. Janoski, Finleyville, PA
Comment on Proposal No: 5-123
Recommendation: Accept this Proposal.
Substantiation: Although the opening paragraph of Section 250.64 is clear that this Section intends to cover grounding electrode conductors at services, buildings or structures where supplied by a feeder, or branch circuits, this Section does not address the installation of grounding electrode conductors in separate buildings or structures with multiple disconnecting means, supplied by feeders.

Sub-section (D) is specific to its use in Services not Feeders. To have rules that apply for feeders, the user is left to modify or interpret this specific code language according to his or her own knowledge base.

I would like to direct your attention to Section 260.64 (D)(2) Individual Grounding Electrode Conductors. If I am installing multiple feeders to a separate building or structure as allowed in Section 225.30, and looking to Section 250.64 for direction, this Code Section is instructing me to size my grounding electrode conductor to the service entrance conductors and to connect my grounding electrode conductor to the grounded conductor in each service disconnect.

No disrespect is meant by pointing this out, I know that the code making panel members know that this would be an 'incorrect installation, I am only highlighting this to point out that the language is missing and is needed.
Panel Meeting Action: Accept in Principle
Revise 250.64(D) from ROP draft as follows:

(D) ~~Service~~Building or Structure with Multiple Disconnecting Means in Separate Enclosures.
For a service or feeder with two or more disconnecting means in separate enclosures supplying a building or structure, ~~If a service consists of more than a single enclosure as permitted in 230.71(A),~~ the grounding electrode connections shall be made in accordance with 250.64(D)(1), (D)(2), or (D)(3).
(1) Common Grounding Electrode Conductor and Taps. A common grounding electrode conductor and grounding electrode conductor taps shall be installed. The common grounding electrode conductor shall be sized in accordance with 250.66, based on the sum of the circular mil area of the largest ungrounded ~~service-entrance~~ conductor(s) of each set of conductors that supply the disconnecting means. If the service-entrance conductors connect directly to overhead service conductors, service drop, underground service conductors, or service lateral, the common grounding electrode conductor shall be sized in accordance with Table 250.66, Note 1.

A grounding electrode conductor tap shall extend to the inside of each ~~service~~ disconnecting means enclosure. The grounding electrode conductor taps shall be sized in accordance with 250.66 for the largest service-entrance or feeder conductor serving the individual enclosure. The tap conductors shall be

connected to the common grounding electrode conductor by one of the following methods in such a manner that the common grounding electrode conductor remains without a splice or joint:
(1) Exothermic welding.
(2) Connectors listed as grounding and bonding equipment.
(3) Connections to an aluminum or copper busbar not less than 6 mm thick × 50 mm wide (1/4 in. × 2 in.) and of sufficient length to accommodate the number of terminations necessary for the installation. The busbar shall be securely fastened and shall be installed in an accessible location. Connections shall be made by a listed connector or by the exothermic welding process. If aluminum busbars are used, the installation shall comply with 250.64(A).

(2) Individual Grounding Electrode Conductors. A grounding electrode conductor shall be connected between the grounding electrode system and one or more of the following as applicable:
(1) grounded conductor in each service equipment disconnecting means enclosure
(2) equipment grounding conductor installed with the feeder
(3) supply side bonding jumper
~~and the grounding electrode system.~~ Each grounding electrode conductor shall be sized in accordance with 250.66 based on the service-entrance or feeder conductor(s) supplying the individual ~~service~~ disconnecting means.

(3) Common Location. A grounding electrode conductor shall be connected in a wireway or other accessible enclosure on the supply side of the service disconnecting means to one or more of the following as applicable:
(1) grounded service conductor(s)
(2) equipment grounding conductor installed with the feeder
(3) supply side bonding jumper
~~in a wireway or other accessible enclosure on the supply side of the service disconnecting means.~~

The connection shall be made with exothermic welding or a connector listed as grounding and bonding equipment. The grounding electrode conductor shall be sized in accordance with 250.66 based on the service-entrance or feeder conductor(s) at the common location where the connection is made.

Panel Statement: The revised text incorporates the necessary clarifying language to ensure that this section can be applied to both services and to buildings served by one or more feeders. The panel concludes this meets the intent of the submitter.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-45 Log #1054 NEC-P05 **Final Action: Accept in Principle**
(250.64(F)(4))

Submitter: George M. Stolz, II, Quicksilver Electrical Training
Comment on Proposal No: 5-125
Recommendation: Accept the proposal.
Substantiation: If the panel believes that the items listed are grounding electrode conductors or bonding jumpers, then we have more headaches in the field than I could have imagined. All steel water lines, steel structural metal, and now in the 2014 rebar embedded in concrete are no longer viable connection points, as they are not made of copper, aluminum, or copper-clad aluminum as required by 250.62. By accepting the proposal, we can pretend that these items are not grounding electrodes, grounding electrode conductors or bonding jumpers yet still viable connection points; and thereby save a heap of editing in Article 250. It will be our little secret.
Panel Meeting Action: Accept in Principle
Revise existing 2011 text as follows:

250.62 Grounding Electrode Conductor Material. The grounding electrode conductor shall be of copper, aluminum, ~~or~~ copper-clad aluminum or the items as permitted in 250.68(C). The material selected shall be resistant to any corrosive condition existing at the installation or shall be protected against corrosion. ~~The c~~Conductors of the wire type shall be solid or stranded, insulated, covered or bare.

Panel Statement: The panel concludes that the concern of the submitter is met by revising 250.62 as shown in the panel action text.

(250.68(C)(2))

Submitter: George M. Stolz, II, Quicksilver Electrical Training
Comment on Proposal No: 5-141
Recommendation: Accept the proposal.
Substantiation: Mr. Mello gets it. Building steel is a good conductor, whether it is in contact with the earth or not. Let 250.52 deal with what is an electrode, and allow 250.68(C) deal with non-wire-type conductors that are sensible to use for interconnecting grounding electrodes. It simplifies and separates concepts. I don't have to earth a copper conductor between a pair of electrodes, there's no reason to require earthing of steel to use it as a conductor. This section also creates a bit of a paradox; if I connect the electrodes to the steel, then suddenly it complies as a conductor to interconnect electrodes. Why have all the extra language, topped off with the proposed "(c) By other approved means of establishing a connection to earth."? It is so wide open as to restrict nothing, so why have all the extra unecessary language?

Less is more!

Panel Meeting Action: Accept in Principle
Revise the text from the 2013 ROP Draft as follows:
(2) The metal structural frame of a building ~~that is directly connected to a grounding electrode as specified in 250.52(A)(2) or 250.68(C)(2)(a), (b), or (c)~~ shall be permitted to be used as a ~~bonding~~ conductor to interconnect electrodes that are part of the grounding electrode system, or as a grounding electrode conductor.
~~a. By connecting the structural metal frame to the reinforcing bars of a concrete-encased electrode, as provided in 250.52(A)(3), or ground ring as provided in 250.52(A)(4)~~
~~b. By bonding the structural metal frame to one or more of the grounding electrodes, as specified in 250.52(A)(5) or (A)(7), that comply with 250.53(A)(2)~~
~~c. By other approved means of establishing a connection to earth~~
Panel Statement: The revised text clarifies that the structural metal is treated the same as the metallic water system. The application from the charging paragraph of 250.68(C) makes it clear that structural metal can be used to connect wire type bonding jumpers or grounding electrode conductors to the structural metal as an extension of the wire type bonding conductor or grounding electrode conductor.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-50 Log #1522 NEC-P05 **Final Action: Reject**
(250.84)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 5-144
Recommendation: Revise text to read as follows:
250.84 Underground Service Cable or Raceway.
(A) Underground Service Cable. The sheath or armor of a continuous underground metal-sheathed or armored service cable system (MC, MI, MV, or

TC) that is connected to the grounded system conductor on the supply side shall not be required to be connected to the grounded system conductor at the building or structure. The sheath or armor shall be permitted to be insulated from the interior metal raceway or piping.

(B) Underground Service Raceway Containing Cable. An underground metal service raceway that contains a metal-sheathed or armored cable (MC, MI, MV, or TC) connected to the grounded system conductor shall not be required to be connected to the grounded system conductor at the building or structure. The sheath or armor shall be permitted to be insulated from the interior metal raceway or piping.

Substantiation: Original proposal had a typographic error referencing 250.80 rather than 250.84.

The list of metal-sheathed or armored cables suggested above may include cables not suitable for service entrance conductors. If that is the case, then it should be pruned. The fact that AC cable is not suitable although it is an armored cable demonstrates the need of a precise list.

Panel Meeting Action: Reject

Panel Statement: The parenthetical list of acronyms of types of cables is not necessary. The wiring methods permitted to be used for services is included in 230.43.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-51 Log #1056 NEC-P05 **Final Action: Reject**

(250.92(B)(1))

Submitter: George M. Stolz, II, Quicksilver Electrical Training

Comment on Proposal No: 5-147

Recommendation: Accept the proposal.

Substantiation: While the entire section deals with equipment, raceways are mentioned by name. It is an appropriate location for a raceway-specific permission.

Allowing installers explicit permission to install a bonding connection on either end of a service raceway will alleviate conductor fill in the service equipment as well.

I see no harm in allowing this sentence to be added, especially since I personally have been ordered to move a bonding connection for no good electrical reason. It does add clarity to the NEC.

Panel Meeting Action: Reject

Panel Statement: The bonding of the service raceway must be accomplished in accordance with 250.92. There is no reference to which end of the raceway to bond and the submitter is correct that it can be at either end. The proposed added sentence is unnecessary.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-52 Log #269 NEC-P05 **Final Action: Reject**

(250.100)

Submitter: Code-Making Panel 14,

Comment on Proposal No: 5-160

Recommendation: Delete 250.100 entirely.

Substantiation: 250.100 is specific to bonding in hazardous (classified) locations and these requirements are addressed in 501.30(A), 502.30(A), 503.30(A), 505.25(A) and 506.25(A). See CMP 14 Proposal 14-56a which deletes the Informational Note that references 250.100. CMP 14 has the responsibility for amending bonding requirements in hazardous (classified) locations.

This comment was developed by a CMP-14 Task Group and balloted through the entire panel with the following ballot results:

15 Eligible to vote
14 Affirmative
1 Ballot Not Returned (W.E. McBride)
No Comments on Vote were received

Panel Meeting Action: Reject

Panel Statement: The panel concludes the text should remain in Article 250. Section 250.100 provides the initial requirement that bonding in hazardous locations be completed and that it be completed by one of the specific methods in 250.92(B)(2). Chapter 5 hazardous location articles can amend the base requirement with additional requirements. For example, 501.30 requires wiring and equipment to be "grounded". Section 501.30(A) then goes on to further modify the installation specified in 250.92(B)(2) but does not establish the initial requirement for bonding to start with. Similar lack of initial requirements exist in the other referenced hazardous location sections.

(Table 250.102(C))

Submitter: Edward G. Kroth, Verona, WI

Comment on Proposal No: 5-42

Recommendation: Revise table title as follows:

Grounded Service or System Conductor.

Substantiation: Having taught code courses for the past 13 years and in particular Grounding and Bonding for the past 8 years, I can really appreciate how this proposal can enhance the usability of the Code. Table 250.66 with its title for sizing Grounding Electrode Conductors was often a stumbling block for both apprentices and JWs when it was referred to for sizing Grounded Service Conductors, Separately Derived System Grounded Conductors, Main Bonding Jumpers, System Bonding Jumpers and Supply Side Bonding Jumpers. In particular the idea of the 12 1/2 % is often times lost on the students by the time they read the rule and then looked at the table. Hopefully with this new separation, different titles and the additional notes on Table 250.102(C) some of the confusion as to how and when to apply the rules for these various grounded and/or bonding items will be lessened. I am not usually in favor of repeating tables, but in this case it does seem justified. Furthermore it might be appropriate to add the phrase "Service or System" in the title where the table heading refers to Grounded conductor. For example: often times there is a grounded conductor installed with branch or feeder circuits and clearly we are not to size these using this new table.

Panel Meeting Action: Reject

Panel Statement: The term "Grounded Conductor" is correct and would be applicable to service grounded conductors and feeder grounded conductors such as supplied from a separately derived system.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

Comment on Proposal No: 5-167

Recommendation: It was the action of the Correlating Committee that this proposal be reconsidered and correlated with the panel action on Proposal 9-15c that modified the definition of "Metal Enclosed Power Switchgear" to "Switchgear".

This action will be considered as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Revise the text of 250.104(A)(2) from the 2012 ROP Draft to read as follows:

(2) Buildings of Multiple Occupancy. In buildings of multiple occupancy where the metal water piping system(s) installed in or attached to a building or structure for the individual occupancies is metallically isolated from all other occupancies by use of nonmetallic water piping, the metal water piping system(s) for each occupancy shall be permitted to be bonded to the equipment grounding terminal of the switchgear, switchboard or panelboard, ~~switchboard, or metal-enclosed switchgear~~ enclosure (other than service equipment) supplying that occupancy. The bonding jumper shall be sized in accordance with Table 250.122, based on the rating of the overcurrent protective device for the circuit supplying the occupancy.

Panel Statement: The panel accepts the direction of the Correlating Committee. The panel has revised the text to be consistent with the actions taken by CMP-9, consistent with other sections in Article 250 and the modification in the definitions.

Ballot Results: Affirmative: 16

5-59 Log #345 NEC-P05 **Final Action: Accept in Principle**
(250.104(B))

Submitter: Christine T. Porter, Seattle, WA

Comment on Proposal No: 5-171

Recommendation: Revise text to read as follows:

(B) Other Metal Piping. If installed in, or attached to, a building or structure, a metal piping system(s), including gas piping, that is likely to become energized shall be bonded to ~~the service equipment enclosure; the grounded conductor at the service; the grounding electrode conductor, if of sufficient size; or to one or more grounding electrodes used~~ any of the following:1) the equipment grounding conductor of the circuit that is likely to energize the piping system(s);2) the service equipment enclosure;3) the grounded conductor at the service;4) the grounding electrode conductor if of sufficient size;5) to one or more grounding electrodes used: The bonding conductor(s) or jumper(s) shall be sized in accordance with 250.122, using the rating of the circuit that is likely to energize the piping system(s). ~~The equipment grounding conductor for the circuit that is likely to energize the piping shall be permitted to serve as the bonding means~~. The points of attachment of ~~the~~ any bonding jumper(s) shall be accessible.

Substantiation: The current order of the requirement seems to be creating confusion for the submitter. Certainly other users of the code have also been confused by this section as evidenced by the continued revisions to this section for reasons of clarity. The reordering of this section should make it easier to understand the requirements by using a list format, and also by changing to order of the requirements. The first choice should be a connection to the equipment grounding conductor of the circuit that is likely to energize the piping in order to ensure a low impedance path back to the source without relying on the continuity of any gas piping throughout a structure. Maintaining the other possible methods allows for options to accomplish the goal of clearing any faults on the piping systems.

Panel Meeting Action: Accept in Principle

Revise 250.104(B) to read as follows:

(B) Other Metal Piping. If installed in, or attached to, a building or structure, a metal piping system(s), including gas piping, that is likely to become energized shall be bonded to any of the following:

1. The equipment grounding conductor for the circuit that is likely to energize the piping system.
2. The service equipment enclosure.
3. The grounded conductor at the service.
4. The grounding electrode conductor, if of sufficient size.
5. One or more grounding electrodes used.

The bonding conductor(s) or jumpers(s) shall be sized in accordance with 250.122, using the rating of the circuit that is likely to energize the piping system(s). The points of attachment of bonding jumper(s) shall be accessible.

Informational Note No. 1: Bonding all piping and metal air ducts within the premises will provide additional safety.

Informational Note No. 2: Additional information for gas piping systems can be found in Section 7.13 of NFPA 54-2009, National Fuel Gas Code.

Panel Statement: Editorial changes were made to better show the list form and the final wording from the submitter's comment. The panel removed the word "any" from the last sentence in the proposed comment text. The panel does not agree that the equipment grounding conductor is the first choice as the point of connection.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

Comment on Affirmative:

PORTER, C.: The title of 250.104 clearly states that the section is dealing with bonding. Section 240.4 clearly gives the purpose of bonding is to provide an effective ground-fault path. I disagree that utilizing gas piping or the grounding electrode system back to the location where it is bonded to the service is always an effective ground-fault return path for clearing faults on piping likely to be energized by an electrical circuit.

5-60 Log #1576 NEC-P05 **Final Action: Reject**
(250.104(B))

Submitter: Robert Torbin, Omega Flex Inc.

Comment on Proposal No: 5-172

Recommendation: Add new (B) and Informational Note to read as follows:

(B) Metal Gas Piping. Metal gas piping installed in or attached to a building or structure shall be bonded in accordance with (A)(1) and (A)(3). The bonding conductor or jumper shall be connected in an accessible location to rigid pipe downstream of the point of delivery of the fuel gas.

Informational Note: Additional information for gas piping systems can be found in Section 7.13 of the National Fuel Gas Code/NFPA 54-2009.

~~**(B)**~~**(C) Other Metal Piping.** If installed in or attached to a building or structure, a metal piping system(s)~~, including gas piping,~~ that is likely to become energized shall be bonded to the service equipment enclosure, the grounded conductor at the service, the grounding electrode conductor if of sufficient size, or to one or more grounding electrodes used. The bonding conductor(s) or jumper(s) shall be sized in accordance with 250.122, using the rating of the circuit that is likely to energize the piping system(s). The equipment grounding conductor for the circuit that is likely to energize the piping shall be permitted to serve as the bonding means. The points of attachment of the bonding jumper(s) shall be accessible.

Informational Note: Bonding all piping and metal air ducts within the premises will provide additional safety.

Renumber existing 250.104(C) as (D) and 250.104(D) as (E).

Substantiation: The requirement to bond to a fitting has been removed as the UL 467 Standard for bonding clamps addresses clamps for round pipe.

The Panel Statement raises the issue of lightning protection. However, I am confused by this statement as my original proposal was submitted to address consumer safety from electrical insults that originate from the electrical system within the premises or from surges from the local power company distribution system. Surely the same electrical faults imposed on structural steel or the copper water pipe may be imposed on the metallic gas piping with equal impact.

Bonding of gas piping has been performed in the prescribed manner within the United States for many years prior to the 2002 NEC and is performed in this fashion around the industrialized world today. Technical substantiation is hardly necessary to validate such a common, yet essential, element of electrical safety as bonding.

Panel Meeting Action: Reject

Panel Statement: No technical substantiation for increasing the level of bonding required has been provided.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-61 Log #344 NEC-P05 **Final Action: Reject**
(250.106)

Submitter: David E. Shapiro, Safety First Electric
Comment on Proposal No: 5-180
Recommendation: Revise text to read as follows:
The bonding connection to the building or structure grounding electrode system shall be located outside the building or structure served where the grounding electrode system is available outside the building or structure.
Substantiation: I believe that the action on this proposal should be changed to "Accept in Principle." The panel made two valid objections to the proposal as stated. The panel did not, however, disagree with the principle behind the proposal. The first objection is that we should not demand that (to spell out the most absurd case) installers run conductors outside from totally interior grounding electrodes to bond them with conductors run outside from totally interior lightning down conductors. No AHJ with a head on this shoulders would require this. However, the objection remains that the proposed wording could be interpreted in such ways. Surely no one believes that Mr. Johnston intended such a tortuous requirement, if only because lightning conductors must not be put through tortuitous bends. Therefore, the phrase I suggest adding to deal with your first objection is simply clarification, not modification. Your second objection is that the required intersystem bonding means may be installed either indoors or out, and this proposal requires bonding outdoors in some cases. There are two responses. First, not all structures incorporate lightning protection systems, and also, as you note, not all grounding electrodes incorporate outdoor components. In every such case, the proposal does not apply, and so the bonding means can be indoors or out. Second, the requirement states that the accessible bonding means must be made available; but I see no requirement that this busbar must serve as the sole bonding means. Even if you interpret the proposal as requiring the intersystem bonding electrode to be mounted on the outsides of structures when 250.106 applies, this becomes a case of a specific rule narrowing the application of a more general rule in keeping with special circumstances. There is nothing unusual about that.
Panel Meeting Action: Reject
Panel Statement: Connection of the lightning protection system to the building or structure grounding system is not intended to provide a path for lightning current to ground. It is intended to minimize a difference in potential between the lightning protection conductors and metallic grounded equipment in or on the building or structure.

Ballot Results: Affirmative: 16

5-62 Log #1152 NEC-P05 **Final Action: Reject**
(250, Part VI)

Submitter: Paul Dobrowsky, American Chemistry Council
Comment on Proposal No: 5-181
Recommendation: The proposal should have been accepted.
Substantiation: The term Equipment Grounding Conductor needs to be replaced. Those opposed have no technical reason for their opposition or any other valid reason. It is not worth the effort and everyone understands what is meant are common responses.
It is very simple: Grounding electrode conductors are the connection to the earth and accomplish grounding. In the present NEC, Equipment Grounding Conductors and bonding jumpers provide a "path back" to the source. Both are always performing a bonding function. If the Grounding Electrode connection is removed or broken, the bonding function remains intact.
Section 250.4 does not permit the earth (ground) to be used as an effective ground fault current path but the term equipment grounding conductor inherently incorrectly contains the word "ground".
Visualize equipment supplied by a portable generator. The generator frame is not required to be connected to the earth. The "green" wire in the flexible cord is not performing a grounding function but is performing a bonding function.
Visualize building one supplied by a service, having the grounded conductor connected to the grounding electrode system by a grounding electrode conductor. A feeder supplies a second building and a grounding electrode conductor is required for grounding any equipment in the second building. An equipment grounding conductor is required to be installed from building 1 to building 2. Not for grounding, but for bonding, providing an effective fault current path.
Making this change has the added benefit of being more harmonized with other international standards and usage of terminology.
Experienced NEC users have to ignore other concepts in other definitions and requirements to use the existing term. This does not help the future NEC user or provide clarity in the existing NEC. Changing the term is the right thing to do and should be supported.

Ballot Results: Affirmative: 16

5-64 Log #939 NEC-P05 **Final Action: Reject**
(250.112(B))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 5-199
Recommendation: Revise text to read as follows:
250.122 Size of Equipment Grounding Conductors.
~~**(B) Increased in Size.** Where ungrounded conductors are increased in size from the minimum size that has sufficient ampacity for the intended installation, wire type equipment grounding conductors, where installed, shall be increased in size proportionately according to the circular mil area of the ungrounded conductors.~~
(B) Increased in Size. If wire type equipment grounding conductor(s) are present, where ungrounded conductors are increased in size from the minimum size that has sufficient ampacity before any adjustments f250.112Bor derating for (1) ambient temperature correction factors, (2) exposure to sunlight on a rooftop, (3) adjustments for more than three current carrying conductors, or (4) for reduction in voltage drop, then the required grounding conductor size shall be calculated using the following equation:
Agnew = Agorg × (Aunew ÷ Auorg)
where:
Agnew = new area required for grounding conductorAgorg = original area of grounding conductorAunew = new area for ungrounded conductor after all adjustments & deratingsAuorg = original area for ungrounded conductor before any adjustments or deratingsall areas in circular mils or mm^2
The new required size of the equipment grounding conductor(s) shall be the next standard size that is equal or greater to the *Agnew* area.
Informational Note: Increases in size for the grounded conductor alone do not require the equipment grounding conductor to be increased in size.
Substantiation: The original text is so chopped up that just displaying the new text is clearer. Suggest that the reasons for increasing size be explicit and that calculation be expressed as a usable formula rather than suggested by the wording. Parens not needed.
Informational note indicates larger grounded conductor (for harmonics for instance) does not trigger larger EGC.
Panel Meeting Action: Reject
Panel Statement: The panel recognizes that the section is 250.122(B). Insufficient technical substitution was provided to support adding the revised text and including a formula. The proposed text does not make this section clearer. The informational note is not needed since the current NEC text refers only to ungrounded conductors.

Ballot Results: Affirmative: 16

5-66 Log #1535 NEC-P05 **Final Action: Accept in Principle**
(250.119 Exception No. 2)

Submitter: Phil Simmons, Copper Development Association, Inc.
Comment on Proposal No: 5-188
Recommendation: Revise the text of the 2014 NEC ROP Draft as follows:
Exception No. 2: Flexible cords having an integral ~~that do not have an equipment grounding conductor, where the~~ insulation and jacket ~~are integral with each other,~~ shall be permitted to have a continuous outer finish that is green.
Substantiation: It seems the qualification that the flexible cord not contain an equipment grounding conductor for the exception to be operative is unnecessary. It also seems an unnecessary limitation on design of flexible cords is being imposed by including the phrase, "that do not have an equipment grounding conductor." Would a flexible cord that has an equipment grounding conductor with integral green insulation and jacket be unsafe?
Panel Meeting Action: Accept in Principle
Revise exception No. 2 as follows:
Exception No. 2: Flexible cords having an integral insulation and jacket without an equipment grounding conductor ~~that do not have an equipment grounding conductor, where the insulation and jacket are integral with each other,~~ shall be permitted to have a continuous outer finish that is green.
Panel Statement: Editorial changes where made for clarity.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-66a Log #CC500 NEC-P05 **Final Action: Accept**
(250.121)

Submitter: Code-Making Panel 5,
Comment on Proposal No: 5-190
Recommendation: Add new exception to 250.121 to read as follows:
Exception. A wire-type equipment grounding conductor installed in compliance with 250.6(A) and the applicable requirements for both the equipment grounding conductor and the grounding electrode conductor in Parts II, III and VI of this article shall be permitted to serve as both an equipment grounding conductor and a grounding electrode conductor.
Substantiation: Section 250.121 restricts all equipment grounding conductors provided in 250.118 from being used as a grounding electrode conductor. This is appropriate for all of the fourteen types with the exception of a wire type, per 250.118(1), if the wire type satisfies all applicable requirements for both the equipment grounding conductor and the grounding electrode conductor simultaneously. Equipment grounding conductors installed in accordance with this restrictive exception that do not carry current during normal operating conditions can comply with 250.6(A).
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 14 Negative: 2
Explanation of Negative:
BRENDER, D.: This Comment should have been rejected. It was developed at the Panel meeting in response to Comment 5-68. That Comment (5-68) requested that Section 250.121 be deleted and did not provide suggested text for an exception. As a result, this Comment is outside the parameters of the NFPA Regulations Governing Committee Projects.
WILLIAMS, D.: The equipment grounding conductor should not be used as a grounding electrode conductor. The previous wording in the code was correct and the addition of the exception was not needed, and will cause complications in the field. Installations in the field where the equipment grounding conductor was attempted to be utilized as a grounding electrode conductor as well created more violations. The exception should be more explicit on all the requirements that are needed in order to have a code compliant installation.

5-67 Log #1138 NEC-P05 **Final Action: Accept in Principle**
(250.121)

Submitter: Phil Simmons, Copper Development Association, Inc.
Comment on Proposal No: 5-190
Recommendation: Continue to reject the proposal and retain the existing text of the 2011 NEC.
Substantiation: Many applications that justify the requirement for individual grounding electrode and equipment grounding conductors come to mind. These include:
1. A separately derived system located in a building or structure where the equipment grounding conductor is supplied to the transformer with or containing the feeder and the grounding electrode conductor is required to be connected where the transformer is located. It would be a violation of the rules in 250.30(A)(4) to connect the grounding electrode conductor at some location remote to the transformer.
2. A generator or transformer is located outdoors. Section 250.30(C) requires the grounding electrode connection to be located at the outdoor source. An equipment grounding conductor or supply-side bonding jumper or conductor is then required to be run to the building or structure supplied or from which the source is supplied as to a transformer.
3. The purpose for the conductors as well as the sizing and installation requirements differ.
4. Let's assume a feeder panelboard that is located in a building or structure supplies a transformer that is located outdoors. Let's also assume a common equipment grounding/grounding electrode conductor is sized properly. Where does it connect in the panelboard. An equipment grounding conductor is required to connect to the equipment grounding terminal bar. The grounding electrode conductor is required to be connected to the grounding electrode. The grounding electrode conductor is generally not permitted to be spliced by 250.64(C).
Using one conductor for both an equipment grounding conductor and a grounding electrode conductor is generally a bad idea.
This section continues to contain a valuable safety requirement and should be retained without Exception. It seems an exception cannot be considered at the Comment meeting as no exception was submitted for action by the Code Panel at the proposal stage. Thus, CMP-5 did not take any action that would be subject to public review and reaction. Submitting a proposed exception at the ROC meeting is in violation of the NFPA Regulations Governing Committee Projects.
Code Making Panels that have jurisdiction over Articles in Chapters 5, 6, 7 and 8 can rightfully craft an exception to the general requirement in 250.121 as provided in 90.3. This section recognizes that the rules in Chapters 1 through 4 apply generally unless amended by the requirements in Chapters 5, 6, 7 or 8. An example of this organization of the Code is found in 690.47(C)(3) where a common grounding electrode conductor and equipment grounding conductor is permitted under the rules and conditions that are applicable.

5-68 Log #1598 NEC-P05 **Final Action: Reject**
(250.121)

Submitter: Scott Cline, Monterey Park, CA
Comment on Proposal No: 5-190
Recommendation: Delete the still totally unsubstantiated Section 250.121.
Substantiation: I believe that it is not possible to give a single example of an installation, meeting the requirements of the 2008 NEC, and presenting a hazard of any kind. NFPA standards for technical substantiation for this Section have not been met.
CMP actions should be based on evidentiary technical substantiation showing a hazard.
Not even a single example of hazard under the rules of the 2008 NEC has been given.
There is quite simply no proper justification for the rule.
2014 cycle Proposal 5-190 both addresses and shows the original 2011 Proposals' "Substantiations" to be flawed and inadequate, and as such should be reviewed. It especially includes the 2011 cycle 5-259 Substantiation statement "Equipment grounding conductors do not normally carry current while a grounding electrode conductor may normally carry current since it is often in parallel with the neutral conductor." Other than a service supplied by a separately grounded utility transformer, please give an example of a neutral being in parallel with the GEC. Even if an EGC was intended in that logic statement: 250.24(A)(5) only very rarely allows the neutral to be in parallel with an EGC. It is also fact that even if a single conductor were carrying some stray current because of its GEC function, it would still be able to carry the rare ground-fault circuit-clearing current needed for its EGC function.
In addition to the Proposal's Substantiation, I submit the following added Substantiation for this Comment. It will address the points of the Panel's Proposal Rejection Statement logic (presented in Bold Italics) from the ROP.
Panel Statement: The panel re-affirms the position that the GEC and EGC's have different functions and shall not be used as both. The substantiation for the proposal contains some of the reasons this proposal is not acceptable. This includes the fact that the two conductors are installed for different purposes, are sized differently and have different installation requirements.
Like the original Proposal, this re-affirmation is made without the required technical facts. The GEC and EGC do not have mutually exclusive functions. They both must be able to carry sufficient electrons from one point to another point - Period. There are many circumstances where the termination points of the GEC and EGC are the same. There are many circumstances where both sets of installation requirements can be satisfied. Where an installation allows compliance with all of the 2008 NEC GEC and EGC requirements, there is no safety/hazard reason to install parallel conductors.

Here are a few illustrations of why the rule needs to remain in the NEC:

(1) An equipment grounding conductor is required to be installed with the circuit conductors to the transformer enclosure. 250.30(A)(4) requires the grounding electrode to be "as near as practicable to, and preferably in the same area as the grounding electrode conductor connection". These locations could and often are widely separated.

They can also be directly adjacent to one another. An example is the very common one of a main service/distribution with an adjacent transformer. It is extremely easy to construct a single conductor GEC-EGC for this circumstance which is both safe and effective AND which satisfies all 2008 NEC requirements. (1) is a futile effort of logic, presenting only a single negative example, and not proving the fact which must be proven: that a conductor satisfying all requirements of the 2008 Code presents a hazard.

(2) A feeder is installed from a source in a building to a transformer that is located outdoors. 250.30(C) requires the grounding electrode connection to be at the transformer that is the source of a separately derived system. A combination grounding electrode conductor/equipment grounding conductor run to the source location would not be acceptable.

Again, a simple negative example, and a flawed one at that. An insultingly poor quality statement is made here – the great deal of time which I have spent to present the issues here, deserves enough time on your part to be accurate with your rebuttals. Section 250.30(C) applies to a system where the source is outside the building. In a correct 250.30(C) example, since any required GEC of the source must be bonded to the structure's GES, then it is a possible situation that a 2008 compliant GEC-EGC connection may be made from the transformer to the same connection point of the source. In your response example of the transformer outside with the source inside, again a 2008 compliant GEC-EGC connection might be made to the GES connection point at the source. Again, (2) is a futile effort.

(3) A supply to a transformer-type separately derived system is installed from a sub-panel (feeder panelboard). Where would a combination grounding electrode conductor/equipment grounding conductor be connected? To the neutral terminal bar? A clear violation of 250.24(A)(5). To the equipment grounding terminal bar? The equipment grounding conductor supplying the panelboard may not be large enough.

Another of the infinitely available negative examples, none of which prove the point which you have the responsibility to prove. The fact which must be proven: that a conductor satisfying all requirements of the 2008 NEC presents a hazard.

And there is a Code compliant answer to the question of (3): Under the right circumstances of location and conduits, the larger of the two sizes would be bonded at the transformer as required for both the GEC and the EGC, then its un-spliced length would be bonded to the panelboard as it passed through the panelboard to do the EGC's task, and would then run to its connection point on the structure's Ground Electrode System. A hazard-free and 2008 NEC compliant installation.

Again: Evidentiary technical substantiation is a standard we as CMP members should always strive to meet. From the original Proposal forward, there has not been a single proper example given of a hazard present in the 2008 NEC. I do not believe that this satisfies your responsibilities as a Code Panel. There is quite simply no proper justification for the rule.

If you can't give the necessary technical example, please take the responsibility required of a CMP to recognize the flawed logic of Section 250.121, and delete it.

Panel Meeting Action: Reject

Panel Statement: Section 250.121 restricts all equipment grounding conductors provided in 250.118 from being used as a grounding electrode conductor. This is appropriate for all of the fourteen types with the exception of a wire type, per 250.118(1), if the wire type satisfies all applicable requirements for both the equipment grounding conductor and the grounding electrode conductor simultaneously. Equipment grounding conductors installed in accordance with this restrictive exception that do not carry current during normal operating conditions can comply with 250.6(A).

Recommendation: Add new Exception as follows:

Exception No. 1: As specified on Article 690.45(A), the equipment grounding conductor does not need to increase in size, if the DC conductors increases in size due to voltage drop consideration.

Substantiation: My inspector in Somerset County, NJ, referring to article 250.122(B) asked me to increase the size of my equipment grounding conductor because my DC conductors feeding my solar panels increases in size to satisfy the voltage drop requirement of 2%.

Panel Meeting Action: Reject

Panel Statement: In accordance with NEC 90.3, Article 690 can modify base requirements of Chapters 1 to 4. This comment should be directed as a new proposal to CMP-4 to modify Article 690 since the comment only applies to photovoltaic installations.

(250.122(D)(2))

Submitter: Code-Making Panel 11,

Comment on Proposal No: 5-201

Recommendation: Continue to Reject Proposal 5-201.

Substantiation: The TCC directed CMP11 to appoint a Task Group to consider its original position regarding the introduction of the acronym "MCP". This Task Group consisted of Jim Wright, Stan Folz, Terry Cole and Luis Bas. Background and the position of the Task Group is as follows.

Proposal 5-201 was rejected by CMP5, and had companion proposals to CMP-11. The first of these was 11-23, Log# 762, These companion proposals were for 430.2, 430.52 and 430.62. Each of these proposals was rejected by CMP-11 with the statement shown below. The circuit breakers being addressed are Instantaneous Trip Circuit Breakers, which are informally referred to as Mag Only Breakers, or Motor Circuit Protectors (MCP). CMP 11 does not see value in documenting all of the informal terms associated with an Instantaneous Trip Circuit Breaker. It is also the position of CMP11 that the introduction of "MCP" will create additional confusion with the already established fused based Motor Short-Circuit Protectors.

CMP11 Panel Action – Reject

CMP11 Panel Statement - The proposed definition is not presently utilized within Article 430. It refers to "magnetic-only" and "thermal trip elements" which ignores the fact that the instantaneous trip and overload functions in circuit breakers may be electronic or magnetic-hydraulic. The additional text of "listed and tested" is redundant. If the device has been listed, then it has been tested.

This comment was developed by a CMP-11 Task Group and balloted through the entire panel with the following ballot results:

5-73 Log #1311 NEC-P05 **Final Action: Reject**
(250.122(D)(2))

Submitter: Mike Weitzel, Bechtel
Comment on Proposal No: 5-201
Recommendation: Revise text to read as follows:
Section 250.122(D)
(2) Instantaneous-Trip Circuit Breaker (MCP) and Motor Short-Circuit Protector. Where the overcurrent device is an instantaneous-trip circuit breaker **(MCP)** or a motor short-circuit protector, the equipment grounding conductor shall be seized not smaller than that given by Section 250.122(A) using the maximum permitted rating of a dual element time-delay fuse selected for branch-circuit short-circuit and ground-fault protection in accordance with Section 430.52(C)(I), Exception No. 1.
Substantiation: This proposal recommends adding the acronym **"MCP"** after Instantaneous Trip Circuit Breaker found in Section 250.122(D)(2), and correlates with a comment to Section 430.2, Definitions. Panel statements from both CMP 5 and CMP 11 were considered.
Motor Circuit Protector. An instantaneous trip type circuit breaker designed to be used as part of a listed motor controller assembly, containing electronic or magnetic-hydraulic instantaneous trip and overload functions, no thermal trip elements, and short circuit protection.
I believe that clarity and a clear definition of a Motor Circuit Protector is needed.
I'm trying to clarify what a Motor Circuit Protector is and how it should be used. It seems that there is some confusion in the field as to how these breakers are used and because they are being used incorrectly, safety is compromised.
They are intended to provide only branch-circuit, short-circuit, and ground-fault protection for individual motor branch circuits.
They may not be used to provide main, motor feeder, motor overload, and general branch-circuit or group motor protection...
NEC 430.52 requires that they shall only be used as part of a listed combination motor controller. MCP's are short-circuit tested only in combination with a motor controller and overload device.
Because of this, they are not labeled with an interrupting rating by themselves.
Per NEC 430.109, they may be used as a motor branch-circuit and controller disconnect, or "at the motor" disconnect only when part of a listed combination motor controller.
Companion proposals have been re-submitted to Section 430.2 to add a new definition for Motor Circuit Protector (MCP) 430.62, everywhere found in Section 430.52, and at the top of Table 430.52, to coincide with the use of the term in the *Code* text of 430.52.
Panel Meeting Action: Reject
Panel Statement: Panel 11 has jurisdiction over the types and descriptions of motor protection devices and has acted to reject the concept. See Comment 5-72.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-74 Log #976 NEC-P05 **Final Action: Reject**
(250.122(F))

Submitter: David Brender, Copper Development Assn. Inc.
Comment on Proposal No: 5-201a
Recommendation: Retain original text.
Substantiation: The original Proposal (5-204), re-crafted by the Panel as Panel Proposal 5-201a, was submitted with no substantiation, and should have been disallowed. The Panel requires every Proposal to be accompanied with technical substantiation and exceptions should not be made. Existing language of Section 250-122 has existed for years and is based on unequal current flow under fault conditions. The NEC Handbook discusses unequal current under certain fault conditions. The submitter of Proposal 5-204, re-crafted as 5-201a, has not submitted a Fact Finding Report or other documentation that the proposed change does not run contrary to the safety issues raised in the Handbook discussion, or is safe.
Further, it is not clear whether "the total sum of equipment grounding conductor" applies to number of conductors or circular mil area. The Panel should not be crafting technical substantiation for the submitter.
Panel Meeting Action: Reject
Panel Statement: The panel concludes removal of all of the changes in Proposal 5-201a is not warranted. The list format and requirements for the largest conductor should remain to improve usability. The panel removed the exception, see panel action on Comment 5-79.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 14 Negative: 2
Explanation of Negative:
BRETT, JR., M.: There was no substantiation provided to support this change. This proposed idea to allow a reduced EGC has been before this committee for several cycles and each time the committee has requested supporting data, none has been provided from the proponents. The EGC provides fire & life safety functions important to the entire electrical system integrity and the safety of the occupants of the installation. This comment and proposal 201a should be rejected until data to support this proposals has been supplied.
PICARD, P.: The exception should be retained. The substantiation is that there are are numerous Underwriters Laboratories Standards (UL 1277 Power and Control Cable, UL 1569 Metal-Clad Cable, UL 1072 Medium Voltage cable) that permit Equipment Grounding Conductors to be sectioned within a cable. The sectioning of an Equipment Grounding Conductor is equivalent to running multiple parallel Equipment Grounding Conductors and joining them together.
Experience in Canada has proven that oversized equipment grounding conductors are unnecessary in parallel installations, and further consideration should be given to this proposal.

5-75 Log #1062 NEC-P05 **Final Action: Reject**
(250.122(F))

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 5-201a
Recommendation: Reject the proposal for lack of technical substantiation.
Substantiation: This proposal should be rejected to remain consistent with the panel actions on similar previous proposals in past NEC development cycles. The same type of proposal was submitted in the 2011 NEC development cycle and was rejected by the panel due to lack of testing or any other type of technical substantiation. During that process the panel indicated that technical substantiation would be needed to accept this type of change. No appartent or additional technical substantiation has been provided to warrant this change that would lessen current sizing requirements. See the negative ballot statements of Williams, Brett and Brender.

5-76 Log #1141 NEC-P05 **Final Action: Reject**
(250.122(F))

Submitter: Phil Simmons, Copper Development Association, Inc.
Comment on Proposal No: 5-201a
Recommendation: Reject the Proposal.
Substantiation: This proposal should be rejected. Inadequate substantiation was provided for the new exception. The exception does not require the engineer to be qualified as an electrical engineer. Nor does it require the people who will install, service and maintain the wire with a reduced size equipment grounding conductor to be qualified in any way.
This section has required for decades that the minimum size equipment grounding conductor must be determined by Table 250.122 based upon the rating of the overcurrent protective device. Now, without any substantiation, the exception will allow an unqualified engineer to select a smaller equipment grounding conductor without restriction so long as the equipment grounding conductor is not smaller than 6 AWG copper or 4 AWG aluminum. This permission applies to wire pulled into raceways as well as to wire installed in cable. The exception should require the cable be listed to ensure proper construction.
The electrical inspector will have his or her hands tied and be required to accept an installation that does not satisfy this long-standing rule.
The Panel should have required a Fact-Finding Study to prove the validity of such a significant change and radical departure from the long-standing rule. Nothing has been provided to prove that safety will not be diminished by the proposed change.
The issue of equipment grounding conductors installed in parallel has long been addressed in the National Electrical Code Handbook. Here are two paragraphs from the 2011 NEC Handbook that apply to this proposed change,
"The full-sized equipment grounding conductor is required to prevent overloading and possible burnout of the conductor should a ground fault occur along one of the parallel branches. The installation conditions for paralleled conductors prescribed in 310.10(H) result in proportional distribution of the current-time duty among the several paralleled grounding conductors only for overcurrent conditions downstream of the paralleled set of circuit conductors. Exhibit 250.51 shows a parallel arrangement with two nonmetallic conduits installed underground. For clarity, a one-line diagram with equipment grounding conductors is shown. A ground fault at the enclosure will cause the equipment grounding conductor in the top conduit to carry more than its proportionate share of fault current. The fault is fed by two different conductors of the same phase, one from the left and one from the right. The shortest and lowest-impedance path to ground from the fault to the supply panelboard is through the equipment grounding conductor in the top conduit. The grounding path from the fault through the bottom conduit is longer and of higher impedance. Therefore, the equipment grounding conductor in each raceway must be capable of carrying a major portion of the fault current without burning open.
The substantiation for the proposal does not address or disprove the theory on unequal loading of the equipment grounding conductors as explained in the NEC Handbook.

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 5-74.

PICARD, P.: See my explanation of negative vote on Comment 5-74.

5-77 Log #1337 NEC-P05 **Final Action: Hold**
(250.122(F))

Submitter: Paul Dobrowsky, Holley, NY
Comment on Proposal No: 5-201a
Recommendation: Revise text to read as follows:
(1) If conductors are installed in multiple raceways or cables as permitted in 310.10(H), wire type equipment grounding conductors, if installed, shall be in parallel in each raceway or cable and shall not be required to be larger than the largest ungrounded conductor installed in each raceway or cable. <u>Alternatively the equipment grounding conductor shall be permitted to be sized based on 250.102(C) based on the largest ungrounded conductor in the raceway.</u>
Substantiation: Continue to accept the proposal in concept but add the provided option. Admittedly the proposed sentence does not blend well with the other language but I want to put the concept before the panel. Base on the 2011 NEC a parallel conductor installation in multiple raceways requires a full size equipment grounding conductor in each raceway. The Equipment grounding conductor is sized based on the overcurrent device protecting the ungrounded conductors. But if the ungrounded conductors are not protected on their supply side, such as the secondary conductors of a transformer with no overcurrent protection at the supply, the supply side bonding jumper is sized based on the largest ungrounded conductor in the raceway using. So without overcurrent protection the “fault carrying conductor” in the raceway is considerably smaller than the equipment grounding conductor as presently required with overcurrent protection. The reason for this proposal it to provide this concept to the panel for discussion.
Panel Meeting Action: Hold
Panel Statement: This comment introduces a concept that has not had public review.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 14 Negative: 2
Explanation of Negative:
BRETT, JR., M.: See my explanation of Negative vote on Comment 5-74. The submitter did not provide any substantiation but only presented the concept for panel discussion.
PICARD, P.: See my explanation of negative vote on Comment 5-74.

5-78 Log #1423 NEC-P05 **Final Action: Reject**
(250.122(F))

Submitter: Keith Fager, Bayer CropScience
Comment on Proposal No: 5-201a
Recommendation: Revise the Exception in the proposal.
Exception: Under engineering supervision in industrial locations the total area of the combined equipment grounding conductors of the wire type shall not be less than the circular mill area specified in Table 250.122, <u>provided that the wire type equipment grounding conductors are not the only ground fault path for the circuit.</u> The individual equipment grounding conductors shall not be smaller than 6 AWG copper or 4 AWG aluminum.
Substantiation: The added text addresses the concerns in the Explanation of Negative comments relative to the example in the NEC Handbook. The Handbook example uses nonmetallic conduit which is a worst case scenario. Metallic conduit with a wire type equipment grounding conductor in parallel with the conduit provides a very effective ground fault path (IEEE Std 142 – 1991, 2.2.3). In industrial installations, it is not unusual to find paralleled cables installed in tray with a single external ground cable, connected in parallel with the cable tray. Concern that there is no requirement that the engineer be qualified was stated in the Explanation of Negative comments also. A search of the NEC found only one instance that requires qualified engineering supervision and that is Section 110.71 for manhole and vault design. State registration laws address engineering qualifications, licensing, and areas of practice.
Panel Meeting Action: Reject
Panel Statement: The panel removed the exception therefore the modifications are not applicable. See panel action on Comment 5-79.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
PICARD, P.: See my explanation of negative vote on Comment 5-74.

5-79 Log #1331 NEC-P05 **Final Action: Reject**
(250.122(F)(1) Exception)

TCC Action: The Correlating Committee directs that Comment 5-79 and Proposal 5-201a be reported as “Reject” because less than two-thirds of the members eligible to vote have voted in the affirmative on the comment and the proposed revision no longer has consensusSubmitter: David Williams, Delta Township
Comment on Proposal No: 5-201a
Recommendation: Delete the following text:
~~Exception: Under engineering supervision in industrial locations the total area of the combined equipment grounding conductors of the wire type shall not be less than the circular mill area specified in Table 250.122. The individual equipment grounding conductors shall not be smaller than 6 AWG copper or 4 AWG aluminum.~~
Substantiation: Delete the proposed exception to section 250.122(F)(1). The code panel agreed that there was not sufficient substantiation to reduce the requirements for equipment grounding conductors installed in parallel and then made two changes to do just that. The present wording in the exception would allow an installation supervised by a sanitation engineer to reduce the equipment grounding conductor below safe limits without proper approval.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 7 Negative: 9
Explanation of Negative:
BOWMER, T.: The Comment 5-79 should have been rejected and the proposed exception to 250.122(F)(1) should be retained. The proposed exception to 250.122(F)(1) helps to make the code more practical and usable by providing the necessary flexibility in industrial installations that are designed under engineering supervision to utilize standard cables. The text of the exception developed in Panel Proposal 201a provides sufficient and adequate safeguards to help ensure appropriate conductor sizing for the proper operation of overcurrent devices during fault conditions.
DOBROWSKY, P.: Reject the comment and keep the exception as it was accepted at the ROP stage. The physics behind parallel conductors used as ungrounded and grounded conductors is the same as for those used as equipment grounding conductors (EGC). Current will take all paths available and divide inversely based on the impedance. If a given EGC size is necessary then permitting multiple conductors, one in each cable, to provide the equivalent area of that size should also be acceptable. This concept is presently permitted when parallel EGC’s are provided as segmented conductors in multi-conductor cables. Without this allowance standard cables cannot to be used in parallel configurations.
HARDING, G.: The proposed exception to 250.122(F)(1) should be retained. The proper safeguarding of persons will be ensured due to the requirement of engineering supervision in these installations.
HARDING, J.: Engineering analysis shows that the proposed exception provides adequate protection for the equipment grounding conductor. The exception should be allowed under engineering supervision in industrial locations.
HELFRICH, W.: After reviewing the many places in the code where the phrase “under engineering supervision” is used, I believe the panel vote to remove the exception was incorrect. The term (under engineering supervision) is used extensively in the code for determining conductor ampacities, which is critical in protecting equipment from fires and shock hazards. The rationale that a “sanitation engineer” could reduce equipment grounding conductors below safe limits, if true, then he could increase ampacities of conductors beyond safe limits, which has not been the case.
MOHLA, D.: The comment should have been rejected.
The text adopted by the Panel in Panel Proposal 201a provides the necessary safeguards to ensure adequate conductor sizing for operation of overcurrent devices during fault conditions without damage to the conductor insulation. The substantiation provided in the Comment, if realistic, would negate all of the exceptions given for engineering supervision and that have not been shown to result in increased hazard.
Any conductor must be large enough to carry the fault current for a sufficient length of time to permit the overcurrent device to open before the conductor is heated to a point where it damages the insulation. The attachment Cable Short Circuit Current Capacity chart shows the maximum current to which various size copper conductors can be subjected for various times without injuring the insulation. It is based on 90 degree C insulation and a maximum temperature of 250 degrees C during fault conditions. It is illogical to believe that phase conductors connected on both ends can be paralleled and will share the current but equipment grounding when paralleled will not. Multiple equipment grounding conductors connected together at both ends will share the fault current the same as phase conductors do. Sections 310.10(H)(5) and 250.122 already permit sectioned equipment grounding conductors in multiconductor cables.
Consider a circuit supplied by two (2) 1/0AWG copper conductors in different raceways. A standard UL listed 1/0 AWG cable has a 6AWG ground wire. A circuit protected by a 300 A circuit breaker would requires two 1/0 AWG in parallel (1/0 AWG is the smallest size permitted for parallel operation). Using Table 250.122 would require a #4 AWG equipment grounding conductor which is 41,740 circular mills in area based on Table in Chapter 9. Paralleling two 1/0

AWG cables in different raceways would allow each to contain # 6AWG (minimum size permitted by the exception). Two #6AWG in parallel would be 52,480 circular mills in area which is 25% greater than one #4 AWG so it is large enough for operation of overcurrent device.

The Instantaneous setting for a 300 A circuit breaker is normally 10 times or less (3000 A). Circuit breaker at this setting will trip in 1 cycle. A 6AWG conductor can withstand almost 9,000 A for 2 cycles and 15,000 A for one cycle. This is 500% of the 3000 A trip set point of the breaker for one cycle operation and 300% for 2 cycles so the concern of conductor burning up is not valid.

Similarly three 500 kcmil with an EGC of 1 AWG would be required for a 1000 A circuit if a standard UL listed multi-conductor cable with ground cable is used. Table 250.122 would require a 2/0 AWG in each cable on the load side of 1000 A circuit breaker. A 2/0 AWG has an area of 133,100 circular mills.

Alternatively, three #1 AWG have a combined area of 3x 83,690= 251,070 circular mills which is 1.9 times the effective area of 2/0 AWG conductor. So the combined area is large enough for circuit breaker to operate. A #1 AWG conductor can handle 40,000 A for one cycle and 30,000 A for 2 cycles. Trip setting for a 1000 A breaker would be 10,000 A max

It is doubtful that any cable supplier will make a 500 kcmil with 2/0 AWG ground wire except in very large quantities. This means essentially a multi-conductor cable with ground cannot be used in a parallel configuration and still meet the code. Allowing this exception would permit utilization of standard UL listed cables under engineering supervision.

The following documents have been supplied with this comment:
Cable Maximum Short Circuit Capacity chart (from Okonite Technical Information Book)
Table 250.122 from National Electrical Code 2011
Chapter 9, Table 8 from National Electrical Code 2011

PICARD, P.: See my explanation of negative vote on Comment 5-74.

PORTER, C.: This comment should have been rejected. This is an important exception that allows the use of an equipment grounding that has been verified by qualified engineers to both be able to carry the maximum fault-current and be able to open the overcurrent device in a safe manner.

STEINMAN, G.: The panel action should have been “reject.” The exception provides the necessary safeguards to ensure adequate conductor sizing for operation of overcurrent devices during fault conditions without damage to the conductor insulation.

Comment on Affirmative:

BRETT, JR., M.: I agree with the submitter, no substantiation has been provided to support the introduction of this major change. Continue to accept this comment to delete the exception.

LEVASSEUR, P.: For many code cycles the panel has determined that a full-sized equipment grounding conductor is needed in each raceway, or cable, if conductors are installed in multiple raceways or cables as permitted in 310.10(H).

The consensus reason for this requirement is that a ground fault may cause a disproportionate share of fault current to be carried on one of the paralleled equipment grounding conductors. It now appears consensus, for the theory of unequal loading of the equipment grounding conductors, is diminishing. For example; 310.10(H)(5) and 250.122 (A) allow sectioned equipment grounding conductors in multiple conductor cables a s long as total area in circular mills of all sectioned conductors meets Table 250.122.

It is logical to assume that fault current on conductors bonded at both ends will be shared by all conductors. What I do not know, with any certainty, is how it will be shared. Because a fault can happen anywhere in an installation I am less certain that a single conductor, of the paralleled set of equipment grounding conductors, will be large enough to carry the fault current for, a sufficient length of time, to permit the overcurrent device to open before the conductor is heated to a point where it will damaged.

WILLIAMS, D.: The panel accepted the proposal without adequate substantiation to reduce the size of the equipment grounding conductor in parallel installations during the ROP Meetings. It was noted and comments submitted and the panel corrected their actions by removing the exception that was inappropriately added during the ROP Meetings.

5-80 Log #1332 NEC-P05 **Final Action: Reject**
(250.122(F)(1) Exception)

Submitter: David Williams, Delta Township
Comment on Proposal No: 5-201a
Recommendation: Revise text to read as follows:
Exception: Under qualified engineering supervision, acceptable to the authority having jurisdiction, in industrial locations the total area of the combined equipment grounding conductors of the wire type shall not be less than the circular mill area specified in Table 250.122. The individual equipment grounding conductors shall not be smaller than 6 AWG copper or 4 AWG aluminum.
Substantiation: The exception should be deleted. The code panel agreed that there was not sufficient substantiation to reduce the requirements for equipment grounding conductors installed in parallel and then made two changes to do just that. The present wording in the exception would allow an installation supervised by a sanitation engineer to reduce the equipment grounding conductor below safe limits without proper approval.

(250.126)

Submitter: Paul Dobrowsky, American Chemistry Council
Comment on Proposal No: 5-206
Recommendation: The proposal should have been accepted.
Substantiation: The term Equipment Grounding Conductor needs to be replaced. Those opposed have no technical reason for their opposition or any other valid reason. It is not worth the effort and everyone understands what is meant are common responses.

It is very simple: Grounding electrode conductors are the connection to the earth and accomplish grounding. In the present NEC, Equipment Grounding Conductors and bonding jumpers provide a “path back” to the source. Both are always performing a bonding function. If the Grounding Electrode connection is removed or broken, the bonding function remains intact.

Section 250.4 does not permit the earth (ground) to be used as an effective ground fault current path but the term equipment grounding conductor inherently incorrectly contains the word “ground”.

Visualize equipment supplied by a portable generator. The generator frame is not required to be connected to the earth. The “green” wire in the flexible cord is not performing a grounding function but is performing a bonding function.

Visualize building one supplied by a service, having the grounded conductor connected to the grounding electrode system by a grounding electrode conductor. A feeder supplies a second building and a grounding electrode conductor is required for grounding any equipment in the second building. An equipment grounding conductor is required to be installed from building 1 to building 2. Not for grounding, but for bonding, providing an effective fault current path.

Making this change has the added benefit of being more harmonized with other international standards and usage of terminology.

Experienced NEC users have to ignore other concepts in other definitions and requirements to use the existing term. This does not help the future NEC user or provide clarity in the existing NEC. Changing the term is the right thing to do and should be supported.

Visualize building one supplied by a service, having the grounded conductor connected to the grounding electrode system by a grounding electrode conductor. A feeder supplies a second building and a grounding electrode conductor is required for grounding any equipment in the second building. An equipment grounding conductor is required to be installed from building 1 to building 2. Not for grounding, but for bonding, providing an effective fault current path.

Making this change has the added benefit of being more harmonized with other international standards and usage of terminology.

Experienced NEC users have to ignore other concepts in other definitions and requirements to use the existing term. This does not help the future NEC user or provide clarity in the existing NEC. Changing the term is the right thing to do and should be supported.

5-85 Log #714 NEC-P05 **Final Action: Accept**
(250.142(B) Exception No. 4)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 5-212
Recommendation: Continue to Accept in Principle.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-86 Log #1250 NEC-P05 **Final Action: Reject**
(250.142(B) Exception No. 4)

Submitter: John Masarick, Independent Electrical Contractors, Inc.
Comment on Proposal No: 5-212
Recommendation: Reject this proposal which would change 600 volts to 1000 volts.
Substantiation: Replacing 600 volts with 1000 volts will have a major impact on installers, component manufacturers, and industry standards. Increased spacing must be considered when going from 600 volts to 1000 volts. Personal safety must also be considered.
Because the proposer has not provided enough information to the public to justify and understand all the ramifications of the proposal, the committee should reject the submitter’s proposal.
Panel Meeting Action: Reject
Panel Statement: The change from 600 Volts to 1000 Volts is consistent with the demarcation point set by CMP-5 for the rest of Article 250 and there is no technical reason this exception should remain at 600 Volts. Electrode type boilers that are manufactured and listed at 240 Volts, 480 Volts, 600 Volts can

only be applied at those voltages. If a manufacturer were to create an electrode type boiler at some voltage greater than 600 Volts and were to get it listed then the Code should not become the stumbling block for the technological innovation. The applicable product safety standards and Code installation requirements would address the submitter's concerns for this equipment at the higher voltage.

5-87 Log #355 NEC-P05 **Final Action: Accept**
(250.146(B))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 5-214
Recommendation: Revise text to read as follows:
(B) Contact Devices or Yokes. Contact devices or yokes designed and listed as self-grounding shall be permitted in conjunction with the supporting screws to establish equipment bonding ~~the grounding circuit~~ between the device yoke and flush-type boxes.
Substantiation: The term bonding alone does not accurately describe what is being established. The word equipment should be added to article 250-146(B) in order to provide a more accurate description. This connection is serving the purpose of an "Equipment Bonding Jumper" as defined in article 100. This would be in keeping with CMP 6 accept action to proposal 6-13. "The fundamentals of these proposals are to clearly state that "systems" are "grounded" and "equipment" is "bonded"." This will also help to provide consistent language throughout the Code.

5-88 Log #1156 NEC-P05 **Final Action: Reject**
(250, Parts VIII, IX, and X)

Submitter: Paul Dobrowsky, American Chemistry Council
Comment on Proposal No: 5-219
Recommendation: The proposal should have been accepted.
Substantiation: The term Equipment Grounding Conductor needs to be replaced. Those opposed have no technical reason for their opposition or any other valid reason. It is not worth the effort and everyone understands what is meant are common responses.

It is very simple: Grounding electrode conductors are the connection to the earth and accomplish grounding. In the present NEC, Equipment Grounding Conductors and bonding jumpers provide a "path back" to the source. Both are always performing a bonding function. If the Grounding Electrode connection is removed or broken, the bonding function remains intact.

Section 250.4 does not permit the earth (ground) to be used as an effective ground fault current path but the term equipment grounding conductor inherently incorrectly contains the word "ground".

Visualize equipment supplied by a portable generator. The generator frame is not required to be connected to the earth. The "green" wire in the flexible cord is not performing a grounding function but is performing a bonding function.

Visualize building one supplied by a service, having the grounded conductor connected to the grounding electrode system by a grounding electrode conductor. A feeder supplies a second building and a grounding electrode conductor is required for grounding any equipment in the second building. An equipment grounding conductor is required to be installed from building 1 to building 2. Not for grounding, but for bonding, providing an effective fault current path.

Making this change has the added benefit of being more harmonized with other international standards and usage of terminology.

Experienced NEC users have to ignore other concepts in other definitions and requirements to use the existing term. This does not help the future NEC user or provide clarity in the existing NEC. Changing the term is the right thing to do and should be supported.

5-89 Log #1013 NEC-P05 **Final Action: Reject**
(250.166)

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 5-222
Recommendation: Revise the text as follows:
250.166 Size of the Direct-Current Grounding Electrode Conductor. The size of the grounding electrode conductor for a dc system shall be as specified in 250.66. ~~250.166(A) and (B), except as permitted by 250.166(C) through (E).~~
~~**(A) Not Smaller Than the Neutral Conductor.** Where the dc system consists of a 3-wire balancer set or a balancer winding with overcurrent protection as provided in 445.12(D), the grounding electrode conductor shall not be smaller than the neutral conductor and not smaller than 8 AWG copper or 6 AWG aluminum.~~
~~**(B) Not Smaller Than the Largest Conductor.** Where the dc system is other than as in 250.166(A), the grounding electrode conductor shall not be smaller than the largest conductor supplied by the system, and not smaller than 8 AWG copper or 6 AWG aluminum.~~
~~**(C) Connected to Rod, Pipe, or Plate Electrodes.** Where connected to rod, pipe, or plate electrodes as in 250.52(A)(5) or (A)(7), that portion of the grounding electrode conductor that is the sole connection to the grounding electrode shall not be required to be larger than 6 AWG copper wire or 4 AWG aluminum wire.~~
~~**(D) Connected to a Concrete-Encased Electrode.** Where connected to a concrete-encased electrode as in 250.52(A)(3), that portion of the grounding electrode conductor that is the sole connection to the grounding electrode shall not be required to be larger than 4 AWG copper wire.~~
~~**(E) Connected to a Ground Ring.** Where connected to a ground ring as in 250.52(A)(4), that portion of the grounding electrode conductor that is the sole connection to the grounding electrode shall not be required to be larger than the conductor used for the ground ring.~~
Substantiation: As is often the case, there is wisdom to be found in the Soares book on grounding (page 133). "Special considerations are required to be given if a direct-current circuit is to be properly protected against transient currents such as are produced by lightning. It is necessary to treat the selection of the grounding electrode conductor as would be done for an alternating-current circuit."

I agree with statement, and see no reason that the GEC for a dc system would have different sizing provisions than a GEC in an ac system. With that said, most of this section can be deleted.

Subsection (A) does not seem defensible from an electrical theory perspective, and (B) through (E) do not give any allowances or requirements that are not already found in 250.66. It seems that perhaps the requirements of (A) were intended to apply to a conductor that carries fault current, not a conductor that connects the system and equipment to earth. Perhaps this rule is a remnant of previous Code editions that used grounding related terms improperly.

While deleting Section 250.166 and letting Section 250.160 is certainly an option, it would require changing many Code rules that refer to it, and would also make manufacturers change product literature that might already refer to Section 250.166.
Panel Meeting Action: Reject
Panel Statement: The reference to Soares was with regard to the physical protection of the grounding electrode conductor and the use of ferrous metal or nonferrous conduit as a means of protection. Table 250.66 is titled "Grounding Electrode Conductor for Alternating Current System" and to reference DC systems to this Table would likely lead to questions and confusion. There was no technical substantiation provided where the sizing in accordance with 250.166(A) and (B) are incorrect and that sizing per Table 250.66 would be adequate. The requirements in 250.166 are clear with the added change to limit the maximum size as was accepted by the panel in Proposal 5-222.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-90 Log #534 NEC-P05 **Final Action: Reject**
(250.167(B))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 5-223
Recommendation: Revise text to read as follows:
250.167 Direct-Current Ground Fault Detection. [ROP 5–223]
(A) Ungrounded Systems. Ground fault detection systems shall be required for ungrounded systems.**[ROP 5–223]**
(B) ~~**Grounded Systems.** Ground fault detection shall be permitted for grounded systems.~~ ~~**[ROP 5–223]**~~
~~**(C)**~~ **Marking.** Direct-current systems shall be legibly marked to indicate the grounding type at the dc source or the first disconnecting means of the system. The marking shall be of sufficient durability to withstand the environment involved. **[ROP 5–223]**
Substantiation: The NEC is a permissive Code things not forbidden are permitted. (B) is therefore unnecessary.
Panel Meeting Action: Reject
Panel Statement: The panel concludes that for this new provision having both the "grounded" and "ungrounded" system references provides clarity to the

user. This is similar to having 250.20 and 250.21 which require grounding and permit grounding of systems respectively.

(250.174(B))

Submitter: Code-Making Panel 9,
Comment on Proposal No: 5-227
Recommendation: The action on the proposal should have been: Accept in Principle and in Part to correlate with action on Proposals 9-7 and 9-15f. Reject the deletion of the words “Dead Front” from the title of 250.174(B). Revise the remaining text to read as follows:

(A) Not on Switchboards or Switchgear. Instruments, meters, and relays not located on switchboards or switchgear operating with windings or working parts at 300 volts or more to ground, and accessible to other than qualified persons, shall have the cases and other exposed metal parts connected to the equipment grounding conductor.
(B) On Dead-Front Switchboards or Switchgear. Instruments, meters, and relays (whether operated from current and potential transformers or connected directly in the circuit) on switchboards or switchgear having no live parts on the front of the panels shall have the cases connected to the equipment grounding conductor.
Substantiation: This change correlates this provision with action taken by CMP 9 to place a revised definition of what used to be “Metal-Enclosed Power Switchgear” in Article 100. The change will rename the defined term as “Switchgear”and make editorial changes to the content accordingly, including adding an informational note.

There was no technical substantiation provided for the removal of “Dead-front Switchboards from this requirement.

12 Eligible to vote
11 Affirmative
1 Ballot Not Returned (J.M. Ferrara, Voting Alternate)
No Comments on Vote were received.
Panel Meeting Action: Accept in Principle
Revise the full text of 250.174 from the 2011 NEC to read as follows:

250.174 **Cases of Instruments, Meters, and Relays, Operating at ~~Less Than~~ 1000 Volts or Less.** Instruments, meters, and relays operating with windings or working parts at less than 1000 Volts or less shall be connected to the equipment grounding conductor as specified in 250.174(A), (B), or (C).
(A) **Not on Switchgear or Switchboards**. Instruments, meters, and relays not located on switchgear or switchboards operating with windings or working parts at 300 volts or more to ground, and accessible to other than qualified persons, shall have the cases and other exposed metal parts connected to the equipment grounding conductor.
(B) **On Switchgear or Dead-Front Switchboards**. Instruments, meters, and relays (whether operated from current and potential transformers or connected directly in the circuit) on switchgear or switchboards having no live parts on the front of the panels shall have the cases connected to the equipment grounding conductor.
(C) **On Live-Front Switchboards**. Instruments, meters, and relays (whether operated from current and potential transformers or connected directly in the circuit) on switchboards having exposed live parts on the front of panels shall not have their cases connected to the equipment grounding conductor. Mats of insulating rubber or other suitable floor insulation shall be provided for the operator where the voltage to ground exceeds 150.
Panel Statement: The revised text incorporates direction from the Correlating Committee for the change in definition from CMP-9 on “Switchgear” as well as confirms the panel action from the 2012 ROP relative to the term “Dead Front” remaining in the title of 250.174(B). The sequence of terms was revised for consistency with other section of Article 250. The added editorial revision of “1000 Volts or less” in the main text was for consistency with the title that did not get changed at the ROP.

(250.184 and 250.184(C))

Submitter: Elliot Rappaport, Electro Technology Consultants

Comment on Proposal No: 5-232

Recommendation: Accept proposal.

Substantiation: The present text of 250.184 is in direct contradiction to 250.24(A)(5). If it is safe for systems and circuits of over 1kV, it should be safe for lower voltages also. But is it? Is there anyone that is ready to permit regrounding of the grounded conductor within a residence or an office building?

The Panel has stated that an advantage of this method is that it permits currents to flow out of the neutral (grounded conductor) into the ground and then back into the neutral. Thus the earth becomes a part of the distribution system in contradiction to 250.4(A)(5) unless these currents are not considered to be ground-faults but, rather, intended currents. Is that the Panel’s intent?

The Panel has indicated that this regrounding effectively reduces the impedance of the neutral to ground. It does so due to the earth, as a conductor, being in parallel with the neutral conductor. This certainly is advantageous if an energized conductor breaks and contacts the earth (downed conductor). However, within a premise where, generally, conductors are contained within a raceway, wireway, cable tray or similar, there is an equipment grounding conductor, in accordance with Part V of Article 250, in close proximity to provide for fault current return to the source and fault clearing. Regrounding is then not necessary for safety.

Regrounding of the grounded conductor is a standard practice for utilities and is understood to provide safety for employees working on poles and in manholes. As written, a medium voltage system within an industrial plant could also use the provisions of this section. Instead of the ground currents flowing in the ground, they would be flowing through the structural steel!

This proposal is not intended to prevent the application of regrounding of the grounded conductor where appropriate. It is intended to prohibit it as a general rule rather than permitting it as a general rule. The initial paragraph of the proposal permits regrounding “provided that the system is supervised and maintained by qualified personnel acceptable to the authority having jurisdiction”. That should satisfy the engineer designing a large campus facility where regrounding might be considered advantageous to the maintenance personnel at the facility. Subparagraph (C) provides for grandfathering existing systems – if there are any. The remainder of Section 250.184 remains consistent with 250.4(A)(5)

Panel Meeting Action: Reject

Panel Statement: The submitter has provided no field evidence that this method for grounding installations over 1000 volts has or is causing any problems. The method has many positive characteristics as noted in the panel statement for Proposal 5-232.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 15 Negative: 1

Explanation of Negative:

MOHLA, D.: The panel action should have been “Accept in Principle” with the simple addition, by the Panel, of an exception: “multi grounded systems shall be permitted if approved by the authority having jurisdiction”. The Panel Comment did not respond to the substantiation provided. As stated, there is no evidence that this method has or is causing any problems. There is also no evidence that this method has been used at all in the short time that this provision has been in the Code.

The benefits of this multi-grounding system, as identified in the Panel’s proposal comment, are inconsistent with safe wiring practices within buildings and structures. That this method “provides a low impedance path for ground currents to flow back into the neutral” does not consider that it also provides a low impedance path for ground currents to flow OUT of the neutral to ground. Is this something that we want to promote within buildings and structures? If it “enables lightning protection to be applied more effectively”, then its application should apply only to outdoor installations.

It is not permissible to reground the grounded conductor if the installation is for under 1000 Volts. It is inconsistent and indefensible to have a rule for 1000 Volts and over that is in conflict with a rule for under 1000 Volts. If it is safe for 1000 Volts and over, it should also be safe for under 1000 Volts. Are we saying shock hazard is less for over 1000 Volts installations than it is for below 1000 Volts installations? Do we really want to permit a 4160 volt multi-grounded system within a metal frame factory?

There was no intention of prohibiting multi-grounded systems where it is appropriate, but not as a general rule. Multi-grounded systems should only be permitted if an engineer can show that a particular design is safer by virtue of multi grounding the neutral.

Recommendation: Continue to accept 5-234 and Revise title of 250.186 (A) as below

(A)Solidly Ground Systems with a Grounded Conductor at the Service Point.

Substantiation: The requirements detailed in this section only apply to solidly grounded systems as ungrounded systems and impedance grounded systems either do not have grounded conductors or follow the requirements of 250.187. Revision of the title will clarify the application. A separate comment has also been submitted for addition requirements for Impedance Grounded systems.

Panel Meeting Action: Reject

Panel Statement: See panel action and statement on Comment 5-101. The premise for this section is a service supplied at over 1000 volts from the utility which the NEC does not have jurisdiction over until the service point is reached. Section 250.186(A) is based on where the utility has a supply system and a grounded (neutral) conductor is provided to the service point where the NEC begins to apply. This system may or may not be solidly grounded based on utility practices and the NEC cannot assume what the utility practices are in all cases. If the premise in the substantiation is correct, that there is no grounded conductor, then 250.186(B) applies where the utility supply system does not have a grounded (neutral) conductor at the service point. In both cases the requirements are to provide a permanent low impedance ground fault return path.

Number Eligible to Vote: 16

Ballot Results: Affirmative: 16

5-101 Log #972 NEC-P05 **Final Action: Accept in Principle**
(250.186)

Comment on Proposal No: 5-234

Recommendation: Continue to accept and Add a new section

(C) **Impedance Grounded Neutral Systems.** The impedance grounded neutral system shall be installed in accordance with 250.187.

Substantiation: Impedance grounded systems cannot be grounded as detailed in 250.186 (A) or 250.186 (B). The addition of new section will provide clarity and prescriptive language for methods to be used for systems with an impedance grounded neutral.

Panel Meeting Action: Accept in Principle
Revise 250.186 from the ROP to read as follows:
250.186 Ground Fault Circuit Conductor Brought to Service Equipment.
(A) Systems with a ~~solidly~~ Grounded Conductor at the Service Point.
Where an ac system operating at over 1000 volts is grounded at any point and is provided with a grounded conductor at the service point, grounded conductor(s) shall be installed and routed with the ungrounded conductors to each service disconnecting means and shall be connected to each disconnecting means grounded conductor(s) terminal or bus. A main bonding jumper shall connect the grounded conductor(s) to each service disconnecting means enclosure. The grounded conductor(s) shall be installed in accordance with 250.186(A)(1) through (A)(~~3~~4). The size of the solidly grounded circuit conductor(s) shall be the larger of that determined by 250.184 or 250.186(A)(1) or (2).
Exception: Where two or more service disconnecting means are located in a single assembly listed for use as service equipment, it shall be permitted to connect the grounded conductor(s) to the assembly common grounded conductor(s) terminal or bus. The assembly shall include a main bonding jumper for connecting the grounded conductor(s) to the assembly enclosure.
(1) Sizing for a Single Raceway or Overhead Conductor. The grounded conductor shall not be smaller than the required grounding electrode conductor specified in Table 250.66 but shall not be required to be larger than the largest ungrounded service entrance conductor(s). In addition, for sets of ungrounded service-entrance conductors larger than 1100 kcmil copper or 1750 kcmil aluminum, the grounded conductor shall not be smaller than 121/2 percent of the circular mil area of the largest set of service-entrance ungrounded conductor(s).
(2) Parallel Conductors in Two or More Raceways or Overhead Conductors. If the ungrounded service-entrance conductors are installed in parallel in two or more raceways or as overhead parallel conductors, the grounded conductors shall also be installed in parallel. The size of the grounded conductor in each raceway or overhead shall be based on the total circular mil area of the parallel ungrounded conductors in the raceway or overhead, as indicated in 250.186(A)(1), but not smaller than 1/0 AWG.
Informational Note: See 310.10(H) for grounded conductors connected in parallel.
(3) Delta-Connected Service. The grounded conductor of a 3-phase, 3-wire delta service shall have an ampacity not less than that of the ungrounded conductors.
(4) Impedance Grounded Neutral Systems. Impedance grounded neutral systems shall be installed in accordance with 250.187.
(B) Systems without a Grounded Conductor at the Service Point
Where an ac system operating at greater than 1000 volts is grounded at any point and is not provided with a grounded conductor at the service point, a supply side bonding jumper shall be installed and routed with the ungrounded conductors to each service disconnecting means and shall be connected to each disconnecting means equipment grounding conductor terminal or bus. The supply side bonding jumper shall be installed in accordance with 250.186(B)(1) through (B)(~~2~~3).
Exception: Where two or more service disconnecting means are located in a single assembly listed for use as service equipment, it shall be permitted to connect the supply side bonding jumper to the assembly common equipment grounding terminal or bus.
(1) Sizing for a Single Raceway or Overhead Conductor. The supply side bonding jumper shall not be smaller than the required grounding electrode conductor specified in Table 250.66 but shall not be required to be larger than the largest ungrounded service entrance conductor(s). In addition, for sets of ungrounded service-entrance conductors larger than 1100 kcmil copper or 1750 kcmil aluminum, the supply side bonding jumper shall not be smaller than 121/2 percent of the circular mil area of the largest set of service-entrance ungrounded conductor(s).
(2) Parallel Conductors in Two or More Raceways or Overhead Conductors. If the ungrounded service-entrance conductors are installed in parallel in two or more raceways or overhead conductors, the supply side bonding jumper shall also be installed in parallel. The size of the supply side bonding jumper in each raceway or overhead shall be based on the total circular mil area of the parallel ungrounded conductors in the raceway or overhead, as indicated in 250.186(A)(1), but not smaller than 1/0 AWG.
(3) Impedance Grounded Neutral Systems. Impedance grounded neutral system shall be installed in accordance with 250.187.
Panel Statement: The Panel incorporated modifications into the new proposed 250.186 that incorporate Impedance Grounded Neutrals into this section. The panel concludes that this meets the intent of the submitter.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16
Comment on Affirmative:
WHITE, C.: While we agree with the Panel intent, we want to express a concern that this action may be misinterpreted to require a connection to a utility ground. If the utility is providing an ungrounded service, then the utility ground cannot be used as a fault current return path. To do so would possibly bypass the protection for premises wiring. This also is a violation of 250.4(A)(5) which states that "The earth shall not be considered as an effective ground-fault current path."

5-102 Log #1359 NEC-P05 **Final Action: Reject**
(250.186 (New))

Submitter: Sergio Panetta, I-Gard Corp.
Comment on Proposal No: 5-234
Recommendation: This new clause should be limited to Solidly grounded systems only. Please add a sentence to revise the text.
Substantiation: This new clause should be removed. In principal it will work for simple single source systems. There will be a great deal of confusion and problems when multiple connected sources are present. For example multiple generators acting as prime or buck up power. It will be very difficult and erroneous to all generators grounded conductors together.
Panel Meeting Action: Reject
Panel Statement: This comment was rejected because it was not submitted in accordance with Paragraph 4.4.5 (c) of the Regulations Governing Committee Projects. The submitter's proposed changes did not include the specific text being requested. The panel concludes that the submitter's intent was satisfied by the panel action taken on Comment 5-101.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-103 Log #1460 NEC-P05 **Final Action: Accept in Principle in Part**
(250.186)

Submitter: Amit Patel, GE
Comment on Proposal No: 5-234
Recommendation: Revise text to read as follows:
250.186 Ground Fault Circuit Conductor (Neutral) Brought to Service Entrance Equipment. [ROP 5–234]
(A) Solidly grounded neutral Systems with a Grounded Conductor (Neutral) at the Service Point. Where an ac system operating at over 1000 volts is grounded at any point and is provided with a grounded conductor (Neutral) at the service point, grounded conductor(s) shall be…
Add a new section 250.186 (C) High Impedance Grounded Neutral Systems. The high impedance grounded neutral system shall be installed in accordance with section 250.187
Substantiation: Section 250.186(A) requirements are only applicable to solidly grounded neutral systems and not applicable to Impedance grounded systems. Ungrounded systems and impedance grounded systems either do not have grounded conductors or neutral. Revision of the title will clarify the application. A separate section(C) is required for clarification for High Impedance Grounded systems. Need to consider effect on residual ground fault relaying scheme that may require neutral CT and zero sequence ground fault relaying schemes already in field.
High Impedance grounded systems cannot be grounded as described in section 250.186 (A) or 250.186 (B). The addition of new section will clarify improved actions to be taken for systems with high impedance grounded neutral.
Panel Meeting Action: Accept in Principle in Part
Panel Statement: The panel accepted in principle the addition of the impedance grounding requirements. See panel action and statement on Comment 5-101.
The panel did not accept the addition of the words "solidly grounded", "neutral", "entrance" and "high" for impedance grounding.
The section title includes two possible installations, one where a utility grounded conductor is present and one where it is not. To add the word "neutral" into the section title would be incorrect. The term "service equipment" is correct and is defined in Article 100 whereas the term "service entrance equipment" is not defined. Section 250.186 is for installation of the service when supplied directly by a utility at over 1000 Volts under two conditions, that the utility either supplied a grounded (neutral) conductor to the service point or they did not. The term "high" was not accepted because 250.187 covers both high and low impedance systems.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-104 Log #1518 NEC-P05 **Final Action: Reject**
(250.186)

Submitter: Peter Sutherland, GE
Comment on Proposal No: 5-234
Recommendation: Add text to read as follows:
250.186 Ground Fault Circuit Conductor Brought to Service Equipment.
(A) An effective ground-fault current path shall be established by grounding and bonding of electrical equipment and bonding of electrically conductive materials and other equipment in accordance with Section 250.4 (A). In order to prevent false operation of ground fault protection systems, the grounded, grounding or bonding conductors shall not be routed with the current-carrying conductors.
Substantiation: Ground fault protection in medium voltage power systems usually utilizes either the residually connected ground relay or the core-balance CT. (IEEE Std. 242-2001, pp. 249-252.) Problems in can occur when a grounded shield is used in the cables with a core-balance CT, requiring special wiring. Use of a grounded conductor in a cable with the phase conductors

would result in even greater wiring problems than are created by grounded shields. With residually connected systems, in four wire systems where a neutral conductor is used, a fourth CT is required. If the fourth conductor could instead be a grounded conductor, confusion between neutral and ground could result in a CT being placed on the grounded conductor, which would prevent the ground fault protection from operating.
Panel Meeting Action: Reject
Panel Statement: The proposed text does not provide the requirements for sizing and other factors that were included in the accepted proposal. Section 250.186 is for the installation of the service when supplied directly by a utility at over 1000 volts under two conditions that utility either supplied a grounded (neutral) conductor to the service point or they did not. The provisions for how to route conductors for ground fault protection is a design issue dependent on specific installation conditions.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-105 Log #587 NEC-P05 **Final Action: Accept**
(250.188(D))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 5-237
Recommendation: Revise text to read as follows:
250.188 **Grounding of Systems Supplying Portable or Mobile Equipment. (D) Ground-Fault Detection and Relaying.** Ground-fault detection and relaying shall be provided to automatically de-energize any component of a system over 1000 volts that has developed a ground fault. The continuity of the equipment grounding conductor shall be continuously monitored so as to ~~de-energize~~ automatically de-energize the circuit of the system over 1000 volts to the portable or mobile equipment upon loss of continuity of the equipment grounding conductor.
Substantiation: 250.188(D) contains "automatically de-energize" and "de-energize automatically" The first form is better English and should be used for the second instance. Consistency reduces confusion.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-106 Log #1157 NEC-P05 **Final Action: Reject**
(250.190(A))

Submitter: Paul Dobrowsky, American Chemistry Council
Comment on Proposal No: 5-239
Recommendation: The proposal should have been accepted.
Substantiation: The term Equipment Grounding Conductor needs to be replaced. Those opposed have no technical reason for their opposition or any other valid reason. It is not worth the effort and everyone understands what is meant are common responses.
It is very simple: Grounding electrode conductors are the connection to the earth and accomplish grounding. In the present NEC, Equipment Grounding Conductors and bonding jumpers provide a "path back" to the source. Both are always performing a bonding function. If the Grounding Electrode connection is removed or broken, the bonding function remains intact.
Section 250.4 does not permit the earth (ground) to be used as an effective ground fault current path but the term equipment grounding conductor inherently incorrectly contains the word "ground".
Visualize equipment supplied by a portable generator. The generator frame is not required to be connected to the earth. The "green" wire in the flexible cord is not performing a grounding function but is performing a bonding function.
Visualize building one supplied by a service, having the grounded conductor connected to the grounding electrode system by a grounding electrode conductor. A feeder supplies a second building and a grounding electrode conductor is required for grounding any equipment in the second building. An equipment grounding conductor is required to be installed from building 1 to building 2. Not for grounding, but for bonding, providing an effective fault current path.
Making this change has the added benefit of being more harmonized with other international standards and usage of terminology.
Experienced NEC users have to ignore other concepts in other definitions and requirements to use the existing term. This does not help the future NEC user or provide clarity in the existing NEC. Changing the term is the right thing to do and should be supported.
Panel Meeting Action: Reject

5-107 Log #873 NEC-P05 **Final Action: Reject**
(250.191)

Submitter: C. Douglas White, Center Point Energy / Rep. Edison Electric Institute/Electric Light & Power Group
Comment on Proposal No: 5-240
Recommendation: This Proposal should have been Accepted in Part. Accept the proposed new text but do not modify any existing text so that it reads as follows:
250.191 Grounding System at Alternating-Current Substations
For ac substations, the grounding system shall be in accordance with Part III of Article 250. Where a grounding grid is installed, the grounding grid shall be designed and installed under engineering supervision.
Informational Note: For further information on outdoor ac substation grounding, see ANSI/IEEE 80-2000, IEEE Guide for Safety in AC Substation Grounding.
Note to staff: It is recommended this section be renumbered to 250.192 and to renumber all succeeding sections accordingly.
Substantiation: The grounding grid, when properly designed and installed under engineering supervision will limit the overall resistance with respect to earth and will help to mitigate step and touch potentials in substation applications. This is an increased safety item that is intended for the protection of personnel and equipment and is widely recognized as the proper grounding method for substation applications.
This is a companion comment to my comment on Proposal 5-111.
Panel Meeting Action: Reject
Panel Statement: Mitigation and acceptable limits of step and touch potentials are not presently provided or required by the NEC. Specifically requiring engineering supervision such as for grounding grids implies that other methods do not require engineering supervision.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
MELLO, C.: See my statement for Comment 5-108.

5-108 Log #1303 NEC-P05 **Final Action: Reject**
(250.191)

Submitter: James M. Imlah, Hillsboro, OR
Comment on Proposal No: 5-240
Recommendation: Revise text to read as follows:
250.191 Grounding System at Alternating-Current Substations.
~~For ac substations, the grounding system shall be in accordance with Part III of Article~~ 250.
Where a grounding grid is installed, the grounding grid shall be installed under engineering supervision.
Substantiation: Please reconsider the CMP action on this proposal to accept or accept in principle. With larger facilities installing their own substations, the current responsibility to assure the grounding system is based upon Part III of Article 250 and the local jurisdiction. Most all jurisdictional inspectors do not have the skills or training to determine a design of the special nature (over 1kV) of the hazards and understanding of a design to determine if touch potential situation could exist. By requiring engineering supervision and responsibility of the desired installation back to the engineer there should be a safer installation to persons. Under the current situation a substation can be installed, inspected, and energized without engineering supervision as a bidder design and the local AHJ unaware of the medium voltage potential hazards.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 5-107.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
MELLO, C.: The comment should have been accepted. There are two items to consider. First the present text is totally unnecessary since section 250.180 already requires all the provisions in Article 250 to apply except as modified by the requirements stated Part X of Article 250. So the original proposer and commenter are correct in deleting the text as indicated. Second, the Commenter, as an Authority Having Jurisdiction involved with large complex manufacturing facilities with their own substations and plant buildings that are installing ground grids, he makes a valid point that AHJs do not have the expertise and do not have present Code language to require that ground grids to be designed and installed under some sort of qualified engineering supervision. This is no different than the new provisions in the 2011 NEC from CMP-4 for some qualified engineering entity to design and oversee the installation of other medium voltage systems in Article 399. The panel cannot ignore the fact that ground grids are being installed on private property and are part of the installation falling under the NEC. The panel should have accepted making it a requirement that when a ground grid is installed, for whatever purposes intended, that it be designed and installed under proper qualified electrical engineering supervision and that having the informational note that references NFPA 80 for guidance on the design, application and construction.

ARTICLE 285 — SURGE-PROTECTIVE DEVICES (SPDs), 1000 VOLTS OR LESS

5-109 Log #1503 NEC-P05 **Final Action: Accept**
(285.3)

Submitter: Alan Manche, Schneider Electric
Comment on Proposal No: 5-244a
Recommendation: Revise text to read as follows:
The panel should continue to accept the proposed language revision and also delete the informational note found in 285.3.
285.3 Uses Not Permitted.
~~Informational Note: For further information on SPDs (TVSSs), see NEMA LS-1-1992, *Standard for Low Voltage Surge Suppression Devices*. The selection of a properly rated SPD (TVSS) is based on criteria such as maximum continuous operating voltage, the magnitude and duration of overvoltages at the suppressor location as affected by phase-to-ground faults, system grounding techniques, and switching surges.~~
Substantiation: The Informational note in 285.3 should be deleted as that NEMA document has been rescinded and is no longer applicable.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-110 Log #1504 NEC-P05 **Final Action: Accept**
(285.3)

TCC Action: The Correlating Committee advises that article scope statements are the responsibility of the Correlating Committee and the Correlating Committee Accepts the panel action.
Submitter: Alan Manche, Schneider Electric
Comment on Proposal No: 5-244a
Recommendation: The panel should continue to accept the proposed language revision and also remove the reference to surge arresters and TVSS. The existing language from the 2011 NEC is shown for reference purposes only and the proposed changes are shown in the strike-through text.
285.1 Scope. This article covers general requirements, installation requirements, and connection requirements for SPDs ~~[surge arresters and transient voltage surge suppressors (TVSSs)]~~ permanently installed on …
~~Informational Note No. 2: Transient voltage surge suppressors (TVSSs) are also known as Type 2 and Type 3 SPDs.~~
285.3 Uses Not Permitted. An SPD ~~(surge arrester or TVSS)~~ device shall not be installed in the following:
(3) Where the rating of the SPD ~~(surge arrester or TVSS)~~ is less than the …
285.4 Number Required. Where used at a point on a circuit, the SPD ~~(surge arrester or TVSS)~~ shall be …
285.5 Listing. An SPD ~~(surge arrester or TVSS)~~ shall be alisted device.
285.6 Short-Circuit Current Rating. The SPD ~~(surge arrester or TVSS)~~ shall be …
II. Installation
285.11 Location. SPDs ~~(surge arresters or TVSSs)~~ shall be permitted to...
285.12 Routing of Connections. The conductors used to connect the SPD ~~(surge arrester or TVSS)~~ to the …
III. Connecting SPDs
285.21 Connection. Where an SPD ~~(surge arrester or TVSS)~~ device is …
285.23 Type 1 SPDs ~~(Surge Arresters)~~. Type 1 SPDs shall be installed in accordance with 285.23(A) and (B).
(A) Installation. Type 1 SPDs ~~(surge arresters)~~ shall be installed as follows:
(1) Type 1 SPDs ~~(surge arresters)~~ shall be permitted to …
(2) Type 1 SPDs ~~(surge arresters)~~ shall be permitted to be connected as specified in 285.24.
285.24 Type 2 SPDs ~~(TVSSs)~~. Type 2 SPDs ~~(TVSSs)~~ shall be installed in accordance with 285.24(A) through (C).
(A) Service-Supplied Building or Structure. Type 2 SPDs ~~(TVSSs)~~ shall be …
(B) Feeder-Supplied Building or Structure. Type 2 SPDs ~~(TVSSs)~~ shall be …
(C) Separately Derived System. The SPD ~~(TVSS)~~ shall be …
285.25 Type 3 SPDs. Type 3 SPDs ~~(TVSSs)~~ shall be …
285.27 Connection Between Conductors. An SPD ~~(surgearrester or TVSS)~~ shall be … only by the normal operation of the SPD ~~(surge arrester or TVSS)~~ during a surge.
Substantiation: The original Article 285 was written when surge protection devices were labeled TVSS. This marking changed due to a change in the product standards as acknowledged in the 2008 NEC revisions. The terminology was retained to support the transition of the terminology. Note that Panel 1 has accepted Proposal 1-186 to eliminate the standard and reference to UL 1449 as covering TVSS. Surge Arresters installations are addressed in Article 280. In order to correlate the actions of the committees and address any confusion in the 2014 NEC, it is time to eliminate "(TVSS)" and "(Arrester)"throughout Article 285 since that terminology is no longer in use across the industry and has not been for many years.
Panel Meeting Action: Accept
Number Eligible to Vote: 16
Ballot Results: Affirmative: 16

5-111 Log #96 NEC-P05 **Final Action: Accept**
(285.13)

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 5-244b
Recommendation: The Correlating Committee directs that the panel clarify the panel action on this proposal with respect to the phrase "are only intended for factory installation and" as non-mandatory language is not permitted by the NEC Style Manual.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revised 285.13 from ROP to read as follows:
285.13 Type 4 and Other Component Type SPDs. Type 4 component assemblies and other component type SPDs shall only be installed by the equipment manufacturer.
Panel Statement: The panel accepts the Correlating Committee direction to reconsider the proposed text and has made revisions to ensure the text meets the requirements of the NEC Style Manual.
Number Eligible to Vote: 16
Ballot Results: Affirmative: 15 Negative: 1
Explanation of Negative:
MELLO, C.: This negative ballot is not intended to object to the direction of the Correlating Committee but is intended to be directed to the text revision that resulted from panel action. The text as revised by the panel lost the intent of the original proposal where Type 4 component and other component type SPD's are not to be installed in the "field". The comment acted on was only Correlating Committee direction to revise the text due to some Style Manual issues. The original text provided that these devices are not to be installed by anyone after the final product has been manufactured and shipped from that manufacturer. The revised text implies that the equipment manufacturer can now complete an installation of Type 4 component or other component SPDs anywhere they want. The panel did not have or provide any technical substantiation to make such a technical change. The issue is that these devices need to be further evaluated with the end use product and are not for installation by anyone in the field.

ARTICLE 300 — WIRING METHODS AND MATERIALS

3-5 Log #650 NEC-P03 **Final Action: Accept**
(300.2)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 3-10
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task group to provide additional substantiation as directed by the Correlating Committee.
The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.
The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally

require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.
Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.
Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.
If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-6 Log #1251 NEC-P03 **Final Action: Reject**
(300.2)

Submitter: John Masarick, Independent Electrical Contractors, Inc.
Comment on Proposal No: 3-10
Recommendation: Reject this proposal which would change 600 volts to 1000 volts.
Substantiation: Replacing 600 volts with 1000 volts will have a major impact on installers, component manufacturers, and industry standards. Increased spacing must be considered when going from 600 volts to 1000 volts. Personal safety must also be considered.
Because the proposer has not provided enough information to the public to justify and understand all the ramifications of the proposal, the committee should reject the submitter's proposal.
Panel Meeting Action: Reject
Panel Statement: The change from 600 to 1000 volts permits the higher rating. It does not simply raise the voltage rating on electrical products. The change permits the listing organization to evaluate the electrical products at voltage levels up to 1000 volts.

3-8 Log #651 NEC-P03 **Final Action: Accept**
(300.3)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 3-12
Recommendation: Continue to Accept in Principle.
Substantiation: This comment is submitted on behalf of the high voltage task group to provide additional substantiation as directed by the Correlating Committee.
The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.
The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.
Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.
Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.
If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

Ballot Results: Affirmative: 13

3-9 Log #1320 NEC-P03 **Final Action: Reject**
(300.3)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 3-12
Recommendation: Revise text to read as follows:
300.3 Conductors.
(C) Conductors of Different Systems.
~~(1) 600~~ 1000 Volts, Nominal, or Less. Conductors of ac and dc circuits, rated ~~600~~ 1000 volts, nominal, or less, shall be permitted to occupy the same equipment wiring enclosure, cable, or raceway. All conductors shall have an insulation rating equal to at least the maximum circuit voltage applied to any conductor within the enclosure, cable, or raceway.
Informational Note No. 1: See 725.136(A) for Class 2 and Class 3 circuit conductors.
Informational Note No. 2: See 690.4(B) for photovoltaic source and output circuits.
(2) Over 600 Volts, Nominal. Conductors of circuits rated over 600 volts, nominal, shall not occupy the same equipment wiring enclosure, cable, or raceway with conductors of circuits rated 600 volts, nominal, or less unless otherwise permitted in (C)(2)(a) through (C)(2)(e).
(a) Secondary wiring to electric-discharge lamps of 1000 volts or less, if insulated for the secondary voltage involved, shall be permitted to occupy the same luminaire, sign, or outline lighting enclosure as the branch-circuit conductors.
(b) Primary leads of electric-discharge lamp ballasts insulated for the primary voltage of the ballast, where contained within the individual wiring enclosure, shall be permitted to occupy the same luminaire, sign, or outline lighting enclosure as the branch-circuit conductors.
(c) Excitation, control, relay, and ammeter conductors used in connection with any individual motor or starter shall be permitted to occupy the same enclosure as the motor-circuit conductors.
(d) In motors, switchgear and control assemblies, and similar equipment, conductors of different voltage ratings shall be permitted.
(e) In manholes, if the conductors of each system are permanently and effectively separated from the conductors of the other systems and securely fastened to racks, insulators, or other approved supports, conductors of different voltage ratings shall be permitted.
Conductors having non-shielded insulation and operating at different voltage levels shall not occupy the same enclosure, cable, or raceway.

(3) Over 1000 Volts, Nominal. Conductors of circuits rated over 1000 volts, nominal, shall not occupy the same equipment wiring enclosure, cable, or raceway with conductors of circuits rated 1000 volts, nominal, or less unless otherwise permitted in (C)(2)(b) through (C)(2)(e).

Substantiation: The ROP 3-12 proposal as modified by the committee has broken a long standing principle from previous editions (2002 – 2011 at least). This principle is that certain conductors energized at voltages exceeding 600 volts are allowed to be installed with conductors insulated for no more than 600 volts.

Suggested rewording supplied above is based on the original 2011 text.

300.3(C)(1) is changed to allow circuits of up to 1000 volts to be comingled provided they are all insulated for the highest voltage present.

300.3(C)(2) is unchanged and permits circuits insulated for 600 volts to comingle with certain higher voltage circuits as before.

300.3(C)(3) applies the 600 Volt rules of 300.3(C)(2) to over 1000 v, nominal conductors. [300.3(C)(2)(a) is omitted here because it is covered by 300.3(C)(1).]

Panel Meeting Action: Reject

Panel Statement: The text suggested in the comment will result in coverage of the same voltages in (1) and (2) and will result in conflicting requirements.

Submitter: Elliot Rappaport, Electro Technology Consultants

Comment on Proposal No: 3-13

Recommendation: Accept proposal.

Substantiation: Although Code Making Panel 5 has jurisdiction over this definition, it is important that Code Making Panel 3 recognize the importance of this conductor in determining how conductors are installed and protected.

The term “equipment grounding conductor” has a definite purpose that is not uniquely expressed in the term, i.e. “bond the equipment to a terminal at the source of voltage”. As a result, there is a misconception that “grounding”, without bonding to the source, will make a system safe. On the contrary, connecting equipment to ground without providing the bonding connection back to the source can make equipment less safe by increasing the time to clear the fault.

There is generally insufficient significance placed on the importance of bonding over grounding. Bonding provides sufficient ground fault current back to the source of voltage to operate an overcurrent device and clear the fault quickly. Connection to ground limits the voltage to ground on normally non-current-carrying parts during non-fault conditions. During fault conditions, the value of grounding is minimal since the primary safety concern is to remove the fault voltage as quickly as possible. A path to ground for fault current is not necessary since ground fault current must return to the source of voltage, not to ground.

Renaming this conductor as an “Equipment Bonding Conductor (EBC)” will clarify that the primary purpose of this conductor is to bond to the source in order to provide a known path for ground fault current that will facilitate rapid fault clearing.

It is recognized that the term “EGC” has been in use for a long time and that changing it to EBC will cause some concerns including changing written literature that uses the EGC term. After the initial period of understanding, users will correctly understand the purpose of this conductor and this will enhance the safety of personnel.

The fundamental purpose of this and companion proposals is to clearly state that “systems” are “grounded” and “equipment” is “bonded”. The fact that the bonding conductor may be grounded also is secondary to the primary function of bonding.

Panel Meeting Action: Reject

Panel Statement: Panel 3 does not have jurisdiction over the definition or the primary usage of the terms “equipment grounding conductor” or “equipment bonding conductor.” Panel 5 has jurisdiction over these terms and they have rejected any changes.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

PACE, D.: This Comment should have been accepted. While it is true that CMP-5 has the lead on this issue, we need to support changing the language. The current language can be confusing to those who have to make the installation. What is installed as a equipment grounding conductor is used to bond equipment, not to ground it. Terms should identify what the conductor is actually being used for.

3-11 Log #767 NEC-P03 **Final Action: Reject**

(300.4)

Submitter: James Dorsey, Douglas County Electrical Inspector

Comment on Proposal No: 3-20

Recommendation: Revise text to read as follows:

(A) Cables and Raceways through Metal or Wood Members

(1) **Bored Holes** In both exposed and concealed locations, where a cable- or raceway-type wiring method is installed through either factor y- or field-punched, cut, or drilled slots or holes bored in wood or metal members, bored holes in joists, rafters, metal, or wood members, holes shall be bored so that the edge of the hole is not less than 32 mm (11/4 in.) from the nearest edge of the metal or wood member. Where this distance cannot be maintained, the cable or raceway shall be protected from penetration by screws or nails by a steel plate(s) or bushing(s), at least 1.6 mm (1/16 in.) thick, and of appropriate length and width installed to cover the area of the wiring.

Exception No. 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.

Exception No. 2: A listed and marked steel plate less than 1.6 mm (1/16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.

(2) **Notches in Metal Or Wood** Where there is no objection because of weakening the building structure, in both exposed and concealed locations, cables or raceways shall be permitted to be laid in notches in metal, or wood studs, joists, rafters, or other metal, or wood members where the cable or raceway at those points is protected against nails or screws by a steel plate at least 1.6 mm (1/16 in.) thick, and of appropriate length and width, installed to cover the area of the wiring. The steel plate shall be installed before the building finish is applied.

Exception No. 1: Steel plates shall not be required to protect rigid metal conduit, intermediate metal conduit, rigid nonmetallic conduit, or electrical metallic tubing.

Exception No. 2: A listed and marked steel plate less than 1.6 mm (1/16 in.) thick that provides equal or better protection against nail or screw penetration shall be permitted.

Substantiation: 300.4a protects both cables & raceways which would include MC & low volt, though only when installed in wood members. The panel in its rejection refers to 300.4b for protection of NM and ENT which does not include “cables”(AC or MC)when installed in metal framing. The part that appears to be overlooked is that it does not include cables therefore MC or AC would not have to be protected when running horizontally through metal studs within the 11/4” from the edge of the stud but does have to, in wood framing per 300.4a.

If it is the intent of the code for AC, MC & low voltage cables to be protected in both wood and metal studs then either 300.4a needs to include metal studs or 300.4b needs to include AC & MC or just cables. I believe that was the intent of the submitter as I had an identical proposal that did not make it either that I have attached.

Panel Meeting Action: Reject

Panel Statement: Section 300.4(A)(1) covers bored holes in wood framing members and (2) covers notches in wood. There has been no technical data provided in either the proposal or the comment that there is an issue with Types MC or AC cable in a metal framing members since the metal framing member does not restrict the movement of these cables as much as a wood installation. Types NM and ENT installed in a metal framing member have the much greater possibility for damage than the other wiring methods, thus the reason these wiring methods were singled out for additional protection techniques in metal framing members.

(300.4(E))

Submitter: Joseph A. Ross, Ross Electrical Assessments

Comment on Proposal No: 3-33

Recommendation: Reconsider and accept Proposal 3-33 (Log No. 2515)

Reconsider Action to unanimously REJECT by a 14 to Zip vote.

Substantiation: What you have done is tell a Big Box store to spend $20,000.00 to $30,000.00 now and in 30 years when you reroof and, if, nail technology has not become obsolete and then should those nails penetrate the wiring systems (Repair cost = $2000.,00); Doesn't make sense, does it??? Spend big bucks now to save peanuts in 30 years???

The cost figures are based on the actual costs of a new Sporting Goods store in NH ($20,000.00/$30,000.00 Extra) (Contractor would not pin-point an actual cost due to competitive bidding). The worst documented damage (Super Market, NH) in New England was 6 nail-hits. There were no injuries or fires; (Cost $2000.00).

Should your ACTION be REJECT, again, I insist that Proposal 3-33 and this comment be submitted into the NFPA process for a COST ANALYSIS.

Panel Meeting Action: Reject

Panel Statement: The original submitter of this proposal for the 2008 NEC process provided pictures of electrical wiring methods that had been damaged from screws designed to penetrate into structural steel but where the structural steel was missed and the screws penetrated rigid metal conduit, EMT, and other wiring. The proposal provided substantial and compelling technical data showing initial metal roof installations, as well as re-roofing installations where these screws penetrated the wiring systems. Cost should not be a factor where safety is compromised.

Number Eligible to Vote: 13

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 3-93
Recommendation: The Correlating Committee directs this proposal be forwarded to Code-Making Panel 9 for action.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
The panel accepts the Correlating Committee comment and continues to reject the proposal.
Panel Statement: As with the proposal the comment submitter fails to evidence that the outlet box covers are the only method of solving a problem that has failed to have been evidenced to exist. The submitter asserts that actual field practice of Inspectors is such that every box is not inspected yet the outlet box cover would make the box interior more difficult to inspect. It must be noted that possible damage to conductors is not the only code requirement inspected at outlet boxes. The amount of cable sheath in the box, length of free conductor, connection of equipment grounding conductors, grounding of metal boxes etc. are also important inspection items that would be hidden if outlet box covers are installed. Additionally the submitter asserts that routers used by drywall installers and similar tools are causing the purported damage. It would be a simple matter for the covers to be removed, the routers etc. used and the covers reinstalled concealing any damage done and increasing the likelihood that damage to conductors would go undiscovered. See 110.12 which covers this information.

Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Coghill, P.

3-13 Log #276 NEC-P03 **Final Action: Accept**
(Table 300.5)

TCC Action: The Correlating Committee directs that the text "Grounding electrode conductors and grounding electrode bonding jumpers shall not be required to comply with 300.5" be added after the last sentence in 250.64(B).
Submitter: Code-Making Panel 5,
Comment on Proposal No: 3-39
Recommendation: Code-Making Panel 5 recommends continuing to reject the change to Table 300.5. However, Code-Making Panel 5 agrees with the submitter that the requirements are unclear, but that 250.64(B) should be amended by adding the following text:
Grounding electrode conductors and grounding electrode bonding jumpers shall not be required to comply with 300.5.
Substantiation: There is continuing confusion as to whether or not Table 300.5 applies to grounding electrode conductors and grounding electrode bonding jumpers. Code-Making Panel 5 agrees with the submitter that Table 300.5 should not be used because it introduces requirements that may not be appropriate. For example, installing the grounding electrode conductor where it is routed down the exterior wall of a building, offset to the burial depth, and then back up to connect to an electrode that is close to the foundation wall would introduce sharp bends that would decrease its effectiveness. However, Code-Making Panel 5 prefers to include this clarification in 250.64(B) where the other requirements for the installation of Grounding Electrode Conductors are located.
This comment was developed by a CMP-5 Task Group and balloted through the entire panel with the following ballot results:
16 Eligible to Vote
14 Affirmative
1 Negative (P. Simmons)
1 Ballot Note Returned (W.J. Helfrich)
The following AFFIRMATIVE comment on vote was received:
P.J. LeLASSEUR: I do not agree with the example. An installation is just as likely to be made using large-radius bends regardless of the depth at which the grounding electrode is installed at.
The following NEGATIVE comment on vote was received:
P. SIMMONS: It is incorrect to presume CMP-5 would accept the additional text to 250.64(B) until after the panel has had an opportunity to consider and vote on the change. It is also incorrect to presume that all installations of grounding electrode conductors to grounding electrodes would be made with one or more sharp bends that would reduce its effectiveness. What is a sharp bend? This is ambiguous language. It should be noted that there is no requirement in Article 250 for "non-sharp" bend installations. The panel has rejected an attempt to add similar language in the past based on our instructions from NFPA staff that we have to avoid installation requirements that more properly belong in NFPA 780, the Lightning Protection Code. We did agree to add the Informational Note following 250.4(A)(1). Note that the Informational Note does not refer to the radius of a bend.

(Table 300.5)

Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 3-36
Recommendation: This Proposal should be rejected.
Substantiation: The present text of OSHA 1926.403(i) limits the requirements in that paragraph to applications up to 600 Volts. Changing the application of the text in Table 300.5 will create a conflict between the two documents because voltages from 601 to 1000 Volts would be in violation of OSHA requirements. In addition, a Note within the OSHA document states that "If the electrical installation is made in accordance with the National Electrical Code ANSI/NFPA 70-1984, exclusive of Formal Interpretations and Tentative Interim Amendments, it will be deemed to be in compliance with 1926.403 through 1926.408, except for 1926.404(b)(1) and 1926.405(a)(2)(ii)(E), (F), (G), and (J)." This would further conflict with the proposed text without significant amendment.
Panel Meeting Action: Reject
Panel Statement: Rejecting the change of the table reference from "600 volts or less" to "1000 volts or less" based on the OSHA 1926 document and a note provided by the OSHA 1926 document addressing a 1984 NEC requirement is not addressing current issues as appropriately documented and recommended by the NEC Correlating Committee High Voltage Task Group.

(300.5(D))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 3-43
Recommendation: Accept the proposal.
Substantiation: The panel statement is not responsive and more directly applies to Proposal 3-45. If this comment is accepted, Proposal 3-45 becomes redundant, and for that reason no comment is offered to revive Proposal 3-45 at this time. The substantiation that came with Proposal 3-45 is pertinent. The panel statement noted that the parent text of 300.5(D) "still applies only to directly buried cables and conductors". The entire purpose of Proposal 3-43 is to change that limitation, so 300.5(D)(3) can be applied to underground service raceways, as was always intended. For example, the reason for the 12-inch minimum separation between the ribbon and the underground wiring is to provide the maximum warning interval feasible with buried nonmetallic conduit in place at its usual 18-inch minimum cover. As the individual responsible for the placement of what is now 300.5(D)(3) in the NEC, this submitter is uniquely qualified to make this point. The proposed change in the parent text does not interfere with any of the provisions in the four numbered paragraphs that follow it, and is essential to incorporating all the intended applications for (3) within the scope of this subsection.
Panel Meeting Action: Reject
Panel Statement: The enclosure or raceway protection from physical damage in 300.5(D)(4) applies only to the raceway or enclosure application in 300.5(D)(1) for directly buried cables and conductors emerging from grade, not for general installation in a raceway or enclosure. For the application of service conductors in a raceway or an enclosure, the general requirements in 300.5(A) and the appropriate column in Table 300.5 applies.

Comment on Proposal No: 3-51
Recommendation: Revise text to read as follows:
Field-cut threads are those threads that are cut in conduit, <u>elbows, or nipples</u> anywhere other than at the factory where the product is listed.
Substantiation: This proposal was submitted to address proposals submitted during the 2011 cycle that concerned corrosion protection of threads on elbows and nipples. The text the Panel accepted only addresses conduit and not the products of primary concern.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:
CASPARRO, P.: Elbows and nipples could be cut and threaded in a supply house, a Home Depot, or a Lowes. For example, the threads on a manufactured 90 degree elbow are sometimes damaged at the time of purchase, so a new thread would have to be applied.

3-18 Log #454 NEC-P03 **Final Action: Reject**
(300.9)

Submitter: Robert A. Jones, IEC Texas Gulf Coast
Comment on Proposal No: 3-59
Recommendation: Accept proposal 3-59.
Substantiation: I have tried to find a technical paper or report about condensation within a conduit or enclosure and I cannot locate such a document. Since the panel statement refers to condensation I assume there must be a technical report or study to support the statement that "the interior of a raceway is often subject to condensation" and I respectfully request Panel 3 to direct me to that study or report. I do not believe the interior of a raceway is subject to condensation and most of my work in electrical construction for the past 40 years has been in an area subject to high humidity. I do believe that water can accumulate in a raceway due to poor workmanship and the use of material such as couplings and connectors that are not raintight. I am sure the members of Panel 3 are aware of the revision made to EMT raintight fittings as required by a UL study to determine the reliability of "raintight".
This information can be found at http://www.ul.com/regulators/raintight.cfm
I still contend that if the installation is in compliance with all NEC requirements, the interior of a raceway abovegrade cannot be a wet location.
Panel Meeting Action: Reject
Panel Statement: Metallic outlet boxes covered in the 2012 UL White Book in category QCIT provides the following listing requirement for metal boxes installed in a damp or wet location: "Boxes and covers intended for use in wet locations as defined by the NEC are marked "Wet Location." Damp location boxes and covers are intended to be so located or equipped as to prevent water from entering or accumulating in the box and are marked "Damp Location." Boxes with threaded conduit hubs will normally prevent water from entering except for condensation within the box or connected conduit." As can be seen by this listing requirement, metal boxes can receive water from condensation within conduit. This same application can occur with any raceway.

9-19 Log #39 NEC-P09 **Final Action: Accept**
(300.15)

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 3-70
Recommendation: It was the action of the Correlating Committee that this proposal be referred to Code-Making Panel 9 for action.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: Panel 9 accepts the direction of the Correlating Committee to take action on this comment. The submitters assertion that electrical connections need not be made in a box only that a box need be located in the vicinity of the connection requires great imagination in order to construe that reasoning to be the intention of section 300.15. Other NEC sections such as 314.17(C) reference type NM and type UF cable requiring the sheaths of such cables to extend ¼" into the box and beyond any cable clamp reinforcing the obvious requirement that the connections, splices etc. themselves be enclosed in the box. See panel action on comment 9-20.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Coghill, P.

9-20 Log #1090 NEC-P09 **Final Action: Accept**
(300.15)

Submitter: Gregory J. Steinman, Thomas & Betts Corporation
Comment on Proposal No: 3-70
Recommendation: Continue to REJECT Proposal 3-70.
Substantiation: The panel's request for a third-party fact finding investigation and report is appropriate since the technology on which the proposal is based contravenes the requirement in Section 300.15(F) which prohibits spicing or terminating conductors in a fitting. This being the case. I respectfully disagree with the panel's request to the TCC that the CMP 9 be given jurisdiction over this issue.
Panel Meeting Action: Accept
Panel Statement: Panel 9 assumes the Correlating Committee has assigned this topic to Panel 9 for comment on comment 9-19. The panel is in agreement to continue to "Reject" the addition of the "Connector Fitting with incorporated Box", noting that using a traditional fitting remains an unacceptable location for a splice or termination. However, Panel 9 does not agree with all of the substantiation from the submitter, as the technology presented in the proposal does not contravene 300.15(F). Specifically, the assembly in question provides more features than a traditional "fitting", and is more analogous to installations described in Sections 300.15(B) and 300.15(E). CMP 9 supports a position where a product evaluated as a Listed assembly (including a terminal) with an integral enclosure is permitted to terminate conductors.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Coghill, P.

9-21 Log #40 NEC-P09 **Final Action: Accept**
(300.15(E))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 3-71
Recommendation: The Correlating Committee directs that this proposal be sent to Code-Making Panel 9 for action in Article 314.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the Correlating Committee to respond to this proposal. Section 300.15(E) limits the use of a device within an integral enclosure to Non-metallic sheathed cable. No evidence has been provided by the submitter that demonstrates the suitability of this type of integral enclosure for use with metal armored cables. The panel rejects the proposal as it does not improve the clarity.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Coghill, P.

3-20 Log #808 NEC-P03 **Final Action: Reject**
(300.17)

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 3-73
Recommendation: Proposal 3-73 should be accepted in part.
Panel 3 should accept the deletion of the Informational Note in 300.17 and continue rejecting the Table 300.17.
Substantiation: The Informational Note is a laundry list and is not needed since the Number of Conductors is clearly identified in the appropriate Articles. In addition, the Information Note is missing NUCC Conduit as stated in Proposal 3-76. Even though NUCC is supplied with preinstalled conductors it still has to meet the requirements of 300.17 and number of conductors as stated in Table 1, Chapter 9.
Panel Meeting Action: Reject
Panel Statement: The informational note provides the user of the NEC a convenient reference to the location within each article covering wiring method fill requirements. There has been insufficient technical substantiation provided by the submitter to delete this informational note.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-21 Log #903 NEC-P03 **Final Action: Reject**
(300.22(B) Exception (New))

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 3-82
Recommendation: Please accept the proposal and add an exception to 300.22 (B) as follows:
<u>*Exception: Wiring that is specifically listed for use within an air-handling space (plenum) shall be permitted to be installed in air ducts, but only if the wiring is directly associated with the air distribution system and the total length of such wiring does not exceed 1.2 m (4 ft).*</u>
Substantiation: Standards Council has stated that NFPA 90A has jurisdiction over products in ducts and plenums, i.e. the areas called "Ducts Not Used for Air Handling, Fabricated Ducts for Environmental Air, and Other Spaces for Environmental Air" in section 300.22 (B) and 300.22 (C).
NFPA 90A allows "plenum cables" to be installed in air ducts under the very extreme limitations indicated above (and as shown below). If this proposal is not accepted there would be a difference in requirements between the NEC and NFPA 90A.
NFPA 90A states, in section 4.3.4 as follows:
4.3.4 Materials for Operation and Control of the Air Distribution System.
4.3.4.1. Wiring shall not be installed in air ducts, except as permitted in 4.3.4.2 through 4.3.4.4.
4.3.4.2 Wiring shall be permitted to be installed in air ducts only if the wiring is directly associated with the air distribution system and does not exceed 1.22 m (4 ft).
4.3.4.3 Wiring permitted by 4.3.4.2 shall be as short as practicable.
4.3.4.4* Electrical wires and cables and optical fiber cables shall consist of wires or cables listed as having a maximum peak optical density of 0.50 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.5 m (5 ft) or less when tested in accordance with NFPA 262, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces*, or shall be installed in metal raceways without an overall nonmetallic covering or metal sheathed cable without an overall nonmetallic covering.
There is also an annex note in NFPA 90A, as follows:
A.4.3.4.4 Electrical wires and cables and optical fiber cables installed in metal raceways or metal sheathed cable are not considered to be exposed to the airflow and need not meet the requirements of 4.3.4.4. Electrical wires and cables and optical fiber cables listed to UL Subject 2424, *Outline of Investigation for Cable Marked Limited Combustible*, are considered to be suitable for use wherever cables tested in accordance with NFPA 262, *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces*, are required.
Panel Meeting Action: Reject
Panel Statement: While the proposed change appears to fall within the provisions of 4.3.4 of NFPA 90A, the panel does not agree with the 4 foot limitation which is considered to be impractical for applications such as the installation of pendant duct smoke detectors. The submitter should consider submitting proposals to NFPA 90A to permit wire lengths more appropriate for such applications.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-22 Log #294 NEC-P03 **Final Action: Accept**
(300.22(C)(1))

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 3-85
Recommendation: Continue to reject proposal 3-85.
Substantiation: The Communications Cable and Connectivity Association supports the panel's action to reject this proposal. Including signaling and communications raceways could give the impression that communications raceways are suitable for use with electric light and power wiring. They are not listed for use with electric light and power wiring.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-23 Log #295 NEC-P03 **Final Action: Accept in Principle**
(300.22(C)(1))

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 3-86
Recommendation: Revise the Panel Action as follows:
Cable ties used to secure cables shall be listed as having ~~adequate fire-resistant and low smoke producing characteristics~~ <u>low smoke and heat release properties</u>.
Informational Note: One method of defining <u>a cable tie with low smoke and heat release properties</u> ~~adequate fire-resistant and low-smoke producing characteristics~~ is <u>that the cable tie exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a peak heat release rate of 100 kW or less when tested</u> in <u>accordance with</u> ANSI/UL 2043-2008, *Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces.*
Substantiation: The panel action on the proposal changed,
"Cable ties used to secure cables shall be listed as having low smoke and heat release properties."
to
"Cable ties used to secure cables shall be listed as having adequate fire resistant and low smoke producing characteristics."
The panel stated that it changed from "low smoke and heat release properties" to "adequate fire resistant and low smoke producing characteristics" in order to more appropriately match the text throughout the NEC where dealing with low smoke and fire resistance characteristics.
This requirement should not match the text used for plenum cables and raceways because *ANSI/UL 2043, Standard for Safety Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces,* measures heat release rate, while NFPA 262 *Standard Method of Test for Flame Travel and Smoke of Wires and Cables for Use in Air-Handling Spaces,* measures flame spread. The tests are different and the text referring to them should be different.
The Panel Action on the informational note removed the reference to the listing requirements in NFPA 90A. Without reference to NFPA 90A it is necessary to cite a least one set of pass/fail criteria as is done in the informational notes for plenum cables in 725.179(A), 760.179(D), 770.179(A), 800.179(A), 820.179(A) and 830.179(B)(1).
Panel Meeting Action: Accept in Principle
Panel Statement: Refer to the panel action and statement on Comment 3-24, which addresses the same issue.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-24 Log #712 NEC-P03 **Final Action: Accept in Principle**
(300.22(C)(1))

TCC Action: The Correlating Committee directs that mandatory text and informational note be revised for correlation as follows:
Nonmetallic cable ties and other nonmetallic cable accessories used to secure and support cables shall be listed as having low smoke and heat release properties.
Informational Note: One method to determine low smoke and heat release properties is that the nonmetallic cable ties and other nonmetallic cable accessories exhibits a maximum peak optical density of 0.50 or less, an average optical density of 0.15 or less and a peak heat release rate of 100 kW or less when tested in accordance with ANSI/UL 2043-2008, Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces.
The Correlating Committee understands the mandatory text and the informational note are to be located at the bottom of the existing paragraph in 300.22(C)(1).
Submitter: George Bish, Secure Watch Security
Comment on Proposal No: 3-86
Recommendation: The panel should continue to Accept in Principle in Part but revise the Panel Action as follows:
Mandatory Text: "Cable ties used to secure cables shall be listed as having ~~adequate fire resistant and~~ low smoke and heat release properties ~~producing~~

~~characteristics~~."

Informational Note: One method ~~of defining adequate fire resistant and low-smoke producing characteristics~~ to determine low smoke and heat release properties is ~~in~~ that the cable tie exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less and a peak heat release rate of 100kW or less when tested in accordance with ANSI/UL 2043-2008, Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces.

Substantiation: The Panel revised the mandatory text to more appropriately match the text throughout the NEC where dealing with low smoke and fire characteristics. The requirement for "Cable Ties" should not "match" text used elsewhere in the NEC dealing with plenum cables and raceways. The standard cited, ANSI/UL 2043-2008, deals with heat release and does not address fire resistance (flame spread).

The Panel Action on the informational note has deleted the reference to NFPA 90A that contains the appropriate listing requirements. Hence, at least one set of listing requirements must be provided in the informational note as is done in the informational notes accompanying 725.179(A), 760.179(D), 770.179(A), 800.179(A), 820.179(A) and 830.179((B)(1).

The proposed changes contained in this comment will correlate requirements addressing the listing of cable ties across Articles 300, 770, 800, 820, and 830

This is one of a group of comments developed by the CMP3/CMP16 Joint Task Group formed at the direction of the Correlating Committee to correlate the requirements of Cable Ties in Articles 300, 770, 800, 820, and 830

The Task Group members were:

George Bish, Chair, representing Satellite Broadcasting & Communication Association

Harry Ohde, representing IBEW

James Brunssen, representing Alliance for Telecommunications Industry Solutions

George Straniero, representing National Electrical Manufacturers Association

Robert Walsh, representing International Association of Electrical Inspectors

Wendell Whistler, representing Intertek Testing Services

Panel Meeting Action: Accept in Principle

Revise the comment recommendation to read as follows:

Mandatory Text: Nonmetallic cable ties and other nonmetallic cable accessories used to secure and support cables shall be listed as having low smoke and heat release properties.

Informational Note: One method to determine low smoke and heat release properties is that the cable tie exhibits a maximum peak optical density of 0.50 or less, an average optical density of 0.15 or less and a peak heat release rate of 100 kW or less when tested in accordance with ANSI/UL 2043-2008, Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces.

Panel Statement: The panel added mandatory text to recognize the use of nonmetallic cable support accessories other than cable ties. The change to "0.50" provides a level of precision consistent with UL 2043.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-25 Log #904 NEC-P03 **Final Action: Accept in Principle**
(300.22(C)(1))

Submitter: Marcelo M. Hirschler, GBH International

Comment on Proposal No: 3-86

Recommendation: Please accept the proposal as written.

Substantiation: The requirements contained in NFPA 90A (and shown in the Informational Note) are the testing of cable ties by means of UL 2043. UL 2043 does not assess "fire resistant and low smoke producing characteristics" but assesses "smoke and heat release characteristics". The UL 2043 determines the heat release rate (and the maximum allowed is 100 kW) and smoke release (as assessed by optical density, peak and average). As the language accepted in articles 770, 800, 820 and 830 contains the terms used by the submitter of this proposal, there needs to be consistency between the requirements. CMP 3 correctly assessed that including the language in 300.22 makes it unnecessary to include the language in articles 725 and 760.

Panel Meeting Action: Accept in Principle

Panel Statement: Refer to the panel action and statement on Comment 3-24.

The revised text includes terminology similar to the original proposal. In addition, text was added to recognize the use of nonmetallic cable supports other than cable ties. The language used was developed by a joint task group (CMP 3 and CMP16).

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-26 Log #1086 NEC-P03 **Final Action: Accept in Principle**
(300.22(C)(1))

Submitter: Timothy P. McNeive, Thomas & Betts Corporation

Comment on Proposal No: 3-86

Recommendation: The panel should continue to Accept in Principle in Part but revise the Panel Action as follows:

"Straps, staples, hangers, ~~C~~cable ties or similar fittings used to secure cables shall be listed as having ~~adequate fire resistant and~~ low smoke and heat release properties ~~producing characteristics~~."

Informational Note: One method ~~of defining adequate fire resistant and low-smoke producing characteristics~~ to determine low smoke and heat release properties is ~~in~~ that the strap, staple, hanger, cable tie or similar fitting exhibits a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less and a peak heat release rate of 100kW or less when tested in accordance with ANSI/UL 2043-2008, Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces.

Substantiation: Cable ties are just one means for securing cables referenced under "Mechanical Execution of Work" throughout the Code.

All "discrete combustible components", not only cable ties, used in conjunction with plenum cables and raceways in spaces according to 300.22(C) and (D) such be held to the same standard with regard to low smoke and heat release properties.

The following UL standards all contain optional classifications and associated markings for listing products such thee according to requirements in UL 2043: UL62275, Cable ties for electrical installations; UL 1565, Positioning devices; and UL 2239, Hardware for support of conduit, tubing and cable.

The reference to UL2043 and the specific minimum index values in the Informational Note will be very helpful to enforcement authorities. Often there is an expectation that discrete products must have flame spread characteristics as well as low-smoke producing characteristics the same as for potentially continuously flame propagating products such as cables. The test method and minimum index values for these continuous products are not appropriate for discrete products. Panel members are invited to review a NEMA document published by NEMA cable tie manufacturers at the following link: http://www.nema.org/Products/Documents/Application%20Guide%201Cable%20Ties_Application%20Environment_AH.pdf

Panel Meeting Action: Accept in Principle

Panel Statement: Refer to the committee action and statement on Comment 3-24, which addresses the same issues.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

3-26a Log #CC301 NEC-P03 **Final Action: Accept**
(300.22(C)(3) and Info Note)

TCC Action: The Correlating Committee directs the action on this comment be reported as "Hold" since the corresponding changes to the referenced section and informational note were proposed for 300.22(C)(1), but did not have public review for 300.22(C)(3) and constitutes new material. The text that was used in 300.22(C)(1) applied specifically to cable ties as well as cable tie accessories. However, the proposed revision for 300.22(C)(3)would apply to all equipment referenced in 300.22(C)(3). This expansion has not had public review.

Submitter: Code-Making Panel 3,

Comment on Proposal No: 3-86

Recommendation: Revise 300.22(C)(3) and it's Informational Note to read as follows (the exception is retained and unchanged):

(3) Equipment. Electrical equipment with a metal enclosure, or electrical equipment with a nonmetallic enclosure listed for use within an air-handling space and having low-smoke and heat release properties, and associated wiring material suitable for the ambient temperature shall be permitted to be installed in such other space unless prohibited elsewhere in this Code.

Informational Note: One method to determine low smoke and heat release properties is that the equipment exhibits a maximum peak optical density of 0.50 or less, an average optical density of 0.15 or less and a peak heat release rate of 100 kW or less when tested in accordance with ANSI/UL 2043-2008, Fire Test for Heat and Visible Smoke Release for Discrete Products and Their Accessories Installed in Air-Handling Spaces.

Substantiation: The panel revised 300.22(C)(3) to be consistent with the action taken for 300.22(C)(1) in Comment 3.24.

Panel Meeting Action: Accept

Number Eligible to Vote: 13

Ballot Results: Affirmative: 12 Negative: 1

Explanation of Negative:

STENE, S.: The action of this comment on 300.22(C)(3) and its informational note is new material that has not had public review. There wasn't a proposal submitted to make a change in this section for equipment to have low smoke and heat release properties, only for cable ties to have low smoke and heat release properties.

Comment on Affirmative:

WALSH, R.: The corresponding changes to the referenced section and informational note were proposed for 300.22(C)(1), but were not allowed public review for 300.22(C)(3) and could constitute new material. I submit that the comment should be evaluated by the Correlating Committee.

3-27 Log #809 NEC-P03 **Final Action: Reject**
(300.22(C)(3))

Submitter: David H. Kendall, Thomas & Betts Corporation

Comment on Proposal No: 3-87

Recommendation: Proposal 3-87 should be accepted.

Substantiation: Electrical professionals are having difficulty finding where

it states that a standard receptacle is permitted (as stated by Panel 3 in their Panel Statement) to be installed in Other Spaces Used for Environmental Air (Plenum) when used with metal outlet boxes and metal covers in the NEC.
Panel Meeting Action: Reject
Panel Statement: A receptacle installed with a metal faceplate would still expose the receptacle to possible fire with resulting smoke and products of combustion. A receptacle installed in an "other space used for environmental air (plenum)", totally enclosed in a metal cover without exposed nonmetallic parts, except while in use, (such as an attended use cover) would be permitted by the text in existing 300.22(C)(3).

3-28 Log #653 NEC-P03 **Final Action: Accept**
(300, Part II)

TCC Action: The Correlating Committee directs that as a result of the changes in voltage thresholds in Article 300, the range of voltage in the first row in Table 300.50 be revised to read: "Over 1000V through 22 kV."
Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 3-89
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task group to provide additional substantiation as directed by the Correlating Committee.
The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.
The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.
Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.
Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.
If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

(300, Part II)

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 3-89
Recommendation: Proposal 3-89 should be rejected.
Substantiation: Panel 3 should reconsider accepting this proposal. Panel Member Burlison is correct in his negative ballot and statement There was not technical substantiation to allow wiring methods over 600 volts to 1000 volts to become a part of 300 Part I. Leaving 300 Part II at 600 volts does not affect unique applications in later articles of the NEC.
Panel Meeting Action: Reject
Panel Statement: Additional substantiation has been provided by Comment 3-28.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-30 Log #555 NEC-P03 **Final Action: Accept**
(300.38 (New))

Submitter: Richard E. Loyd, Sun Lakes, AZ
Comment on Proposal No: 3-92
Recommendation: Reconsider and approve this comment to add a new Section 300.38.
Substantiation: I originally submitted the proposal as I interpreted 300.2(A) to limit Part 1 of Article 300 to less than 600 volt installations and in some cases the limitations are for less than 600 volts, and that Part II only gives specific permission for over 600 volts.
It seems to me that each of the two sentences in 300.2(A) stand alone? For example notice 300.32 in Part II sends the reader back to 300.3(C)(2) which I believe is helpful. This same action could be done for wet locations above ground, or just accept this comment.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
STENE, S.: This should have been a reject. Duplicating every section in Part I of Article 300 that is not voltage specific and inserting it into Part II is unnecessary. Section 300.9 already requires the interior of raceways in above-ground installations to be considered to be wet locations and is not limited by voltage. Part II of Article 300 is specific to installations over (600 volts)1000 volts (as changed in Proposal 3-89 and Comment 3-28), however, an over (600 volt) 1000 volt application must still comply with Part I where it is not voltage specific.

3-31 Log #1556 NEC-P03 **Final Action: Reject**
(300.45 (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 3-94
Recommendation: Accept the proposal.
Substantiation: The panel statement is incorrect. There is no such warning requirement that applies generally to all points of access to conductors, although the sections cited in the panel statement are generally correct. However, it must be remembered that this proposal was a companion to one that deleted 225.70. The proposal (4-88) was effectively accepted by CMP 4. The substation provision will no longer exist in the form it did in the 2011 NEC. It is important to realize that every one of this submitter's companion proposals to the one to delete 225.70 has been accepted by the relevant panels, with the notable exception of this one by CMP 3. If this provision is not accepted in at least some form, the requirement will not carry forward to the 2014 NEC.
Panel Meeting Action: Reject
Panel Statement: The panel's statement in Proposal 3-94 did not make the statement that there was a warning requirement that applied generally, as alleged by the submitter. The deletion of 225.70 requiring warning signs applied only to substations and does not have anything to do with the submitters request to have warning signs placed on all points of access to conductors in all conduit and cable systems for over 1000 volts. There is no technical substantiation to apply the warning sign criteria for all access points in all conduit and cable systems. In addition, the submitter only referenced conduit and cabling, leaving off any references to tubing of any kind, such as EMT.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 310 — CONDUCTORS FOR GENERAL WIRING

6-1 Log #253 NEC-P06 **Final Action: Reject**
(310.4)

Submitter: Raymond J. Dezik, 400 Hz Repair
Comment on Proposal No: N/A
Recommendation: We ask that the code be changed to allow cables as small as 2 #4 in parallel as that is a practical application and may not fall under the sections Exception 1, a-b &c.
Substantiation: Conductors in parallel even at 400 Hz are not allowed if smaller than 1/0.
We parallel 400 Hz conductors for voltage drop and not ampacity.
2 -#3 cables equal a 1/0 in cross section yet we lower our voltage drop by 50%. A change in the codes for 600 Hz would allow wires as small as 2-#4 in parallel as that is a practical application for 400 Hz.
We would rather use 2#3 rather than 1/0. Therefore we ask that the code be changed to allow cables as small as 2 #4 in parallel as that is a practical application and may not fall under the sections Exception 1, a-b &c.
Panel Meeting Action: Reject
Panel Statement: The comment is incomplete and inadequate in that the submitter has not provided the necessary wording to complete the proposal in accordance with 4.4.5(b) and (c) of the Regulations Governing Committee Projects.
The 310.10(H)(1) Exception No. 1 provides requirements for 360 Hz and higher for systems. The submitter has not provided specific substantiation why Exception 1 is inadequate.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
CLINE, S.: In support of the Panel's action:
The submitter may not realize that Exception No. 1 appears to give permission exactly as he requests. IF (a), (b), and (c) are satisfied, THEN multiple smaller-than-1/0 conductors are allowed to reduce the voltage drop.

6-2 Log #403 NEC-P06 **Final Action: Reject**
(310.10(F))

Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 6-14
Recommendation: Reject Proposal 6-14.
Substantiation: Although present OSHA requirements do not directly address required burial depth, the present text of OSHA 1926.403 (General Requirements), 1926.404 (Wiring Design and Protection), and 1926.405 (Wiring Methods, Components for General Use) all contain voltage breaks at 600 Volts. Changing the application of the text in 310.10(F) will create a conflict between the two documents causing voltages from 601 to 1000 Volts to possibly be in violation of OSHA requirements. In addition, a Note within the OSHA document states that "If the electrical installation is made in accordance with the National Electrical Code ANSI/NFPA 70-1984, exclusive of Formal Interpretations and Tentative Interim Amendments, it will be deemed to be in compliance with 1926.403 through 1926.408, except for 1926.404(b)(1) and 1926.405(a)(2)(ii)(C), (F), (G), and (J)." This would further conflict with the proposed text without significant amendment.
Panel Meeting Action: Reject
Panel Statement: Proposal 6-14 did not present any safety concerns to the panel.
Although OSHA has certain requirements based on voltage break, the NEC must lead in establishing product voltage requirements.
The proposed changes are necessary to keep up with technological changes in the methods employed to generate power.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

6-3 Log #715 NEC-P06 **Final Action: Accept**
(310.10(F))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 6-14
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.
The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.
The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.
Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.
Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.
If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

6-4 Log #423 NEC-P06 **Final Action: Accept**
(310.10(H)(2)(6))

Submitter: Mark C. Ode, UL LLC
Comment on Proposal No: 6-15
Recommendation: Revise text to read as follows:
(6) ~~When~~ Where paralleled in ~~ferrous metal~~ enclosures or raceways, conductors shall be grouped with all conductors of the same circuit to prevent heating effects from imbalances of current.
Information Note: Where conductors are paralleled in ~~ferrous metal~~ enclosures or raceways, failure to group one conductor from each phase in each raceway or grouping within a wiring method may result in overheating and current imbalance.
Substantiation: "When" was changed to "where" since this is not a condition of time. "Ferrous metal" was deleted since the conductors not being grouped together and the resulting heat, as well as current imbalance, will occur in both ferrous and non-ferrous enclosures and raceways. Limiting this restriction to just ferrous enclosures would still subject non-grouped conductors to large imbalances of current and the heating effects of this imbalance.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

6-5 Log #1006 NEC-P06 **Final Action: Accept**
(310.10(H)(2)(6))

Submitter: David Clements, International Association of Electrical Inspectors
Comment on Proposal No: 6-15
Recommendation: Revise text to read as follows:
(6) ~~When~~ Where paralleled in ~~ferrous metal~~ enclosures or raceways, conductors shall be grouped with all conductors of the same circuit to prevent heating effects from imbalances of current.
Information Note: Where conductors are paralleled in ~~ferrous metal~~ enclosures or raceways, failure to group one conductor from each phase in each raceway or grouping within a wiring method may result in overheating and current imbalance.
Substantiation: "When" was changed to "where" since this is not a condition of time. "Ferrous metal" was deleted since the conductors not being grouped together and the resulting heat, as well as current imbalance, will occur in both

ferrous and nonferrous enclosures or raceways. Limiting this restriction to just ferrous enclosures would still subject non-grouped conductors to large imbalances of current and the heating effects of this imbalance.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

6-6 Log #559 NEC-P06 **Final Action: Accept in Principle**
(310.10(H)(6) and Informational Note)

Submitter: Richard E. Loyd, Sun Lakes, AZ
Comment on Proposal No: 6-15
Recommendation: Revise text to read as follows:
(6) When paralleled in ~~ferrous metal~~ enclosures or raceways, conductors shall be grouped with all conductors of the same circuit to prevent heating effects from imbalances of current.
Information Note: Where conductors are paralleled in ferrous metal enclosures or raceways, failure to group one conductor from each phase in each raceway or grouping within a wiring method may result in overheating and current imbalance.
Substantiation: "Ferrous metal" should be deleted since the conductors are generally not grouped together enclosures. The large imbalances of current and the heating effects of this imbalance will occur in both ferrous, nonferrous and nonmetallic enclosures. The informational note is helpful but not enforceable.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 6-4.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

6-7 Log #1063 NEC-P06 **Final Action: Accept**
(310.10(H)(6))

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 6-15
Recommendation: Continue to accept the proposal but revise as follows:
(6) ~~When~~ <u>Where</u> paralleled in ~~ferrous metal~~ enclosures or raceways, conductors shall be grouped with all conductors of the same circuit to prevent heating effects from imbalances of current.
Information Note: Where conductors are paralleled in ~~ferrous metal~~ enclosures or raceways, failure to group one conductor from each phase in each raceway or grouping within a wiring method may result in overheating and current imbalance.
Substantiation: This comment seeks to build on the concepts presented in the original proposal. The word "where" is more appropriate because the rule should not be related to a point in time. The problem of induction and grouping exists not only with parallel conductor sets installed in magnetic (ferroius) enclosures, but is can also be problematic in nonferrous enclosures, relative to improper grouping. Since the original proposal was related to reducing induction problems by grouping, the expansion of the proposal to nonferrous types of enclosures should not be considered new material as it relates to the same problem presented in the original proposal.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

6-8 Log #346 NEC-P06 **Final Action: Reject**
(310.15)

Submitter: Johnnie Miller, Electrical Solutions
Comment on Proposal No: N/A
Recommendation: ASHRAE has complied 10 years of dry-bulb design temperature data in the 2009 ASHRAE Handbook of Fundamentals (The American Society of Heating, Refrigeration and Air-conditioning Engineers).
ASHRAE published a Temperature Table and the calculations shown in the table are based on ASHRAE 2% design temperatures for 10 years of data and CDA research covering over five years of monitoring air temperatures inside rooftop raceways. The result of which can be used to apply the correction factors in Table 310.15(B)(2)(a) and table 310.15(B)(2)(b) of the 2011 NEC.
The table covers most of the US and selected Canadian weather station locations included in the ASHRAE Handbook. The complete Handbook can be ordered from ASHRAE (www.ashrae.org).
Substantiation: The problem with the current code is that personnel in the field including inspectors have to guess at the ambient temperature. Incorporating the ASHRAE table into the 2014 NEC would help to denote the rooftop conductor temperatures for virtually all geographic locations throughout the North American continent. By implementing this new Table into the NEC, it would alleviate the guesswork in estimating ambient temperatures used for derating of conductors due to temperature conditions. Moreover, the NEC has already referenced use of the above noted table in the existing 2011 NEC language (reference 310.15 - Ampacities for Conductors Rated 0-2000 Volts, (3) adjustment Factors (ref. pg 70-152).
Panel Meeting Action: Reject
Panel Statement: The proposal is incomplete and inadequate in that the submitter has not provided the necessary wording to complete the proposal in accordance with 4.4.5(b) and (c) of the Regulations Governing Committee Projects.
CMP-6 points out that as per 90.1(C), the NEC is not a design guide.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

6-9 Log #380 NEC-P06 **Final Action: Hold**
(310.15)

TCC Action: Based on the panel action on this Comment of "Hold", the Correlating Committee directs that Proposal 6-19 also be reported as "Hold."
Submitter: Scott Cline, Monterey Park, CA
Comment on Proposal No: 6-19
Recommendation: Please see the following documentation of suggested reorganization-only of Article 310. There is no intention to change the requirements of the Code, only restructure it. The recommendation expressed here is based on the 2011 NEC, previous to the ROP and ROC, and in no way intends to change any approved Code requirement action of the ROP or ROC for the 2014 edition of the NEC.
Formatting of this beginning portion is as a final-draft with underlining only included
(Starting on the 11th page, is a working-draft complete with legislative text)

Reorganization and Editorial Corrections only of 310

Article 310 Conductors for General Wiring
I. General
310.1 Scope. This article covers general requirements for conductors <u>used in general wiring</u> and their type designations, insulations, markings, mechanical strengths, ampacity ratings, and uses. These requirements do not apply to conductors that form an integral part of equipment, such as motors, motor controllers, and similar equipment, or to conductors specifically provided for elsewhere in this *Code*.
Informational Note: For flexible cords and cables, see Article 400. For fixture wires, see Article 402.
310.2 Definitions.
Electrical Ducts. As used in Article 310, electrical ducts shall include any of the electrical conduits recognized in Chapter 3 as suitable for use underground; other raceways round in cross section, listed for underground use, and embedded in earth or concrete.
Thermal Resistivity. As used in this *Code*, the heat transfer capability through a substance by conduction. It is the reciprocal of thermal conductivity and is designated Rho and expressed in the units °C-cm/watt.
II. Installation
310.10 Uses Permitted. The conductors described in 310.104 shall be permitted for use in any of the wiring methods covered in Chapter 3 and as specified in their respective tables or as permitted elsewhere in this *Code*.
Informational Note: Thermoplastic insulation may stiffen at temperatures lower than −10°C (+14°F). Thermoplastic insulation may also be deformed at normal temperatures where subjected to pressure, such as at points of support. Thermoplastic insulation, where used on dc circuits in wet locations, may result in electroendosmosis between the conductor and insulation.
(A) Dry Locations. Insulated conductors and cables used in dry locations shall be any of the types identified in this *Code*.
(B) Dry and Damp Locations. Insulated conductors and cables used in dry and damp locations shall be Types FEP, FEPB, MTW, PFA, RHH, RHW, RHW-2, SA, THHN, THW, THW-2, THHW, THWN, THWN-2, TW, XHH, XHHW, XHHW-2, Z, or ZW.
(C) Wet Locations. Insulated conductors and cables used in wet locations shall comply with one of the following:
(1) Be moisture-impervious metal-sheathed
(2) Be types MTW, RHW, RHW-2, TW, THW, THW-2, THHW, THWN, THWN-2, XHHW, XHHW-2, ZW
(3) Be of a type listed for use in wet locations
(D) Locations Exposed to Direct Sunlight. Insulated conductors or cables used where exposed to direct rays of the sun shall comply with (D)(1) or (D)(2):
(1) Conductors and cables shall be listed, or listed and marked, as being sunlight resistant
(2) Conductors and cables shall be covered with insulating material, such as tape or sleeving, that is listed, or listed and marked, as being sunlight resistant
(E) Shielding. Non-shielded, ozone-resistant insulated conductors with a maximum phase-to-phase voltage of 5000 volts shall be permitted in Type MC cables in industrial establishments
where the conditions of maintenance and supervision ensure that only qualified persons service the installation. For other establishments, solid dielectric insulated conductors operated above 2000 volts in permanent installations shall have ozone-resistant insulation and shall be shielded. All metallic insulation shields shall be connected to a grounding electrode conductor, a grounding busbar, an equipment grounding conductor, or a grounding electrode.
Informational Note: The primary purposes of shielding are to confine the voltage stresses to the insulation, dissipate insulation leakage current, drain off the capacitive charging current, and carry ground-fault current to facilitate operation of ground-fault protective devices in the event of an electrical cable fault.

Exception No. 1: Nonshielded insulated conductors listed by a qualified testing laboratory shall be permitted for use up to 2400 volts under the following conditions:

(a) Conductors shall have insulation resistant to electric discharge and surface tracking, or the insulated conductor(s) shall be covered with a material resistant to ozone, electric discharge, and surface tracking.

(b) Where used in wet locations, the insulated conductor(s) shall have an overall nonmetallic jacket or a continuous metallic sheath.

(c) Insulation and jacket thicknesses shall be in accordance with Table 310.104(D).

Exception No. 2: Nonshielded insulated conductors listed by a qualified testing laboratory shall be permitted for use up to 5000 volts to replace existing nonshielded conductors, on existing equipment in industrial establishments only, under the following conditions:

(a) Where the condition of maintenance and supervision ensures that only qualified personnel install and service the installation.

(b) Conductors shall have insulation resistant to electric discharge and surface tracking, or the insulated conductor(s) shall be covered with a material resistant to ozone, electric discharge, and surface tracking.

(c) Where used in wet locations, the insulated conductor(s) shall have an overall nonmetallic jacket or a continuous metallic sheath.

(d) Insulation and jacket thicknesses shall be in accordance with Table 310.104(D).

Informational Note: Relocation or replacement of equipment may not comply with the term *existing* as related to this exception.

Exception No. 3: Where permitted in 310.10(F), Exception No. 2.

(F) Direct-Burial Conductors. Conductors used for direct-burial applications shall be of a type identified for such use.

Cables rated above 2000 volts shall be shielded.

Exception No. 1: Nonshielded multiconductor cables rated 2001–2400 volts shall be permitted if the cable has an overall metallic sheath or armor.

The metallic shield, sheath, or armor shall be connected to a grounding electrode conductor, grounding busbar, or a grounding electrode.

Exception No. 2: Airfield lighting cable used in series circuits that are rated up to 5000 volts and are powered by regulators shall be permitted to be nonshielded.

Informational Note to Exception No. 2: Federal Aviation Administration (FAA) Advisory Circulars (ACs) provide additional practices and methods for airport lighting.

Informational Note No. 1: See 300.5 for installation requirements for conductors rated 600 volts or less.

Informational Note No. 2: See 300.50 for installation requirements for conductors rated over 600 volts.

(G) Corrosive Conditions. Conductors exposed to oils, greases, vapors, gases, fumes, liquids, or other substances having a deleterious effect on the conductor or insulation shall be of a type suitable for the application.

(H) Conductors in Parallel.

(1) General. Aluminum, copper-clad aluminum, or copper conductors, for each phase, polarity, neutral, or grounded circuit shall be permitted to be connected in parallel (electrically joined at both ends) only in sizes 1/0 AWG and larger where installed in accordance with 310.10(H)(2) through (H)(6).

Exception No. 1: Conductors in sizes smaller than 1/0 AWG shall be permitted to be run in parallel to supply control power to indicating instruments, contactors, relays, solenoids, and similar control devices, or for frequencies of 360 Hz and higher, provided all of the following apply:

(a) They are contained within the same raceway or cable.

(b) The ampacity of each individual conductor is sufficient to carry the entire load current shared by the parallel conductors.

(c) The overcurrent protection is such that the ampacity of each individual conductor will not be exceeded if one or more of the parallel conductors become inadvertently disconnected.

Exception No. 2: Under engineering supervision, 2 AWG and 1 AWG grounded neutral conductors shall be permitted to be installed in parallel for existing installations.

Informational Note to Exception No. 2: Exception No. 2 can be used to alleviate overheating of neutral conductors in existing installations due to high content of triplen harmonic currents.

(2) Conductor Characteristics. The paralleled conductors in each phase, polarity, neutral, grounded circuit conductor, equipment grounding conductor, or equipment bonding jumper shall comply with all of the following:

(1) Be the same length
(2) Consist of the same conductor material
(3) Be the same size in circular mil area
(4) Have the same insulation type
(5) Be terminated in the same manner

(3) Separate Cables or Raceways. Where run in separate cables or raceways, the cables or raceways with conductors shall have the same number of conductors and shall have the same electrical characteristics. Conductors of one phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor shall not be required to have the same physical characteristics as those of another phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor.

(4) Ampacity Adjustment. Conductors installed in parallel shall comply with the provisions of 310.15(B)(3)(a).

(5) Equipment Grounding Conductors. Where parallel equipment grounding conductors are used, they shall be sized in accordance with 250.122. Sectioned equipment grounding conductors smaller than 1/0 AWG shall be permitted in multiconductor cables in accordance with 310.104, provided the combined circular mil area of the sectioned equipment grounding conductors in each cable complies with 250.122.

(6) Equipment Bonding Jumpers. Where parallel equipment bonding jumpers are installed in raceways, they shall be sized and installed in accordance with 250.102.

III. Ampacities for Conductors

310.13 General.

(A) Tables or Engineering Supervision. Ampacities for conductors shall be permitted to be determined by tables as provided in 310.15 or 310.60, or under engineering supervision, as provided in 310.13(F).

Informational Note No. 1: Ampacities provided by this part do not take voltage drop into consideration. See 210.19(A), Informational Note No. 4, for branch circuits and 215.2(A), Informational Note No. 2, for feeders.

Informational Note No. 2: For the allowable ampacities of Type MTW wire, see Table 13.5.1 in NFPA 79-2007, *Electrical Standard for Industrial Machinery*.

(B) Selection of Ampacity. Where more than one ampacity applies for a given circuit length, the lowest value shall be used.

Exception: Where two different ampacities apply to adjacent portions of a circuit, the higher ampacity shall be permitted to be used beyond the point of transition, a distance equal to 3.0 m (10 ft) or 10 percent of the circuit length calculated at the higher ampacity, whichever is less.

Informational Note: See 110.40 for conductor temperature limitations due to termination provisions.

(C) Temperature Limitation of Conductors. No conductor shall be used in such a manner that its operating temperature exceeds that designated for the type of insulated conductor involved. In no case shall conductors be associated together in such a way, with respect to type of circuit, the wiring method employed, or the number of conductors, that the limiting temperature of any conductor is exceeded.

Informational Note No. 1: The temperature rating of a conductor [see Table 310.104(A) and Table 310.104(C)] is the maximum temperature, at any location along its length, that the conductor can withstand over a prolonged time period without serious degradation. The allowable ampacity tables, the ampacity tables of Article 310 and the ampacity tables of Informative Annex B, the ambient temperature correction factors, and the notes to the tables provide guidance for coordinating conductor sizes, types, allowable ampacities, ampacities, ambient temperatures, and number of associated conductors. The principal determinants of operating temperature are as follows:

(1) Ambient temperature — ambient temperature may vary along the conductor length as well as from time to time.

(2) Heat generated internally in the conductor as the result of load current flow, including fundamental and harmonic currents.

(3) The rate at which generated heat dissipates into the ambient medium. Thermal insulation that covers or surrounds conductors affects the rate of heat dissipation.

(4) Adjacent load-carrying conductors — adjacent conductors have the dual effect of raising the ambient temperature and impeding heat dissipation.

Informational Note No. 2: Refer to 110.14(C) for the temperature limitation of terminations.

(D) Tables General. For explanation of type letters used in the tables of 310.15 and 310.60 and for recognized sizes of conductors for the various conductor insulations, see Table 310.104(A) and Table 310.104(B). For installation requirements, see 310.1 through 310.13(C) and the various articles of this *Code*. For flexible cords, see Table 400.4, Table 400.5(A)(1), and Table 400.5(A)(2).

(E) Ambient Temperature Correction Factors. Ampacities for ambient temperatures other than those specified in the ampacity tables shall be corrected in accordance with the Tables of 310.15(B)(2) or 310.60(B)(4), or shall be permitted to be calculated using the following equation:

[Unedited formula]

where:

I' = ampacity corrected for ambient temperature

I = ampacity shown in the table for Tc and Ta

Tc = temperature rating of conductor (°C)

Ta' = new ambient temperature (°C)

Ta = ambient temperature used in the table (°C)

(F) Engineering Supervision. Under engineering supervision, conductor ampacities shall be permitted to be calculated by using the following general equation:

[Unedited formula]

where:

Tc = conductor temperature (°C)

Ta = ambient temperature (°C)

ΔTd = dielectric loss temperature rise, used only for 2001 through 35,000 volts

Rdc = dc resistance of conductor at temperature Tc

Yc = component ac resistance resulting from skin effect and proximity effect

Rca = effective thermal resistance between conductor and surrounding ambient

Informational Note: The dielectric loss temperature rise (ΔTd) is negligible for single circuit extruded dielectric cables rated below 46 kV.

310.15 Conductors rated 0 through 2,000 Volts.

(A) Ampacities of Conductors Rated 0 through 2000 Volts. Ampacities for conductors shall be permitted to be determined by 310.15(B) Tables, or under engineering supervision as provided in 310.13(F).

(B) Tables. Ampacities for conductors rated 0 through 2000 volts shall be as specified in the Allowable Ampacity Table 310.15(B)(16) through Table 310.15(B)(19), and Ampacity Table 310.15(B)(20) and Table 310.15(B)(21) as modified by 310.13(D) and (E), and 310.15(B)(1) through (B)(6).

The temperature correction and adjustment factors shall be permitted to be applied to the ampacity for the temperature rating of the conductor, if the corrected and adjusted ampacity does not exceed the ampacity for the temperature rating of the termination in accordance with the provisions of 110.14(C).

Informational Note: Table 310.15(B)(16) through Table 310.15(B)(19) are application tables for use in determining conductor sizes on loads calculated in accordance with Article 220. Allowable ampacities result from consideration of one or more of the following:

(1) Temperature compatibility with connected equipment, especially the connection points.

(2) Coordination with circuit and system overcurrent protection.

(3) Compliance with the requirements of product listings or certifications. See 110.3(B).

(4) Preservation of the safety benefits of established industry practices and standardized procedures.

(1) Bare or Covered Conductors. Where bare or covered conductors are installed with insulated conductors, the temperature rating of the bare or covered conductor shall be equal to the lowest temperature rating of the insulated conductors for the purpose of determining ampacity.

(2) Ambient Temperature Correction Factors Tables (a) and (b). Tables for 310.13(E) for 0 through 2000 volt conductors.

Table 310.15(B)(2)(a)

[Content unchanged]

Table 310.15(B)(2)(b)

[Content unchanged]

(3) Adjustment Factors.

(a) *More Than Three Current-Carrying Conductors in a. Raceway or Cable.* Where the number of current-carrying conductors in a raceway or cable exceeds three, or where single conductors or multiconductor cables are installed without maintaining spacing for a continuous length longer than 600 mm (24 in.) and are not installed in raceways, the allowable ampacity of each conductor shall be reduced as shown in Table 310.15(B)(3)(a). Each current-carrying conductor
of a paralleled set of conductors shall be counted as a current-carrying conductor. Where conductors of different systems, as provided in 300.3, are installed in a common raceway or cable, the adjustment factors shown in Table 310.15(B)(3)(a) shall apply only to the number of power and lighting conductors (Articles 210, 215, 220, and 230).

Informational Note No. 1: See Annex B, Table B.310.15(B)(2)(11), for adjustment factors for more than three current-carrying conductors in a raceway or cable with load diversity.

Informational Note No. 2: See 366.23(A) for adjustment factors for conductors in sheet metal auxiliary gutters and 376.22(B) for adjustment factors for conductors in metal wireways.

(1) Where conductors are installed in cable trays, the provisions of 392.80 shall apply.

(2) Adjustment factors shall not apply to conductors in raceways having a length not exceeding
600 mm (24 in.).

(3) Adjustment factors shall not apply to underground conductors entering or leaving an outdoor trench if those conductors have physical protection in the form of rigid metal conduit, intermediate metal conduit, rigid polyvinyl chloride conduit (PVC), or reinforced thermosetting resin conduit (RTRC) having a length not exceeding 3.05 m (10 ft), and if the number of conductors does not exceed four.

(4) Adjustment factors shall not apply to Type AC cable or to Type MC cable under the following conditions:

a. The cables do not have an overall outer jacket.

b. Each cable has not more than three current-carrying conductors.

c. The conductors are 12 AWG copper.

d. Not more than 20 current-carrying conductors are installed without maintaining spacing, are stacked, or are supported on "bridle rings."

(5) An adjustment factor of 60 percent shall be applied to Type AC cable or Type MC cable under the following conditions:

a. The cables do not have an overall outer jacket.

b. The number of current carrying conductors exceeds 20.

c. The cables are stacked or bundled longer that 600 mm (24 in) without spacing being maintained.

[Table 310.15(B)(3)(a) unchanged]

(b) *More Than One Conduit, Tube, or Raceway.* Spacing between conduits, tubing, or raceways shall be maintained.

(c) *Circular Raceways Exposed to Sunlight on Rooftops.* Where conductors or cables are installed in circular raceways exposed to direct sunlight on or above rooftops, the adjustments shown in Table 310.15(B)(3)(c) shall be added to the outdoor temperature to determine the applicable ambient temperature for application of the correction factors in Table 310.15(B)(2)(a) or Table 310.15(B)(2)(b).

Informational Note: One source for the average ambient temperatures in various locations is the ASHRAE *Handbook — Fundamentals*.

[Table 310.15(B)(3)(c) unchanged]

Informational Note to Table 310.15(B)(3)(c): The temperature adders in Table 310.15(B)(3)(c) are based on the results of averaging the ambient temperatures.

(4) Neutral Conductor.

(a) A neutral conductor that carries only the unbalanced current from other conductors of the same circuit shall not be required to be counted when applying the provisions of 310.15(B)(3)(a).

(b) In a 3-wire circuit consisting of two phase conductors and the neutral conductor of a 4-wire, 3-phase, wye-connected system, a common conductor carries approximately the same current as the line-to-neutral load currents of the other conductors and shall be counted when applying the provisions of 310.15(B)(3)(a).

(c) On a 4-wire, 3-phase wye circuit where the major portion of the load consists of nonlinear loads, harmonic currents are present in the neutral conductor; the neutral conductor shall therefore be considered a current-carrying conductor.

(5) Grounding or Bonding Conductor. A grounding or bonding conductor shall not be counted when applying the provisions of 310.15(B)(3)(a).

(6) 120/240-Volt, 3-Wire, Single-Phase Dwelling Services and Feeders. For individual dwelling units of one-family, two-family, and multifamily dwellings, conductors, as listed in Table 310.15(B)(6), shall be permitted as 120/240-volt, 3-wire, single-phase service-entrance conductors, service-lateral conductors, and feeder conductors that serve as the main power feeder to each dwelling unit and are installed in raceway or cable with or without an equipment grounding conductor. For application of this section, the main power feeder shall be the feeder between the main disconnect and the panelboard that supplies, either by branch circuits or by feeders, or both, all loads that are part or associated with the dwelling unit. The feeder conductors to a dwelling unit shall not be required to have an allowable ampacity rating greater than their service-entrance conductors. The grounded conductor shall be permitted to be smaller than the ungrounded conductors, provided the requirements of 215.2, 220.61, and 230.42 are met.

Table 310.15(B)(6)

Tables 310.15(B)(16) through 310.15(B)(21)

310.60 Conductors rated 2001 through 35,000 Volts.

(A) Ampacities of Conductors Rated 2001 through 35,000 Volts. Ampacities for solid dielectric-insulated conductors shall be permitted to be determined by 310.60(B) Tables, or under engineering supervision as~~,~~ provided in 310.13(F).

(B) Tables. Ampacities for conductors rated 2001 through 35,000 volts shall be as specified in Table 310.60(B)(67) through Table 310.60(B)(86) in compliance with 310.60(B)(1), (2), and (3). Ampacities for ambient temperatures other than those specified in the ampacity tables shall be corrected in accordance with 310.13(E).

Informational Note No. 1: For ampacities calculated in accordance with 310.60(A), reference IEEE 835-1994 (IPCEA Pub. No. P-46-426), *Standard Power Cable Ampacity Tables,* and the references therein for availability of all factors and constants.

Informational Note No. 2: Ampacities provided by this section do not take voltage drop into consideration. See 210.19(A), Informational Note No. 4, for branch circuits and 215.2(A), Informational Note No. 2, for feeders.

(1) Grounded Shields. Ampacities shown in Table 310.60(B)(69), Table 310.60(B)(70), Table 310.60(B)(81), and Table 310.60(B)(82) are for cable with shields grounded at one point only. Where shields are grounded at more than one point, ampacities shall be adjusted to take into consideration the heating due to shield currents.

(2) Burial Depth of Underground Circuits. Where the burial depth of direct burial or electrical duct bank circuits is modified from the values shown in a figure or table, ampacities shall be permitted to be modified as indicated in (B)(2)(a) and (B)(2)(b).

(a) Where burial depths are increased in part(s) of an electrical duct run, no decrease in ampacity of the conductors is needed, provided the total length of parts of the duct run increased in depth is less than 25 percent of the total run length.

(b) Where burial depths are deeper than shown in a specific underground ampacity table or figure, an ampacity derating factor of 6 percent per 300-mm (1-ft) increase in depth for all values of rho shall be permitted.

No rating change is needed where the burial depth is decreased.

(3) Electrical Ducts in Figure 310.60. At locations where electrical ducts enter equipment enclosures from under ground, spacing between such ducts, as shown in Figure 310.60, shall be permitted to be reduced without requiring the ampacity of conductors therein to be reduced.

(4) Ambient Temperature Correction Factors Table. Table for 310.13(E) for 2001 through 35,000 volt conductors.

The 310.60(C)(4) table is used as-is, except to correct its title-reference number from (C) to (B).

Table 310.60(B)(4)

The content of **Figure 310.60** is unchanged. The two references to "**(C)**" in the title of Figure 310.60 change to "**(B)**" instead.

The "**(C)**" table title references in Tables 310.60(C)(67) through (86) change to "**(B)**" instead. This is in all the tables. The final parenthetic table number

remains unchanged. IE: "**Table 310.60(C)(4)**" changes to "**Table 310.60(B)(4)**"
The data of the tables (67) through (86) remains unchanged.
Table asterisk * footnote references to "**310.60(C)(4)**" are to be changed to "**310.13(E)**" instead; this is in Tables (67) through (76).

IV. Construction Specifications

[310.104 to the end of Article 310 are unchanged.]

*****

Following is a formatting as a draft with Reasons, Strikethrough, and Underlining

Because of the complexity of this reorganization, an additional type of text has been added to the standard legislative text protocol. The editorial standard of [brackets] in order to add in clarifying text which is not a part of the NEC printing is utilized. Where parts have been moved, the prefix information [within brackets] ahead of the moved part's text has been used, such as:

~~[310.15(A)(1)]~~ [310.13](A) General. To indicate that **[310.15(A)(1)]** is not part of the actual NEC text in the new location, but it is where the relocated part came from, that both the section and the Sub are deleted/changed, that **(1)** is no longer the number, that the new Sub is **(A)** within **310.13**, and that "**General.**" Remains as-is.

Also, explanation for each part's modification is printed above each part, in italics within brackets below asterisks as follows here:

*****

[Explanation]

There is no reproduction of the Tables, Figures, or Formulas here – the data in them is/are unchanged, only some section reference numbers within the titles or footnotes are edited.

Reorganization and Editorial Corrections only of 310

*****

["used in general wiring" was added as editorial clarification of the separation of the subject of this article from the many other specialized conductors addressed in other Code sections, such as raceways, bus bars, and specialty wire conductors. As per the existing title, this article deals with conductors for general wiring.]

Article 310 Conductors for General Wiring

I. General

310.1 Scope. This article covers general requirements for conductors used in general wiring and their type designations, insulations, markings, mechanical strengths, ampacity ratings, and uses. These requirements do not apply to conductors that form an integral part of equipment, such as motors, motor controllers, and similar equipment, or to conductors specifically provided for elsewhere in this *Code*.

Informational Note: For flexible cords and cables, see Article 400. For fixture wires, see Article 402.

*****

[The definitions used in 310 should not be in two places as they are now: 310.2 and 310.60. The Electrical Ducts definition in 310.60 seemed more complete, and the Thermal Resistivity definitions are identical.]

~~[310.60(A)]~~ 310.2 Definitions.

Electrical Ducts. As used in Article 310, electrical ducts shall include any of the electrical conduits recognized in Chapter 3 as suitable for use underground; other raceways round in cross section, listed for underground use, and embedded in earth or concrete.

Thermal Resistivity. As used in this *Code*, the heat transfer capability through a substance by conduction. It is the reciprocal of thermal conductivity and is designated Rho and expressed in the units °C-cm/watt.

*****

[Part II. Installation and all of 310.10 remain unchanged – EXCEPT for an unrelated correction of a table reference error in the 2011 print: in 310.10(E) Ex.No.2(d) " . . . Table 310.~~13~~104(D)."]

II. Installation

310.10 Uses Permitted. The conductors described in 310.104 shall be permitted for use in any of the wiring methods covered in Chapter 3 and as specified in their respective tables or as permitted elsewhere in this *Code*.

Informational Note: Thermoplastic insulation may stiffen at temperatures lower than −10°C (+14°F). Thermoplastic insulation may also be deformed at normal temperatures where subjected to pressure, such as at points of support. Thermoplastic insulation, where used on dc circuits in wet locations, may result in electroendosmosis between the conductor and insulation.

(A) Dry Locations. Insulated conductors and cables used in dry locations shall be any of the types identified in this *Code*.

(B) Dry and Damp Locations. Insulated conductors and cables used in dry and damp locations shall be Types FEP, FEPB, MTW, PFA, RHH, RHW, RHW-2, SA, THHN, THW, THW-2, THHW, THWN, THWN-2, TW, XHH, XHHW, XHHW-2, Z, or ZW.

(C) Wet Locations. Insulated conductors and cables used in wet locations shall comply with one of the following:

(1) Be moisture-impervious metal-sheathed
(2) Be types MTW, RHW, RHW-2, TW, THW, THW-2, THHW, THWN, THWN-2, XHHW, XHHW-2, ZW
(3) Be of a type listed for use in wet locations

(D) Locations Exposed to Direct Sunlight. Insulated conductors or cables used where exposed to direct rays of the sun shall comply with (D)(1) or (D)(2):

(1) Conductors and cables shall be listed, or listed and marked, as being sunlight resistant
(2) Conductors and cables shall be covered with insulating material, such as tape or sleeving, that is listed, or listed and marked, as being sunlight resistant

(E) Shielding. Non-shielded, ozone-resistant insulated conductors with a maximum phase-to-phase voltage of 5000 volts shall be permitted in Type MC cables in industrial establishments
where the conditions of maintenance and supervision ensure that only qualified persons service the installation. For other establishments, solid dielectric insulated conductors operated above 2000 volts in permanent installations shall have ozone-resistant insulation and shall be shielded. All metallic insulation shields shall be connected to a grounding electrode conductor, a grounding busbar, an equipment grounding conductor, or a grounding electrode.

Informational Note: The primary purposes of shielding are to confine the voltage stresses to the insulation, dissipate insulation leakage current, drain off the capacitive charging current, and carry ground-fault current to facilitate operation of ground-fault protective devices in the event of an electrical cable fault.

Exception No. 1: Nonshielded insulated conductors listed by a qualified testing laboratory shall be permitted for use up to 2400 volts under the following conditions:

(a) Conductors shall have insulation resistant to electric discharge and surface tracking, or the insulated conductor(s) shall be covered with a material resistant to ozone, electric discharge, and surface tracking.

(b) Where used in wet locations, the insulated conductor(s) shall have an overall nonmetallic jacket or a continuous metallic sheath.

(c) Insulation and jacket thicknesses shall be in accordance with Table 310.104(D).

Exception No. 2: Nonshielded insulated conductors listed by a qualified testing laboratory shall be permitted for use up to 5000 volts to replace existing nonshielded conductors, on existing equipment in industrial establishments only, under the following conditions:

(a) Where the condition of maintenance and supervision ensures that only qualified personnel install and service the installation.

(b) Conductors shall have insulation resistant to electric discharge and surface tracking, or the insulated conductor(s) shall be covered with a material resistant to ozone, electric discharge, and surface tracking.

(c) Where used in wet locations, the insulated conductor(s) shall have an overall nonmetallic jacket or a continuous metallic sheath.

(d) Insulation and jacket thicknesses shall be in accordance with Table 310.~~13~~104(D).

Informational Note: Relocation or replacement of equipment may not comply with the term *existing* as related to this exception.

Exception No. 3: Where permitted in 310.10(F), Exception No. 2.

(F) Direct-Burial Conductors. Conductors used for direct-burial applications shall be of a type identified for such use.

Cables rated above 2000 volts shall be shielded.

Exception No. 1: Nonshielded multiconductor cables rated 2001–2400 volts shall be permitted if the cable has an overall metallic sheath or armor.

The metallic shield, sheath, or armor shall be connected to a grounding electrode conductor, grounding busbar, or a grounding electrode.

Exception No. 2: Airfield lighting cable used in series circuits that are rated up to 5000 volts and are powered by regulators shall be permitted to be nonshielded.

Informational Note to Exception No. 2: Federal Aviation Administration (FAA) Advisory Circulars (ACs) provide additional practices and methods for airport lighting.

Informational Note No. 1: See 300.5 for installation requirements for conductors rated 600 volts or less.

Informational Note No. 2: See 300.50 for installation requirements for conductors rated over 600 volts.

(G) Corrosive Conditions. Conductors exposed to oils, greases, vapors, gases, fumes, liquids, or other substances having a deleterious effect on the conductor or insulation shall be of a type suitable for the application.

(H) Conductors in Parallel.

(1) General. Aluminum, copper-clad aluminum, or copper conductors, for each phase, polarity, neutral, or grounded circuit shall be permitted to be connected in parallel (electrically joined at both ends) only in sizes 1/0 AWG and larger where installed in accordance with 310.10(H)(2) through (H)(6).

Exception No. 1: Conductors in sizes smaller than 1/0 AWG shall be permitted to be run in parallel to supply control power to indicating instruments, contactors, relays, solenoids, and similar control devices, or for frequencies of 360 Hz and higher, provided all of the following apply:

(a) They are contained within the same raceway or cable.

(b) The ampacity of each individual conductor is sufficient to carry the entire load current shared by the parallel conductors.

(c) The overcurrent protection is such that the ampacity of each individual conductor will not be exceeded if one or more of the parallel conductors become inadvertently disconnected.

Exception No. 2: Under engineering supervision, 2 AWG and 1 AWG grounded neutral conductors shall be permitted to be installed in parallel for existing installations.

Informational Note to Exception No. 2: Exception No. 2 can be used to alleviate overheating of neutral conductors in existing installations due to high content of triplen harmonic currents.

(2) Conductor Characteristics. The paralleled conductors in each phase, polarity, neutral, grounded circuit conductor, equipment grounding conductor,

or equipment bonding jumper shall comply with all of the following:
(1) Be the same length
(2) Consist of the same conductor material
(3) Be the same size in circular mil area
(4) Have the same insulation type
(5) Be terminated in the same manner

(3) Separate Cables or Raceways. Where run in separate cables or raceways, the cables or raceways with conductors shall have the same number of conductors and shall have the same electrical characteristics. Conductors of one phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor shall not be required to have the same physical characteristics as those of another phase, polarity, neutral, grounded circuit conductor, or equipment grounding conductor.

(4) Ampacity Adjustment. Conductors installed in parallel shall comply with the provisions of 310.15(B)(3)(a).

(5) Equipment Grounding Conductors. Where parallel equipment grounding conductors are used, they shall be sized in accordance with 250.122. Sectioned equipment grounding conductors smaller than 1/0 AWG shall be permitted in multiconductor cables in accordance with 310.104, provided the combined circular mil area of the sectioned equipment grounding conductors in each cable complies with 250.122.

(6) Equipment Bonding Jumpers. Where parallel equipment bonding jumpers are installed in raceways, they shall be sized and installed in accordance with 250.102.

*****

[This part name is added to contain all of the ampacity rules. Existing part III. Construction Specifications is changed to part IV. Construction Specifications.]

III. Ampacities for Conductors

*****

[This Section number is added to bring into one section the items general to both the 0 through 2000 and the 2001 through 35,000 volts section items. Texts which apply to both 0 through 2000 and to 2001 through 35,000 volts. are combined and transferred into new A, B, C, D, E, and F below, and placed in the new 310.13, before the individual voltage-group sections: 310.15 and 310.60. This eliminates a full half-page of lines of text.]

310.13 General.

*****

[The specific reference numbers are adjusted to take the relocations into account. Within Info Note 1, "section" becomes "part" because three sections within this new part affect the ampacity.]

~~[310.15(A)(1)]~~ [310.13](A) Tables or Engineering Supervision. Ampacities for conductors shall be permitted to be determined by tables as provided in 310.15~~(B)~~ or 310.60, or under engineering supervision, as provided in ~~310.15(C)~~ 310.13(F).

Informational Note No. 1: Ampacities provided by this ~~section~~ part do not take voltage drop into consideration. See 210.19(A), Informational Note No. 4, for branch circuits and 215.2(A), Informational Note No. 2, for feeders.

Informational Note No. 2: For the allowable ampacities of Type MTW wire, see Table 13.5.1 in NFPA 79-2007, *Electrical Standard for Industrial Machinery*.

*****

[The texts and exceptions of 310.15(A)(2) and 310.60(B)(1) "Selection of Ampacity" say the same thing, but with different syntax/wording. The most recently edited, the body of 310.15(A)(2), and the exception of 310.60(B)(1) are used here. The corresponding Informational Notes are identical, and only one is shown here.]

~~[310.15(A)(2)]~~ [310.13](B) Selection of Ampacity. Where more than one ampacity applies for a given circuit length, the lowest value shall be used.

~~*Exception: Where two different ampacities apply to adjacent portions of a circuit, the higher ampacity shall be permitted to be used beyond the point of transition, a distance equal to 3.0 m (10 ft) or 10 percent of the circuit length figured at the higher ampacity, whichever is less.*~~

~~**310.60(B)(1) Selection of Ampacity.** Where more than one calculated or tabulated ampacity could apply for a given circuit length, the lowest value shall be used.~~

~~[310.60(B)(1)]~~ *Exception: Where two different ampacities apply to adjacent portions of a circuit, the higher ampacity shall be permitted to be used beyond the point of transition, a distance equal to 3.0 m (10 ft) or 10 percent of the circuit length calculated at the higher ampacity, whichever is less.*

Informational Note: See 110.40 for conductor temperature limitations due to termination provisions.

*****

[The single ambient temperature correction factors Table number is removed since there are two within 310.15 and one in 310.60, and all three provide guidance.]

~~[310.15(A)(3)]~~ [310.13](C) Temperature Limitation of Conductors. No conductor shall be used in such a manner that its operating temperature exceeds that designated for the type of insulated conductor involved. In no case shall conductors be associated together in such a way, with respect to type of circuit, the wiring method employed, or the number of conductors, that the limiting temperature of any conductor is exceeded.

Informational Note No. 1: The temperature rating of a conductor [see Table 310.104(A) and Table 310.104(C)] is the maximum temperature, at any location along its length, that the conductor can withstand over a prolonged time period without serious degradation. The allowable ampacity tables, the ampacity tables of Article 310 and the ampacity tables of Informative Annex B, the ambient temperature correction factors ~~in 310.15(B)(2)~~, and the notes to the tables provide guidance for coordinating conductor sizes, types, allowable ampacities, ampacities, ambient temperatures, and number of associated conductors. The principal determinants of operating temperature are as follows:

(1) Ambient temperature — ambient temperature may vary along the conductor length as well as from time to time.

(2) Heat generated internally in the conductor as the result of load current flow, including fundamental and harmonic currents.

(3) The rate at which generated heat dissipates into the ambient medium. Thermal insulation that covers or surrounds conductors affects the rate of heat dissipation.

(4) Adjacent load-carrying conductors — adjacent conductors have the dual effect of raising the ambient temperature and impeding heat dissipation.

Informational Note No. 2: Refer to 110.14(C) for the temperature limitation of terminations.

*****

[The term "Tables" is added in front of "General" for clarity; this general information is about only the tables. The two table sections involved are referenced. 310.15(A)(3) is changed to 310.13(C) to reflect the relocations of 310.15(A)'s paragraphs (1), (2), and (3).]

~~[310.15(B)(1)]~~ [310.13](D) Tables General. For explanation of type letters used in the tables of 310.15 and 310.60 and for recognized sizes of conductors for the various conductor insulations, see Table 310.104(A) and Table 310.104(B). For installation requirements, see 310.1 through 310.13(C) and the various articles of this *Code*. For flexible cords, see Table 400.4, Table 400.5(A)(1), and Table 400.5(A)(2).

*****

[This panel had edited the titles and texts below of both sections for the 2011 cycle. They are functionally the same, but the title of 310.15 and the body of 310.60 seemed best. The formulas are the same, and the "where"s are the same other than 310.60's more clear expression of I in the "where" portion.]

~~[310.15(B)(2)]~~ [310.12](E) Ambient Temperature Correction Factors. ~~Ampacities for ambient temperatures other than those shown in the ampacity tables shall be corrected in accordance with Table 310.15(B)(2)(a) or Table 310.15(B)(2)(b), or shall be permitted to be calculated using the following equation:~~

~~[Unedited formula]~~
~~where:~~
~~*I'* = ampacity corrected for ambient temperature~~
~~*I* = ampacity shown in the tables~~
~~*Tc* = temperature rating of conductor (°C)~~
~~*Ta'* = new ambient temperature (°C)~~
~~*Ta* = ambient temperature used in the table (°C)~~

~~[310.60(C)](4)] Ambient Temperature Correction.~~ Ampacities for ambient temperatures other than those specified in the ampacity tables shall be corrected in accordance with ~~Table 310.60(C)(4)(4)~~ the Tables of 310.15(B)(2) or 310.60(B)(4), or shall be permitted to be calculated using the following equation:

[Unedited formula]
where:
I' = ampacity corrected for ambient temperature
I = ampacity shown in the table for *Tc* and *Ta*
Tc = temperature rating of conductor (°C)
Ta' = new ambient temperature (°C)
Ta = ambient temperature used in the table (°C)

*****

[Again, both 310.15 and 310.60 had been edited for 2011, but are functionally identical other than the "dielectric loss temperature rise" component. This component can simply be ignored for 0-2000 volts, and text to indicate that is added in that line. I do not have the expertise to evaluate if the term should be there at all, since the Info Note seems to say that it does not apply to voltages below 46,000 volts. Unless there are 2001-35,000 volt conductors where it does apply, then perhaps the formula of 310.15(B)(2) and its "where" terms should be used instead.]

~~**[310.15](C) Engineering Supervision.** Under engineering supervision, conductor ampacities shall be permitted to be calculated by means of the following general equation:~~

~~[Unedited formula]~~
~~where:~~
~~*Tc* = conductor temperature in degrees Celsius (°C)~~
~~*Ta* = ambient temperature in degrees Celsius (°C)~~
~~*Rdc* = dc resistance of conductor at temperature *Tc*~~
~~*Yc* = component ac resistance resulting from skin effect and proximity effect~~
~~*Rca* = effective thermal resistance between conductor and surrounding ambient~~

~~[310.60](D)~~ [310.13](F) Engineering Supervision. Under engineering supervision, conductor ampacities shall be permitted to be calculated by using the following general equation:

[Unedited formula]
where:
Tc = conductor temperature (°C)
Ta = ambient temperature (°C)

ΔTd = dielectric loss temperature rise, used only for 2001 through 35,000 volts

Rdc = dc resistance of conductor at temperature *Tc*

Yc = component ac resistance resulting from skin effect and proximity effect

Rca = effective thermal resistance between conductor and surrounding ambient

Informational Note: The dielectric loss temperature rise (ΔTd) is negligible for single circuit extruded dielectric cables rated below 46 kV.

*****

[The Title of 310.15 is left as general for the voltage, and the term "Ampacities is moved to the redone (A) title below it where the rules for ampacity are stated. The ambiguity of the 0-2000 dash and the use of the term "to" elsewhere is resolved by the use of the term "through" in the text locations. An edited copy of 310.60(B) is utilized here as the text source for a simple declarative statement for (A).]

310.15 Conductors rated 0 through 2,000 Volts.

~~[310.15(B)]~~ (A) Ampacities of Conductors Rated 0 through 2000 Volts. Ampacities for ~~solid dielectric-insulated~~ conductors shall be permitted to be determined by ~~tables~~ 310.15(B) Tables, or under engineering supervision ~~;~~ as provided in ~~310.60(C) and (D)~~ 310.13(F).

*****

[The term "to" is changed to "through". 310.15(B)(1) and (2) are moved to 310.13(D) and (E). The number of items in (B) changes from 7 to 6 because of the complete relocation of 310.15(B)(1) to 310.13).]

[310.15](B) Tables. Ampacities for conductors rated 0 ~~to~~ through 2000 volts shall be as specified in the Allowable Ampacity Table 310.15(B)(16) through Table 310.15(B)(19), and Ampacity Table 310.15(B)(20) and Table 310.15(B)(21) as modified by 310.13(D) and (E), and 310.15(B)(1) through (B)~~(7)~~(6).

The temperature correction and adjustment factors shall be permitted to be applied to the ampacity for the temperature rating of the conductor, if the corrected and adjusted ampacity does not exceed the ampacity for the temperature rating of the termination in accordance with the provisions of 110.14(C).

Informational Note: Table 310.15(B)(16) through Table 310.15(B)(19) are application tables for use in determining conductor sizes on loads calculated in accordance with Article 220. Allowable ampacities result from consideration of one or more of the following:

(1) Temperature compatibility with connected equipment, especially the connection points.

(2) Coordination with circuit and system overcurrent protection.

(3) Compliance with the requirements of product listings or certifications. See 110.3(B).

(4) Preservation of the safety benefits of established industry practices and standardized procedures.

*****

[Existing (1) is relocated to 310.13, and (4) is moved to take its place both because it has to do with temperature (as does the last section paragraph above), and because it allows the highly referenced (2) and (3) to remain (2) and (3).]

[310.15(B)~~(4)~~](1) Bare or Covered Conductors. Where bare or covered conductors are installed with insulated conductors, the temperature rating of the bare or covered conductor shall be equal to the lowest temperature rating of the insulated conductors for the purpose of determining ampacity.

*****

[The sub-section title is added for the tables because the main text is now in 310.13(E). The 0 through 2000 volt 310.15(B)(2) tables are used as-is.]

[310.15(B)(3) Content unchanged including both its Tables, (3)(a) and (3)(c).]

(3) Adjustment Factors.

(a) *More Than Three Current-Carrying Conductors in a. Raceway or Cable.* Where the number of current-carrying conductors in a raceway or cable exceeds three, or where single conductors or multiconductor cables are installed without maintaining spacing for a continuous length longer than 600 mm (24 in.) and are not installed in raceways, the allowable ampacity of each conductor shall be reduced as shown in Table 310.15(B)(3)(a). Each current-carrying conductor of a paralleled set of conductors shall be counted as a current-carrying conductor. Where conductors of different systems, as provided in 300.3, are installed in a common raceway or cable, the adjustment factors shown in Table 310.15(B)(3)(a) shall apply only to the number of power and lighting conductors (Articles 210, 215, 220, and 230).

Informational Note No. 1: See Annex B, Table B.310.15(B)(2)(11), for adjustment factors for more than three current-carrying conductors in a raceway or cable with load diversity.

Informational Note No. 2: See 366.23(A) for adjustment factors for conductors in sheet metal auxiliary gutters and 376.22(B) for adjustment factors for conductors in metal wireways.

(1) Where conductors are installed in cable trays, the provisions of 392.80 shall apply.

(2) Adjustment factors shall not apply to conductors in raceways having a length not exceeding
600 mm (24 in.).

(3) Adjustment factors shall not apply to underground conductors entering or leaving an outdoor trench if those conductors have physical protection in the form of rigid metal conduit, intermediate metal conduit, rigid polyvinyl chloride conduit (PVC), or reinforced thermosetting resin conduit (RTRC) having a length not exceeding 3.05 m (10 ft), and if the number of conductors does not exceed four.

(4) Adjustment factors shall not apply to Type AC cable or to Type MC cable under the following conditions:

a. The cables do not have an overall outer jacket.

b. Each cable has not more than three current-carrying conductors.

c. The conductors are 12 AWG copper.

d. Not more than 20 current-carrying conductors are installed without maintaining spacing, are stacked, or are supported on "bridle rings."

(5) An adjustment factor of 60 percent shall be applied to Type AC cable or Type MC cable under the following conditions:

a. The cables do not have an overall outer jacket.

b. The number of current carrying conductors exceeds 20.

c. The cables are stacked or bundled longer that 600 mm (24 in) without spacing being maintained.

[Table 310.15(B)(3)(a) unchanged]

(b) *More Than One Conduit, Tube, or Raceway.* Spacing between conduits, tubing, or raceways shall be maintained.

(c) *Circular Raceways Exposed to Sunlight on Rooftops.* Where conductors or cables are installed in circular raceways exposed to direct sunlight on or above rooftops, the adjustments shown in Table 310.15(B)(3)(c) shall be added to the outdoor temperature to determine the applicable ambient temperature for application of the correction factors in Table 310.15(B)(2)(a) or Table 310.15(B)(2)(b).

Informational Note: One source for the average ambient temperatures in various locations is the ASHRAE *Handbook — Fundamentals*.

[Table 310.15(B)(3)(c) unchanged]

Informational Note to Table 310.15(B)(3)(c): The temperature adders in Table 310.15(B)(3)(c) are based on the results of averaging the ambient temperatures.

*****

~~III.~~ IV. Construction Specifications

[310.104 to the end of Article 310 are unchanged.]

Substantiation: This comment was submitted by a panel 6 task group. The original proposer's recommendations were for both reorganization and changes to the requirements of the Code. We did find that there was basis for reorganizing based basically on reduction of duplicated text. We felt that the requirements changes were not warranted, and/or did not have the required technical substantiation for the change. Great effort and review of this work has taken place by the participating members of the CMP-6 who chose to participate in this task group effort.

Panel Meeting Action: Hold

Panel Statement: Acceptance of the comment would change the text to the point where the panel would have to restudy the entire subject text. It would also propose text that could not be properly handled in the time available to process the report.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

Comment on Affirmative:

LAIDLER, W.: The action to hold this comment was unfortunate considering the effort that went in to the initial proposal and the comment that was the end result of a task group addressing the proposal. Article 310 went through a rewrite in the 2011 cycle that did a great job of organizing the article. Proposal 6-19 showed panel 6 that there is an alternative means to structure this article. The idea of the creation of a new section "III. Ampacities for Conductors" was a great idea. The action to put this comment on hold will allow the panel to have a guideline for future reorganization.

6-10 Log #1042 NEC-P06 **Final Action: Reject**
(310.15)

Submitter: George M. Stolz, II, Quicksilver Electrical Training

Comment on Proposal No: 3-19

Recommendation: Accept the proposal in part regarding using the 2011 text of 310.15(B)(5) and (B)(6) as a platform for elaborating on the definition of a current-carrying conductors as follows:

~~310.15(B)(5) Neutral Conductor.~~ 310.30 Current-Carrying Conductors. Conductors shall be defined as current-carrying conductors for the purposes of ampacity correction as specified in (A) through (C).

(A) Ungrounded Conductors. All ungrounded conductors capable of being energized simultaneously shall be considered current-carrying.

(B) Grounded Conductors.

(1) In a single phase system, if a circuit consists of a single ungrounded conductor and a grounded conductor, the grounded conductor shall be considered current-carrying.

(2) In a single-phase system, if a circuit consists of a pair of ungrounded circuit conductors sharing a common grounded conductor, the grounded conductor shall not be considered current-carrying.

(3) In a 3-phase system, if a circuit consists of one or two ungrounded conductors sharing a common grounded conductor, the conductor shall be considered current-carrying.

(4) In a 3-phase system, if a circuit consists of three ungrounded conductors sharing a common grounded conductor, the grounded conductor shall not be considered current-carrying.

Exception to (4): Where a major portion of the loads are non-linear loads, the grounded conductor shall be considered current-carrying.

~~(a) A neutral conductor that carries only the unbalanced current from other conductors of the same circuit shall not be required to be counted when applying the provisions of 310.15(B)(3)(a).~~

~~(b) In a 3-wire circuit consisting of two phase conductors and the neutral conductor of a 4-wire, 3-phase, wye-connected system, a common conductor carries~~

~~approximately the same current as the line-to-neutral load currents of the other conductors and shall be counted when applying the provisions of 310.15(B)(3)(a).~~

~~(c) On a 4-wire, 3-phase wye circuit where the major portion of the load consists of nonlinear loads, harmonic currents are present in the neutral conductor; the neutral conductor shall therefore be considered a current-carrying conductor.~~

~~310.15(B)(6) Grounding or Bonding Conductor. A grounding or bonding conductor shall not be counted when applying the provisions of 310.15(B)(3)(a).~~

310.30(C) Grounding and Bonding Conductors. All grounding and bonding conductors shall not be considered current-carrying.

Substantiation: This concept was put forth in the original proposal. The existing text is somewhat unclear, as it requires a fundamental understanding of electrical theory and systems in order to understand and comply with the rules.

Before you even start, I agree that this level of understanding should be expected in the field, but two qualified people can have differing views of "unbalanced current." The proposed wording will eliminate all question through simply stating the number of conductors involved and handing the reader a result: Yes, it is "current-carrying" or no, it is not. I have met people who believe that in the scenario outlined in proposed 310.30(B)(1), the grounded conductor is not current-carrying. It happens.

The proposed text uses the existing principles in 310.15(B)(5) and (B)(6) to create a list akin to the format used in 210.5. The main purpose of the list is given in the parent section, "defining current-carrying conductor for the purpose of ampacity correction." Repeating the phrase "when applying the provisions of 310.15(B)(3)(a)" as 2011 does over and over again is unnecessary with the purpose stated clearly in a parent section, and repeating the code reference is not as clear as simply calling an apple an apple. 310.15 is currently a minefield of cross-references that can be safely replaced with words that simply state the concept being addressed.

It is sensible to group the three different types of conductor in the same section, on the same footing, to clearly define when to count and when not to count a conductor as current-carrying.

2011's 310.15(B)(5)(c) is more appropriate as an exception, as it directly contradicts the main rule.

The terms "3-wire" and "4-wire" were discarded as they add little clarity to the rule.

The new section number proposed is coordinated with my comment regarding changing the outline of 310.15 on the whole. By segregating ungrounded, grounded and grounded conductors into separate subsections of a new section, it is easy to determine where to insert changes to these base concepts in the future. Further substantiation was provided in the original proposal, under new sections "310.15(A)".

This section should be located ahead of the 2011's 310.15(B)(3)(a) – informing us what current-carrying conductors are, before telling us what to do with them.

Panel Meeting Action: Reject

Panel Statement: All users of the NEC are expected to have a fundamental understanding of electrical theory and systems. The existing language is descriptive and adequate, and is well understood in the field. If the submitter chooses to resubmit this proposal in the next cycle, it is suggested that he clarify his proposed 310.30(B)(3).

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

Comment on Affirmative:

CLINE, S.: In support of the Panel's action:

Among other problems, Item (B)(2) is false/confusing since this is not the case for a circuit such as those coming from a typical 208/120-Volt Single-Phase dwelling service. The system is single-phase, the source transformer is not.

6-11 Log #1043 NEC-P06 **Final Action: Reject**

(310.15)

Submitter: George M. Stolz, II, Quicksilver Electrical Training

Comment on Proposal No: 6-19

Recommendation: Accept the proposal in principle pertaining to the rewrite and expansion of 310.15(B)(3)(a) as follows:

Retitle Table 310.15(B)(3)(a) to Table 310.52.

Add a line to new Table 310.52 to reduce verbiage in the text of (B)(3)(a):

1-3 conductors = 100% Percent of Values Given in Ampacity Tables

Renumber 310.15(B)(3)(a) to Section 310.32.

Revise the text of 310.15(B)(3)(a) (new section 310.32) as follows:

~~310.15(B)(3) Adjustment Factors.~~

310.32 Number of Current-Carrying Conductors in Proximity.

~~(a) More Than Three Current-Carrying Conductors in a Raceway or Cable.~~

(A) Conductors. ~~Where the number of current-carrying conductors in a raceway or cable exceeds three, or where single conductors or multiconductor cables are installed without maintaining spacing for a continuous length longer than 600 mm (24 in.) and are not installed in raceways, the allowable ampacity of each conductor shall be reduced as shown in Table 310.15(B)(3)(a).~~ Except as specified in (C) through (F), current-carrying conductors inside a raceway or cable shall have their ampacity adjusted according to Table 310.52. Each current-carrying conductor of a paralleled set of conductors shall be counted as a current-carrying conductor.

Where conductors of different systems, as provided in 300.3, are installed in a common raceway or cable, the adjustment factors shown in ~~Table 310.15(B)(3)(a)~~ Table 310.52 shall apply only to the number of power and lighting conductors ~~(Articles 210, 215, 220, and 230)~~.

~~310.15(B)(3)(a)(2)~~ *Exception: Adjustment factors shall not apply to conductors in raceways having a length not exceeding 600 mm (24 in.).*

(B) Cables. Except as specified in (C) through (F), a bundle of single-conductor or multiconductor cables installed without maintaining spacing for a continuous length longer than 600 mm (24 in.) outside of a cable tray shall have the ampacities of their current-carrying conductors adjusted according to Table 310.52. Cables passing through a raceway shall be considered bundled for the purposes of this section.

~~310.15(B)(3)(a)(3)~~ *Exception No. 1: Adjustment factors shall not apply to underground cables entering or leaving an outdoor trench if those conductors have physical protection in the form of rigid metal conduit (RMC), intermediate metal conduit (IMC), rigid polyvinyl chloride conduit (PVC), or reinforced thermosetting resin conduit (RTRC) having a length not exceeding 3.05 m (10 ft), and if the number of current-carrying conductors does not exceed four.*

~~310.15(B)(3)(a)(4), 310.15(B)(3)(a)(5)~~ *Exception No. 2: The following allowances shall be permitted to adjust type AC cables or MC cables without overall outer jackets, where each cable has less than four current-carrying conductors, and the conductors are 12 AWG copper:*

(1) Zero to twenty current-carrying conductors shall not be required to be adjusted.

(2) A 60 percent adjustment factor shall be applied where there are more than 20 current-carrying conductors.

~~310.15(B)(3)(a)(1)~~ 310.30(C) Cable Trays. Conductors and/or cables in cable trays shall be adjusted according to 392.80. ~~Where conductors are installed in cable trays, the provisions of 392.80 shall apply.~~

~~Informational Note No. 2: See 366.23(A) for adjustment factors for conductors in sheet metal auxiliary gutters and 376.22(B) for adjustment factors for conductors in metal wireways.~~

(D) Sheet Metal Auxilliary Gutters. Conductors and/or cables in Sheet Metal Auxiliary Gutters shall be adjusted according to 366.23(A).

(E) Metal Wireways. Conductors and/or cables in Metal Wireways shall be adjusted according to 376.22(B).

(F) Nonmetallic Wireways. Conductors and/or cables in Nonmetallic Wireways shall be adjusted according to 310.30 (A) and/or (B) as applicable.

Substantiation: All language about rules kicking in with "with more than three conductors" is eliminated when you add the first lines to the associated table, "1-3 conductors." This makes the language in the text easier to follow without interruption.

2011's 310.15(B)(3)(a) is complicated enough to warrant it's own section.

Proposed subsection 310.32(A) covers conductors installed inside a cable or raceway in solitude to start – and covers only that. By dividing the similar (but different) concepts that the conductors inside a cable or raceway need derating, and then later covering that cables that are bundled require derating, it makes both concepts easier to understand. The language in this comment varies from what was proposed in that by using the successful "Except as specified in (C) through (F)" language that is also employed in 240.4(D), it becomes clear that (A) and (B) cover most installations, while (C) through (F) make their presence known right up front as exceptions from these two general rules. In the 2011 cycle, items (1) through (4) are not even referenced in the parent text, which leaves the reader confused as to whether (1) through (4) fall in line with the parent text or contradict it. With the proposed language written in positive text given context by the parent section, readers should be far less confused how the machine fits together.

2011's (B)(3)(a)(4), (5) and (6) were changed from exceptions from the 2008 to the 2011 cycle, but little was changed except the italics of the text. These sections are in fact exceptions to the main rule that says these cables must be derated. They should return to being exceptions to proposed 310.32(B). Exceptions also serve to clarify a code rule. For years, the exceptions made it clear that cables bundled together required derating – in 2011 that clarification is lost. If this proposal is accepted, is clarified and reinforced.

The language of proposed Exception #2 to (B) is improved, and puts the "less than four conductors" limitation back to it's 2008 status of pertaining to both 2011 (B)(3)(a)(4) and (5). It was unintentionally lost in 2011. Additionally, the phrase "less than four conductors" replaces "more than three conductors" where it remained, for uniformity.

Proposed 310.32 (D) through (F) are changed from Informational Notes (or omissions) to enforceable "exceptions" or clarifications of what to do with these wiring methods. Control of how these wiring methods are adjusted remain with the CMPs in charge of each wiring method. Also, with the list format given, it is extremely easy for new wiring methods (or new rules for existing wiring methods) to be added as "exceptions" to the normal rules of derating.

The reference in (B)(3)(a) to "(Articles 210, 215, 220, and 230)" was deleted because the style manual directs us not to reference Articles en masse, much less four times. It adds no clarity to "power and lighting conductors."

Panel Meeting Action: Reject

Panel Statement: CMP-6 does not agree that the proposed changes provide added clarity to the code. Certain words might cause confusion, such as "proximity". CMP-6 refers the submitter to the 2011 NEC Style Manual and NFPA Manual of Style. Changing the informational note referring to Article 366.23(A) and 376.22(B) to mandatory text provides a circular reference.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

Comment on Affirmative:

CLINE, S.: In support of the Panel's action:

Among other problems to do with significant violations of the NFPA style directives, the various sub-sections having to do with conductor ampacity of general wiring 0 through 2000-Volt conductors must not be separated into separate sections.

6-12 Log #1044 NEC-P06 **Final Action: Reject**
(310.15)

Submitter: George M. Stolz, II, Quicksilver Electrical Training
Comment on Proposal No: 6-19
Recommendation: Accept the proposal in part. Reorganize the 2011 edition of the NEC as follows:

Part III Ampacity Calculation for Conductors Rated 0 – 2000V
~~310.15(A)(1)~~ 310.14 (Text Unchanged including Informational Notes if existing)
~~310.15(A)(2)~~ 310.16 (Text Unchanged including Informational Notes if existing)
~~310.15(A)(3)~~ 310.18 (Text Unchanged including Informational Notes if existing)
~~310.15(B)~~ 310.20 (Text Unchanged including Informational Notes if existing)
~~310.15(B)(1)~~ 310.22 (Text Unchanged including Informational Notes if existing)
~~310.15(B)(4)~~ 310.24 (Text Unchanged including Informational Notes if existing)
~~310.15(B)(3)(b)~~ 310.26 (Text Unchanged including Informational Notes if existing)
~~310.15(B)(7)~~ 310.28 (Text Unchanged including Informational Notes if existing)
~~310.15(B)(5)~~ 310.30(B) (Text Unchanged including Informational Notes if existing)
~~310.15(B)(6)~~ 310.30(C) (Text Unchanged including Informational Notes if existing)
~~310.15(B)(3)(a)~~ 310.32 (Text Unchanged including Informational Notes if existing)
~~310.15(B)(2)~~ 310.34 (Text Unchanged including Informational Notes if existing)
~~310.15(B)(3)(c)~~ 310.36 (Text Unchanged including Informational Notes if existing)
~~310.15(C)~~ 310.38 (Text Unchanged including Informational Notes if existing)
Part IV. Tables

~~Table 310.15(B)(20)~~ Table 310.64
~~Table 310.15(B)(21)~~ Table 310.65
Part V. Conductors Rated 2001 – 35,000 Volts
(Remainder of Article Unchanged)

Substantiation: Essentially, this is the same outline proposed by the original proposal, going a step further in eliminating the need for all subsections. Similar concepts have been grouped, and the Tables have been grouped and moved to their own Part. While some effort was placed in grouping similar concepts, that has taken a backseat to what I believe should be the primary first step – getting this one section spread out to several, to ease the editing process, both for myself and for future cycles. It is not absolutely critical that like concepts be grouped at this time; I believe the first step is fanning out the existing text first. Every "new" section shown is essentially a standalone concept that can easily hold it's own as a section.

In response to the Chair's objection to having a separate Part for Tables, I would ask that the Panel locate "Section 310.15(B)(16)" for me and read it aloud. 2011 NEC section 310.15 (parent) references all these Tables within the same sentence, leaving the reader to make their own determination as to which Table best fits their installation. 2011 NEC 310.15(B)(2) expects the reader to select the correct Table based upon their selection of Tables 16 – 21. Getting the tables out of the text is a great benefit to the reader, and arguably does not even violate the Manual of Style 2.3.1 per se.

More than half the problem with the coherence of this section are the tables interrupting all over the place! As I see it, if a person is trying to better understand how to use the tables, they are going to read and understand the text first, and then go to the Tables to work examples. You don't necessarily need to refer to the text while you are making use of the tables, and it would be helpful if they were grouped together as well. Just looking at the 2014 ROP Draft is proof that the tables greatly impair legibility.

By placing the first Table at 310.50 (per MOS 2.4.2.1), ample room prior to 310.50 is provided for future expansion of text in Part III. By placing the first Ampacity Table at 310.60, there is room for more Correction Tables to be added without disrupting the pattern. Also, "310.60" is much friendlier on the tongue than "310.15(B)(16)." The term "310.60" is also phonetically similar to "310.16". The suggested alternative of verbally calling it "Ampacity Table 16" regardless of it's true name is not very reasonable in a class setting, and illustrates the problem very well – we shouldn't have to call it something else because the TCC had a lapse.

By spacing the existing rules mostly to even-numbered sections, there is ample room for future expansion of these rules while avoiding the "super sub-section effect" that has pervaded this portion of the code for many cycles, and gotten less intuitive with each cycle.

I hope the panel will consider this proposal the first and most important step in bringing clarity to the core of the NEC. This comment serves as the outline for section-number selections of other more specific comments on this proposal.

An example has been provided with this comment, using 2011 text with the proposed section numbers. It does not feature many corrected references within the text itself.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: The table references do not refer back to the section language. Code users must choose the correct ampacity table based on the conditions of use.

CMP-6 agrees that the table and language formatting is difficult to follow in some cases and requests that the tables be grouped more logically.

Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
CLINE, S.: In support of the Panel's action:
I can't read it to him aloud as requested by the submitter, but I can point it out: "310.15(B) Tables. Ampacities for conductors rated 0 to 2000 volts shall be as specified in the Allowable Ampacity Table 310.15(B)(16) through Table 310.15(B)(19), and... ". A section may refer to more than one table, and therefore the tables must have their own numbers as a subset of the section number. The 2008 NEC table suffix numbering was utilized to aid users in the transition to the corrected format. There was no lapse by the TCC nor by the CMP; the submitter needs to study and follow the NFPA style directives. The submitter should understand that the "grouping" we speak of has to do with the table's page layout location relative to the section, not the numbering.

6-13 Log #1046 NEC-P06 **Final Action: Reject**
(310.15)

Submitter: George M. Stolz, II, Quicksilver Electrical Training
Comment on Proposal No: 6-51
Recommendation: The proposal should have been accepted.
Substantiation: Simply put, residential load diversity should not be addressed by manipulating conductor sizing in Article 310, it should be handled in Article 220 when calculating the load. The entire premise of the section is flawed, which means that if the section remains then CMP-6 will be harassed about it forever. This proposal and it's companions should have been accepted.

The panel's action in proposal 6-49a still has an additional fundamental problem. Conductors connected to circuit breakers are required to be sized to 125% of the continuous load in order for the conductor to draw heat away from the breaker as a heat sink. By the panel's action, undersized conductors are still allowed to be connected to overcurrent devices. By accepting this proposal and leaning on CMP-2 to accept a load diversity factor in lieu of 310.15(B)(7), this basic problem is averted while meeting the intentions of CMP-6. It is the right way to put this issue to bed, forever.

Panel Meeting Action: Reject
Panel Statement: Technical substantiation was not provided to justify the deletion of the allowances of 310.15(B)(7) and Table 310.15(B)(7).

The submitter has not provided any technical substantiation that the existing text would allow undersized conductors.

Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
CLINE, S.: In support of the Panel's action:
Stating that "The entire premise of the section is flawed, " without any evidence or justification is a waste of everyone's time. The basis for this allowance was well established when this section was first adopted. It has been a successful practice for decades. Could it be a load adjustment rather than an ampacity adjustment? Certainly. Would it be better for CMP-2 to "be harassed about it forever"? Perhaps.

But for that to happen, joint-action Proposals would have to be submitted to both CMP-2 and CMP-6, with full and accurate suggested text, clearly and correctly stating the equivalent existing technical allowance in the relocated format. Both panels would have to accept, and the CC would have to agree.

6-14 Log #1057 NEC-P06 **Final Action: Accept in Part**
(310.15)

Submitter: George M. Stolz, II, Quicksilver Electrical Training
Comment on Proposal No: 6-19
Recommendation: Revise text to read as follows:
~~310.15(B)(3)(b)~~ 310.26 ~~More Than One Conduit, Tube, or~~ Raceway Spacing. Spacing between ~~conduits, tubing, or~~ raceways shall be maintained.
Substantiation: In response to the Chair's objection: "The changes made in 310.14(F) are neither accurate nor acceptable. Conduits and tubing are only two of the many types of raceways. There is no substantiation to support

adding all other raceways to this requirement."

All raceways are currently bound by this requirement. It says, "Spacing between conduits, tubing OR RACEWAYS shall be maintained." Unless the text is supposed to ensure spacing between different types of wiring methods exclusively (i.e. Space EMT from FMC, Space FMT from IMC), then the Chair's statement is inaccurate.

Conduits and tubing are types of raceways, the 2011 sentence structure is redundant, and unnecessarily confusing.

Cables are permitted to be bundled without spacing, we are given instructions on what we must do if we bundle them. This sub-sub-section is prohibiting raceways from being bundled.

Panel Meeting Action: Accept in Part

Revise text to read as follows:

310.15(B)(3)(b) Raceway Spacing. Spacing between raceways shall be maintained.

Panel Statement: CMP-6 accepts the submitter's text but rejects the renumbering.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

Comment on Affirmative:

CLINE, S.: In support of the Panel's action:

The reason for my comment was due to the inaccurate presentation of the existing text of 310.15(B)(3)(b) in the Proposal. The submitter's incorrect portrayal of the 2011 text (below) indicated that "Conduit" was to change to "Raceway" - not all raceways are conduits. The body of the text was acceptable, but the title was not.

~~"310.15(B)(3)(b)~~ (F) ~~Conduit~~ Raceway Spacing. Spacing between ~~conduits, tubing, or~~ raceways shall be maintained."

6-14a Log #CC600 NEC-P06 **Final Action: Accept**
(Table 310.15(B)(3)(c))

Submitter: Code-Making Panel 6,

Comment on Proposal No: 6-29

Recommendation: Reject Proposal 6-29.

Substantiation: Due to what appears to be conflicting data presented, and the panel's request to the Correlating Committee to assemble an independent Task Group to review the Ambient Temperature Adjustment Table, 310.15(B)(2)(a), the panel revises its action on Proposal 6-29 from "Accept in Principle in Part" to "REJECT". Thus, Table 310.15(B)(3)(c) shall revert to the NEC 2011 values. This is an effort to respond to all comments on this issue. The panel is unable to come to a decision to revise the values of Table 310.15(B)(3)(c) and looks forward to the independent task group's findings concerning the need for Table 310.15(B)(3)(c), "Ambient Temperature Adjustment for Raceways or Cables Exposed to Sunlight on or Above Rooftops" and whether CMP-6 acted correctly upon past substantiation. CMP-6 requests that the task group evaluate the need for and the values in Tables 310.15(B)(2)(a), (2)(b) and (3)(c).

Panel Meeting Action: Accept

Number Eligible to Vote: 10

Ballot Results: Affirmative: 8 Negative: 1 Abstain: 1

Explanation of Negative:

ZIMNOCH, J.: Limited parameters were presented to understand the context of "what appears to be conflicting data presented" to the panel. The original studies and the UL Fact-Finding Study that supports Proposal 6-29 was sponsored and monitored by nine wire and cable manufacturers. None of the manufacturers found any problems with the results of the study. The addendum to the original Fact-Finding Study performed by UL showed the maximum temperature rise above outdoor ambient for all wiring systems mounted 36 inches above the roof with a 95 % confidence interval is 46.2 F and the maximum temperature rise above outdoor ambient for all wiring systems mounted 60 inches above the roof with a 95 % confidence interval is 40.6 F.

1. Only 1 size of cables (#6) was tested using two insulations. Other insulations and wire types were not considered.
2. Tests were indoors and not related to real world.
3. Were oven tests on a mandrill, not real installation conditions
4. Tests were at continuous temperature, not daily temperature cycles, thus not heating and cooling at frequent intervals
5. The testing was performed in free air, not conduits in sunlight
6. Testing does not consider friction from expansion and contraction due to heating and cooling. In a larger sense, wear and tear due to expansion and contraction has more of an effect than simply temperature, and was not considered in the testing.
7. Code is written for all cables in all sizes. This test was not comprehensive and thorough
8. The concluding statement was very specifically worded "XHHW sample can better withstand the 212 C temperatures for a 60 day period." Electrical equipment is expected to last 40 years or more.
9. Thermoset insulation is not the only way to make XHHW; for example, XHHW-2 can be made with EPR rubber.
10. The UL letter is not a Fact Finding and has little meaning

The UL letter specifically states: UL Verification Services did not select the samples, determine whether the samples were representative of production samples, witness the production of the test samples, nor were we provided with information relative to the formulation or identification of component materials used in the test samples. The test results apply only to the actual samples tested.

11. UL is basically not certifying anything other than that a report of the testing was submitted by General Cable
12. The test report and UL letter were not reviewed or available to the public. Both the report and letter are dated in the Fall of 2012. They were not available for Public Comment.
13. Based on the above, this Comment should be rejected. The report and letter are non-persuasive, and have no relevance to real cables installed in sunlight directly or in conduit, which was the subject of a UL Fact Finding.

Explanation of Abstention:

PICARD, P.: The Aluminum Association could not reach consensus.

Comment on Affirmative:

HUDDLESTON, JR., R.: The Panel is correct that there is conflicting data from various reports on temperatures inside of circular raceways. Also of concern is the evidence presented to the Panel that wiring installed for many years on rooftops is not failing. This Panel Member looks forward to the results from the Independent Task Groups findings so that this issue can be put to rest.

KENT, G.: With little doubt, all studies review show an increase in the temperature inside the conduit. A further study reviewed at the Comment meeting revealed the lack of damage to an XHHW-2 conductors at extreme heat. None of the studies reflect damage to wiring, in fact just the opposite for at least two studies, which show no damage to wire. It would seem the studies indicate the need for a study to determine if our correction requirements for ambient temperature need to be altered or in some situations eliminated altogether. Today's technology in insulation design is without a doubt much further advanced than this table which had not changed in the NEC since at least the 1971 edition which is the oldest I have that actually has the table. I do not find this table in my 1953 edition.

STACEY, J.: Although it is our position that 310.15(B)(3)(c) be deleted in its entirety, it appears unlikely that the panel will agree. Therefore we are voting to accept this panel comment and await the findings of the requested review. See comment 6-16.

WALL, C.: I concur with the panel to reject Proposal 6-29. Different wiring systems exposed to solar radiation heat differently; however, the fact finding report combined the various systems together. Reports submitted during the cycle related to this one subject contain useful information but seemingly contradict one another. I believe that the sum of the reports is too limited to make a decision. Since the NEC is a truly an international code, it must provide allowances for application worldwide without being burdensome. The independent task group should:

1. In the absence of data showing failures of conductors on rooftops, consider whether adjustments for solar heating are indicated.
2. If solar heating is found to be a factor, the solar heating adjustments should be based on actual geographic location and not based on one worst case location.
3. Cables, cables in cable trays and raceways exposed to the sun heat differently and should be afforded this variance rather than being lumped into one category based on a "worst case" approach.
4. Consider providing options for solar heating calculations.

6-15 Log #588 NEC-P06 **Final Action: Reject**
(Table 310.15(B)(3)(a) and 310.15(B)(X))

Submitter: James F. Williams, Fairmont, WV

Comment on Proposal No: 6-40

Recommendation: Revise text to read as follows:

Table 310.15(B)(3)(a) Adjustment Factors for More Than Three Current-Carrying Conductors in a Raceway or Cable

Number of conductors is the total number of conductors in the raceway or cable, including spare conductors. The count shall be adjusted in accordance with 310.15(B)(5), ~~and~~ (6), and (X). ~~and shall not include conductors that are connected to electrical components but that cannot be simultaneously energized.~~ **[ROP 6–40]**

310.15(B)(X) Diversity. When two or more conductors cannot be simultaneously energized due to the nature of the circuit, only the maximum number of simultaneously energized shall be considered current-carrying conductors.

Informational note: The two conductors used as travelers between 3-way and 4-way switches count as one current-carrying conductor under this rule.

Substantiation: The concept of not including all the conductors in a group where not all are simultaneously energized (e.g.: 3-way travelers) is important enough that it should be in the main text, not buried in the text following a table. The ideal location would be 310.15(B)(7), and shift the present (7) to (8).

If 310.15(B)(7) is moved to 310.15(B)(8) the following references would need to be fixed: 110.14(C)(1)

Panel Meeting Action: Reject

Panel Statement: The submitter's additional text to the table does not add clarity.

CMP-6 does not agree with the submitter's text of 310.15(B)(X) Diversity as it is not accurate or substantiated.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

6-16 Log #825 NEC-P06 **Final Action: Reject**
(310.15(B)(3)(c) and Table 310.15(B)(3)(c))

Submitter: Robert Huddleston, American Chemistry Council
Comment on Proposal No: 6-18
Recommendation: Delete Section 310.15(3)(2)(c) and Table 310.15(8)(3)(c).
Substantiation: This proposal should have been accepted by the Panel. See the "Rooftop Wiring Study" which has been provided to the Panel for their edification and knowledge. This study clearly shows that wiring installed in raceways on rooftops is NOT being damaged by heat from the sun, and that ambient temperature correction that has always been utilized (Table 310.15(8)(2)(a)) is sufficient to ensure safe, long-life installations.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Technical substantiation has been provided during the 2008 and 2011 NEC code cycles to support the ambient adjustment factors to conduit exposed to sunlight on rooftops. The original testing and a subsequent Underwriters Laboratories Fact-Finding Report has been accepted by the panel. CMP-6 requests the Correlating Committee appoint a task group to review the basis for ambient temperature correction factors.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 6 Negative: 3 Abstain: 1
Explanation of Negative:
HUDDLESTON, JR., R.: The Comment should have been accepted by the Panel. The substantiation for rejecting this Comment conflicts with the Panel Comment for 6-14a which points out the conflicting temperature data from the various studies and that the Panel may have accepted data in the past that may not have been correct. The Rooftop Wiring Study and other evidence presented to the Panel provided substantial real data that rooftop wiring is not being damaged by exposure to sunlight-heated conduits.
STACEY, J.: This proposal should have been accepted. Evidence was submitted by multiple commenters indicating that this additional temperature adder for wiring on rooftops is unnecessary. Long term installations of wiring on rooftops all over the country have proven for decades that the short term exposure of wiring to the effects of direct sunlight has no appreciable effect on the longevity or durability of conductors. The reason for this has been explained many times by several engineers on CMP-6, with evidence previously submitted from IEEE, ICEA and NEMA documents indicating that conductors are designed and manufactured to withstand high operating temperatures for short periods of time (such as those experienced on rooftops during a few hours a day a few days a year) with no detrimental effect. In addition, the Southern Nevada Chapter of IAEI performed testing proving that the adders presently in the Code are far too high to be realistic. The requirement in Section 310.15(B)(3)(c) increases cost with no benefit to the safety of people or the protection of equipment, and this requirement should be removed in its entirety.
WALL, C.: Panel action on comment 6-14a casts doubt on the 2008 technical substantiation referenced. Based on the data provided by the submitter, other reports available to the panel, and panel's request for appointment of a task group to review the basis for ambient temperature correction factors, I believe this comment should be accepted. Also see my explanation on comment 6-14a.
Explanation of Abstention:

Recommendation: Delete Section 310.15(B)(3)(c) and Table 310.15(B)(3)(c).
Substantiation: This proposal should have been accepted by the Panel. See the "Rooftop Wiring Study" which has been provided to the Panel for their edification and knowledge. This study clearly shows that wiring installed in raceways on rooftops is NOT being damaged by heat from the sun, and that ambient temperature correction that has always been utilized (Table 310.15(8)(2)(a)) is sufficient to ensure safe, long-life installations.
Note: Supporting material is available for review at NFPA Headquarters.

PICARD, P.: The Aluminum Association could not reach consensus.

6-23 Log #832 NEC-P06 **Final Action: Accept in Principle**
(310.15(B)(3)(c) and Table 310.15(B)(3)(c))

Submitter: Robert Huddleston, American Chemistry Council
Comment on Proposal No: 6-62
Recommendation: Accept proposal 6-62 as worded by the author.
Substantiation: This proposal should have been accepted by the Panel. Currently, the ampacity for bus bars is found under Article 366 (Auxiliary Gutters) in section 366.23 which is titled "Ampacity of Conductors". It is also referenced in Article 669 (Electroplating). While bus bars are not technically "conductors for general wiring", it would seem that their ampacity calculation would fit much better under Article 310 than Article 366. As the NEC attempts to make corrections and revisions that are (1) easier to use, and (2) easier to find the information that is being sought, it is obviously a much better place in the Code to have bus bar ampacity information in Article 310 rather than buried in Article 366. <u>No one</u> would readily think to look for this information in an Article titled "Auxiliary Gutters".
Panel Meeting Action: Accept in Principle
Revise informational note 2 in 310.15(B)(3)(a) to read as follows:
Informational Note No. 2: See 366.23(A) for adjustment factors for conductors and ampacity for bare copper and aluminum bars in sheet metal auxiliary gutters, and 376.22(B) for adjustment factors for conductors in metal wireways.
Panel Statement: CMP-6 notes that the submitter intended to refer to 310.15(B)(8).
CMP-6 does not agree to relocate the text as requested by the submitter. However, CMP-6 sees the difficulty of locating the requirement and revises an informational note to direct the user to 366.23(A). The change meets the submitter's intent.
As a convenience to the user, CMP-6 requests a reference to 366.23 for busbar ampacity be placed in the index.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

6-24 Log #854 NEC-P06 **Final Action: Reject**
(Table 310.15(B)(3)(c))

Submitter: Travis Lindsey, Travis Lindsey Consulting Services
Comment on Proposal No: 6-29
Recommendation: Revise the last line in the table as shown with panel actions included:
~~Greater than 300 mm (12 in.) 900 mm (36 in.) 14 C 25F~~
<u>Greater than 900 mm (12 in.)-4500 mm (60 in.) 22 C 40F</u>
Substantiation: In review of proposal 6-29, the committee chose to limit temperatures for wiring located above t2 inches to previous values. Ongoing research was conducted
subsequent to the submission of proposal 6-29. This research was the subject of an addendum to the original Fact Finding Investigation by Underwriters Laboratories. This investigation indicated that the maximum temperature rise above outdoor ambient for all wiring systems mounted 36 inches above the roof with a 95 % confidence interval would be 46.2 F and the maximum temperature rise above outdoor ambient for all wiring systems mounted 60 inches above the roof with a 95 % confidence interval would be 40.6 F.
The subject Fact Finding Report Investigation Part II is included with this comment for review.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: CMP-6 notes conflicting reports presented to the panel. CMP-6 finds variations in the results of the tests. Refer to the data to Comment 6-34.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 8 Negative: 2
Explanation of Negative:
XERRI, M.: Subsequent to the committee meeting and after reviewing the information provided I have the following comments:
Code panel 6 reject panel comment 6-24 stating "CMP-6 notes conflicting reports presented to the panel. CMP-6 finds variations in the results of the tests. Refer to the data to Comment 6-34". The conflicting data referred to in the panels' response is that the data provided by Travis Lindsey by way of the UL fact finding report did not correlate with the data provided by Howard Herndon from his Roof top study.
I have the following comments:
Correlating data between 2 laboratories where you can control the environment, the test set up, etc. can at times be challenging. Correlating data between two studies where several variables exist can be very difficult and should not be expected.
1. In the Howard Herndon report ½ EMT was tested. The UL Fact finding Reports of 2010 and 2011 did not test this size EMT. UL tested ¾ EMT at one (1) foot above the roof. However, this testing was conducted with a white colored roof. The UL report noted that from the testing experiences, "…as wiring systems are mounted further from the roof, solar reflection off the roof becomes more of an influencing factor than the solar absorption by the roof." Therefore, a white roof would likely have produced hotter temperatures. From the pictures provided with the Herndon report, the roof did appear to be darker than the one used with the UL fact Finding report which would reflect less heat back up to the EMT resulting in lower temperature measurements.
2. In the UL fact Finding Report, 17 different conduit and cable systems were tested. From the data, larger conduits and dark color cable tended to produce the maximum temperature differentials. Based on this, one could infer that ½ EMT, although not tested by UL, would be expected to produce a lesser temperature differential than the other 17 systems that UL had tested.
3. In the UL Fact Finding report, solar irradiance was measured and recorded. This data was not provided with the Herndon report. The UL Fact Finding report noted that because of the variable weather conditions during the time period of August - September 2012 in the Las Vegas area, only three days were found where the solar irradiance was greater than or equal to 1000 W/m2 for an extended period of time, and even on those three days, the time period those days where that solar irradiance exceeded 1000 W/m2 was only for about one hour. On some very hot days solar irradiance can exceed 1000 W/m2 for three or more hours.
4. Other variables that could affect correlation of data include shading differences and air flow(winds).
Although the data from both these studies do not correlate, that does not mean that the data is wrong from either report. If you want to get correlating data from different locations or different roof tops, you need to control the variables.
ZIMNOCH, J.: See Comment 6-14a.
Comment on Affirmative:
STACEY, J.: This proposal was correctly rejected, but the reason should have been the deletion of this entire section and associated table. See my comment on 6-16.

6-25 Log #874 NEC-P06 **Final Action: Accept**
(Table 310.15(B)(3)(c))

TCC Action: Based on the Panel action on Comment 6-14a, to Reject Proposal 6-29, the Correlating Committee directs this Comment be reported as "Accept."
Submitter: C. Douglas White, Center Point Energy / Rep. Edison Electric Institute/Electric Light & Power Group
Comment on Proposal No: 6-29
Recommendation: Reject proposal 6-29.
Substantiation: 1. The application of the findings in the UL *Fact-Finding Report on Ambient Temperature Adjustment for Raceway and Cable Systems Exposed to Sunlight on Rooftops* (File IN16969) to all locations where the NEC is adopted is flawed. The proposed change for the "On Roof" temperature adder for cables was determined from tests performed in Las Vegas. The sun's rays strike roofs at smaller angles the further a location is from the equator, causing less heating of the roof. For example, the sun's rays striking a roof in Alaska occurs at a much smaller angle than Las Vegas. Thus the "On Roof" temperature adder for Las Vegas would not be justified for Alaska. The fact finding report erroneously extends these solar radiation heating effects to all locations in the United States without verification. Additionally, by inclusion of the requirements in the NEC, the requirement would erroneously be extended to all locations where the NEC is adopted or used. The NEC is an international standard that has been adopted in Mexico, Columbia, Costa Rica, Venezuela, Panama, and Ecuador and has been translated into Korean, Thai, and Japanese, suggesting use in these locations. The fact finding report did not justify application of the findings to all these locations.

2. The fact finding report considered cable systems on a black roof, and did not consider cable systems on a white roof. Similarly, it considered cable systems above a white roof and did not consider cable systems above a black roof. According to page 11 of the report, this was done to account for additional heating. The cable systems on a white roof would experience less heating than those on a black roof because the white roof reflects the sun. Similarly, when cable systems are above a black roof the cable systems would experience less heating than those above a white roof because the black roof does not reflect the sun onto the cable system the same as a white roof does. Cable systems should only be required to be designed for actual conditions.

3. The testing was performed with a flat roof surface, horizontal to the earth's surface. It did not consider that some roof surfaces are inclined away from the sun, thus would have less heating due to the smaller angle at which the sun's rays strike the roof.

4. The data presented on page 17 of the UL report to justify a 60 degree adder indicates that many of the cable types "On Roof" were much less than 60 degrees higher (the suggested adder). More than 50% of the cable types were 50 degrees Fahrenheit difference or less. Some were less than 40 degrees Fahrenheit difference. The proposed change would require the de-rating of cable systems more than necessary, at considerable expense.

5. Similarly, over 61% of the cable system types "Above the Roof" had no more than a 40 degree Fahrenheit temperature rise; 72% had no more than a 41 degree rise, whereas the UL report was used to propose a temperature adder of 50 degrees Fahrenheit, requiring more de-rating of cable systems than justified. These 72% of the cable systems have a high probability of being adequately rated with the current 40 degree Fahrenheit adder.

6. There have not been any submissions of data of failures of cable systems on roofs.

7. No options for reducing the cable heating by such means as shading wiring systems on or above roofs were considered in the fact finding report.

These concerns warrant rejection of proposal 6-29.
Panel Meeting Action: Reject
Panel Statement: Adequate evidence has not been provided by the submitter to substantiate this change.

CMP-6 is looking at worst case data for rise of ambient temperature. In other areas of the world, ambient correction factors would apply. The installer is still able to perform his own calculations in accordance with 310.15(C).

An installation in a shaded area is not in direct sunlight and would not apply.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 6 Negative: 3 Abstain: 1
Explanation of Negative:

HUDDLESTON, JR., R.: Panel's substantiation for rejecting this comment did not address the submitter's Comment substantiation.

STACEY, J.: The panel should have accepted this comment and rejected proposal 6-29. The values requested by the Copper Development Association have been proven to be artificially elevated by the test methods employed. The Southern Nevada Chapter of IAEI testing proves that the temperatures experienced inside wiring methods on rooftops during sunlight exposure do not even come close to those "measured" in the backyard testing performed by the Copper conductor manufacturers. The panel statement was inadequate and shows that the panel did not even attempt to address the majority of the submitter's substantiation, particularly point 6 - there have been no failed conductors due to sunlight exposure on rooftops.

WALL, C.: The panel is overlooking the fact that solar heating of conductors on rooftops in other areas of the world could be significantly less than the solar heating recorded in Las Vegas and is not accounted for by selecting the ambient temperature for that location. Panel action on comment 6-14a accomplished what the submitter of this comment desired.
Explanation of Abstention:

PICARD, P.: The Aluminum Association could not reach consensus.

6-26 Log #973 NEC-P06 **Final Action: Reject**
(Table 310.15(B)(3)(c))

Submitter: David Brender, Copper Development Assn. Inc.
Comment on Proposal No: 6-29
Recommendation: Revise text to read as follows:
~~Greater than 300 mm (12 in.) 900 mm 14C 25F~~
Greater than 300 mm (12 in.) - 1500 mm (60 in.) 22C 40F
Note: There is an error in the NEC Draft.
Substantiation: UL has performed Fact Finding investigation subsequent to the submission of the original proposal and the Panel ROP meeting. The new Fact Finding report is dated September 25, 2012. The findings were that a temperature adder of 46.2 degrees F applies to all wiring methods mounted 36 inches above the roof and 40.6 degrees F for wiring systems mounted 1500 mm (60 inches) above the roof, both with a 95% confidence interval at 1000 w/m2 solar irradiance. (Note that there is a mistake in the Draft of the 2014 NEC inconsistent with Panel actions at the ROC meeting.)
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: CMP-6 notes conflicting reports presented to the panel. CMP-6 finds variations in the results of the tests. Refer to the data of Comment 6-34.

CMP-6 disagrees with the submitter of an error for the greater than 300 mm values between the proposal action and the A2013 ROP Draft. Values for greater than 300 mm are to remain unchanged from 2011 NEC.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:

ZIMNOCH, J.: See Comment 6-14a.
Comment on Affirmative:

STACEY, J.: See comment on 6-24.

6-27 Log #1113 NEC-P06 **Final Action: Accept**
(310.15(B)(3)(c) and Table 310.15(B)(3)(c))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 6-28
Recommendation: Continue to Reject the Proposal.
Substantiation: The Panel was correct in rejecting the proposal to delete Section 310.15(B)(3)(c) and Table 310.15(B)(3)(c). The requirement was added to the 2008 NEC after very significant documentation was provided that shows excessive temperatures in raceways that are exposed to direct sunlight.

The submitter of this proposal does not provide any evidence to refute the vast amount of data that proves the increased temperatures exist.

Elevated temperature is the major enemy of electrical safety. We take steps in several requirements in the NEC to reduce or manage this enemy. The science proven in the documentation for elevated temperatures in raceways on rooftops that are exposed to sunlight must be accepted.
Panel Meeting Action: Accept
Panel Statement: CMP-6 does not necessarily agree with all of the submitter's substantiation to the comment.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 7 Negative: 2 Abstain: 1
Explanation of Negative:

HUDDLESTON, JR., R.: I agree with the Panel Statement - the substantiation for the Comment is not correct. However, this Comment should have been rejected and the original Proposal accepted.

STACEY, J.: This submitter is a paid consultant for the Copper Development Association (who he represents on CMP-5.) His comments about the "vast amounts of data" refer to unrealistic simulation testing performed in a backyard in Las Vegas by the organization that is paying him. The CDA also paid UL to come in and witness this same unrealistic testing in the same backyard, generating the report from UL. See comment on 6-16.
Explanation of Abstention:

PICARD, P.: The Aluminum Association could not reach consensus.

6-28 Log #1114 NEC-P06 **Final Action: Reject**
(310.15(B)(3)(c) and Table 310.15(B)(3)(c))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 6-29
Recommendation: The Proposal should continue to be accepted in principle by incorporating the changes made in Proposal 6-31. Accept the values proposed to be added to the ambient temperature due to sunlight exposure.
Substantiation: The values to be added to the ambient temperature due to the raceway or cable having direct exposure to the sun have been determined through a Fact-Finding Report from Underwriters Laboratories. The Report should not be ignored or discounted but should be accepted as factual.

The requirement was added to the 2008 NEC after very significant documentation was provided that shows excessive temperatures in raceways that are exposed to direct sunlight. Every journeyman electrician knows better than with bare hands to pick up a piece of metal conduit that has been exposed to the sun for any length of time. The conduit gets much hotter than the ambient air temperature.

The requirement from UL that the raceways be plugged with cotton makes the test realistic to real-world installations. When raceways are installed for other than physical protection for cables, the raceways are installed complete from enclosure-to-enclosure. They are not installed in any manner to facilitate airflow through the raceway.

The Panel should not be looking for failures (aka body counts) to accept the science contained in the Fact-Finding Report. The science should be accepted as factual and the proposal accepted to prevent insulated conductor failure due to elevated operating temperatures.

This Comment was accepted by the Northwestern Section IAEI meeting in Missoula, MT for forwarding to the IAEI International Office for processing as an International Office Comment.

Panel Meeting Action: Reject

Panel Statement: CMP-6 accepted Proposal 6-29 in principle in part. The submitter's direction to the panel is unclear.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 9 Negative: 1

Explanation of Negative:

ZIMNOCH, J.: See Comment 6-14a.

Comment on Affirmative:

HUDDLESTON, JR., R.: The panel should have rejected the original proposal 6-29 and was correct in rejecting this comment. The substantiation for this Comment conflicts with the Panel Comment for 6-14a which points out the conflicting temperature data from the various studies and that the Panel may have accepted data in the past that may not have been correct. The Rooftop Wiring Study and other evidence presented to the Panel provided substantial real data that rooftop wiring is not being damaged by exposure to sunlight-heated conduits.

STACEY, J.: The submitter's comment that plugging conduit with cotton makes for a realistic test is puzzling. As an inspector for many years, I have never approved such an installation. See comment on 6-27.

6-29 Log #1115 NEC-P06 **Final Action: Accept**
(310.15(B)(3)(c) and Table 310.15(B)(3)(c))

Submitter: Phil Simmons, Simmons Electrical Services

Comment on Proposal No: 6-31

Recommendation: Continue to accept the Proposal in Principal with the actions by the Panel at the ROP meeting.

Substantiation: The Proposal presented actions that were appropriate based upon the testing that was performed by Underwriters Laboratory and reported in the Fact Finding Report. Removing the word "circular" and including "or cables" are correct actions to include the wiring methods that were covered in the exhaustive study of the effects of temperature gain due to solar exposure.

The requirement was added to the 2008 NEC after very significant documentation was provided that shows excessive temperatures in raceways that are exposed to direct sunlight. Every journeyman electrician knows better than with bare hands to pick up a piece of metal conduit that has been exposed to the sun for any length of time. The conduit gets much hotter than the ambient air temperature.

This Comment was accepted by the Northwestern Section IAEI meeting in Missoula, MT for forwarding to the IAEI International Office for processing as an International Office Comment.

Panel Meeting Action: Accept

Panel Statement: CMP-6 does not necessarily agree with all of the submitter's substantiation to the comment.

6-32 Log #1238 NEC-P06 **Final Action: Reject**
(310.15(B)(3)(c))

Submitter: Richard A. Maddox, Las Vegas, NV

Comment on Proposal No: 6-37

Recommendation: Delete 310.15(B)(3)(c) and Table 310.15(B)(3)(c).

Substantiation: This proposal should have been accepted to delete this requirement. There have been no documented failures of conductor insulation due to sunlight exposure. I have seen conductors fail due to overloading, physical damage, poorly done connections and splices, etc., but not due to sunlight exposure on a rooftop.

I have been searching locally for some evidence of conductor failure on rooftops. You would think that with the high temperatures experienced in the Southern Nevada area that we would be likely to see some quite a bit of evidence of failures if the proposals submitted by the Copper Development Association were valid. Instead, I have found numerous examples of conductors pulled out of conduits after years and decades that show no deterioration at all. I'm including photos of several of these installations with

this proposal.
It appears likely that the methodology used by the Copper Development Association led to exaggerated temperatures that are not experienced in actual installations on rooftops. While UL came in and witnessed the Copper Development Association consultant, Travis Lindsey, again perform testing on tables in his backyard in Las Vegas, there was still no examples of real installations, insulation failure, etc. The Southern Nevada Chapter of IAEI sponsored a study to test the temperatures of conductors in conduit on a real roof in Las Vegas, and the results show that the temperatures experienced in actual installations come nowhere near what the Copper industry has been reporting for the past few code cycles.
Research that does not reflect the real world should not be used to write Code. People depend on the Code-Making Panels to identify safety concerns and address them in the most reasonable and economical way possible. This section of the code does not increase safety, it just makes more money for wire manufacturers while making installations more expensive for building owners and more complicated for installers and inspectors.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Technical substantiation has been provided during the 2008 and 2011 NEC code cycles to support the ambient adjustment factors to conduit exposed to sunlight on rooftops. The original testing and a subsequent Underwriters Laboratories Fact-Finding Report has been accepted by the panel. CMP-6 requests the Correlating Committee appoint a task group to review the basis for ambient temperature correction factors.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 6 Negative: 3 Abstain: 1
Explanation of Negative:
HUDDLESTON, JR., R.: See my explanation of negative vote on Comment 6-16.
STACEY, J.: The panel action should have been "Accept". The submitter provided a report and examples of conductors (THW) that have survived with no visible deterioration in Las Vegas, NV and Laughlin, NV (two of the hottest areas of the country) for decades. The conductors were sized without using the adders in 310.15(B)(3)(c), and remained intact and flexible.
WALL, C.: See my explanation on comments 6-14a and 6-16.
Explanation of Abstention:
PICARD, P.: The Aluminum Association could not reach consensus.

6-33 Log #1264 NEC-P06 **Final Action: Accept**
(310.15(B)(3)(a))

TCC Action: The Correlating Committee understands that the words "in a Raceway or Cable" are also deleted in the title of Table 310.15(B)(3)(a) for correlation.
Submitter: Donald A. Ganiere, Ottawa, IL
Comment on Proposal No: 6-44
Recommendation: This proposal should be accepted.
Substantiation: I don't really understand the panel comment. The text seams very clear that derating is required for other than raceways or cables. The heading of the section is in direct conflict with the section text.. If the panel's intent is that the derating only applies to raceways and cables with more than three current carrying conductors than the words "or where single conductors or multiconductor cables are installed without maintaining spacing for a continuous length longer than 600 mm (24 in.) and are not installed in raceways," should be deleted from the section. If these words are to remain, then it is clear that the section requires derating for conductors that are not in a raceway or cable and that this proposal should be accepted.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
HUDDLESTON, JR., R.: It should be understood that the title of Table 310.15(B)(3)(a) should also have the same words "in a Raceway or Cable" deleted.
LAIDLER, W.: The title of Table 310.15(B)(3)(a) should also have the same words "in a Raceway or Cable" deleted, as they are not needed."

6-34 Log #1307 NEC-P06 **Final Action: Reject**
(310.15(B)(3)(c) and Table 310.15(B)(3)(c))

Submitter: Howard Herndon, South West Electritech Services
Comment on Proposal No: 6-29
Recommendation: Delete 310.15(B)(3)(c) and Table 310.15(B)(3)(c).
Substantiation: To test the hypothesis that the testing performed by the Copper Development Association and later observed by UL was not representative of real world electrical rooftop installations, the Southern Nevada Chapter of IAEI designed and installed a test setup to determine if real world electrical installations on rooftops experienced the temperatures reported to Code-Making Panel 6.
In short, the temperatures measured on an actual rooftop in Las Vegas in an actual installation of conduits with wires (both loaded and unloaded) did not approach the temperatures reported to CMP-6 by the Copper Development Association. On the contrary, the average temperature differential recorded was 15 degrees Fahrenheit for unloaded conductors in conduit. Since the conduits were installed approximately 6" above the rooftop, the adjustment factors required by CMP-6 would require an adder of 50 degrees F, over three times the actual measured values.
Additionally, it was observed during this real world rooftop test that the loaded conductors never exceeded the operating temperature of the conductors or terminations during the testing. Since the whole reason this additional temperature adjustment was added to the code was the premise that conductors would exceed their rated temperature, this testing shows that the premise was false. The highest recorded temperature was 148 degrees F for loaded conductors. The ambient temperature on that day was 114 degrees F according to NOAA, resulting in a differential of 34 degrees Fahrenheit for loaded conductors in conduit operating at the maximum load recorded on the circuit (37 amps). The conductors are rated at 194 degrees F and the connections are limited to 167 degrees F.
This indicates that even should the temperature be more extreme or if there was additional load on the circuit, there is sufficient buffer zone that additional temperature correction as required by the 2011 NEC 310.15(B)(c)(3) or 2014 NEC Proposal 6-29 is unnecessary.
Since the testing performed by the CDA to add these temperature correction factors does not reflect real world installations, Proposal 6-29 should not have been accepted.
A full report of the test methods and data collected by the Southern Nevada Chapter of IAEI is being submitted for review by the panel members.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Technical substantiation has been provided during the 2008 and 2011 NEC code cycles to support the ambient adjustment factors to conduit exposed to sunlight on rooftops. The original testing and a subsequent Underwriters Laboratories Fact-Finding Report has been accepted by the panel. CMP-6 requests the Correlating Committee appoint a task group to review the basis for ambient temperature correction factors.
The submitter has presented additional data but it was not persuasive enough to change the panel's position.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 6 Negative: 3 Abstain: 1
Explanation of Negative:
HUDDLESTON, JR., R.: See my explanation of negative vote on Comment 6-16
STACEY, J.: The panel action should have been "Accept". The Southern Nevada Chapter of IAEI performed testing on an actual rooftop in Las Vegas, NV with both loaded and unloaded conductors. The testing proves that the adders reported by the Copper Development Association are unrealistically high. Additionally, even with fully loaded conductors feeding an air conditioner (located on the same rooftop) during the hottest summer on record, the conductor and termination temperatures never exceeded those allowable by the conductor or equipment manufacturers. The conductor used was the minimum size allowable for the ampacity while keeping the voltage drop under 3%, but without the adders required by Section 310.15(B)(3)(c). The testing submitted by the CDA to support these adders was simulation testing, supposedly designed to reflect real world conditions. However, the real world testing performed to support this comment shows that actual installations do not approach the predicted temperatures required by this Code requirement. If simulation testing does not reflect the real world results, it must be rejected. The requirements in Section 310.15(B)(3)(c) are unnecessary and simply add cost without benefit.
WALL, C.: See my explanation on comments 6-14a and 6-16.
Explanation of Abstention:
PICARD, P.: The Aluminum Association could not reach consensus.

6-35 Log #1424 NEC-P06 **Final Action: Reject**
(310.15(B)(3)(c))

Submitter: Pete Fergen, Mojave Electric
Comment on Proposal No: 6-37
Recommendation: Delete 310.15(B)(3)(c) and Table 310.15(B)(3)(c).
Substantiation: This proposal should have been accepted to delete this requirement. This requirement adds significant cost without adding safety to rooftop installations. It also adds complexity to jobs since the oversized conductors this provision requires often do not fit in the equipment terminations. I work for Mojave Electric in Las Vegas, NV. Mojave Electric is an IBEW INECA contractor doing a variety of electrical work in Las Vegas, including service work. We have never found a rooftop conductor failure due to sunlight exposure. Conductors operate just fine on rooftops for decades if they are not overloaded or physically damaged during installation or operation.
I was told by CDA representative Travis Lindsey that when the wire is sized larger than the equipment manufacturers termination point that the contractor would have to splice the wire reducing it down to the size necessary. I do have an example of what happens when that is done. I have a splice that was cut out of a run due to overheating and Phase loss for a business. Every splice that is inserted into a wire run increases the cost of maintenance and the chance of mechanical breakdown or
fire hazard.
I also belong to the Southern Nevada Chapter of IAEI. Our Chapter funded a study to determine the temperature experienced in rooftop electrical

installations. The
test site was installed by Mojave Electric employees and located on a building owned by Mojave Electric. The results we found indicate that in real installations, the
high temperatures reported by the copper industry do not occur. I've never seen an installation with surgical cotton stuffed in the conduit, so maybe that affected their
results.
We ran an analysis of the cost of installing a 225 amp panel with rooftop feeders under different conditions. With this temperature adder, it would cost anywhere from
50% more to 400% more than the cost of an installation without this requirement, depending on the height of the conductors above the roof. With no showing of
failures in the field, and this new study that shows the temperatures aren't anywhere near what the copper industry claims, there is no justification for keeping this
requirement in the code.

Panel Meeting Action: Reject

Panel Statement: Technical substantiation has been provided during the 2008 and 2011 NEC code cycles to support the ambient adjustment factors to conduit exposed to sunlight on rooftops. The original testing and a subsequent Underwriters Laboratories Fact-Finding Report has been accepted by the panel. CMP-6 requests the Correlating Committee appoint a task group to review the basis for ambient temperature correction factors.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 6 Negative: 3 Abstain: 1

Explanation of Negative:

HUDDLESTON, JR., R.: See my explanation of negative vote on Comment 6-16.

STACEY, J.: The panel action should have been "Accept". The submitter has experienced first-hand the difficulties and hazards created by the unnecessary upsizing of conductors required by Section 310.15(B)(3)(c). The upsizing of conductors required by this code requirement result in conductors that are too large to terminate on normal equipment, increasing the chance of failure due to the more numerous connections that are required. Not only does this code requirement increase cost (by significant amounts, as shown by this submitter and in Comment 6-16), it may actually decrease safety and reliability of our systems.

WALL, C.: See my explanation on comments 6-14a and 6-16.

Explanation of Abstention:

PICARD, P.: The Aluminum Association could not reach consensus.

6-36 Log #1425 NEC-P06 **Final Action: Reject**
(310.15(B)(3)(c) and Table 310.15(B)(3)(c))

Submitter: Howard Herndon, South West Electritech Services / Rep. Southern Nevada Chapter IAEI

Comment on Proposal No: 6-31

Recommendation: Delete 310.15(B)(3)(c) and Table 310.15(B)(3)(c).

Substantiation: To test the hypothesis that the testing performed by the Copper Development Association and later observed by UL was not representative of real world electrical rooftop installations, the Southern Nevada Chapter of IAEI designed and installed a test setup to determine if real world electrical installations on rooftops experienced the temperatures reported to Code-Making Panel 6.
In short, the temperatures measured on an actual rooftop in Las Vegas in an actual installation of conduits with wires (both loaded and unloaded) did not approach the temperatures reported to CMP-6 by the Copper Development Association. On the contrary, the average temperature differential recorded was 15 degrees Fahrenheit for unloaded conductors in conduit. Since the conduits were installed approximately 6" above the rooftop, the adjustment factors required by CMP-6 would require an adder of 50 degrees F, over three times the actual measured values.
Additionally, it was observed during this real world rooftop test that the loaded conductors never exceeded the operating temperature of the conductors or terminations during the testing. Since the whole reason this additional temperature adjustment was added to the code was the premise that conductors would exceed their rated temperature, this testing shows that the premise was false. The highest recorded temperature was 148 degrees F for loaded conductors. The ambient temperature on that day was 114 degrees F according to NOAA, resulting in a differential of 34 degrees Fahrenheit for loaded conductors in conduit operating at the maximum load recorded on the circuit (37 amps). The conductors are rated at 194 degrees F and the connections are limited to 167 degrees F.
This indicates that even should the temperature be more extreme or if there was additional load on the circuit, there is sufficient buffer zone that additional temperature correction as required by the 2011 NEC 310.15(B)(c)(3) or 2014 NEC Proposal 6-29 is unnecessary.
Since the testing performed by the CDA to add these temperature correction factors does not reflect real world installations, proposal 6-29 should not have been accepted.
A full report of the test methods and data collected by the Southern Nevada Chapter of IAEI is being submitted for review by the panel members.

Panel Meeting Action: Reject

6-37 Log #1430 NEC-P06 **Final Action: Accept in Principle**
(310.15(B)(3)(c) Exception (New))

Submitter: Christel K. Hunter, Alcan Cable, a General Cable Company

Comment on Proposal No: 6-41

Recommendation: Add new exception that states:

<u>Exception: Conductors with thermoset insulation rated at 90C or higher are not subject to this ampacity adjustment.</u>

Substantiation: This proposal should have been accepted. Technical substantiation was provided at the ROP meeting supporting the claim that thermoset insulation is superior to thermoplastic insulation in high heat applications. Industry standards from IEEE, ICEA and NEMA indicate that thermoset insulation is adequate for much higher temperatures than those experienced on rooftops for the period of time indicated.
In response to the request of several code panel members, testing was performed to validate the assertion that thermoset insulated conductors are more resistant to high
heat conditions than thermoplastic. Two rounds of testing were performed. For the first test, General Cable performed a comparative test of thermoplastic and thermoset insulated wires at high temperature under physical stress. The test was based on an industry recognized test method called Heat Shock found in UL 83, Thermoplastic-insulated Wires and Cables. The test is normally run for one hour during wire certification testing, but this test was run for 60 days to better emulate the expected lifetime exposure of conductors to high heat over many decades. The results show that thermoset insulation is far more resistant to high heat than thermoplastic, even when under physical stress. The thermoplastic conductors showed significant aging (evidenced by insulation cracking when unwound from a steel mandrel). The report is included for the panel's review.
Additionally, to substantiate these results, the same test was performed by UL. UL also performed additional testing such as tensile and elongation, flexibility, and dielectric voltage withstand and breakdown. The report is included as supporting material. The conductors tested at UL show very similar cracking of the thermoplastic conductors and no detectable cracking of the thermoset insulation.
Based on published industry standards and testing submitted with this comment, commonly used thermoset insulation is clearly more resistant to high heat applications than thermoplastic. Even in the hottest areas of the country with fully loaded conductors, this information demonstrates that there is no safety concern with thermoset insulation in these installations.
Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept in Principle

Add new exception to read as follows:

Exception: Type XHHW-2 insulated conductors shall not be subject to this ampacity adjustment.

Panel Statement: CMP-6 edits the submitter's text to comply with the 2011 NEC Style Manual.

CMP-6 changes "thermoset insulation" to "XHHW-2" to limit the wire type to the submitted data and results from two testing laboratories. CMP-6 deletes "rated at 90°C or higher" as XHHW-2 is so rated.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 6 Negative: 3 Abstain: 1

Explanation of Negative:

FRIEDMAN, S.: A full Fact-Finding Investigation should be provided to take into account all aspects of the conductors installed on roof tops.

XERRI, M.: The testing performed on 6 AWG THHN employing PVC insulation and 6 AWG XHHW-2 employing XLPE insulation seems to indicate that XHHW-2 with XLPE insulation performs better than the THHN with PVC insulation based on the limited tests performed.
Since this proposal is to allow the use of a 900 C rated cable to be used for a limited time frame above its' rated temperature, it is important that all insulation materials that XHHW-2 can be extruded with should have been tested. As XHHW-2 can also employ EPCV type insulation, this should also have been subjected to an appropriate test program.
In addition, based on the test program requested by the submitter, because the cable is being subjected to temperatures above its' temperature rating, a cycling

of heating and cooling (dry and humid?) of the cable would provide more pertinent data than just constant heating. The effects of heating and cooling can cause stresses that heating alone will not show.

Also, the samples subjected to the test program requested by the submitter consisted of one sample of cable from the two different manufacturers. Additional samples from other manufacturers should be included in any investigation.

The submitter also stated in the presentation that the oven aging time of 60 days that was performed on the cable represented 32.7 years of exposure to the elevated temperatures. In the Roof Top Wiring Study that was performed by Robert Huddleston, that was provided to the panel, he makes reference to cables that were installed in 1972, making them 40 years old and still in use. This would infer that the cable should have been aged longer to represent a time period of longer than 32.7 years.

Based on the limited testing performed by the submitter and requested of UL, the action taken by the Panel was not correct. We would recommend revisiting during the next code cycle. An independent Fact-Finding Investigation Report would allow the Code Panel to review additional needed data and other pertinent facts regarding all aspects of XHHW-2 cable when subjected to sunlight on rooftops.

ZIMNOCH, J.: The supporting information presented in support of the comment was very limited in scope. A full Fact-Finding Investigation should be provided to take into account all aspects of the conductors installed on roof tops. The UL letter specifically states: "UL Verification Services did not select the samples, determine whether the samples were representative of production samples, witness the production of the test samples, nor were we provided with information relative to the formulation or identification of component materials used in the test samples. The test results apply only to the actual samples tested. " XHHW with cross-linked polyethylene insulation is not the only way to manufacture XHHW; for example, XHHW-2 can be made with EPR rubber or made with a PVC (thermoplastic) jacket over a single conductor.

The ambient temperature on the roof tops does not change the fact that if the added ambient is ignored, the conductor temperature will exceed the 90C limit regardless if it is thermoset or thermoplastic. There is a precedent being set where exception from a temperature limitation in the code is being introduced. This being the case, there should be a more comprehensive test report to support this concept since the same type exception could be applied to any of the temperature correction tables in the code.

1. Only 1 size of cables (#6) was tested using two insulations. Other insulations and wire types were not considered.
2. Tests were indoors and not related to real world.
3. Were oven tests on a mandrill, not real installation conditions
4. Tests were at continuous temperature, not daily temperature cycles, thus not heating and cooling at frequent intervals
5. The testing was performed in free air, not conduits in sunlight
6. Testing does not consider friction from expansion and contraction due to heating and cooling. In a larger sense, wear and tear due to expansion and contraction has more of an effect than simply temperature, and was not considered in the testing.
7. Code is written for all cables in all sizes. This test was not comprehensive and thorough
8. The concluding statement was very specifically worded "XHHW sample can better withstand the 212 C temperatures for a 60 day period." Electrical equipment is expected to last 40 years or more.
9. Thermoset insulation is not the only way to make XHHW; for example, XHHW-2 can be made with EPR rubber.
10. The UL letter is not a Fact Finding and has little meaning

The UL letter specifically states: UL Verification Services did not select the samples, determine whether the samples were representative of production samples, witness the production of the test samples, nor were we provided with information relative to the formulation or identification of component materials used in the test samples. The test results apply only to the actual samples tested.

11. UL is basically not certifying anything other than that a report of the testing was submitted by General Cable
12. The test report and UL letter were not reviewed or available to the public. Both the report and letter are dated in the Fall of 2012. They were not available for Public Comment.

Explanation of Abstention:

PICARD, P.: The Aluminum Association could not reach consensus.

Comment on Affirmative:

CLINE, S.: In support of the Panel's action:

The testing results submitted clearly showed significant differences between insulation degradation, and showed that the XHHW-2 type was much more resistant to the effects of heat. Further testing of all modern insulation types is recommended - see 6-14a.

KENT, G.: No explanation provided.

LAIDLER, W.: We are voting with the panel to Accept this Comment in Principle. The Submitter of the comment provided substantiation that showed that a No. 6 XHHW-2 conductor was more resistive to a high heat condition and showed no apparent damage to the conductor.

The language in the Code that requires the ampacity of the conductor to be corrected when the ambient temperature is higher than 30C or 86F was added to the document before the newer types of conductor insulations were developed. We think that the time has come to take into consideration the types of insulations we are currently using and how they measure up with the existing ampacity and ambient temperature correction factor tables. A recommendation was made during the panel's discussion that the TCC appoint a Task Group to look into the effectiveness of the high temperature rated insulation and its use with current ambient temperature correction factor tables: we strongly support that recommendation. Until that time comes, we will continue to support the application of ambient temperature correction factors including the air inside raceways. Although accepting the proposed exception to 310.15(B)(3) is in conflict with the previous statement, this action sends a message that the panel recognizes that the insulation types used today are more robust and resilient than the insulation types used when the ambient temperature correction tables were first developed.

STACEY, J.: Although it is our position that 310.15(B)(3)(c) be deleted in its entirety, it appears unlikely that the panel will agree. Therefore, we accept this submitter's language as it provides a compromise that allows installers to use conductors that are sized to fit the equipment on which they must terminate. Thermoset insulation has been proven in laboratory testing and field installations to be far more resistant to high heat than thermoplastic. The panel's limitation to XHHW-2 only was unnecessary, as all thermosets (like XHHW) have better performance in high heat applications than thermoplastics (like THHN)

6-38 Log #1557 NEC-P06 **Final Action: Reject**
(Table 310.15(B)(3)(a))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 6-40
Recommendation: Accept the proposal in principle. In addition to making the changes as accepted to the table note, delete the phrase "current-carrying" from 310.15(B)(3) from the two locations where it occurs in the first paragraph.
Substantiation: This action is essential to remove a direct conflict between the table note and the provisions of the parent text in the section text that gives rise to the table. This has been a problem ever since the panel removed the phrase in the table note for the 2011 NEC, and this is the time to remove the conflict.
Panel Meeting Action: Reject
Panel Statement: The adjustment factors are on conductors which are or may be normally current carrying conductors. Not all conductors need to be subject to the adjustment factors.

CMP-6 disagrees with the submitter that there is a conflict.

Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

6-39 Log #97 NEC-P06 **Final Action: Accept**
(310.15(B)(7))

Submitter: Technical Correlating Committee on National Electrical Code®,
Comment on Proposal No: 6-49a
Recommendation: The Correlating Committee directs that the panel clarify their action on this proposal.

The Correlating Committee also directs the panel to revise the Informational Note as it contains permissive language, i.e. the word "may".

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: CMP-6 accepts the direction of the Correlating Committee to clarify the action on Proposal 6-49a. See panel action and statement on Comment 6-52.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

6-40 Log #293 NEC-P06 **Final Action: Reject**
(310.15(B)(7))

Submitter: Lowell Reith, Interstates Construction Services Inc.
Comment on Proposal No: 6-49a
Recommendation: Revise text to read as follows:

(7) 120/240 Volt, Single-Phase Dwelling Services and Feeders. For service and feeder conductors of 120/240-volt, single-phase, individual dwelling unit one-family, two-family, and multifamily service ratings from 100 through 400 amperes, an adjustment factor of 0.83 of the service ampere rating shall be permitted to be used to determine the size of the ungrounded conductors. The grounded conductor shall be permitted to be smaller than the ungrounded conductors, provided that the requirements of 215.2, 220.61, and 230.42 are met.

Substantiation: The revising of 310.15 (B) (7) makes no sense if it does not change the result of the conductor size that can be used for 120/240 volt services for Residential dwellings. The use of the table is very clear to those who use it. Taking 83% times the amperage of the minimum service sized based on the standard calculation for dwelling as shown in Informational Annex D1. It also lets the field decide which insulation that they would use to apply the 83% to. THHN has a higher amperage then a THWN in the 75 degree column. Field people would also have to work better with 110.14 (C) to

apply the correct wire size based on the terminal rating of the panel. I feel the table provides the base way of sizing the conductors for the residential service from 100 amp to 400 amp.
Panel Meeting Action: Reject
Panel Statement: The intent of the submitter is unclear. It seems that the substantiation does not support his proposed text.
See panel action and statement on Comment 6-52.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

6-41 Log #383 NEC-P06 **Final Action: Reject**
(310.15(B)(7))

Submitter: Carl Timothy Wall, Alabama Power Company
Comment on Proposal No: 6-49a
Recommendation: Reject Proposal 6-49a.
Substantiation: Removal of the table does not add clarity or usability to the NEC. The electrical industry that includes designers, installers and inspectors is better served by the long standing code Table 310.15(B)(7) rather than a narrative text that requires an equation with calculations. The table adds clarity, facilitates and expedites the installation and inspection process.
Panel Meeting Action: Reject
Panel Statement: Use of the table does improve usability of the NEC if conditions of use don't require correction factors. The problem of using the table is that the user has no way to apply the required adjustment factors to the types of insulation dependent upon conditions of installation.
The panel affirms that the new language accepted in Comment 6-52 is a compromise to address the misuse of prior published table.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
STACEY, J.: The panel action should have been "Accept". The existing table is descriptive, adequate, and is well understood in the field. As stated in Mr. Walls substantiation, (Removal of the table does not add clarity or usability to the NEC. The electrical industry that includes designers, installers and inspectors is better served by the long standing code Table 310.15(B)(7) rather than a narrative text that requires an equation with calculations. The table adds clarity, facilitates and expedites the installation and inspection process). There were no proposals from the public to remove the table only, and put in a calculation. Proposal 6-49a was created by the panel and is a step backwards as stated in ROC 6-45.
An Inspector is not going to stop at each residential inspection with a new service and do a calculation. This easy to use time proven ampacity table is needed and used daily. There is no proof of any failures to show that the table is broken? Both ROC 6-43 and 6-45 tried to fix the broken text. The panel concerns of issues where a feeder ran through an attic or insulation requiring some correction factors be applied are addressed in 6-45. ROC 6-52 new part (c) appears to allow a feeder to run through the same attic with no correction factor required, only Info Note 1 that is not enforceable. There is no need to get rid of the Table310.15(B)(7).
Comment on Affirmative:
WALL, C.: I support the panel action to clarify 310.15(B)(7); however, I believe a table increases usability and should be included, subject to requirements to apply adjustment factors.

6-42 Log #977 NEC-P06 **Final Action: Reject**
(310.15(B)(7))

Submitter: Charles J. Palmieri, Town of Norwell
Comment on Proposal No: 6-49a
Recommendation: Delete the panel action on this proposal and accept proposal 6-50 by deleting this section in its entirety.
Substantiation: Code panel 6 is to be applauded for the work it performed on the 12 proposals submitted for deletion or modification to this section. Unfortunately the panel action is still lacking on two issues. The panel action language still contains the term feeder. 1. The example in the statement by panel member Cline cites a 100 A feeder from a 200 A panel. If one wishes to use the 83 percent this feeder must be sized to 166 A. Under this scenario it is agreed that a 100 feeder will most likely be selected from Table 310.15(B)(16). What about a 300 or 400A Service where the installer chooses to use a meter enclosure with factory installed double barrel lugs on the load terminals and feed two 150A or 200 A panels. This is very common. For example consider a 300 A service 1 meter with 2 150 A load centers. The conductors from the meter are not feeders. There is no overcurrent protection at the meter enclosure. The service conductors to the meter to each load center must each must have an ampacity of 249 A (300 x.83=249A). These conductors are not allowed to use 240.21(B). I believe there is still confusion in the application of the 83 percent, installers may attempt to install conductors sized at 83 percent of the individual panels' overcurrent protection. I am not sure this was the intent of the panel's action. There were several proposals to delete this table that were rejected by CMP-6 see Proposals 6-50 thru 56. 2. The panel statement for each rejected proposal indicated a lack of technical substantiation to delete this section. I disagree. In P-56 Mr. Mercier points to an increase of electrical loads. This is a statement of fact. Both P 6-50 and 55 list a problem of voltage sag under the existing installation requirements. This also is factual. The panels' substantiation statement to its action of Proposal 49a also does not provide technical documentation to support retention of this permissive language allowing reduced size service conductors. It simply states that the multiplier essentially accomplishes the same end as applying the 301.15(B)(7) the Table
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided substantiation that electric loads have increased. Nor has he provided substantiation that voltage sag conditions referenced are relevant to this section. CMP-6 requests the submitter provide documented failures due to use of these calculations/tables.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
KENT, G.: Clearly by our actions of providing a percentage we have clarified this is a calculation of derating the service based on diversity. Calculations of the necessary service amperage requirement should be found in Article 220 not Article 310.
Comment on Affirmative:
HUDDLESTON, JR., R.: I find it fascinating that the Panel requested documented failures in their Panel Statement to substantiate this Comment, when all of the Comments for ampacity adjustments for rooftop wiring have had ZERO documented failures and many documented cases demonstrating NO FAILURES - yet the Panel accepted the drastic temperature adjustments and consequent MUCH LARGER CONDUCTORS on rooftops. Rather inconsistent? Indeed.

6-43 Log #1014 NEC-P06 **Final Action: Reject**
(310.15(B)(7))

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 6-19
Recommendation: Revise text to read as follows:
(7) 120/240-Volt, 3-Wire, Single-Phase Dwelling Services and Feeders. For individual dwelling units of one-family, two-family, and multifamily dwellings, conductors, as listed in Table 310.15(B)(7), shall be permitted as
120/240-volt, 3-wire, single-phase service-entrance conductors, service-lateral conductors, and feeder conductors that serve as the main power feeder<u>(s)</u> to each dwelling unit and are installed in raceway or cable with or without an equipment grounding conductor. For application of this section, the main power feeder<u>(s)</u> shall be the feeder between the main disconnect and the panelboard<u>(s)</u> ~~that supplies, either by branch circuits or by feeders, or both, all loads that are part or associated with the dwelling unit~~. The feeder conductors to a dwelling unit shall not be required to have an allowable ampacity rating greater than their service-entrance conductors. The grounded conductor shall be permitted to be smaller than the ungrounded conductors, provided the requirements of Sections 215.2, 220.61, and 230.42 are met.
Substantiation: This proposal seeks to fix an issue that was created in the 2008 edition of the NEC. Up until that point, this table could be used for multiple feeder circuits in a dwelling. This concept was changed with no real substantiation, and the change allowed for absurd installation requirements. For example, a 150A feeder circuit that serves a single panelboard can use this table. Imagine that this panelboard contains the circuits for two air conditioners. I can still use this table. Now imagine removing those two circuits and placing them outside at the service equipment. The feeder circuit has much, much less load on it, and yet it would now have to be sized larger! This obviously makes no sense, and is really an indefensible concept.
Considering the amount of proposals to fix this in the last Code cycle, it is obvious that the industry wants a change in this section. Please consider this proposal, which, for the most part, reverts this text back to the 2005 language, which was clear and consistent.
Panel Meeting Action: Reject
Panel Statement: CMP-6 does not accept the submitter's recommendation. CMP-6 addressed the submitter's concerns noted in his substantiation.
See panel action and statement on Comment 6-52.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
STACEY, J.: The panel action should have been "Accept in principle" The submitter's substantiation is correct, the entire load should not be required to use this section or table. There is no proof that this is an issue only concerns. This is where diversity begins by dropping off or cycling of loads. In addition to the submitter's comment it is an industry practice to install a 400 amp service with 2-200 amp panels fed from the meter socket using this table with no issues only concerns.
See my comments on 6-41, 6-45 and 6-52.

6-44 Log #1045 NEC-P06 **Final Action: Reject**
(310.15(B)(7))

Submitter: George M. Stolz, II, Quicksilver Electrical Training
Comment on Proposal No: 6-49a
Recommendation: This proposal should be rejected.
Substantiation: One difficult to understand section is being replaced with another, and the proposed language disallows using the reduced wire size in

anything but a single family dwelling unit. For example, an apartment served by an 800A service disconnect and a 100A feeder disconnect in series would not be permitted to use a #2 AL as allowed in previous editions of the NEC. The proposed text is bound to a service disconnect rating that may not be relevant to the installation at hand, as is the case with most apartments. The panel seems to have been fixated on single family installations when they drafted the proposed language, as shown by the "200A service to 200A feeder" example given. It is common to have a few high-amperage service disconnects supplying dozens of small amperage feeders supplying each unit.

The panel's action in proposal 6-49a still has an additional fundamental problem. Conductors connected to circuit breakers are required to be sized to 125% of the continuous load in order for the conductor to draw heat away from the breaker as a heat sink. By the panel's action, undersized conductors are still allowed to be connected to overcurrent devices. By accepting this proposal and leaning on CMP-2 to accept a load diversity factor in lieu of 310.15(B)(7), this basic problem is averted while meeting the intentions of CMP-6. It is the right way to put this issue to bed, forever.

Panel Meeting Action: Reject

Panel Statement: CMP-6 has addressed the submitter's concerns noted in his substantiation relative to apartments in Comment 6-52. The submitter has not provided evidence that undersized conductors are allowed.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

6-45 Log #1088 NEC-P06 **Final Action: Reject**
(310.15(B)(7) and Table 310.15(B)(7))

Submitter: L. Keith Lofland, International Association of Electrical Inspectors (IAEI)

Comment on Proposal No: 6-49a

Recommendation: Revise text at 310.15(B)(7) as follows and revive Table 310.15(B)(7) to 2011 NEC format:

<u>**(7) Conductors Supplying Individual Dwellings.** Conductors supplying individual dwelling units shall be permitted to be sized in accordance with (a) through (d). Use of Table 310.15(B)(7) shall not be permitted where ampacity correction or adjustment for service or feeder conductors is required elsewhere in this Code.</u>

<u>**(a) Service Conductors.** Where connected to a 120/240-volt, 3-wire, single-phase system, service conductors that supply the entire load associated with a one-family dwelling, or the entire load associated with the individual units of two-family and multifamily dwellings shall be permitted to be sized in accordance with Table 310.15(B)(7).</u>

<u>**(b) Feeder Conductors.** Where connected to a 120/240-volt, 3-wire, single-phase system, feeder conductors that supply the entire load associated with a one-family dwelling, or the entire load associated with the individual units of two-family and multifamily dwellings shall be permitted to be sized in accordance with Table 310.15(B)(7).</u>

<u>**(c) Not Larger than Service Conductors.** Unless ampacity correction or adjustment is required, feeder conductors installed between the service equipment and panelboards or similar distribution equipment shall not be required to be sized larger than the service conductors.</u>

<u>**(d) Grounded Conductor Reduction.** Grounded conductors shall be permitted to be smaller than the ungrounded conductors, provided the requirements of 215.2 and 220.61 for feeders or the requirements of 220.61 and 230.42 for services are met.</u>

Substantiation: Over the past 3 Code cycles, CMP-6 has worked hard to satisfy all concerned parties in conjunction to 310.15(B)(7) and the companion Table 310.15(B)(7). I believe the removal in its entirety of Table 310.15(B)(7) is a step backward in this process. By removing the table and adding a 17% adjustment factor formula (0.83 of the service ampacity rating) will only add confusion to sizing requirements for dwelling unit services and the main power feeder. The main argument in dealing with Table 310.15(B)(7) seems to be ampacity adjustment factors (such as temperature or number of conductors in the same raceway or bundled together). Does Table 310.16(B)(7) override any ampacity adjustment factors or does any ampacity adjustment factors render Table 310.15(B)(7) noncompliant? The proposed text in this comment will make it clear that Table 310.15(B)(7) is not to be used where ampacity adjustment factors are required for the service or feeder conductors elsewhere in the Code. This proposed text makes 310.15(B)(7) more "user-friendly" in breaking up a large level 2 subdivision paragraph into (4) level 3 subdivisions. The existing Table 310.15(B)(7) has worked well and be part of the Code of 21 Code cycles. Its removal will not add clarity or aid in the usability of the NEC to the user of the NEC.

Panel Meeting Action: Reject

Panel Statement: Changing to text as in Comment 6-52 allows the 83% adjustment factor to continue to be used with the adjustments, where accepting this proposal prohibits the use of the table when subject to other adjustments. The panel affirms the intent to require the application of adjustments or corrections as required, and that the text given in the panel's action and statement on Comment 6-52 addresses the prior misuse of the table.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 9 Negative: 1

Explanation of Negative:

STACEY, J.: The panel action should have been "Accept". The submitter is correct with the substantiation and has provided text that would not allow the use of the Table where correction or adjustments are required. The public will be more confused with an 83% calculation than an easy to use time proven table. See my comments on 6-41 and 6-5.2

6-46 Log #1095 NEC-P06 **Final Action: Reject**
(310.15(B)(7) and Table 310.15(B)(7))

Submitter: Ron B. Chilton, Rep. NC Code Clearing Committee

Comment on Proposal No: 6-55

Recommendation: This Proposal should have been accepted.

Substantiation: This is the proper step to begin to address deficiencies in services for dwellings due to reductions in connected loads by the "diversity" theory of Article 220 and substituting calculated loads based on a 50 year old diversity assumption. When the diversity factor was introduced, prior to the 1959 NEC, this was given as reasons for exaggerating the ampacities for dwelling services. There was no scientific study or electrical engineering data that could be used to compare to what loads may be imposed on dwellings constructed at the present, not an indication of the variations of electrical appliances beyond a range and refrigerator. This theory permitting overloading of service conductors was based on annual load data of residential utility use at the time, not to mention how the reasoning allowing reductions in actual loads for a dwelling were surmised. The Panel could recognize that any diversity is already considered in the permitted reduction of loads used as the method of calculation. To permit the continued practice of overloading conductors just due to being dwelling service conductors is not consistent with the goal of practical safeguarding of persons and property from hazards of the use of electricity.

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided substantiation that electric loads have increased. CMP-6 requests the submitter provide documented failures due to use of these calculations/tables. The submitter has not provided evidence of the overloading of conductors.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 9 Negative: 1

Explanation of Negative:

KENT, G.: Clearly by our actions of providing a percentage we have clarified this is a calculation of derating the service based on diversity. Calculations of the necessary service amperage requirement should be found in Article 220 not Article 310.

6-47 Log #1118 NEC-P06 **Final Action: Reject**
(310.15(B)(7) and Table 310.15(B)(7))

Submitter: Phil Simmons, Simmons Electrical Services

Comment on Proposal No: 6-49a

Recommendation: Reject the Proposal.

Substantiation: There are many problems with the Panel action on this Proposal. These include:

1. The section now simply refers to a feeder without qualification. The Panel in the past has consistently required that a feeder carry the entire load of the service to qualify for the diversity. With the accepted language, a single branch circuit, for a heating load requiring a 125% factor could be supplied by a feeder sized at 83% of the rating of the load. This would obviously be unsafe.
2. The Table allows a conductor to be used at a calculated load that has always been greater than what we know to be the maximum rating of the conductor from Table 310.15(B)(16).
3. No reference is made to the sizing rules for the neutral in 250.24(C).
4. The first sentence is really confusing.

If there is any validity to the assertion that the service conductors are oversized, the load calculations in Article 220 should be revised. This section gets changed every NEC cycle and should simply be eliminated. Surely, we all have better things to do that try to fix this section over and over!

Panel Meeting Action: Reject

Panel Statement: The panel action in Comment 6-52 addresses the submitter's concern relative to his item 1. The submitter's item 2 is technically incorrect. Rules for grounded conductors are retained which addresses the submitter's concern in item 3.
CMP-6 refers the submitter to Comment 6-52.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

6-48 Log #1119 NEC-P06 **Final Action: Reject**
(310.15(B)(7) and Table 310.15(B)(7))

Submitter: Phil Simmons, Simmons Electrical Services

Comment on Proposal No: 6-50

Recommendation: Accept the Proposal to delete 310.15(B)(7) and Table 310.15(B)(7).

Substantiation: Over the last 30 years or better this antiquated paragraph and Table has been a contentious issue, more recently due to changes in the definition of a main power feeder, the reference to the 60-degree ampacity required for service cable passing through thermal insulation, and that the Table allows a conductor to be used at a calculated load that has always been greater than what we know to be the maximum rating of the conductor from Table 310.15(B)(16).

There are several assumptions as to why this Table was allowed to be used, most commonly a perceived diversity of electrical loads in the dwelling. When complaints are being made by homeowners, who have recently purchased a brand new dwelling, that when the heat pump starts the lights go dim, we realize that the perceived diversity has evaporated. Responding to those complaints that the home meets minimum National Electrical Code standards does not ease their concerns, it only amplifies the fact that we should not permit this situation any longer, and as we strive to eliminate other Sections the Code that permit deliberate overloading of a system.

If there is any validity to the assertion that the service conductors are oversized, the load calculations in Article 220 should be revised. This additional table that gets changed every NEC cycle should be eliminated. Surely, we all have better things to do that try to fix this section over and over!

Panel Meeting Action: Reject

Panel Statement: The submitter has not provided substantiation that electric loads have increased. Nor has he provided substantiation that light dimming conditions referenced are relevant to this section. CMP-6 requests the submitter provide documented failures due to use of these calculations/tables.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 9 Negative: 1

Explanation of Negative:

KENT, G.: While I do not agree on the substation, I do support deletion. Clearly by our actions of providing a percentage we have clarified this is a calculation of derating the service based on diversity. Calculations of the necessary service amperage requirement should be found in Article 220 not Article 310.

6-49 Log #1210 NEC-P06 **Final Action: Reject**
(310.15(B)(7))

Submitter: Leo F. Martin, Sr., Martin Electrical Consulting

Comment on Proposal No: 6-49a

Recommendation: Delete section 310.15(B)(7) and Table 310.15(B)(7).

Substantiation: Dwellings are increasing in square footage. This may be of no significance when a minimum service/feeder demand load is calculated in accordance with Article 220, parts III and/or IV, but consumer habits are leaning heavily towards an increase in appliances/products that use electricity. Many homes today have a swimming pool, air conditioning, garage door openers, spa/hot tub, as well as others. Not all jurisdictions require licensed individuals perform electrical installations. In many areas AHJ's are not afforded the opportunity to perform a plan review for dwellings. This section and table are antiquated and need to be deleted. The ampacity of conductors should be in accordance with Table 310.15(B)(16).

Panel Meeting Action: Reject

Panel Statement: If qualified individuals are not employed and buildings are not inspected, requiring one table over another is not going to make a difference. The submitter has not provided technical substantiation to support his recommendation.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 9 Negative: 1

Explanation of Negative:

KENT, G.: Clearly by our actions of providing a percentage we have clarified this is a calculation of derating the service based on diversity. Calculations of the necessary service amperage requirement should be found in Article 220 not Article 310.

6-50 Log #1324 NEC-P06 **Final Action: Reject**
(310.15(B)(7))

Submitter: James F. Williams, Fairmont, WV

Comment on Proposal No: 6-49a

Recommendation: Revise text to read as follows:

310.15 Ampacities for Conductors Rated 0–2000 Volts.

(B) Tables.

(7) 120/240 <u>or 208Y/120</u> Volt, Single-Phase Dwelling Services and Feeders. For service and feeder conductors of 120/240 <u>or 208Y/120</u>-volt, single-phase, individual dwelling unit one-family, two-family, and multifamily service ratings from 100 amperes through 400 amperes, an adjustment factor of 0.83 of the service ampere rating shall be permitted to be used to determine the size of the ungrounded conductors. The grounded conductor shall be permitted to be smaller than the ungrounded conductors, provided that the requirements of Sections 215.2, 220.61, and 230.42 are met. **[ROP 6–49a]**

Substantiation: Parallel usage in 220.82(A), 220.83, 250.140<exc>(1), 551.4(A) and (B), 551.31(C), 551.73(A), 552.47, and Annex D.

Panel Meeting Action: Reject

Panel Statement: This section has never applied to 208Y/120-volt single phase systems. The neutral conductor in this case carries significant current. The submitter has not provided adequate technical substantiation to effect this change.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

6-51 Log #1368 NEC-P06 **Final Action: Accept in Principle**
(310.15(B)(7))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Comment on Proposal No: 6-49a

Recommendation: Replace the language in 310.15(B)(7) with the following:

(7) **120/240 Volt, Single-Phase Dwelling Services and Feeders.** For one-family dwellings and the individual dwelling units of two-family and multifamily dwellings, service and feeder conductors supplied by a single phase, 120/240-volt system shall be permitted be sized in accordance with 310.15(B)(7)(a) through (c).

(a) For a service rated 100 through 400 amperes, the service conductors supplying the entire load associated with a one-family dwelling or the service conductors supplying the entire load associated with an individual dwelling unit in a two-family or multifamily dwelling shall be permitted to have an ampacity not less than 83% of the service rating.

(b)For a feeder rated 100 through 400 amperes, the feeder conductors supplying the entire load associated with a one-family dwelling or the feeder conductors supplying the entire load associated with an individual dwelling unit in a two-family or multifamily dwelling shall be permitted to have an ampacity not less than 83% of the feeder rating.

Exception: In no case shall a feeder originating at the service equipment be required to have an ampacity greater than that of the service conductors supplying a one-family dwelling or an individual dwelling unit of a two-family or multifamily dwelling.

(c) Grounded conductors shall be permitted to be sized smaller than the ungrounded conductors provided the requirements of 220.61 and 230.42 for service conductors or the requirements of 215.2 and 220.61 for feeder conductors are met.

<u>Informational No. 1: The conductor ampacity may require other correction or adjustment factors applicable to the conductor installation.</u>

<u>Informational No. 2: See example DXXX in Annex D.</u>

Substantiation: The language developed by CMP-6 does not adequately address multifamily dwellings and is somewhat confusing. The proposed language is clearer and easier to understand.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Comment 6-52.

Ballot Results: Affirmative: 9 Negative: 1

Explanation of Negative:

STACEY, J.: The panel action should have been "Reject." See my comments on 6-41 and 6-52

6-52 Log #1428 NEC-P06 **Final Action: Accept in Principle**
(310.15(B)(7))

Submitter: Christel K. Hunter, Alcan Cable, a General Cable Company

Comment on Proposal No: 6-49a

Recommendation: Replace the language in 310.15(B)(7) with the following:

<u>(7) **120/240 Volt, Single-Phase Dwelling Services and Feeders.** For one-family dwellings and the individual dwelling units of two-family and multifamily dwellings, service and feeder conductors supplied by a single phase, 120/240-volt system shall be permitted be sized in accordance with 310.15(B)(7)(a) through (c).</u>

<u>(a) For a service rated 100 through 400 amperes, the service conductors supplying the entire load associated with a one-family dwelling or the service conductors supplying the entire load associated with an individual dwelling unit in a two-family or multifamily dwelling shall be permitted to have an ampacity not less than 83% of the service rating.</u>

<u>(b) For a feeder rated 100 through 400 amperes, the feeder conductors supplying the entire load associated with a one-familydwelling or the feeder conductors supplying the entire load associated with an individual dwelling unit in a two-family or multifamily dwelling shall be permitted to have an ampacity not less than 83% of the feeder rating.</u>

<u>Exception: In no case shall a feeder originating at the service equipment be required to have an ampacity greater than that of the service conductors supplying a one-family dwelling or an individual dwelling unit of a two-family or multifamily dwelling.</u>

<u>(c) Grounded conductors shall be permitted to be sized smaller than the ungrounded conductors provided the requirements of 220.61 and 230.42 for service conductors or the requirements of 215.2 and 220.61 for feeder conductors are met.</u>

<u>Informational No. 1: The conductor ampacity may require other correction or adjustment factors applicable to the conductor installation.</u>

<u>Informational No. 2: See example DXXX in Annex D.</u>

Substantiation: The panel proposal goes a long way toward addressing the difficulties in application this code allowance has generated over the last few years. CMP-6 Chairman Scott Cline came up with the idea to provide a simple multiplier and accompanying language that would allow this code section to remain in effect, while also addressing concerns raised since the original language and table did not allow for applications where the service entrance and feeder conductor ampacities might need to be adjusted for temperature or number of conductors. After further review of the language, the proposed

language is submitted to further clarify the requirements and to address the inadvertent exclusion of feeders to individual units in multifamily buildings.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:

(7) **120/240 Volt, Single-Phase Dwelling Services and Feeders.** For one-family dwellings and the individual dwelling units of two-family and multifamily dwellings, service and feeder conductors supplied by a single phase, 120/240-volt system shall be permitted be sized in accordance with 310.15(B)(7)(a) through (d).

(a) For a service rated 100 through 400 amperes, the service conductors supplying the entire load associated with a one-family dwelling or the service conductors supplying the entire load associated with an individual dwelling unit in a two-family or multifamily dwelling shall be permitted to have an ampacity not less than 83% of the service rating.

(b) For a feeder rated 100 through 400 amperes, the feeder conductors supplying the entire load associated with a one-family dwelling or the feeder conductors supplying the entire load associated with an individual dwelling unit in a two-family or multifamily dwelling shall be permitted to have an ampacity not less than 83% of the feeder rating.

(c) In no case shall a feeder for an individual dwelling unit be required to have an ampacity greater than that of its 310.15(B)(7)(a) or (b) conductors.

(d) Grounded conductors shall be permitted to be sized smaller than the ungrounded conductors provided the requirements of 220.61 and 230.42 for service conductors or the requirements of 215.2 and 220.61 for feeder conductors are met.

Informational Note No. 1: It is possible that the conductor ampacity will require other correction or adjustment factors applicable to the conductor installation.

Informational Note No. 2: See example DXXX in Annex D.

Panel Statement: CMP-6 accepts the submitter's text but modifies the exception to become new (B)(7)(c).

CMP-6 edits Informational Note No. 1 to delete "may."

Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:

STACEY, J.: The panel action should have been "Reject". Table 310.15(B)(7) should stay in place. There where no request from the public to turn this table into a calculation. There is no proof of any failures or deficiencies with the table. It appears that the new text part (c) is in conflict with note Info Note 1.

See my comments on 6-41 and 6-45.

Comment on Affirmative:

KENT, G.: Although deletion is the proper action but does not appear to have the support of the committee, this option at least offers some clarity to the wording.

6-53 Log #1558 NEC-P06 **Final Action: Accept in Principle**
(310.15(B)(7))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 6-49a
Recommendation: Accept the proposal in principle. Revise text to read as follows:

For service or feeder conductors of 120/240-volt single phase systems rated 100 through 400 amperes and used to supply all loads that are part of or associated with an individual dwelling unit of a single-family, two-family, or multifamily dwelling, an adjustment factor of 0.83 shall be permitted to be applied to the service or feeder ampere rating for the purpose of determining the size of the ungrounded conductors.

Substantiation: This is a largely editorial comment that flows better and resolves the problem that the panel text refers to two-family and multi-family service ratings, and often the relevant rating will not be a service rating but a feeder rating instead. Although not intended, the panel text does support an interpretation that this provision applies to a multifamily service rating, since the individual dwelling unit rating in such an occupancy would be supplied by a feeder and would not have a "service rating". The comment also retains the important concept that the provision only applies to conductors that see the entire load and therefore benefit from the diversity present is such a load.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 6-52.

6-57 Log #1594 NEC-P06 **Final Action: Reject**
(310.15(B)(7))

Submitter: Scott Cline, Monterey Park, CA
Comment on Proposal No: 6-49a
Recommendation: Add an Informational Note and Annex item as follows:
Informational Note No. 4: See example DXXX in Annex D.
The example would show a restructured form of the 2011 Table 310.15(B)(7). Its content would be:
Example DXXX : Partial listing of possible conductor AWG or kcmil sizes for 310.15(B)(7) applications, showing only 75°C (167°F) conductors, under conditions of installation which do not require any other adjustments.
The Table's title and title heading would be unused. Only the portion of the existing Table 310.15(B)(7) below the double line would be used, and one column heading must be edited: the heading of the first column would need to have "or Feeder" deleted since the relationship is always to the "Service Rating" even for feeders. It should read "Service Rating (Amperes)" The rest of the Table to be used as-is.
Substantiation: The purpose would be as a helpful transition from the Table method to 6-49a's easier adjustment factor method. The Info Note and Annex could be removed after a couple of cycles.
The wording "AWG or kcmil" are used purposely instead of "size" to avoid the ambiguity of the term "size" as it relates to conductors. Does "size" mean "physical size" or "ampacity"?
Panel Meeting Action: Reject
Panel Statement: The addition of the table will add more confusion than clarity.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
WALL, C.: Inclusion of a table adds clarity and usability. Inclusion of a table in the example along with a reference to 310.15(B)(7) new informational note 1, added by comment 6-52, would make note of the need to consider adjustment factors.
Comment on Affirmative:
LAIDLER, W.: The panel was correct in the action to include an example in the annex to provide the code user a reference to apply the revised code language to 310.15(B)(7). This 83% permitted adjustment factor for the services and feeders described in 310.15(B)(7) is simply a conversion of the 2011 Table 310.15(B)(7). This action was taken to ensure that conductors that are being installed with the permitted 83% adjustment factor are still subject to the correction and adjustment factors required in Article 310. The panel made a commitment to remove the table from 310.15(B)(7) for the 2014 NEC and the inclusion of the table or any resemblance to the table is in conflict with that action.

6-58 Log #589 NEC-P06 **Final Action: Accept in Principle**
(310.15(B)(7), Informational Note 2)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 6-49a
Recommendation: Revise text to read as follows:
310.15 Ampacities for Conductors Rated 0–2000 Volts.
(B) Tables.
(7) 120/240 Volt, Single-Phase Dwelling Services and Feeders.
Informational Note No. 2: See example D~~XXX~~ <correct reference> in Annex D.
Substantiation: I was unable to find a reference to 6-49a in Annex D.
Panel Meeting Action: Accept in Principle
Panel Statement: CMP-6 directs the submitter to the A2013 ROP Draft Annex D7, Page 70–857. The A2013 ROP Draft is correct.

6-59 Log #1593 NEC-P06 **Final Action: Reject**
(310.15(B)(7), Informational Note 3 (New))

Submitter: Scott Cline, Monterey Park, CA
Comment on Proposal No: 6-49a
Recommendation: Add an Informational Note No. 3:
Informational Note No. 3: Section 310.15(B)(7) excludes 208Y/120-Volt systems (single or three phase) due to the additional heat from the presence of a third current carrying conductor.
Substantiation: I realize that the NEC is not a design manual, but this issue is so often misunderstood that it seems worth the print space to help assure that AHJs have proper and easy tools to use, and to help avoid all the repeated proposals and comments.
Panel Meeting Action: Reject
Panel Statement: The submitter's text does not add clarity.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
CLINE, S.: In opposition to the Panel's action:
This Comment should have been accepted.
I believe that without a note such as this, incorrect interpretations by AHJs and installers applying this section for 208Y/120-Volt derived systems will continue.
I believe that it is a disservice to the usability of the users of the NEC to not have this added Informational Note. Over and over again, NFPA get requests to edit this section to include the 208Y/120-Volt systems, and we hear of or read about people who are sure that the section applies to 208Y/120-Volt Single Phase systems as if they were the same.
People are constantly confused by this seeming inconsistency. They do not think of, or they do not comprehend, the physics differences between the two systems.

6-60 Log #1120 NEC-P06 **Final Action: Accept**
(Table 310.15(B)(21))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 6-64
Recommendation: Continue to Reject the Proposal.
Substantiation: The submitter has failed to provide sufficient technical justification for the Proposal. A fact finding report that demonstrates that this product is suitable for the proposed application has not been provided. There is no indication how one would determine whether the conductor is 30% or 40% conductivity material. In addition, there is no indication that terminals on equipment are designed, tested and suitable for terminating copper-clad steel conductors.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

6-61 Log #833 NEC-P06 **Final Action: Accept**
(310.15(C))

Submitter: Robert Huddleston, American Chemistry Council
Comment on Proposal No: 6-66
Recommendation: Accept proposal 6-66 as worded by the submitter.
Substantiation: This proposal should have been accepted by the Panel. The equation shown under 310.15(C) has units shown for Tc and Ta, and yet there are no units shown for Rdc. The units submitted with this proposal are correct. The Panel should include these units, or should completely eliminate the equation from the text of the Code, as without the units it is basically useless.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

6-62 Log #98 NEC-P06 **Final Action: Accept**
(310.60(C)(1))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 6-68
Recommendation: The Correlating Committee directs that the panel clarify the panel action on this proposal, and notes that the first sentence is not written in mandatory language as required by the NEC Style Manual.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise text to read as follows:
(1) **Grounded Shields.** Ampacities shown in Table 310.60(C)(69), Table 310.60(C)(70), Table 310.60(C)(81), and Table 310.60(C)(82) shall apply for cables with shields grounded at one point only. Where shields for these cables are grounded at more than one point, ampacities shall be adjusted to take into consideration the heating due to shield currents.
Informational Note: Tables other than those listed contain the ampacity of cables with shields grounded at multiple points.
Panel Statement: CMP-6 accepts the direction of the Correlating Committee to clarify the panel action on Proposal 6-68. CMP-6 adds an informational note for clarity.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

6-63 Log #716 NEC-P06 **Final Action: Accept**
(310.104)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 6-70
Recommendation: Continue to Accept in Principle.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.
The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for

uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

6-64 Log #834 NEC-P06 **Final Action: Accept in Part**
(310.104)

Submitter: Robert Huddleston, American Chemistry Council
Comment on Proposal No: 6-71
Recommendation: Delete Informational Note at end of 310.104.
Substantiation: This proposal should have been accepted in principal by the Panel. The submitter is correct in that electroendosmosis is not the correct word to describe the phenomenon in question. However, this Informational Note is not worthy of inclusion in the NEC as it does nothing to assist users of the Code in their application, and describes a very atypical circumstance that the vast majority of Code users will never experience. The Informational Note should be deleted completely.
Panel Meeting Action: Accept in Part
Panel Statement: CMP-6 accepts retaining part of the informational note. CMP-6 does not accept deletion of the first two sentences of the informational note. CMP-6 affirms that the first two sentences are still valid and useful for users of the code.

See panel action and statement on Comment 6-65.

Ballot Results: Affirmative: 10

6-65 Log #1429 NEC-P06 **Final Action: Accept**
(310.104)

Submitter: Christel K. Hunter, Alcan Cable, a General Cable Company
Comment on Proposal No: 6-71
Recommendation: Revise text to read as follows:
310.104 Conductor Constructions and Applications.
Insulated conductors shall comply with the applicable provisions of Table 310.104(A) through Table 310.104(E).
Informational Note: Thermoplastic insulation may stiffen at temperatures lower than -10°C (+14°F). Thermoplastic insulation may also be deformed at normal temperatures where subjected to pressure, such as at points of support. ~~Thermoplastic insulation, where used on dc circuits in wet locations, may result in electroendosmosis may result in the migration of plasticizer between the conductor and insulation. Equipment exposed to conductor terminations should be compatible with plasticizer.~~
Substantiation: This last part of this informational note does not provide useful information. There is controversy about the effects of both electroendosmosis and plasticizer migration, and this note does not provide any actionable information to the users of the Code. Instead, it is likely to lead to more questions and confusion.

Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

6-66 Log #145 NEC-P06 **Final Action: Accept**
(Table 310.104(A))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 9-15h
Recommendation: The Correlating Committee understands that the panel action in this proposal incorporates the modified definition of "Metal Enclosed Power Switchgear" to "Switchgear" in Proposal 9-7.

It was the action of the Correlating Committee that this proposal be referred to Code-Making Panel 6 for action.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: CMP-6 accepts the direction of the Correlating Committee to review and consider. CMP-6 agrees with the action of the addition of "and switchgear" in Table 310.104(A).
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

ARTICLE 312 — CABINETS, CUTOUT BOXES, AND METER SOCKET ENCLOSURES

9-22 Log #1559 NEC-P09 **Final Action: Accept**
(312.5(C) Exception (g))

TCC Action: The Correlating Committee understands that the panel statement on this comment erroneously renamed from the preliminary panel discussion. The TCC directs that the phrase "where installed as conduit or tubing" be left in the final text for this subsection.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 9-24
Recommendation: Accept the proposal in principle. Revise text to read as follows:

(g) Where installed as conduit or tubing, the ~~allowable~~ cable fill does not exceed <u>the amount</u> that <u>would be</u> permitted for complete conduit or tubing systems by Table 1 of Chapter 9 of this Code and all applicable notes thereto.

Substantiation: This exception was never intended to apply to a conventional raceway system that is complete from box to box, etc. The basic rule is that every cable must have its own direct connection to the cabinet. The exception applies only to a method of bringing multiple cables into the cabinet without those individual connections. The requirements then constrain this permission in a number of ways, including a raceway fill limitation that is more severe than the usual Table 1 Note 2 permission to stuff a raceway cable sleeve to the limits of its physical capacity. The revision suggested in this comment, by making the reference to complete systems subjunctive, clarifies that item (g) does not imply that the cable sleeve covered in the exception is a complete system. The word "allowable" is deleted as redundant because the limitation is simply one on actual fill.
Panel Meeting Action: Accept
Panel Statement: Accept the changes proposed by the submitter and delete the following text: "Where installed as conduit or tubing". This portion of the text is not clear. It leads the reader to believe that the installation described in "g" is somehow different than described in "a through f". Since all of the conditions of the must be met in order to use the installation described in the exception the installation must be the same.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Coghill, P.
Comment on Affirmative:

HARTWELL, F.: The reported panel action conflicts with the reported panel statement, which would support a action to accept in principle. The panel first entertained a motion to accept in principle with the introductory part of the sentence deleted, but finally changed the action to a straight accept, in part because the various allowable "nonflexible raceways" include non-circular raceways such as surface metal raceways. Apparently the panel statement for the accept in principle erroneously remained in the staff report even though the Final Action was to accept. This could easily happen because no statement is required for a motion to accept, and the panel had moved on at this point.

OSBORNE, R.: The panel statement is not reflective of the panel's action to

"Accept". While there was discussion to remove the noted text, the decision to proceed with the text as presented in Comment 9-22 was the point of final agreement.

9-23 Log #723 NEC-P09 **Final Action: Accept**
(312.11(A)(3))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 9-27
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

FERRARO, J.: It is recognized that increasing voltage from 600 volts to 1000 volts may be applicable to specific installations. However, adequate technical substantiation has not been provided to support the change in this Article.

ARTICLE 314 — OUTLET, DEVICE, PULL, AND JUNCTION BOXES; CONDUIT BODIES; FITTINGS; AND HANDHELD ENCLOSURES

9-24 Log #1282 NEC-P09 **Final Action: Reject**
(314, 404, 408, and 490)

Submitter: Elliot Rappaport, Electro Technology Consultants
Comment on Proposal No: 9-29
Recommendation: Accept proposal.
Substantiation: The Panel Statement indicates that the issue is one of education and not terminology. When the terminology does not reflect the core requirement, then education becomes difficult.

The term "equipment grounding conductor" has a definite purpose that is not uniquely expressed in the term, i.e. "bond the equipment to a terminal at the source of voltage". As a result, there is a misconception that "grounding", without bonding to the source, will make a system safe. On the contrary, connecting equipment to ground without providing the bonding connection back to the source can make equipment less safe by increasing the time to clear the fault.

There is generally insufficient significance placed on the importance of bonding over grounding. Bonding provides sufficient ground fault current back to the source of voltage to operate an overcurrent device and clear the fault quickly. Connection to ground limits the voltage to ground on normally non-current-carrying parts during non-fault conditions. During fault conditions, the value of grounding is minimal since the primary safety concern is to remove the fault voltage as quickly as possible. A path to ground for fault current is not necessary since ground fault current must return to the source of voltage, not to ground.

Renaming this conductor as an "Equipment Bonding Conductor (EBC)" will clarify that the primary purpose of this conductor is to bond to the source in order to provide a known path for ground fault current that will facilitate rapid fault clearing.

It is recognized that the term "EGC" has been in use for a long time and that changing it to EBC will cause some concerns including changing written literature that uses the EGC term. After the initial period of understanding, users will correctly understand the purpose of this conductor and this will enhance the safety of personnel.

Reference to a "nightmare of revisions and changes" is not appropriate where safety is concerned. Documents need only be changed when revisions become necessary. Having the bonding conductor connected to the ground rather than to the source, as implied by the terminology, is a safety issue that is not "thoroughly ingrained" as witnessed by the number of questions raised at inspectors' code sessions and code classes.

The fundamental purpose of this and companion proposals is to clearly state that "systems" are "grounded" and "equipment" is "bonded". The fact that the bonding conductor may be grounded also is secondary to the primary function of bonding.
Panel Meeting Action: Reject
Panel Statement: The submitter suggests that there is a misconception in the industry as to the purpose of equipment grounding conductors, due to the words used in the NEC, without providing any substantive proof or evidence. This debate has been recently completed with no desired change as a result. Proper education of the installer will prove worthy over a modification of terms in the NEC. The panel concludes that CMP 5 should take the lead on this issue.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 9 Negative: 2
Ballot Not Returned: 1 Coghill, P.
Explanation of Negative:

SENGUPTA, S.: The submitter's substantiation clearly addresses the requirement of a conductor to provide an effective ground fault current path. Equipment Bonding Conductor (EBC) establishes the path for fault clearance.

YOUNG, R.: The term "equipment grounding conductor" should be replaced with the term "equipment bonding conductor" throughout the NEC - it's a better definition of what is being done. The definition in Art 100 would have to be changed. This conductors purpose is primarily a bonding function and should be described as such. We need to moved towards wording used by the international community and that also will be better understood by those who are new to the electrical industry where the use of these existing terms can be confusing. There has been been no technical reason for rejecting this change. This conductor has always provided a bonding function but does not necessarily always provide a grounding function (such as in the case of a portable generator installed on a separately derived system).

9-25 Log #1252 NEC-P09 **Final Action: Reject**
(314.15)

Submitter: John Masarick, Independent Electrical Contractors, Inc.
Comment on Proposal No: 9-32
Recommendation: I recommend the following changes be made to article 314.15 for the issue described in proposal 9-32.
314.15 Damp or Wet Locations. In damp ~~or wet~~ locations, <u>drainage openings not larger than 6 mm (1/4 in.) shall be permitted to be installed in the field in accordance with the manufacturer's instructions. In wet locations,</u> boxes, conduit bodies, and fittings shall be placed or

equipped so as to prevent moisture from entering or accumulating within the box, conduit body, or fitting. Boxes, conduit bodies, and fittings installed in wet locations shall be listed for use in wet locations.
Substantiation: Article 314.15 as it presently stands is very confusing and misleading. When a product is tested by a testing laboratory there is a very different interpretation for "Suitable for Damp Locations" and Suitable for "Wet Locations" Currently article 314.15 appears to treat both damp and wet the same.
Panel Meeting Action: Reject
Panel Statement: The comments suggests drainage openings are only relevant to damp locations, and concerns related to locating or placing boxes, conduit bodies, and/or fittings to prevent moisture from entering or accumulating is only relevant to wet locations. While damp and wet locations are different environments, each require consideration to concerns related to drainage and selection and placement of boxes, conduit bodies, and fittings. The application of these requirements to both damp and wet locations is appropriate.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Coghill, P.

9-26 Log #1560 NEC-P09 **Final Action: Accept in Principle**
(314.15)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 9-35
Recommendation: Accept the proposal wording in principle. Revise text to read as follows:
In damp or wet locations, boxes, conduit bodies, and fittings shall be placed or equipped so as to prevent moisture from entering or accumulating within the box, conduit body, or fitting. <u>Approved drainage openings not larger than 6 mm (¼ in.) shall be permitted to be installed in the field.</u> Boxes, conduit bodies, <u>outlet box hoods,</u> and fittings installed in wet locations shall be listed for use in wet locations.
Substantiation: The panel action is too restrictive. Very few manufacturers adequately address field condensation issues with instructions that will comply with the provision as CMP 9 worded it. However, some control may be needed. This comment adds a requirement to install in "approved" locations, thereby requiring an express finding on the part of the inspector. It is strongly suggested that NEMA companies and testing laboratories review instructions and relevant product standards in this area. After, say two cycles, this topic could then be revisited and the "approved" parameter could be changed to match the ROP wording. Anyone who has opened an outdoor aluminum threaded box and seen the effects of standing water (from condensation and not from inadequate sealing) within understands the necessity for practical relief now, instead of waiting for instructions to catch up to this. CMP 9 did the right thing in the 1996 cycle when it expressly allowed this practice and should do so again. This comment includes the outlet box hood wording accepted as part of proposal 9-33 for completeness.
Panel Meeting Action: Accept in Principle
Revise the wording to read as follows:
"In damp or wet locations, boxes, conduit bodies, and fittings shall be placed or equipped so as to prevent moisture from entering or accumulating within the box, conduit body, or fitting. Boxes, conduit bodies, outlet box hoods, and fittings installed in wet locations shall be listed for use in wet locations. <u>Approved drainage openings not larger than 6 mm (1/4 in.) shall be permitted to be installed in the field in boxes or conduit bodies listed for use in damp or wet locations. For installation of listed drain fittings, larger openings are permitted to be installed in the field in accordance with manufacturer's instructions."</u>
Panel Statement: CMP-9 accepts the submitter's revision to requirement text but determined the new text should be placed at the end of the section and added the text "in boxes or conduit bodies for use in damp and wet locations". This ensures that holes are not drilled in listed fittings and listed outlet box hoods. There is no substantiation provided for allowing such openings to be drilled in listed fittings and listed outlet box hoods. This would introduce many more variables that would need further consideration. An additional statement was added for Listed drain fittings which may require larger holes according to manufacturer's instructions. Drain fittings have been customized for use in certain installations, such as the food and beverage industry, that cannot permit moisture to simply drain out of a box. It must be drained away to a suitable location. When such a fitting is used, limiting the opening hole size to 6mm (1/4 in.) can result in too much constriction that would inhibit flow.

(314.16(B)(4))

Submitter: Jericho Housman, SD Housing Development Authority
Comment on Proposal No: 9-38
Recommendation: Revise text to read as follows:
For each yoke or strap containing one or more devices or equipment, a double volume allowance in accordance with Table 314.16(B) shall be made for each yoke or strap based on largest conductor connected to a device(s) or equipment supported by that yoke or strap.
<u>Where a Ground-Fault Circuit Interrupter receptacle device is used, a triple volume allowance in accordance with Table 314.16(B) shall be made based on largest conductor connected to device.</u>
Substantiation: The existing language is modified to eliminate box over-fill based on the large size of the Ground-Fault Circuit Interrupter receptacle device(s).
Panel Meeting Action: Reject
Panel Statement: The double volume allowance placed in the NEC in the 1990 cycle was originally intended to only apply to dimmers and ground-fault receptacles. However, subsequent discussion substantiated that the final device installed in a box was often determined after the rough inspection and final wall finish was complete. Therefore the decision was made to make the allowance apply generally. The substantiation in this proposal, and in countless other similar proposals over the years, supports the concept of a single allowance for all but certain devices, as was originally proposed in the 1987 cycle. It does not support a triple allowance for devices.

9-31 Log #1166 NEC-P09 **Final Action: Reject**
(314.17(E))

Submitter: Carlo Compagnone, Jr., Compa Covers, Inc.
Comment on Proposal No: 9-41
Recommendation: This proposal should be accepted.
Substantiation: The NEC contains provisions for protecting the wiring at all points of vulnerability throughout the construction process. Blatantly, however, the NEC fails to ensure the integrity of the wiring once it reaches the outlet box. At this point, wires sit exposed for months, while various tradesmen work, subjecting the wiring in the outlet boxes to damage from plaster, power routers, insulation and paint contamination. This is a problem that must be addressed by the NEC with specificity that includes a mandatory provision for protecting wiring within the electrical outlet box.

The Panel statement acknowledges the vulnerability of electrical equipment during the construction phase and the need to protect this equipment. The Panel states that the focus should be on compliance of the final installation, and not on how to protect this vulnerable electrical equipment, however this proposal is not in regard to equipment- it is in regard to the unprotected wiring inside the outlet box.

While there are broad provisions contained in the NEC for safequarding all electrical equipment and connections from damage and contamination, these provisions are not specific enough. For instance, Section 110.12, which provides that the equipment must be installed in a "neat and workmanlike manner," and states that 'there shall be no damaged parts that may adversely affect safe operation or mechanical strength of the equipment...." The concept that electrical equipment be neat and workmanlike is unenforceable, and ultimately meaningless. In addition, despite its use of the word "equipment," Section 110.12 is not broad enough to address the concerns raised in Proposal 9-41. Nowhere in Section 110.12 is there a reference to wiring or the protection of wiring within electrical outlet boxes during the construction phase. The section only refers to equipment, including, "busbars, wiring terminals, insulators, and other surfaces...." It is not enough to assume Section 110.12 requires the protection of wiring in electrical boxes.

The concept of providing specific solutions for the protection of wiring is not foreign to the NEC, which mandates prescriptive requirements upon all areas of the wiring, except for wiring within the electrical outlet box. For example, Article 300 provides for very detailed methods of safeguarding cables which are subject to damage during the construction phase. Article 300.4 requires the installation of a nail plate where cable wiring is subject to nail or screw penetration. Article 300.4(B)(1) requires installation of bushings or grommets on all metal edges of punched out or factory-installed holes. If an electrician does not meet these Code requirements, wires are damaged and the inspection is deemed a failure.

The Panel indicates that they do not want inspectors to go out of their way during inspections, showing more concern for the comfort of the inspector than for safety. The Panel completely disregards the actual practice of inspectors, who do not inspect each and every box. Unless there is a specific method imposed for protecting the interior of the electrical box, there will continue to be safety issues.

In essence, the Panel is simply hoping for the best, rather than requiring it. Unfortunately, in reviewing the statistics, this is not good enough. Specifically, many home fires arise from faulty premises wiring group equipment resulting from damage to wiring within the electrical outlet box. According to statistics provided by the national Fire Protection Association ("NFPA"), there was no improvement over three (3) years relative to non-confined home structure fires. In 2006, there were 16,380 reported U.S. non-confined home structure fires, with 145 civilians dead and 458 civilians injured. (Please see "Home Electrical Fires," John R. Hall, Jr., March 2009, National Fire Protection Association) In 2009, there were 13,080 reported U.S. non-confined home structure fires, with 113 civilian deaths and 438 civilians injured. (Please see "Home Electrical Fires," John R. Hall, Jr., January 2012, National Fire Protection Association) Despite the decrease in the number of reported non-confined home structure fires, just 32 less civilian deaths and 20 less civilian injuries were reported.

In leaving this area of the NEC open to interpretation, with no specific mandate for how to protect the integrity of the electrical wiring within the outlet box during construction, the NEC simply fails to safeguard persons and property. This is unacceptable.

9-32 Log #1373 NEC-P09 **Final Action: Accept**
(314.28(A)(3))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 9-67
Recommendation: Accept the panel action but replace the text for clarity and editorially revise the entire subsection:
(3) Smaller Dimensions. Listed ~~B~~boxes or listed conduit bodies of dimensions less than those required in 314.28(A)(1) and (A)(2) shall be permitted for installations of combinations of conductors that are less than the maximum conduit or tubing fill (of conduits or tubing being used) permitted by Table 1 of Chapter 9~~,~~. ~~provided the box or conduit body has been listed for, and is permanently marked with, the maximum number and maximum size of conductors permitted.~~
~~The conductor fill for listed conduit bodies of dimensions less than those required in 314.28(A)(2) and having a radius of the curve to the centerline not less than as indicated in Table 2, Chapter 9 for one shot and full shoe benders shall be limited only to Table 1 Chapter 9 as applied to entering raceways. These conduit bodies shall be marked to show they have been specifically evaluated in accordance with this provision.~~
Listed conduit bodies of dimensions less than those required in 314.28(A)(2) having a radius of the curve to the centerline not less than as indicated in Table 2, Chapter 9 for one shot and full shoe benders, shall be permitted for installations of combinations of conductors permitted by Table 1 of Chapter 9. These conduit bodies shall be marked to show they have been specifically evaluated in accordance with this provision.
Where the permitted combinations of conductors for which the box or conduit body has been listed are less than the maximum conduit or tubing fill permitted by Table 1 of Chapter 9, the box or conduit body shall be permanently marked with the maximum number and maximum size of conductors permitted.
Substantiation: The text proposed by the panel action is difficult to interpret and may introduce unintended confusion.
The term "conductor fill", if introduced into this Section could create confusion with the requirement in Section 314.16(B)(1). The term "combinations of conductors" is used in the present text of 314.28(A)(3) and is appropriate as the subject for this new text.
Use of the strong terminology "shall be limited only by", could be interpreted as precluding the requirement in 314.16(B)(1) for these conduit bodies. The qualifier "as applied to entering raceways" does not sufficiently mitigate the risk of potentially widespread misinterpretation.
Finally, the panel's action eliminated, without explanation, the important provision that relieves conduit bodies having this provision from the marking requirement included in the present text. The recommended text maintains the present requirement for conduit bodies without this unique provision and editorially isolates its application in order to avoid the potential for misinterpretation that that marking applies in all cases of conduit bodies having smaller dimensions.

9-33 Log #725 NEC-P09 **Final Action: Accept**
(314.30(A))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 9-68
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

Panel Meeting Action: Accept

Ballot Not Returned: 1 Coghill, P.
Explanation of Negative:

FERRARO, J.: It is recognized that increasing voltage from 600 volts to 1000 volts may be applicable to specific installations. However, adequate technical substantiation has not been provided to support the change in this Article.

ARTICLE 320 — ARMORED CABLE: TYPE AC

7-1 Log #1280 NEC-P07 **Final Action: Reject**
(320 through 340, and 396)

Submitter: Elliot Rappaport, Electro Technology Consultants
Comment on Proposal No: 7-19
Recommendation: Accept proposal.
Substantiation: The Panel Statement refers to the "accuracy to the intended functionality of the circuit". The term "equipment grounding conductor" cannot represent accuracy of the function of the conductor because "grounding" is not its primary function.

The term "equipment grounding conductor" has a definite purpose that is not uniquely expressed in the term, i.e. "bond the equipment to a terminal at the source of voltage". As a result, there is a misconception that "grounding", without bonding to the source, will make a system safe. On the contrary, connecting equipment to ground without providing the bonding connection back to the source can make equipment less safe by increasing the time to clear the fault.

There is generally insufficient significance placed on the importance of bonding over grounding. Bonding provides sufficient ground fault current back to the source of voltage to operate an overcurrent device and clear the fault quickly. Connection to ground limits the voltage to ground on normally non-current-carrying parts during non-fault conditions. During fault conditions, the value of grounding is minimal since the primary safety concern is to remove the fault voltage as quickly as possible. A path to ground for fault current is not necessary since ground fault current must return to the source of voltage, not to ground.

Renaming this conductor as an "Equipment Bonding Conductor (EBC)" will clarify that the primary purpose of this conductor is to bond to the source in order to provide a known path for ground fault current that will facilitate rapid fault clearing.

It is recognized that the term "EGC" has been in use for a long time and that changing it to EBC will cause some concerns including changing written literature that uses the EGC term. After the initial period of understanding, users will correctly understand the purpose of this conductor and this will enhance the safety of personnel.

The fundamental purpose of this and companion proposals is to clearly state that "systems" are "grounded" and "equipment" is "bonded". The fact that the bonding conductor may be grounded also is secondary to the primary function of bonding.
Panel Meeting Action: Reject
Panel Statement: The primary purpose of an equipment grounding conductor is to provide that primary path for fault current in case of a ground fault but can have a secondary purpose to also provide some bonding of the metal. The primary and most important part of the equipment grounding conductor, as evidenced by the sizing requirements in 250.134(A), 250.118, and 250.122, is to provide an appropriately sized conductor so a ground fault will trip the overcurrent protective device.

CMP-7 agrees with the submitter that "equipment bonding conductor" is technically correct, particularly in an ungrounded system. However, CMP-5 has jurisdiction over this term and has rejected the change.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:

NIELSEN, D.: The IEEE agrees with the panel statement that the prime purpose of this conductor is equipment bonding to allow overcurrent devices to operate during a ground fault condition. This panel with qualified and knowledgeable personnel has very astutely recognized what other panels missed. The responsibility of CMP7 is to state or to provide an official statement to CMP5 recommending this change.

RUNYON, G.: The term "equipment grounding conductor" needs to be replaced with "equipment bonding conductor" throughout the NEC. Yes, the term equipment grounding conductor in Article 100 would need to be changed to the term equipment bonding conductor.
Some have argued that it is just a problem of education. Having the word "grounding" in a term describing conductor that is used primarily for a bonding function is not a problem to be solved by education.
The use of the term "equipment grounding conductor" is confusing both for those new to the electrical industry and even for some experienced users. The problem is compounded when dealing with other international standards.
No technical reason has been provided for not making the change. This conductor always provides a bonding function but does not always provide a grounding function such as in the case of a portable generator installed as a separately derived system.
The panel acknowledged that this is technically correct, but rejected it because Panel 5 had not accepted it.

7-2 Log #1237 NEC-P07 **Final Action: Reject**
(320.108, 324.56(B), 324.60, 330.108, 332.108, 334.15(C), 334.108, 335.10(7), 340.10(2), 340.108, 342.2, and 342.60)

Submitter: Gregory L. Runyon, American Chemistry Council
Comment on Proposal No: 7-19
Recommendation: Revise text to read as follows:
"equipment ~~grounding~~ <u>bonding</u> conductor"
Substantiation: The term Equipment Grounding Conductor needs to be replaced. Those opposed have no technical reason for their opposition or any other valid reason. "It is not worth the effort" and "everyone understands what is meant" are common responses to this change.
It is very simple: Grounding electrode conductors are the connection to the earth and accomplish grounding. In the present NEC, Equipment Grounding Conductors and bonding jumpers provide a "path back" to the source. Both are always performing a bonding function. If the Grounding Electrode connection is removed or broken, the bonding function remains intact.
Section 250.4 does not permit the earth (ground) to be used as an effective ground fault current path but the term equipment grounding conductor inherently incorrectly contains the word "ground".
Visualize equipment supplied by a portable generator. The generator frame is not required to be connected to the earth. The "green" wire in the flexible cord is not performing a grounding function but is performing a bonding function.
Visualize building one supplied by a service, having the grounded conductor connected to the grounding electrode system by a grounding electrode conductor. A feeder supplies a second building and a grounding electrode conductor is required for grounding any equipment in the second building. An equipment grounding conductor is required to be installed from building 1 to building 2. Not for grounding, but for bonding, providing an effective fault current path.
Making this change has the added benefit of being more harmonized with other international standards and usage of terminology.
Experienced NEC users have to ignore other concepts in other definitions and requirements to use the existing term. This does not help the future NEC user or provide clarity in the existing NEC. Changing the term is the right thing to do and should be supported.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 7-1.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:

NIELSEN, D.: See my statement on 7-1.

RUNYON, G.: See comment on 7-1.

ARTICLE 324 — FLAT CABLE CONDUCTOR: TYPE FCC

7-3 Log #467 NEC-P07 **Final Action: Accept in Principle**
(324.2.FCC System)

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 7-22
Recommendation: Revise text to read as follows:
FCC System. A complete wiring system for branch circuits that is designed for installation under carpet squares. ~~The FCC~~ <u>Such a</u> system includes Type FCC cable and associated shielding, connectors, terminators, adapters, boxes, and receptacles.
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains the defined term and the NEC manual of style does not permit the definition to contain the defined term. Definitions are not requirements. The proposed changes eliminate the defined term. An alternative, if CMP 7 believes this is a requirement is to place the information somewhere else in Article 324, where it would serve as a valid requirement.
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Alternate approach, could be as follows (by eliminating the second sentence):
<u>**Informational Note:** The FCC system includes Type FCC cable and associated shielding, connectors, terminators, adapters, boxes, and receptacles.</u>
Panel Meeting Action: Accept in Principle

Revise text to read as follows:
FCC System. A complete wiring system for branch circuits that is designed for installation under carpet squares. ~~The FCC system includes Type FCC cable and associated shielding, connectors, terminators, adapters, boxes, and receptacles.~~

<u>**Informational Note:** The FCC system includes Type FCC cable and associated shielding, connectors, terminators, adapters, boxes, and receptacles.</u>
Panel Statement: CMP-7 agrees with the submitter that definitions should not include requirements. CMP-7 relocates the second sentence of the definition to an informational note. CMP-7 notes that this complies with the 2011 NEC Style Manual, Section 2.2.2.2.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 330 — METAL-CLAD CABLE: TYPE MC

7-4 Log #941 NEC-P07 **Final Action: Reject**
(330.2(A)(11)(c))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 7-26a
Recommendation: Revise text to read as follows:
330.10 Uses Permitted.
(A) General Uses. Type MC cable shall be permitted as follows:
(11) In wet locations where a corrosion resistant jacket is provided over the metallic covering and any of the following conditions are met: **[ROP 7–27]**
a. The metallic covering is impervious to moisture.
b. A jacket resistant to moisture is provided under the metal covering. **[ROP 7–27, ROP 7–26a]**
c. The insulated conductors under the metallic covering are ~~listed~~ <u>suitable</u> for use in wet locations. **[ROP 7–27, ROP 7–26a]**
Substantiation: It is not clear to me that the conductors in MC cable are separately listed apart from the cable. The same situation exists for NM cable for sure.
UL White Book 2012:
METAL-CLAD CABLE (PJAZ)
This category covers Type MC metal-clad cable. The cable is rated for use up to 2000 V, and Listed in sizes 18 AWG through 2000 kcmil for copper, 12 AWG through 2000 kcmil for aluminum or copper-clad aluminum, and employs *thermoset or thermoplastic insulated conductors*. It is intended for installation in accordance with Article 330 of ANSI/NFPA 70, ‘‘National Electrical Code’’ (NEC).
NONMETALLIC-SHEATHED CABLE (PWVX) USE
This category covers Types NM-B and NMC-B nonmetallic-sheathed cable, rated 600 V, intended for use in accordance with Article 334 of ANSI/NFPA 70, ‘‘National Electrical Code’’ (NEC), and Listed in copper sizes 14 to 2 AWG inclusive and aluminum or copper-clad aluminum sizes 12 to 2 AWG inclusive. This cable contains *conductors rated 90°C*; however, the ampacities of the cable are those of 60°C conductors as specified in Article 334 and Table 310.16 of the NEC.
Panel Meeting Action: Reject
Panel Statement: It is not up to this panel to determine whether it is suitable for the application or not. Only the AHJ can make that determination based on the installation. To ensure proper installation, the term “listed” should remain in the article.
The 2011 NEC Style Manual provides a list of unenforceable terms which includes “suitable”; see Table 3.2.1.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-4a Log #1609 NEC-P07 **Final Action: Reject**
(330.12(1))

Submitter: Phil Simmons, National Armored Cable Manufacturers Assoc.
Comment on Proposal No: 7-28
Recommendation: Accept the proposal. Revise 330.12(1) as follows;
(1) Where subject to severe physical damage
Substantiation: The terms “Physical Damage” and “Severe Physical Damage” are not defined in the NEC. As a result, the differences between the terms will continue to be subject to varying interpretation by the Authority Having Jurisdiction.
The requirements in 300.4 are intended to provide protection against ordinary “Physical Damage” but not against “Severe Physical Damage.” The present prohibition in 330.12(1) against use in locations subject to Physical Damage basically says that Type MC cable cannot be used in any of the conditions where 300.4 provides the protection methods. The present prohibition in 330.12(1) should be corrected.
Addition of the word “severe” to the Uses Not Permitted for Type MC cable provides recognition and guidance that the metal covered cable provides a greater level of protection against physical damage and is differentiated from other wiring methods such as SE and UF that presently have the same limitation of use where subject to physical damage.
Types SE, UF cable, and MC cables contain the same type of insulated conductor. The difference between the cables is the mechanical protection against physical damage provided by the outer metal covering of Type MC cable over the insulated conductors.
The insulated conductors of nonmetallic cables are covered with 0.030 inch of PVC with a typical UL requirement for Tensile Strength of 1,500 PSI. The conductors of MC cable are covered with a 0.012 to 0.025 inch thickness of steel or aluminum with a UL required Tensile Strength of 38,000 to 40,000 PSI. The difference in requirements is substantial as is the difference in mechanical protection provided by a metallic covering.
The protection against physical damage provided by the metallic covering of Type MC will offer more than adequate protection against normal physical damage and differentiate the use of Type MC cable from Types UF and SE where subject to Severe Physical damage.
Panel Meeting Action: Reject
Panel Statement: The submitter has not shown that there is a clear delineation between “physical damage” and “severe physical damage.” No evidence was presented that adding the word “severe” aids the AHJ in determining that Type MC Cable is suitable for one installation in preference to another where the degree of physical damage must be determined.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 2
Ballot Not Returned: 1 Schumacher, D.
Explanation of Negative:
HUNTER, C.: Section 358.12 for EMT already uses the term “severe physical damage” without concern for delineating between physical damage and severe physical damage. Since there is no aid for the AHJ in the use of either term in 358.12, the term severe physical damage should be preferred for 330.12(1) to delineate MC from less robust non-metallic cable constructions.
STRANIERO, G.: While there may be no clear delineation between the terms “physical damage” and “severe physical damage” it should be acknowledged that there is a clear delineation between the protection afforded to insulated conductors by non-metallic covered cables and metallic covered cables. Adding the term “severe physical damage” will aid the AHJ and designers in judgment calls and enforcement on the use of MC in place of a nonmetallic cable that is not suitable due to exposure to damage.

7-5 Log #1236 NEC-P07 **Final Action: Accept in Principle in Part**
(330.30(B))

TCC Action: The Correlating Committee directs the Panel action be revised for clarity as follows:
“In vertical installations, listed cables with ungrounded conductors 250 kcmil and larger shall be permitted to be secured at intervals not exceeding 3 m (10 ft.).”
Submitter: Dave Mercier, Southwire Company
Comment on Proposal No: 7-29
Recommendation: Proposal 7-29 proposed added text should be revised to limit conductors sizes to 1/0 AWG and larger.
“In vertical installations, cables with ungrounded conductors 1/0 AWG and larger shall be allowed to be secured at intervals not exceeding 3 m (10 ft.) when listed and identified for the use.”
Substantiation: Restricting the wire size to 1/0 AWG and larger addresses the concern of maintaining spacing, limiting movement during fault conditions and complying with the requirements in 110.12 for mechanical execution of work. Supporting test data from a third party is underway and will be provided to the panel with a Fact-Finding Report.
Panel Meeting Action: Accept in Principle in Part
Add new last sentence to read as follows:
In vertical installations, cables with ungrounded conductors 250 kcmil and larger shall be allowed to be secured at intervals not exceeding 3 m (10 ft.) where listed.
Panel Statement: CMP-7 changes “1/0 AWG” to “250 kcmil” and removes “and identified for the use” based on review of the UL Fact-Finding Report, Project 12ME07391, dated November 30, 2012.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-6 Log #717 NEC-P07 **Final Action: Accept**
(330.112(A) and (B))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 7-34
Recommendation: Continue to Accept in Principle.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.
The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.
The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that

UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 332 — MINERAL-INSULATED, METAL-SHEATHED CABLE: TYPE MI

7-7 Log #1173 NEC-P07 **Final Action: Reject**
(332.25)

Submitter: Rick Breezee, Metropolitan Airport Commission / Rep. NFPA Building Code Development Committee (BCDC)
Comment on Proposal No: 7-35
Recommendation: Accept the proposal as originally submitted:

332.25 Performance testing. Where installed as power conductors for fire pumps, emergency systems and legally required standby systems in accordance with Articles 695, 700 and 701, the completed cable installation shall be Insulation Resistance (IR) tested in accordance with the manufacturer's installation instructions and a report shall be submitted to the AHJ.

Substantiation: Similar to the requirements found in NFPA 110 (section 7.13.4.6), components of critical life safety systems should be tested and documentation should be submitted to the AHJ. The panel statement did not address the submission of documentation of the test results to the AHJ. We are not contesting the requirement for these tests that are already in the NEC, but we are asking that documentation of the tests noted should be required to be provided to the AHJ.
Panel Meeting Action: Reject
Panel Statement: The AHJ has the right to request this documentation on critical life safety systems. The original panel statement from the ROP is still applicable: "Manufacturer's instructions address installation of MI with regard to moisture mitigation and IR performance. 110.3(B) requires that instructions from the manufacturer be followed."
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 334 — NONMETALLIC-SHEATHED CABLE: TYPES NM, NMC, AND NMS

7-8 Log #106 NEC-P07 **Final Action: Accept**
(334.40(B))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 7-49
Recommendation: The Correlating Committee directs the panel to clarify the action on this proposal with respect to the panel action on Proposals 7-50 and 7-51.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

Revise text to read as follows:

(B) Devices of Insulating Material. Self-contained switches, self-contained receptacles, and nonmetallic sheathed
cable interconnector devices of insulating material that are listed shall be permitted to be used without boxes in exposed cable wiring and for repair wiring in existing buildings where the cable is concealed. Openings in such devices shall form a close fit around the outer covering of the cable, and the device shall fully enclose the part of the cable from which any part of the covering has been removed. Where connections to conductors are by binding screw terminals, there shall be available as many terminals as conductors.

Panel Statement: CMP-7 accepts the direction of the Correlating Committee to clarify the action on this proposal with respect to the panel action on Proposals 7-50 and 7-51.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-9 Log #107 NEC-P07 **Final Action: Accept**

Ballot Results: Affirmative: 14

7-10 Log #108 NEC-P07 **Final Action: Accept**
(334.40(B))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 7-51
Recommendation: The Correlating Committee directs the panel to clarify the action on this proposal with respect to the panel action on Proposals 7-49 and 7-50.

The action will be considered as a public comment.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: CMP-7 accepts the direction of the Correlating Committee to clarify the action on this proposal with respect to the panel action on Proposals 7-50 and 7-51.

See panel action and statement on Comment 7-8.

Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-11 Log #590 NEC-P07 **Final Action: Reject**
(334.40(B))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 7-49
Recommendation: Revise text to read as follows:

334.40 Boxes and Fittings.

(B) Devices of Insulating Material. Self-contained switches, self-contained receptacles, and nonmetallic-sheathed cable interconnector devices of insulating material that are listed shall be permitted to be used without boxes in exposed cable wiring and for repair wiring in existing buildings where the cable is concealed. Openings in such devices shall form a close fit around the outer covering of the cable, and the device shall fully enclose the part of the cable from which any part of the covering has been removed. ~~Where connections to conductors are by binding-screw terminals, there shall be available as many terminals as conductors.~~

<u>Only listed nonmetallic-sheathed cable interconnector devices are allowed to be concealed.</u>

Substantiation: The last sentence in the first paragraph is unnecessary. It is covered by the general rule found in UL White Book AALZ and is not repeated whenever binding screws are referenced in the rest of the NEC.

The second paragraph addresses my concern about concealed switches and receptacles that the original text would appear to allow.

The fewer concealed splices the better.

Panel Meeting Action: Reject
Panel Statement: CMP-7 inserted "that are listed" in Proposal 7-50 and Comment 7-8. The change addresses the submitter's concern.

CMP-7 rejects the deletion of the last sentence as proposed. The language in the UL Product Guide Card "AALZ" does not require that a nonmetallic sheath cable interconnector provide a listed termination for each conductor of the cables intended to be joined. The guide card only requires "Product terminals, including wire connectors and terminal screws, are acceptable for connection

of only one conductor, unless there is marking or a wiring diagram indicating the number of conductors which may be connected". The sentence which this submitter proposes deleting requires that there shall be a terminal available for all conductors. CMP-7 rejects the new wording of this proposal. The language as accepted by panel action on Proposal 7-50 clearly states that only listed nonmetallic sheath cable interconnectors are acceptable ("nonmetallic sheathed cable interconnector devices of insulating material that are listed shall be permitted to be used").
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 338 — SERVICE-ENTRANCE CABLE: TYPES SE AND USE

7-12 Log #287 NEC-P07 **Final Action: Accept in Principle**
(338.10(B)(4)(b))

TCC Action: The panel action on the comment placed a requirement in an Informational Note which is not permitted by the NEC Style Manual. The Correlating Committee directs the panel action on this comment be revised as follows:
Exception: Single conductor Type USE and multi-rated USE conductors shall not be subject to the ampacity limitations of Part II of Article 340.
Submitter: Dennis Alwon, Alwon Electric Inc.
Comment on Proposal No: 7-59
Recommendation: Add Exception as follows:
(b) Exterior Installations. In addition to the provisions of this article, service entrance cable used for feeders or branch circuits, where installed as exterior wiring, shall be installed in accordance with Part I of Article 225. The cable shall be supported in accordance with 334.30. Type USE cable installed as underground feeder and branch circuit cable shall comply with Part II of Article 340.
Exception: Type USE installed as underground feeders shall not be restricted by 340.80.
Substantiation: The problem is that I don't believe the board read my proposal correctly. Here is your comment
"The submitter is referring to single conductor USE per Table 310.104(A), whereas 338.10(B)(4)(b) is referring to a USE cable assembly with a plastic covering as defined in 338.2. Single conductor USE is not limited to the ampacity in 340.80."
338.2 does not define USE cable only as an assembly with a plastic covering as you state. It states with or without an overall covering so single conductor, triplex or quadruplex cable is relevant to this article.
The last sentence states that USE cable shall comply with Part II of article 340. USE cable can be a triplex, quad or individual cable and as written art. 340.80 states that UF shall be 60C. Thus if USE must follow part II of 340 then it must be rated at 60C when used as a feeder or branch circuit. I don't believe this is the intent but it is how it reads. Thus with the words "excluding 340.80" USE cable would not be limited to 60C as intended.
I have shown this proposal to many respected members of the electrical community and they all agreed that the board did not read the proposal or the section correctly.
I do not understand how your comment about this section only pertains to jacketed cable as it clearly states USE.
Panel Meeting Action: Accept in Principle
Add informational note to read as follows:
Informational Note. Single conductor Type USE and multi rated USE conductors are not subject to the ampacity limitations of Part II of Article 340. Requirements for single conductor USE are in Table 310.104(A).
Panel Statement: CMP-7 does not accept adding an exception to 338.10(B)(4)(b). Instead, CMP-7 adds an informational note for clarity.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-13 Log #1058 NEC-P07 **Final Action: Accept in Principle**
(338.10(B)(4)(b))

Submitter: George M. Stolz, II, Quicksilver Electrical Training
Comment on Proposal No: 7-59
Recommendation: Accept the proposal.
Substantiation: Last I checked, USE cable comes in both single and multiconductor styles. The last sentence clearly refers to Part II of Article 340, which clearly includes 340.80.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 7-12.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

7-14 Log #1229 NEC-P07 **Final Action: Reject**
(338.10(B)(4)(a))

Submitter: Christel K. Hunter, Alcan Cable, a General Cable Company
Comment on Proposal No: 7-61
Recommendation: Revise text as follows:
~~Where installed in thermal insulation, the ampacity shall be in accordance with the 60°C (140°F) conductor temperature rating.~~ The maximum conductor temperature rating shall be permitted to be used for ampacity adjustment and correction purposes~~, if the final derated ampacity does not exceed that for a 60°C (140°F) rated conductor~~.
Substantiation: The language restricting SE cable to 60C in thermal insulation should be deleted. No technical substantiation was submitted to the panel to support this
restriction, and technical substantiation was submitted to the panel during the 2014 ROP meeting to support the deletion of this requirement.
SE cable is listed according to UL854 and is typically listed at 75C with 90C insulated conductors. SE cable is commonly available in copper 8 AWG and larger and aluminum 6 AWG and larger. The smaller sizes are often used in residential applications to feed large appliances such as stoves and dryers. Applicance receptacles sized 30 amps and larger are listed and marked for use at 75C with both copper and aluminum. Therefore, the breaker, cable and receptacles are all suitable for use at 75C. NM cable is frequently used for smaller devices such as receptacles and switches that are listed for use at 60C. Non-metallic sheathed cable (NM-B) was limited to 60C in the 1980s because of the overheating that occurred in lighting fixtures in ceilings after thermal insulation was blown on top of the conductors and fixtures in the 1970s. The trapped heat from the light fixtures (which were commonly overlamped) caused heat related damage to the 60C insulation in NM cable. Therefore, the industry decided to require 90C insulation but still limit NM cable to 60C. SE cable is not used for residential light fixtures, therefore the reason for the limitation to 60C in place for NM cable does not exist for SE cable.
Research titled "Thermally Induced Failure of Low-Voltage Electrical Nonmetallic-Sheathed Cable Insulation" was presented during the 2014 ROP meeting and is included again as supporting material. This research was conducted by Robert W. Armstrong, Ph.D. (Armstrong Engineering), James Mason, Ph.D. (SEAL Laboratories), Arun Kumar, Ph.D. (SEAL Laboratories), and James E. Hall (James Hall & Associates, Fire Investigations). The research concluded that even when installed in typical thermal insulation and subjected to 190% of its NEC allowable ampacity, nonmetallic sheathed cable barely exceeded its insulation temperature (205 F vs 194 F) under continuous loading conditions. Even at these temperatures, the researchers concluded that "The test results presented here show that chemical and electrical breakdown do not occur at temperatures below the autoignition temperatures of most common structural materials." This testing was done with individual cables, not bundled cables.
The NEC has already placed limits on bundled SE cable. NEC 310.15(B)(3)(a) directs that multiconductor cables installed without maintaining spacing for a continuous length longer than 24 inches (and not installed in raceways) must have their ampacity reduced in accordance with Table 310.15(B)(3)(a). This requirement is supported by a National Bureau of Standards report issued in 1978 titled "Exploratory Study of Temperatures Produced by Self-Heating of Residential Branch Circuit Wiring When Surrounded by Thermal Insulation." The study found that when groups of cables were tightly installed in thermal insulation, they would
overheat when operated for extended periods at their maximum allowable ampacity. Therefore, when multiple cables are installed in contact with each other for longer distances, the conductors must have ampacity adjustment. However, the study also found that single conductors installed in thermal insulation and operating at their maximum ampacity (12 AWG, 20 amps) never exceeded 152F, which is below the listed temperature of SE cable and the terminations used for these interior branch circuits. This report is public information, and relevant pages are included as supporting material.
In summary, there is no safety concern with a single SE cable operating in thermal insulation, yet we are limiting it to an ampacity below its Listed value. Some panel members have indicated that since SE looks like NM, it should be treated the same, but this is an emotional argument, not a technical argument. We have many examples in the electrical industry of items that look the same but perform differently. Fuses, circuit breakers, and transformers come to mind. The same is true of wire and cable products. As an example, AC and MC cable may look alike, but we still have separate installation requirements and listing requirements. Schedule 40 and Schedule 80 PVC may look alike, but we allow them to be used in different applications. Likewise, SE cable is constructed to a different standard than NM cable and should be allowed to be used in accordance with its listing.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: This proposal does not present statistical data indicating the effects of thermal exposure to Type SE Cable when installed and operated as a interior wiring method and installed in thermal insulation. The laboratory test results submitted indicating the effects of thermal damage on interior branch circuit conductors contained within a factory cable assemblies only evaluates Type NM Cable. CMP-7 would like to see additional testing on Type SE Cable embedded in thermal insulation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 2 Abstain: 1
Explanation of Negative:
NIELSEN, D.: The IEEE agrees with the substantiation provided by the submitter that SE cable should be allowed to be used in accordance with its listing. Overcurrent protection protects Type SE conductors where conductors are adjusted for ampacity and correction based on maximum temperature

rating. The exclusion of Article 334.80 is applicable since Type SE is not Type NM/NMC/NMS. The present language was added in the 2011 cycle. Technical documentation was submitted at the meeting supporting the basis for thermal insulation not posing an issue. The proposal should have been approved as Accept in Principal with the text to read as follows:

~~Where installed in thermal insulation, the ampacity shall be in accordance with the 60°C (140°F) conductor temperature rating.~~ The maximum conductor temperature rating shall be permitted to be used for ampacity adjustment and correction purposes~~, if the final derated ampacity does not exceed that for a 60°C (140°F) rated conductor~~.

RUNYON, G.: The panel should have accepted this comment. SE cable is not NM cable. It is constructed, tested and listed differently and it should not be required to be installed with the same limitations as NM cable. The standard used to test and list SE type cable is ANSI/UL854 which is a minimum 75 degree Centigrade outer jacket and 90 degree Centigrade conductors.

Explanation of Abstention:

HUNTER, C.: The Aluminum Association could not reach consensus.

7-15 Log #1562 NEC-P07 **Final Action: Reject**
(338.10(B)(4)(a))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 7-63
Recommendation: Accept the proposal in part. Do not accept the deletion of "excluding 334.80". Accept the remainder of the proposal.
Substantiation: The technical substantiation clearly shows that the provision added by CMP 7 in the 2011 cycle was on the correct track, but did not go far enough. Embedding these cables in thermal insulation actually reduces their ampacity even below the 60°C column, and no allowance for mutual conductor heating or ambient temperature derating should even begin in the 90°C column. CMP 7 clearly reviewed this information because it refers to the 1987 NEC Proposal 4-97 in its statement. The fact that CMP 4 rejected it at the time is irrelevant; what is relevant is the uncontradicted report of what happens to wiring embedded in thermal insulation. In fact, the same substantiation (in form of a reference to the same Proposal 4-97!) was used by CMP 7 to insert, also in the 1987 code cycle, what are now the informational notes that follow 334.10(4), 336.10(8), 338.10(B)(4), and 340.10(8). The panel's assertion of a lack of technical substantiation on this issue is frankly preposterous.

The submitter agrees that 334.80 need not apply because the new paragraph added in the 2011 cycle adequately incorporates the relevant provisions without dragging in additional baggage about passage through bored holes, etc.

Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 7-14.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:

STRANIERO, G.: The comment should be accepted. Section 334.80 includes several requirements to adjust the ampacity depending on how the cable is installed. Deletion of the requirement to comply with 334.80 will permit SE to be installed under conditions where the necessary ampacity correction will not be made.

ARTICLE 342 — INTERMEDIATE METAL CONDUIT: TYPE IMC

8-6 Log #1082 NEC-P08 **Final Action: Reject**
(342 through 392)

Submitter: Michael C. Martin, American Chemistry Council
Comment on Proposal No: 8-43
Recommendation: Replace the phrase "equipment grounding conductor" with the phrase "equipment bonding conductor" in the Articles and Sections identified in Proposal 8-43.
Substantiation: The Panel should have accepted Proposal 8-43. In the present NEC, Equipment Grounding Conductors and bonding jumpers provide a "path back" to the source. Both are always performing a bonding function. If the Grounding Electrode connection is removed or broken, the bonding function remains intact.

Section 250.4 does not permit the earth (ground) to be used as an effective ground fault current path but the term equipment grounding conductor inherently incorrectly contains the word "ground".

Visualize equipment supplied by a portable generator. The generator frame is not required to be connected to the earth.

The "green" wire in the flexible cord is not performing a grounding function but is performing a bonding function.

Visualize building one supplied by a service, having the grounded conductor connected to the grounding electrode system by a grounding electrode conductor. A feeder supplies a second building and a grounding electrode conductor is required for grounding any equipment in the second building. An equipment grounding conductor is required to be installed from building 1 to building 2. Not for grounding, but for bonding, providing an effective fault current path.

Making this change has the added benefit of being more harmonized with other international standards and usage of terminology.

Experienced NEC users have to ignore other concepts in other definitions and requirements to use the existing term. This does not help the future NEC user or provide clarity in the existing NEC. Changing the term is the right thing to do and should be supported.

Panel Meeting Action: Reject
Panel Statement: CMP-8 reaffirms its position to reject Proposal 8-43. The submitter has not demonstrated a need in the field to change electrical grounding conductor to electrical bonding conductor.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

MARTIN, M.: The term "equipment grounding conductor" needs to be replaced with "equipment bonding conductor" throughout the NEC. Yes, the term equipment grounding conductor in Article 100 would need to be changed to the term equipment bonding conductor.

Some have argued that it is just a problem of education. Having the word "grounding" in a term describing conductor that is used primarily for a bonding function is not a problem to be solved by education.

The use of the term "equipment grounding conductor" is confusing both for those new to the electrical industry and even for some experienced users. The problem is compounded when dealing with other international standards.

No technical reason has been provided for not making the change. This conductor always provides a bonding function but does not always provide a grounding function such as in the case of a portable generator installed as a separately derived system.

MYERS, P.: The correct terminology will assist the training of new practitioners of the Code on the purpose of this conductor. This change will minimize field errors. Several Proposals and several Comments have pointed out the difference in function between grounding and bonding and it should be clear to all members of the Panel (and, indeed, any Panel receiving similar Proposals and Comments) that the function of the subject conductor is bonding. Thus, the requests to change its name to "equipment bonding conductor". In the Panel Statement during the Proposal stage, the Panel indicated that the issue was felt to be "one of education and not terminology". IEEE respectfully disagrees and believes that the use of terminology consistent with the conductors function will enhance education.

8-7 Log #1281 NEC-P08 **Final Action: Reject**
(342 through 392)

Submitter: Elliot Rappaport, Electro Technology Consultants
Comment on Proposal No: 8-43
Recommendation: Accept proposal.
Substantiation: The Panel Statement indicates that the issue is one of education and not terminology. When the terminology does not reflect the core requirement, then education becomes difficult.

The term "equipment grounding conductor" has a definite purpose that is not uniquely expressed in the term, i.e. "bond the equipment to a terminal at the source of voltage". As a result, there is a misconception that "grounding", without bonding to the source, will make a system safe. On the contrary, connecting equipment to ground without providing the bonding connection back to the source can make equipment less safe by increasing the time to clear the fault.

There is generally insufficient significance placed on the importance of bonding over grounding. Bonding provides sufficient ground fault current back to the source of voltage to operate an overcurrent device and clear the fault quickly. Connection to ground limits the voltage to ground on normally non-current-carrying parts during non-fault conditions. During fault conditions, the value of grounding is minimal since the primary safety concern is to remove the fault voltage as quickly as possible. A path to ground for fault current is not necessary since ground fault current must return to the source of voltage, not to ground.

Renaming this conductor as an "Equipment Bonding Conductor (EBC)" will clarify that the primary purpose of this conductor is to bond to the source in order to provide a known path for ground fault current that will facilitate rapid fault clearing.

It is recognized that the term "EGC" has been in use for a long time and that changing it to EBC will cause some concerns including changing written literature that uses the EGC term. After the initial period of understanding, users will correctly understand the purpose of this conductor and this will enhance the safety of personnel.

The fundamental purpose of this and companion proposals is to clearly state that "systems" are "grounded" and "equipment" is "bonded". The fact that the bonding conductor may be grounded also is secondary to the primary function of bonding.

Panel Meeting Action: Reject
Panel Statement: CMP-8 reaffirms its position to reject Proposal 8-43. See panel action and Statement on Comment 8-6.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 2
Explanation of Negative:

MARTIN, M.: See my explanation of negative vote on Comment 8-6.

MYERS, P.: See IEEE statement opposing the Panel action on comment 8-6.

ARTICLE 344 — RIGID METAL CONDUIT: TYPE RMC

8-8 Log #110 NEC-P08 **Final Action: Accept**
(344.100 (New))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 8-52a
Recommendation: The Correlating Committee directs the panel to clarify the action on this proposal based on 3.1.1 of the NEC Style Manual to require mandatory text.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: CMP-8 accepts the Correlating Committee's direction to clarify. See panel action on Comment 8-9.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-9 Log #812 NEC-P08 **Final Action: Accept**
(344.100)

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 8-52a
Recommendation: Section 344.100 per Proposal 8·52a should be revised to read as follows:
344.100 Construction. RMC shall be made of one of the following:
(1) Steel (ferrous), with or without protective coatings
(2) Aluminum (nonferrous)
(3) Red Brass
(4) Stainless Steel
Substantiation: This comment is submitted to address the TCC Comment pertaining to the NEC Style of Manual for mandatory text.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-10 Log #439 NEC-P08 **Final Action: Accept**
(344.120)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 1-114
Recommendation: 110.21 Marking.
(A) Manufacturer Markings. The manufacturer's name, trademark, or other descriptive marking by which the organization responsible for the product can be identified shall be placed on all electrical equipment. Other markings that indicate voltage, current, wattage, or other ratings shall be provided as specified elsewhere in this *Code*. The marking or label shall be of sufficient durability to withstand the environment involved. **[ROP 1–114]**
344.120 Marking. Each length shall be clearly and durably identified in every 3 m (10 ft) as required in the first sentence of 110.21<u>(A)</u>. Nonferrous conduit of corrosion-resistant material shall have suitable markings.
Substantiation: Accepted ROP 1-114 moved the text in 110.21 from 2008 to 110.21(A) in 2014. 110.21 is now devoid of text and has no first sentence. The first sentence is in 110.21(A).
Panel Meeting Action: Accept
Panel Statement: CMP-8 recognizes that CMP-1 "accept in principle in part" Proposal 1-114 that created new Sections 110.21(A) and (B). CMP-8 is treating this comment as editorial and this comment and section will need to be correlated by the Correlating Committee if any action by CMP-1 occurs to Proposal 1-114 and section 110.21 during the ROC meeting.

(Sequence #8-14 was not used)

11-2 Log #112 NEC-P11 **Final Action: Accept**
(350.60)

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 8-60
Recommendation: It was the action of the Correlating Committee that this proposal be reported as "Reject" to correlate with the action taken on Proposal 11-83.
The Correlating Committee directs that this proposal be sent to Code-Making Panel 11 for action in Article 440.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
MISSILDINE, JR., J.: Acceptance of this comment was only to accept responsibility for Proposal 8-60 as directed by the TCC. The panel's action appears to accept the change as written in the proposal. See the negative ballot statement on Comment 11-32 for reasons why no wire type ground conductor should be required.

11-3 Log #1253 NEC-P11 **Final Action: Reject**
(350.60)

Submitter: John Masarick, Independent Electrical Contractors, Inc.
Comment on Proposal No: 8-60
Recommendation: I ask the panel to approve proposal 8-60 dealing with article 350.60. Below is the article from Proposal 8-60.
350.60 Grounding. <u>Grounding and bonding for LFMC shall be installed in accordance with 350.60(A) and (B).</u>
<u>(A)</u> If used to connect equipment where flexibility is necessary to minimize

the transmission of vibration from equipment or to provide flexibility for equipment that requires movement after installation, an equipment grounding conductor shall be installed.

Where flexibility is not required after installation, LFMC shall be permitted to be used as an equipment grounding conductor when installed in accordance with 250.118(6).

Where required or installed, equipment grounding conductors shall be installed in accordance with 250.134(B).

Where required or installed, equipment bonding jumpers shall be installed in accordance with 250.102.

Informational Note: See 501.30(B), 502.30(B), 503.30(B), 505.25(B), and 506.25(B) for types of equipment grounding conductors.

<u>(B) Where Air Conditioning or Refrigerating Equipment is installed outdoors, an equipment grounding conductor per 250.118(1) shall be provided within the raceway and shall be sized per 250.122.</u>

Substantiation: In a recent survey conducted by IEC over 50% of the respondents said they had observed or heard of non- threaded conduit, to HVAC and refrigerator equipment, that came apart after being installed on rooftops. Also, over 7% indicated they knew of or received a serious electrical shock as a result of the separation of the conduit.

Panel Meeting Action: Reject

Panel Statement: CMP 11 accepts responsibility for taking action on this comment. The requirement belongs in Article 440 and not section 350.60. Article 440 deals specifically with HVAC equipment. See the panel action and statement on Comment 11-32.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

MISSILDINE, JR., J.: The panel's action to reject the comment is appropriate; but not with the panel statement. The proposed change in proposal 8-60 should not be accepted. If the wire type ground conductor is necessary in outdoor LFMC supplying air conditioning and refrigeration equipment, it should be applied to all outdoor applications of this material. Article 350 would be the appropriate place for the change, not Article 440. See the negative ballot statement on Comment 11-32 for reasons why no wire type ground conductor should be required.

11-3a Log #1370 NEC-P11 **Final Action: Accept**
(350.60)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Comment on Proposal No: 8-60

Recommendation: Continue to Reject the proposed requirement for an equipment grounding conductor in Liquidtight Flexible Metal Conduit.

Substantiation: It is not reasonable to simply require a grounding conductor on a product that has an excellent record of performance. Manufacturers of this product have not had issues or complaints about problems with either the armor opening or with grounding. The substantiation submitted with the proposal provides a single incident and does not provide any information on the construction of the raceway, whether or not it was listed, or if listed fittings were used or properly installed.

The construction of LFMC requires that it be provided with a bonding strip wound into the conduit convolutions throughout its entire length. It is required to withstand a 300 pound tension, and up to a 750 Amp fault current. The raceway is required to be terminated in listed fittings and required to be protected by overcurrent devices rated a maximum 20 or 60 amps, depending on the size of the raceway. In addition the use of the raceway as a ground fault path is limited to six feet.

The Panel 11 Technical Committee should require more substantive substantiation. There are many non-listed, off-shore sourced Liquid tight products in the marketplace, was the product in this incident listed? Were the fittings used also listed for the application? Were all of the metal components properly bonded? Was the installation compliant with the NEC®?

In light of the construction, listing, and installation requirements in place for this wiring method and the excellent record of performance when installed in accordance with the requirements of the NEC®, the requirement for an equipment grounding conductor in this application should not be required.

Panel Meeting Action: Accept

Panel Statement: CMP 11 agrees with the recommended action of the submitter but disagrees with the submitter's substantiation. The requirement belongs in Article 440 and not section 350.60. See the panel action and statement on Comment 11-3.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

MISSILDINE, JR., J.: Agree with the panel's action to accept Comment 11-3a which rejects Proposal 8-60. This proposal should be rejected for the reasons stated in the negative ballot statement for comment 11-31.

THOMPSON, J.: I support the position provided by the submitter, but disagree with the panel statement.

WRIGHT, J.: While NEMA votes affirmative on this Panel Action, which Rejects the requirement for an equipment grounding conductor in Liquidtight Flexible Metal Conduit in Section 350.60, NEMA does not agree that the requirement belongs in Article 440. The requirement should not be contained in either Section 350.60 or Article 440.

ARTICLE 352 — RIGID POLYVINYL CHOLOIDE CONDUIT: TYPE PVC

ARTICLE 356 — LIQUIDTIGHT FLEXIBLE NONMETALLIC CONDUIT: TYPE LFNC

8-17 Log #469 NEC-P08 **Final Action: Accept in Part**
(356.2.Liquidtight Flexible Nonmetallic Conduit (LFNC) and 356.3 Installation of Conductors in LFNC (New))

Submitter: Marcelo M. Hirschler, GBH International

Comment on Proposal No: 8-81

Recommendation: Revise text to read as follows:

Liquidtight Flexible Nonmetallic Conduit (LFNC). A<u> flame-resistant</u> raceway<u>, with fittings,</u> of circular cross section of various types as follows:

(1) A smooth seamless inner core and cover bonded together and having one or more reinforcement layers between the core and covers, designated as Type LFNC-A

(2) A smooth inner surface with integral reinforcement within the raceway wall, designated as Type LFNC-B

(3) A corrugated internal and external surface without integral reinforcement

within the conduit wall, designated as LFNC-C
~~LFNC is flame resistant and with fittings and is approved for the installation of electrical conductors~~
Informational Note: FNMC is an alternative designation for LFNC.
356.3 Installation of conductors in LFNC. The installation of electrical conductors in LFNC shall be permitted.
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains the defined term in the last sentence and also contains requirements and the NEC manual of style does not permit the definition to contain the defined term. Definitions are not requirements. The proposed changes eliminate the defined term and the requirements.
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Alternate approach, could be as follows (by eliminating the second sentence):
Informational Note: LNFC is a flame resistant raceway which can have fittings and is approved for the installation of electrical conductors.
Panel Meeting Action: Accept in Part
Panel Statement: CMP-8 accepts in part Comment 8-17. CMP-8 accepts only the deletion of "LFNC is flame resistant and with fittings and is approved for the installation of electrical conductors". CMP-8 agrees to remove requirements from the definition of LFNC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
LOYD, R.: The committee should have clarified in the panel action, that the only part accepted was to delete the last paragraph as follows;
"LFNC is flame-resistant and with fittings is approved for the installation of conductors"

8-18 Log #1017 NEC-P08 **Final Action: Reject**
(356.12(4))

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 8-81a
Recommendation: Reject this proposal.
Substantiation: This wiring method is little more than a piece of garden hose. Please let me know where in the world people are using this for over 600V (as indicated by the substantiation) so that I can keep myself, my family, and my friends as far away as possible. I agree with Mr. Loyd's statement regarding the UL White Book as well. Refer to product category DXOQ in the white book.
Panel Meeting Action: Reject
Panel Statement: CMP-8 reaffirms its position to accept Proposal 8-81a. LFNC is Listed and is required to meet or exceed the very rigorous physical requirements such as impacts and crush per UL1660, Liquid-Tight Flexible Nonmetallic Conduit. In addition, UL Certification Guide Information, DXOQ, does not limit LFNC to 600 volts.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
LOYD, R.: CMP-8 acted inconsistently in rejecting 8-26 for lack of substantiation to and continuing to accept ROP 8-81a on this exact same subject.
LFNC is produced in three types, Type (B) and (A) may pass 3rd party testing to safely protect conductors of circuits over 600 volts for specific purposes. Type(C) likely would not be suitable for enclosing circuit conductors over 600 volts. No substantiation was submitted or provided to support this change. This committee action sets a precedent that that substantiation is no longer required for changing the code! This comment should have been accepted to be consistent with 826.

8-19 Log #1254 NEC-P08 **Final Action: Accept**
(356.12(4))

Submitter: John Masarick, Independent Electrical Contractors, Inc.
Comment on Proposal No: 8-82
Recommendation: Continue to reject this proposal which would change 600 volts to 1000 volts.
Substantiation: Replacing 600 volts with 1000 volts will have a major impact on installers, component manufacturers, and industry standards. Increased spacing must be considered when going from 600 volts to 1000 volts. Personal safety must also be considered.
Because the proposer has not provided enough information to the public to justify and understand all the ramifications of the proposal, the committee should continue to reject the original submitters proposal.
Panel Meeting Action: Accept
Panel Statement: CMP-8 reaffirms its position to reject Proposal 8-82. However, CMP-8 recognizes that LFNC is currently permitted to be used in voltages over 600 volts and that the standard and listing does not restrict the product to 600 volts. See CMP-8 Action on Proposal 8-81a.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
LOYD, R.: See my Statement on negative vote 8-18.

8-20 Log #1018 NEC-P08 **Final Action: Accept in Principle**
(356.60)

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 8-84
Recommendation: Reject the proposal, or revise it by deleting the entire first paragraph.
Substantiation: This is a nonmetallic wiring method. It can't be used as an equipment grounding conductor regardless of vibration, movement, etc.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 8-21.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-21 Log #1059 NEC-P08 **Final Action: Accept**
(356.60)

Submitter: George M. Stolz, II, Quicksilver Electrical Training
Comment on Proposal No: 8-84
Recommendation: Accept the proposal in principle in part by harmonizing 356.60 with 352.60 instead:
352.60 Grounding. Where equipment grounding is required, a separate equipment grounding conductor shall be installed in the conduit.
Exception No. 1: As permitted in 250.134(B), Exception No. 2, for dc circuits and 250.134(B), Exception No. 1, for separately run equipment grounding conductors.
Exception No. 2: Where the grounded conductor is used to ground equipment as permitted in 250.142.
Substantiation: Since LFNC is not a recognized equipment grounding conductor per 250.118, the wording should match other **nonmetallic** raceways.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 358 — ELECTRICAL METALLIC TUBING: TYPE EMT

8-22 Log #1142 NEC-P08 **Final Action: Accept**
(358.44 (New))

Submitter: William A. Wolfe, Steel Tube Institute
Comment on Proposal No: 8-87
Recommendation: Delete the proposed new text
~~358.44 Expansion Fittings. Expansion fittings for EMT shall be provided to compensate for thermal expansion and contraction where the length is expected to be 6 mm (1/4 inch) or greater in a straight run between securely mounted items such as boxes, cabinets, elbows, or other conduit terminations.~~
~~Informational Note: The coefficient of expansion for steel electrical metallic tubing is 1.170 × 10E-5 (0.0000117 mm per mm of tubing for each degree C in temperature change) [0.650 × 10E-5 (0.0000065 in. per inch of tubing for each degree F in temperature change)]. The coefficient of expansion for aluminum electrical metallic tubing is 2.34 × 10E-5 (0.0000234 mm per mm of tubing for each degree C in temperature change) [1.30 × 10-E5 (0.000013) in. per inch of tubing for each degree F in temperature change].~~
Substantiation: This should be a reject. This proposal requires an expansion fitting to compensate for thermal expansion and contraction "…where the length is expected to be 6 mm (1/4 inch) or greater in a straight run…" but it only considers the expansion of the Steel EMT and not the relative change between the steel EMT and the thermal coefficient of expansion of the material it is mounted to. It is the "relative" change of 6 mm (1/4 inch) that we are concerned with. Steel EMT securely mounted on a steel building should expand and contract at the same relative rate and therefore not require an expansion fitting. If we consider a 100 degree F change between the Summer high and the Winter low it would require an expansion fitting at 32 feet. But if the steel EMT was mounted on a steel building or structure, the relative change would be zero. Why require an expansion fitting? Other common building materials that have a thermal coefficient of expansion less than that of steel are shown on the attached chart (Exhibit "A") with the linear distance in feet before achieving a relative change of 6 mm (1/4 inch).
The informational note information is already contained in the Information Note following 300.7(B) and is not need.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

(Sequence #'s 8-23 and 8-24 were not used)

11-4 Log #113 NEC-P11 **Final Action: Accept**
(358.60)

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 8-90
Recommendation: It was the action of the Correlating Committee that this proposal be reported as "Reject" to correlate with the action on Proposal 11-83. The Correlating Committee directs that this proposal be sent to Code-Making Panel 11 for action in Article 440.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
MISSILDINE, JR., J.: Acceptance of this comment was only to accept responsibility for Proposal 8-90 as directed by the TCC. The panel's action appears to accept the change as written in the proposal. See the negative ballot statement on Comment 11-32 for reasons why no wire type ground conductor should be required.

11-4a Log #1255 NEC-P11 **Final Action: Reject**
(358.60)

Submitter: John Masarick, Independent Electrical Contractors, Inc.
Comment on Proposal No: 8-90
Recommendation: I ask the panel to accept proposal 8-90 to read as submitted below.
358.60 Grounding. <u>Grounding and bonding EMT shall be installed in accordance with 358.60(A) and (B).</u>
<u>(A)</u> EMT shall be permitted as an equipment grounding conductor.
<u>(B) Where Air Conditioning or Refrigerating Equipment is installed outdoors, an equipment grounding conductor per 250.118(1) shall be provided within the raceway and shall be sized per 250.122.</u>
Substantiation: In a recent survey conducted by IEC over 50% of the respondents said they had observed or heard of non- threaded conduit, to HVAC and refrigerator equipment, that came apart after being installed on rooftops. Also, over 7% indicated they knew of or received a serious electrical shock as a result of the separation of the conduit.
Panel Meeting Action: Reject
Panel Statement: CMP 11 accepts responsibility for taking action on this comment. The requirement belongs in Article 440 and not section 358.60. Article 440 deals specifically with HVAC equipment. See the panel action and statement on Comment 11-32.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
MISSILDINE, JR., J.: The panel's action to reject the comment is appropriate; but not with the panel statement. The proposed change in proposal 8-90 should not be accepted. If the wire type ground conductor is necessary in outdoor EMT supplying air conditioning and refrigeration equipment, it should be applied to all outdoor applications of this material. Article 358 would be the appropriate place for the change, not Article 440. See the negative ballot statement on Comment 11-32 for reasons why no wire type ground conductor should be required.
WRIGHT, J.: While NEMA votes affirmative on this Panel Action, which Rejects the requirement for an equipment grounding conductor in EMT in Section 358.60, NEMA does not agree that the requirement belongs in Article 440. The requirement should not be contained in either Section 358.60 or Article 440.

11-4b Log #1369 NEC-P11 **Final Action: Accept**
(358.60)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 8-90
Recommendation: Whether the action of the TCC is accepted or rejected by Panel 8, the concept of Proposal 8-90 should be rejected.
Substantiation: The substantiation does not support this change. Neither the CPSC report nor the report of the Chicago incident indicates the wiring method was the cause of the electrocution. The photos enclosed with the substantiation show that EMT was not used. The CPSC report is dated 2002, five (5) years before the incident, and only shows the number of consumer product-related electrocutions by specific products involved, not the specific cause. The report shows a greater number of electrocutions were related to other components of the installed household wiring than to the wiring method. In the case of damaged or exposed wiring, the "exact nature of the wiring was unspecified". The use of a supplemental equipment grounding conductor should be a design decision based on the wiring method to be used and the unique installation environment in which the equipment is being installed. The NEMA/Georgia Tech research study on grounding validates that EMT is a proven equipment grounding conductor when installed in accordance with the NEC and with either set-screw or compression type fittings.
Panel Meeting Action: Accept
Panel Statement: CMP 11 agrees with the recommended action of the submitter but disagrees with the submitter's substantiation. The requirement belongs in Article 440 and not section 358.60. See the panel action and statement on Comment 11-4a.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
MISSILDINE, JR., J.: The panel's action to reject the comment is appropriate; but not with the panel statement. If the wire type ground conductor is necessary in outdoor EMT for HVAC, it should be applied to all outdoor applications of this material. Article 358 would be the appropriate place for the change, not Article 440. See negative ballot statement on Comment 11-31 for reasons why no wire type ground conductor should be required.
THOMPSON, J.: I support the position provided by the submitter, but disagree with the panel statement.
WRIGHT, J.: See my Affirmative comment on Comment 11-4a.

ARTICLE 366 — AUXILIARY GUTTERS

8-28 Log #815 NEC-P08 **Final Action: Reject**
(366.1)

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 8-96
Recommendation: Reject the TCC Comment. Article 366 per Proposal 8-96 should be ACCEPTED as stated in the Panel Action.
Substantiation: This comment is submitted to address the TCC Comment pertaining to the NEC Style Manual and the reference to “metal”. “Metallic” is also an acceptable term per the NEC Style Manual and is found in the same list as “metal”. “Metallic” is used to describe the material and is used in 366.2.
Panel Meeting Action: Reject
Panel Statement: CMP-8 reaffirms its position to accept Proposal 8-96. CMP-8 rejects the Correlating Committee’s comment pertaining to “metal” vs “metallic”. Not only is “metallic” currently being used in 366.2 for the definition of a “metallic auxiliary gutter” but “metallic” is also an acceptable term per the NEC Style Manual and is found in the same list as “metal”.
It is noted that “metallic” appears in 375 locations and CMP-8 is supportive of a task group to correlate the terms “metal” and “metallic” for consistency throughout the entire NEC, per the style manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-28a Log #CC800 NEC-P08 **Final Action: Accept**
(366.2)

Submitter: Code-Making Panel 8,
Comment on Proposal No: 8-98
Recommendation: Revise 366.2 to read as follows:
Metallic Auxiliary Gutter. A sheet metal enclosure used to supplement wiring spaces at meter centers, distribution centers, switchgear, switchboards, and similar points of wiring systems. The enclosure has hinged or removable covers for housing and protecting electrical wires, cable, and busbars. The enclosure is designed for conductors to be laid or set in place after the enclosures have been installed as a complete system.
Nonmetallic Auxiliary Gutter. A flame retardant, nonmetallic enclosure used to supplement wiring spaces at meter centers, distribution centers, switchgear, switchboards, and similar points of wiring systems. The enclosure has hinged or removable covers for housing and protecting electrical wires, cable, and busbars. The enclosure is designed for conductors to be laid or set in place after the enclosures have been installed as a complete system.
Substantiation: CMP-8 accepts Comment 8-29 for Proposal 9-73a. Proposal 9-73a revises “metal-enclosed switchgear” to “switchgear”. CMP-8 recognizes that the submitter incorrectly referenced Proposal 8-98 instead of Proposal 9-73a.
CMP-8 accepts Comment 8-31 and Proposal 9-73a. Proposal 9-73a revises “metal-enclosed switchgear” to “switchgear”.
CMP-8 accepts to reconsider Proposal 8-98, however, rejects the deletion of the term “distribution centers” from Section 366.2, per Comment 8-30 and Proposal 8-98 since it is utilized throughout the NEC. CMP-8 also rejects revising “Metallic” to “metal” per Comment 8-30 and Proposal 8-96. CMP-8 continues to support Proposal 8-96 and the revision of metal to metallic. The TCC stated that “metal” is the correct term to used based on the NEC Style Manual. “Metallic” is also an acceptable term per the NEC Style Manual and is found in the same list as “metal”.
It is noted that “metallic” appears in 375 locations and CMP-8 is supportive of a task group to correlate the terms “metal” and “metallic” for consistency throughout the entire NEC, per the Style Manual.

8-32 Log #592 NEC-P08 **Final Action: Hold**
(366.22 and 366.23)

TCC Action: The Correlating Committee directs that the panel action be reported as “Hold” in compliance with the NFPA Regulations Governing Committee Projects as the comment contains new material that has not had public review.
Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 8-96
Recommendation: Revise text to read as follows:
366.22 Number of Conductors.
~~**(A) Sheet Metal Auxiliary Gutters.**~~ The sum of the cross-sectional areas of all contained conductors at any cross section of ~~a sheet metal~~ an auxiliary gutter shall not exceed 20 percent of the interior cross-sectional area of the ~~sheet metal~~ auxiliary gutter. ~~The adjustment factors in 310.15(B)(3)(a) shall be applied only where the number of current-carrying conductors, including neutral conductors classified as current-carrying under the provisions of 310.15(B)(5), exceeds 30. Conductors for signaling circuits or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors.~~
~~**(B) Nonmetallic Auxiliary Gutters.** The sum of cross-sectional areas of all contained conductors at any cross section of the nonmetallic auxiliary gutter shall not exceed 20 percent of the interior cross-sectional area of the nonmetallic auxiliary gutter.~~
366.23 Ampacity of Conductors. The current carried continuously in bare copper bars in auxiliary gutters shall not exceed 1.55 amperes/mm2 (1000 amperes/in.2) of cross section of the conductor. For aluminum bars, the current carried continuously shall not exceed 1.09 amperes/mm2 (700 amperes/in.2) of cross section of the conductor.
(A) Sheet Metal Auxiliary Gutters. ~~Where the number of current-carrying conductors contained in the sheet metal auxiliary gutter is 30 or less, the adjustment factors specified in 310.15(B)(3)(a) shall not apply.~~ The adjustment factors in 310.15(B)(3)(a) shall be applied only where the number of current-carrying conductors, including neutral conductors classified as current-carrying under the provisions of 310.15(B)(5), exceeds 30. Conductors for signaling circuits
or controller conductors between a motor and its starter and used only for starting duty shall not be considered as current-carrying conductors. ~~The current carried continuously in bare copper bars in sheet metal auxiliary gutters shall not exceed 1.55 amperes/mm2 (1000 amperes/in.2) of cross section of~~

~~the conductor. For aluminum bars, the current carried continuously shall not exceed 1.09 amperes/mm2 (700 amperes/in.2) of cross section of the conductor.~~
(B) Nonmetallic Auxiliary Gutters. The adjustment factors specified in 310.15(B)(3)(a) shall be applicable to the current-carrying conductors in the nonmetallic auxiliary gutter.
Substantiation: 1: With the removal of the ampacity text in 366.22, (A) and (B) are essentially duplicate text and can be merged into a single sentence under 366.22 directly. (as is done 366.44 through 366.58 for example).
2: The ampacity rules for sheet metal auxiliary gutters are presently contained in 366.22 (which is labeled "Number of Conductors" and in 366.23(A). Further the rules differ in detail and could easily lead others into confusion (as it has for me).
3: The definitions for sheet metal and nonmetallic auxiliary gutters both reference bus bars, but the busbar ampacities in the original text only appear under sheet metal auxiliary gutters. Moving that information directly under 366.23 solves that problem.
Combining the ampacity rules in a single place for sheet metal auxiliary gutters and especially in a place labeled "Ampacity of Conductors" leads to easier correct application of the *NEC*. Placing the busbar ampacity directly in 366.23 makes it easier to find for nonmetallic auxiliary gutters.
Panel Meeting Action: Reject
Panel Statement: This comment contains new material that has not had public review. CMP-8 states that the proposed restructuring and wording does not improve the clarity or usability of the NEC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 368 — BUSWAYS

8-33 Log #817 NEC-P08 **Final Action: Accept**
(368, Part IV)

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 8-109
Recommendation: Continue to Reject Proposal 8-109.
Substantiation: There was not technical substantiation to change the requirements for 600 volts to 1000 volts. Leaving 368 Part IV as is does not affect unique applications nor prohibits applications at or over 1000 volts.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 370 — CABLEBUS

8-34 Log #470 NEC-P08 **Final Action: Accept in Part**
(370.2.Cablebus and Informational Note 1 and 2 (New))

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 8-113
Recommendation: Revise text to read as follows:
Cablebus. An assembly of insulated conductors with fittings and conductor terminations in a completely enclosed, ventilated protective metal housing. ~~Cablebus is ordinarily assembled at the point of installation from the components furnished or specified by the manufacturer in accordance with instructions for the specific job. This assembly is designed to carry fault current and to withstand the magnetic forces of such current.~~
<u>**Informational Note 1:** Cablebus is ordinarily assembled at the point of installation from the components furnished or specified by the manufacturer in accordance with instructions for the specific job.</u>
<u>**Informational Note 2:** This assembly is designed to carry fault current and to withstand the magnetic forces of such current.</u>
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains the defined term and the NEC manual of style does not permit the definition to contain the defined term. Definitions are not requirements. An alternative, if CMP 8 believes this is a requirement is to place the information somewhere else in Article 370, where it would serve as a valid requirement.
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Alternate approach, could be as follows:
<u>**370.3 Cablebus assembly:**</u>
<u>**370.3.1** A cablebus shall be assembled at the point of installation from the components furnished or specified by the manufacturer in accordance with instructions for the specific job.</u>
<u>**370.3.2** A cable bus assembly shall be designed to carry fault current and to withstand the magnetic forces of such current.</u>
Panel Meeting Action: Accept in Part
Panel Statement: CMP-8 accepts Informational Note No. 1 and the deletion of the second sentence in the definition. CMP-8 rejects Informational Note No. 2 and the deletion of the third sentence, since it adds a requirement to an informational note which is in violation of the NEC Style Manual.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12
Comment on Affirmative:
LOYD, R.: **CMP-8 should have clarified the action by stating in the action "to read as follows:**
Cablebus. An assembly of insulated conductors with fittings and conductor terminations in a completely enclosed, ventilated protective metal housing. This assembly is designed to carry fault current and to withstand the magnetic forces of such current.
<u>**Informational Note 1:** Cablebus is ordinarily assembled at the point of installation from the components furnished or specified by the manufacturer in accordance with instructions for the specific job."</u>

8-35 Log #818 NEC-P08 **Final Action: Accept in Principle**
(370.4(B))

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 8-115
Recommendation: Accept in Principle ProposaI 8-115. Revise 370.4(B) to read as follows:
(B) Ampacity of Conductors. The ampacity of conductors in cablebus shall be in accordance with Table 310.15(B)(17) and Table 310.15(B)(19) <u>for installations up to and including 2000 volts</u>, or with Table 310.60(C)(69) and Table 310.60(C)(70) for installations over ~~600~~ <u>2001 to 35,000</u> volts.
Substantiation: Changing 600 volts to 1000 volts is not relevant for 370.4(B). Tables 310.15 are for voltages up to 2000 volts. Whereas Tables 310.60 are for 2001 to 35,000 volts.
Panel Meeting Action: Accept in Principle
Section 370.4(B) is revised as follows:
(B) Ampacity of Conductors. The ampacity of conductors in cablebus shall be in accordance with Table 310.15(B)(17) and Table 310.15(B)(19) for installations up to and including 2000 volts, or with Table 310.60(C)(69) and Table 310.60(C)(70) for installations 2001 to 35,000 volts.
Panel Statement: CMP-8 accepts in principle Comment 8-35. CMP-8 removes the word "over" from 370.4(B) since it does not apply.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-36 Log #819 NEC-P08 **Final Action: Accept**
(370.5 Exception)

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 8-117
Recommendation: Accept Proposal 8-117.
Substantiation: This is a correlation issue. Panel 10 Accept Proposal 10-60 to revise 240, Part IX and Sections 240.100 and 240.101 to apply for overcurrent protection over 1000 volts, nominal.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-41 Log #593 NEC-P08 **Final Action: Accept**
(374.11, Informational Note)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 8-120a
Recommendation: Revise text to read as follows:
374.11 Connection to Cabinets and Extensions from Cells. Connections between raceways and distribution centers and wall outlets shall be made by means of liquidtight flexible metal conduit, flexible metal conduit where not installed in concrete, rigid metal conduit, intermediate metal conduit, electrical metallic tubing, or approved fittings. Where there are provisions for the termination of an equipment grounding conductor, rigid polyvinyl chloride conduit, reinforced thermosetting resin conduit, electrical nonmetallic tubing, or liquidtight flexible nonmetallic conduit shall be permitted. Where installed in concrete, liquidtight flexible metal conduit and liquidtight flexible nonmetallic conduit shall be listed and marked for direct burial.
~~Informational Note: Liquidtight flexible metal conduit and liquidtight flexible nonmetallic conduit that is suitable for installation in concrete is listed and marked for direct burial.~~
Substantiation: The informational note now just repeats the meaning of the last sentence of 374.11. It serves no purpose.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 376 — METAL WIREWAYS

8-42 Log #594 NEC-P08 **Final Action: Accept**
(376.56)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 8-142
Recommendation: Revise text to read as follows:
376.56 Splices, Taps, and Power Distribution Blocks.
(A) Splices and Taps. Splices and taps shall be permitted within a wireway, provided they are accessible. The conductors, including splices and taps, shall not fill the wireway to more than 75 percent of its area at that point.
(B) Power Distribution Blocks.
(1) Installation. Power distribution blocks installed in metal wireways shall be listed.
(2) Size of Enclosure. In addition to the wiring space requirement in 376.56(A), the power distribution block shall be installed in a wireway with dimensions not smaller than specified in the installation instructions of the power distribution block.
(3) Wire Bending Space. Wire bending space at the terminals of power distribution blocks shall comply with 312.6(B).
(4) Live Parts. Power distribution blocks shall not have uninsulated live parts exposed within a wireway, whether or not the wireway cover is installed.
(5) ~~Through~~ Conductors. ~~Where the wireway is used for conductors that do not terminate on the power distribution block(s), the through~~ Conductors shall be arranged so the power distribution block terminals are unobstructed following installation.
Substantiation: Suggest that obstruction by any conductors is bad.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-43 Log #556 NEC-P08 **Final Action: Accept in Principle**
(376.56(B)(1))

Submitter: Richard E. Loyd, Sun Lakes, AZ
Comment on Proposal No: 8-140
Recommendation: Reconsider and accept the proposal.
Substantiation: I agree with the negative voter comments. I do agree with 90.1(C) I also agree with 90.1(A). This change does add language that will reduce the likelihood of misapplication with could lead to shock hazard. Where safety is an issue redundancy is warranted.
Panel Meeting Action: Accept in Principle
Revise 376.56(B)(1) to read as follows:
(1) **Installation.** Power distribution blocks installed in metal wireways shall be listed. Power distribution blocks installed on the line side of the service equipment shall be listed for the purpose.
Panel Statement: CMP-8 recognizes that power distribution blocks may be suitable for line side of the installation if listed for the purpose.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
ZIELKE, L.: Comment 8-43 should be rejected. While the submitter's Comment is informative, there was no substantiation of a problem with the current use of the set screw type power distribution blocks. The safety and ease of installation is enhanced by the use of the power distribution blocks, rather than the previous methods with split-bolt connectors and tape. The Comment should be Rejected since it is unenforceable with no specifically listed product currently available.

ARTICLE 384 — STRUT-TYPE CHANNEL RACEWAY

8-44 Log #444 NEC-P08 **Final Action: Accept**
(384.120)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 1-114
Recommendation: 110.21 Marking.
(A) Manufacturer Markings. The manufacturer's name, trademark, or other descriptive marking by which the organization responsible for the product can be identified shall be placed on all electrical equipment. Other markings that indicate voltage, current, wattage, or other ratings shall be provided as specified elsewhere in this *Code*. The marking or label shall be of sufficient durability to withstand the environment involved. **[ROP 1–114]**
384.120 Marking. Each length of strut-type channel raceways shall be clearly and durably identified as required in the first sentence of 110.21<u>(A)</u>.
Substantiation: Accepted ROP 1-114 moved the text in 110.21 from 2008 to 110.21(A) in 2014. 110.21 is now devoid of text and has no first sentence. The first sentence is in 110.21(A).
Panel Meeting Action: Accept
Panel Statement: See panel statement on Comment 8-10.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 386 — SURFACE METAL RACEWAYS

8-45 Log #1426 NEC-P08 **Final Action: Reject**
(386)

TCC Action: The Correlating Committee does not agree with all of the Panel Statement and disagrees with referencing 90.2(C) as adequate substantiation for rejecting the comment.
Submitter: David A. Gerstetter, UL LLC
Comment on Proposal No: 8-154
Recommendation: Revise text as follows:
386.2 Definition.
Surface Metal Raceway. A metallic raceway that is intended to be mounted to the surface of a structure, <u>either directly or by suspension, along</u> with associated couplings, connectors, boxes, and fittings for the installation of electrical conductors.
<u>386.10(5) Surface or Suspension (Pendant) Mounted.</u>
386.30 Securing and Supporting. ~~Surface metal raceways shall be supported at intervals in accordance with the manufacturer's installation instructions.~~
<u>(A) Surface Mount. Surface metal raceways shall be secured to the mounting surface at intervals in accordance with the manufacturer's installation instructions.</u>

(B) Suspension Mount. Surface metal raceways shall be permitted to be suspension mounted at the manufacturer's recommended Intervals and by uslng mounting methods accordance with the manufacturer's installation instructions.
Substantiation: Perhaps a revision to either the definition and/or to the accepted installation practices for surface metal raceways is required in order to make the modified proposed revision, provided above, to the Securing and Supporting portion of Article 386 acceptable.
The securing and support portion of proposal 8-154 was simply an attempt to align the language in Article 386 with what has bee identified to UL by industry as a commonly accepted installation practice for surface metal raceways.
In 2010, UL proposed to revise the current definition of a surface metal raceway in the standard for Surface Metal Raceways and Fittings, ULS, to remove the word "pendant" when referring to how a surface raceway could be mounted. The belief was that by removing the pendant mounting option from the definition in the standard that the definition in the standard would better align with the definition in the NEC for a surface metal raceway. The message from industry was loud and clear that it is common practice for AHJs to accept the suspension/pendant mounting of surface metal raceways, by the use of all-thread or strut, and that the definition in the standard should continue to include the word "pendant" as it had since 1996.
As noted in the explanation of the negative ballot by Mr. Berman, the NEC definition of a surface metal raceway simply states that the raceway is to be mounted to the surface of a structure and makes no mention that the raceway must be in intimate contact with the surface of that structure. The current definition and accepted installation practices for surface metal raceways have been in Article 386 of the NEC since 2002.
Since it can be verified that industry believes that it is common prac ‘ce for AHJs to accept tbe suspension/pendant mounting of surface metal raceways, would respectfully request tbat the portion of proposal 8-154 to revise 386.30 Securing and Supporting surface metal raceways, as modified above, be considered and accepted in order to provide guidance to AHJs and installers when determining whether either surface mounted or suspension mounted surface metal raceways are being installed employing approved appropriate methods in accordance with the manufacturer's installation instructions. I would also request that at this time special consideration also be given to revising the definition and/or uses permitted portion of Article 386.
Panel Meeting Action: Reject
Panel Statement: CMP-8 reaffirms its position to accept in part Proposal 8-154. CMP-8 clearly stated that the scope of Article 386 states that surface metal raceways are intended to be mounted on the surface of the structure.
The submitter has given anecdotal statements of "commonly accepted installation practice" and "The message from industry was loud and clear that it is common practice for the authority having jurisdiction (AHJ) to accept the suspension/pendant mounting of surface metal raceways" without any technical supporting data to support the installation. AHJs are always permitted to accept the installation per 90.2(C). The submitter goes on to state that the application can be "verified" without supplying the verification.
CMP-8 would support revisiting this issue for the 2017 NEC and recommends that the submitter includes a fact finding report that technically supports the use of surface metal raceways in suspended applications.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BERMAN, R.: As indicated in the comment substantiation, the NEC definition of a surface metal raceway simply states that the raceway is to be mounted to the surface of a structure and makes no mention that the raceway must be in intimate contact with the surface of that structure. The UL 5 Standard for Safety for Surface Metal Raceways and Fittings defines this product as "A raceway for surface or pendant mounting...." The UL 5 Standards Technical Panel, composed of manufacturers and other industry professionals, has previously gone on record supporting the pendant mounting means as an option. By rejecting this proposal and comment, and not clarifying this NEC definition with respect to the mounting method, there is potential for enforcement inconsistencies and for listed products to be rejected in the field.

ARTICLE 388 — SURFACE NONMETALLIC RACEWAYS

8-46 Log #1427 NEC-P08 **Final Action: Reject**
(388)

TCC Action: The Correlating Committee does not agree with all of the Panel Statement and disagrees with referencing 90.2(C) as adequate substantiation for rejecting the comment.
Submitter: David A. Gerstetter, UL LLC
Comment on Proposal No: 8-157
Recommendation: Revise text as follows:
388.2 Definition.
Surface Nonmetallic Raceway. A nonmetallic raceway that is intended to be mounted to the surface of a structure,either directly or by suspension, along with associated couplings, connectors, boxes, and fittings for the installation of electrical conductors.
388.10(3) Surface or Suspension (Pendant) Mounted.
388.30 Securing and Supporting. ~~Surface nonmetallic raceways shall be supported at intervals in accordance with the manufacturer's installation instructions~~
(A) Surface Mount. Surface nonmetallic raceways shall be secured to the mounting surface at intervals in accordance with the manufacturer's installation Instructions.
(B) Suspension Mount. Surface nonmetallic raceways shall be permitted to be suspension mounted at the manufacturer's recommended intervals and by using mounting methods in accordance with the manufacturer's installation instructions.
Substantiation: Perhaps a revision to either the definition and/or to the accepted installation practices for surface nonmetallic raceways is required in order to make the modified proposed revision, provided above, to the Securing and Supporting portion of Article 388 acceptable.
The securing and support portion of proposal 8-157 was simply an attempt to align the language in Article 388 with what has been identified to UL by representatives from NEMA, CSA, U.S. and Canadian industries as a commonly accepted installation practice for surface nonmetallic raceways when they worked together to develop and publish the Third Edition of UL SA, the bi-national standard for Nonmetallic Surface Raceways and Fittings. Requirements used to develop the third edition of the standard were derived from the First Edition of CSA C22.2 No. 62, Surface Raceway Systems, and the Second Edition of UL SA, Nonmetallic Surface Raceways and Fittings. The group included the following definition for a surface nonmetallic raceway: SURF ACE NONMETALLIC RACEWAY - a raceway for surface or suspension mounting with a nonmetallic base and a nonmetallic or metal cover. The group also included in the standard evaluation criteria for pendant type raceways.
As noted in the explanation of the negative ballot by Mr. Berman. the NEC definition of a surface nonmetallic raceway simply states that the raceway is to be mounted to the surface of a structure and makes no mention that the raceway must be in intimate contact with the surface of that structure. The current definition and accepted installation practices for surface metal raceways have been in Article 388 of the NEC since 2002.
Since it can be verified that NEMA, CSA, U.S. and Canadian industries all believe that it is common practice for AHJs to accept the suspension/pendant mounting of surface nonmetallic raceways, I would respectfully request that the portion of proposal 8-157 to revise 388.30 Securing and Supporting surface nonmetallic raceways as provided above, be considered and accepted in order to provide guidance to AHJs and installers when determining whether either surface mounted or suspension mounted surface nonmetallic raceways are being installed in accordance with the manufacturer's installation instructions. I would also request that at this time special consideration also be given to revising the definition and/or uses permitted portion of Article 388.
Panel Meeting Action: Reject
Panel Statement: CMP-8 reaffirms its position to accept in part Proposal 8-157. CMP-8 clearly stated that the scope of Article 388 states that surface metal raceways are intended to be mounted on the surface of the structure.
The submitter has given anecdotal statements of "commonly accepted installation practice" and "The message from industry was loud and clear that it is common practice for the authority having jurisdiction (AHJ) to accept the suspension/pendant mounting of surface nonmetallic raceways" without any technical supporting data to support the installation. AHJs are always permitted to accept the installation per 90.2(C). The submitter goes on to state that the application can be "verified" without supplying the verification.
It should also be noted that by revising the definition in the tri-national standard is not substantiation for changing the NEC. In fact, the revised definition is incorrect per the NEC and should be revisited.
CMP-8 would support revisiting this issue for the 2017 NEC and recommends that the submitter includes a fact finding report that technically supports the use of surface non-metallic raceways in suspended applications.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
BERMAN, R.: As indicated in the comment substantiation, the NEC definition of a surface nonmetallic raceway simply states that the raceway is to be mounted to the surface of a structure and makes no mention that the raceway must be in intimate contact with the surface of that structure. The UL 5A Standard for Safety for Nonmetallic Surface Raceways and Fittings defines this product as "A raceway for surface or suspension mounting...." The UL 5A Standards Technical Panel, composed of manufacturers and other industry professionals, has previously gone on record supporting the suspension mounting means as an option. By rejecting this proposal and comment, and not clarifying this NEC definition with respect to the mounting method, there is potential for enforcement inconsistencies and for listed product to be rejected in the field.

8-47 Log #595 NEC-P08 **Final Action: Accept**
(388.120)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 8-154
Recommendation: Revise text to read as follows
388.120 Marking. Surface nonmetallic raceways that have limited smoke-producing characteristics shall be permitted to be so identified. Each length of

surface nonmetallic raceways shall be clearly and durably identified as required in the first sentence of 110.21(A).
Substantiation: 110.21 is now devoid of text, the text is now in 110.21(A).
Panel Meeting Action: Accept
Panel Statement: See panel statement on Comment 8-10.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ARTICLE 392 — CABLE TRAYS

8-48 Log #311 NEC-P08 **Final Action: Accept in Principle**
(Table 392.10(A))

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 8-158a
Recommendation: Delete the rows "optical fiber raceways" and "signaling raceways".
Substantiation: CMP 16 actions on proposal 16-81 eliminated optical fiber raceways; they were replaced by communications raceways. CMP 3 action on proposal 3-156 eliminated signaling raceways; they too were replaced by communications raceways.
Panel Meeting Action: Accept in Principle
Panel Statement: CMP-8 continues to support Proposal 8-158a. Per Comment 8-48, the proposed Table 392.10(A) needs to delete rows "optical fiber raceways" and "signaling raceways". The "article" column for "communication raceways" needs to be revised to add "725" and "770" so that it reads "725, 770 and 800".
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-49 Log #1228 NEC-P08 **Final Action: Reject**
(392.10(B)(1)(a), Exception (New))

Submitter: Christel K. Hunter, Alcan Cable, a General Cable Company
Comment on Proposal No: 8-176
Recommendation: Add new exception to 392.10(B)(1)(a) that reads:
Exception: Where the cable tray system is not installed on, in or connected to a building, conductors installed in cable tray shall not be required to be identified for use in cable tray.
Substantiation: This proposal should have been accepted. The "CT" mark on a conductor is strictly based on how far flame is propagated on a conductor installed in a vertical cable tray; there are no other tests required for the "CT" mark. The purpose is to limit the spread of fire throughout a building by conductors and mitigate the flame spread ability of the conductors through fire-rated penetrations. The relevant language from UL 44 and UL 83.
Requiring this rating on conductors installed in open air installations that do not connect in any way to a building is unnecessary and does not improve safety. The panel statement included the sentence "These conductors could still be a fire risk even though not on or connected to a building." I'm not sure what that means in this context. Even "CT rated" conductors can burn, just more slowly. A common example of where this exception might be used is in large open air industrial-type ground-mount solar installations, where requiring a CT mark for conductors installed in cable tray does not increase safety. There is precedence for this in other areas of the code. For example, USE-2 conductors are not required to have any flame resistance when installed outside a building, even if they are not directly buried.
I have requested that the new language be included as an exception to 392.10(B)(1)(a) since that is the requirement that is specific to the cable tray requirement. I used the word "identified" in place of "listed and marked" in order to avoid any perception that this exception relaxes the requirement for a listed conductor.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: CMP-8 agrees that for some specific installations such as large open air industrial-type ground-mount solar installations, the CT rating may not be required in accordance with Article 690.
However, regarding other applications adequate substantiation has not been provided by the submitter to permit unlimited outdoor applications.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-50 Log #1602 NEC-P08 **Final Action: Reject**
(392.10(B)(1)(a))

Submitter: Mark Albers, SunPower Corp.
Comment on Proposal No: 8-176
Recommendation: Add new text to read as follows:
Exception: Where the cable tray system is not installed on, in or connected to a building, conductors installed in cable tray shall not be required to be of a type listed and marked on the surface for use in cable tray.
Substantiation: SunPower supports the comment submitted by Christel Hunter from General Cable on this proposal. SunPower uses single conductor cables in cable trays extensively in industrial scale ground mounted PV Systems. To date, our cable selection for these systems has been limited to cables with a CT rating. Unfortunately, this restriction offers no added value. The CT rating was designed for slowing the spread of fire inside of a building. This is particular important when the cable trays are in an environment where they could be the fastest means for spreading a fire when they do NOT have the CT rating. Whereas, in an outdoor application like a ground mounted PV system, there are other combustibles that allow a fire to spread more rapidly than the cables, such as grass or other vegetation. Thus, in the unlikely event of a fire, the CT rating has no affect on slowing the spread of fire. While, SunPower requires the use of fire retardant cables, such as PV Wire, in ground mounted PV Systems, the CT rating requires additional provisions beyond those of fire retardant cables to slow the spread of fire. As a result, we request that you include this important exemption in 392.10(B)(1)(a). This will allow single conductor cable types such as PV Wire to be used this application without modifications.
In this proposed text, we have used the same language that is used 392.10(B)(1)(a) to reference the certification in question. We believe this will improve clarity about the intended exemption for inspectors.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 8-49.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-51 Log #821 NEC-P08 **Final Action: Accept**
(392.18(H))

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 8-181
Recommendation: Continue to Reject Proposal 8-181.
Substantiation: This requirement pertains to marking and does not restrict conductors over 600, 1000 or 15,000 volts. Section 392.18(H) just states that if there are conductors over 600 volts, the Cable Tray shall be marked.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-52 Log #1083 NEC-P08 **Final Action: Reject**
(392.18(H))

Submitter: Michael C. Martin, American Chemistry Council
Comment on Proposal No: 8-182
Recommendation: Exception after 392.18(H) to read as follows:
Exception: Where not readily accessible ~~(as applied to equipment)~~, in industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation, cable tray system warning notices shall be located where necessary for the installation to assure safe maintenance and operation.
Substantiation: It is more appropriate to use the term "readily accessible". Using the term "accessible (as applied to equipment)" for a wiring method (tray) is confusing. I believe the term "readily accessible" matches the intent of the Panel in approving the exception.
Panel Meeting Action: Reject
Panel Statement: CMP-8 reaffirms its position to accept in principle Proposal 8-182. The panel does not accept the term "readily accessible" as it pertains to equipment because it does add clarity to the requirement.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11 Negative: 1
Explanation of Negative:
MARTIN, M.: I believe that changing the phrase "accessible (as applied to equipment)" to "readily accessible" would add clarity since this applies to a wiring method without significantly changing the meaning.

8-53 Log #837 NEC-P08 **Final Action: Accept in Principle**
(392.20(A) and (B))

Submitter: Thomas F. Mueller, The Southern Company
Comment on Proposal No: 8-187
Recommendation: Revise text to read as follows:
392.20 Cable and Conductor Installation.
(A) Multiconductor ~~Cables~~ Circuits Rated 600 Volts or Less. Multiconductor ~~cables~~ circuits rated 600 volts or less shall be permitted to be installed in the same tray.
(B) ~~Cables~~ Circuits Rated Over 600 Volts. ~~Cables~~ Circuits rated over 600 volts and those rated 600 volts or less installed in the same cable tray shall comply with either of the following:
(1) The ~~cables~~ circuits rated over 600 volts are Type MC.
(2) The ~~cables~~ circuits rated over 600 volts are separated from the ~~cables~~ circuits rated 600 volts or less by a solid fixed barrier of a material compatible with the cable tray.
Substantiation: The original proposal should have been 'accepted in principle' rather than rejected. The panel statement acknowledged that the submitter's intent and reasoning was basically sound and reasonable. Even though cable rating, rather than circuit rating is used appropriately in other places in Article 392, I found no other places where cable rating was used in this restrictive manner.
From time to time, my company will design 480 volt nominal circuits using

both 600 volt cable and 2000 volt cable. There is no reason that such 480 volt nominal cables cannot be placed side by side in the same tray, but the code currently disallows this. Additionally, 2000 volt cable may be the cable readily available at installation time when design originally called for 600 volt cable. Again, both such cables should be allowed in the same tray side by side. The intent of the rule is to separate for safety higher voltage circuits from lower voltage circuits in a tray. The re-write above makes the directive plain without being too restrictive.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
392.20 Cable and Conductor Installation.
(A) Multiconductor Cables Operating at 600 Volts or Less. Multiconductor cables operating at 600 volts or less shall be permitted to be installed in the same tray.
(B) Cables Operating at Over 600 Volts. Cables operating at over 600 volts and those operating at 600 volts or less installed in the same cable tray shall comply with either of the following:
(1) The cables operating at over 600 volts are Type MC.
(2) The cables operating at over 600 volts are separated from the cables operating at 600 volts or less by a solid fixed barrier of a material compatible with the cable tray.
Panel Statement: CMP-8 recognizes that the submitter is attempting to rationalize a mismatch between insulation rating of cables and operating voltage of circuits. The panel modified the existing text to address the concerns of the submitted comment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-54 Log #260 NEC-P08 **Final Action: Accept**
(392.22(B)(1)(d))

Submitter: Code-Making Panel 6,
Comment on Proposal No: 8-191
Recommendation: Continue to Reject Proposal 8-191.
Substantiation: We assume that CMP-6 was included in this evaluation because the width of trays and any installation spacing requirements have to do with proper and adequate heat dissipation for the conductors. If these rules were violated, then the equivalent of bundling-induced heating would change the safe ampacity of the conductors.
There is no substantiation given for possibly changing the requirements for the width of the various trays. The submitter apparently believes that the same physics apply to under 600-volts as to over 2000-volts, but gives no technical substantiation for this belief.
The submitter's issue of having to do with how the cables are installed should be addressed in Section 392.20. If the suggested text was added to the end of 392.22(B)(1)(d) as requested, it would only apply to 1/0 through 4/0 cables.
This comment was developed by a CMP-6 Task Group and balloted through the entire panel with the following ballot results:
10 Eligible to Vote
10 Affirmative
No Comments on Vote were received
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-55 Log #261 NEC-P08 **Final Action: Accept**
(392.22(B)(1)(e) (New))

Submitter: Code-Making Panel 6,
Comment on Proposal No: 8-192
Recommendation: Continue to Reject Proposal 8-192.
Substantiation: We assume that CMP-6 was included in this evaluation because the width of trays and any installation spacing requirements have to do with proper and adequate heat dissipation for the conductors. If these rules were violated, then the equivalent of bundling-induced heating would change the safe ampacity of the conductors.
The special ampacity allowances for 392.80(A)(2)(d) do not apply to all bundled cable systems. No substantiation is given for possibly changing the requirements. There is no substantiation given for possibly changing the requirements for the width of the various trays.
There is no need for a statement regarding single layer installation for a case where the bundles must already have a maintained spacing. Any requirements having to do with installation alone should be in 392.20.
This comment was developed by a CMP-6 Task Group and balloted through the entire panel with the following ballot results:
10 Eligible to Vote
10 Affirmative
No Comments on Vote were received
Panel Meeting Action: Accept
Number Eligible to Vote: 12

8-56 Log #1461 NEC-P08 **Final Action: Reject**
(392.22(B)(1)(b) and (c))

Submitter: Robert Crain, Legrand/Cablofil
Comment on Proposal No: 8-190
Recommendation: Revise text and tables as follows:
392.22(B)(1) (b) Where all of the cables are from 250 kcmil through 900 kcmil, the sum of the cross-sectional areas of all single conductor cables shall not exceed the maximum allowable cable fill area in Column 1 of Table 392.22(B)(1) for the appropriate cable tray width.
<u>*Informational Note: See Tables in Annex C.13-C.15 for maximum number of conductors*</u>
392.22 (B)(1)(c) Where 1000 kcmil or larger single-conductor cables are installed in the same cable tray with single-conductor cables smaller than 1000 kcmil, the sum of the cross sectional areas of all cables smaller than 1000 kcmil shall not exceed the maximum allowable fill area resulting from the computation in Column 2 of Table 392.22(B)(1) for the appropriate cable tray width.
<u>*Informational Note: See Tables in Annex C.13-C.15 for maximum number of conductors*</u>
Add 3 tables to new or revised Annex C(13) through C(15) for single conductor power cables used in cable tray as follows:
(See Tables C.13, C.14 (XHHW) and C.14 (RHW) on the following pages.)
Substantiation: The rules and charts provided in Article 392 for determining the required cable tray size are complex. Cable tray manufacturers receive many technical inquiries regarding how to calculate cable tray sizes. Locating a table of industry standard single conductor cable sizes would allow for simplified determination of the maximum number of cable allowed in a tray width.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: CMP-8 identified a number of errors with original Proposal 8-190. The submitted comment also contains many of the same errors that appeared in that proposal.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

8-57 Log #1371 NEC-P08 **Final Action: Accept**
(392.60.Grounding and Bonding)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 8-195
Recommendation: NEMA opposes the Panel Action (reject), because the original submitter has a valid point with respect to the deletion of the phrase "not smaller than a 10 AWG," which NEMA supports.
392.60 Grounding and Bonding.
(A) Metallic Cable Trays. Metallic cable trays shall be permitted to be used as equipment grounding conductors where continuous maintenance and supervision ensure that qualified persons service the installed cable tray system and the cable tray complies with provisions of this section. Metallic cable trays that support electrical conductors shall be grounded as required for conductor enclosures in accordance with 250.96 and Part IV of Article 250. Metal cable trays containing non-power conductors shall be electrically continuous through approved connections or the use of a bonding jumper ~~not smaller than a 10 AWG~~
Informational Note: Examples of non-power conductors include nonconductive optical fiber cables and Class 2 and Class 3 Remote Control Signaling and Power Limiting Circuits.
Substantiation: As substantiation for the original proponent's revision to delete the phrase "not smaller than a 10 AWG", NEMA reports that draft NEMA VE 2-2013, Cable Tray Installation Guidelines, no longer contains the provision for installing a 10 AWG bonding jumper as there is no identified substantiation for this statement. An alternative is to delete this entire sentence and Informational that was added in 2011.
Panel Meeting Action: Accept
Panel Statement: CMP-8 only accepts the deletion of "not smaller than a 10 AWG ". The panel recognizes that the submitter of the comment inadvertently omitted the term "only" before the words "non-power conductors " in the last sentence.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

Conductor diameter based on Chapter 9, Table 5

8-56 (Log #1461)

8-58 Log #1019 NEC-P08 **Final Action: Reject**
(392.60(A))

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 8-194
Recommendation: Revise as follows:
392.60 Grounding and Bonding. (A) Metallic Cable Trays. Metallic cable trays shall be permitted to be used as equipment grounding conductors where continuous maintenance and supervision ensure that qualified persons service the installed cable tray system and the cable tray complies with provisions of this section. Metallic cable trays that support electrical conductors shall be grounded as required for conductor enclosures in accordance with 250.96 and Part IV of Article 250. ~~Metal cable trays containing only non-power conductors shall be electrically continuous through approved connections or the use of a bonding jumper not smaller than a 10 AWG.~~
~~Informational Note: Examples of non-power conductors include nonconductive optical fiber cables and Class 2 and Class 3 Remote Control Signaling and Power Limiting Circuits.~~
Substantiation: This comment seeks to remove the language that was added to the 2011 NEC. There was no substantiation for this change, which makes sense because you couldn't possibly substantiate such a requirement. Bonding the cable tray when it is full of communications cables does what exactly? We aren't connecting the tray to earth to help mitigate induced energy from lightning. We aren't connecting it to a power supply so as to remove ground-fault voltage by opening an overcurrent device. It seems that the only thing bonding the tray is doing is ensuring that the entire tray (instead of just a small portion) gets energized in the event of a fault!
Panel Meeting Action: Reject
Panel Statement: CMP-8 reaffirms its position to reject Proposal 8-194. One of the results of effective grounding and bonding electrical systems is the reduction of electrical shock hazards. Per the submitter's statement: "It seems that the only thing bonding the tray is doing is ensuring that the entire tray (instead of just a small portion) gets energized in the event of a fault!"
If properly bonded and grounded, the cable tray voltage potential will go to ground and the cable tray will be at ground (zero) potential reducing electrical hazards.
Further, CMP-8 does not agree that any substantiation was provided for this change.

Recommendation: Revise text as follows:
(B) Multiwire Branch Circuits. Where connected to a multiwire branch circuit, the disconnecting means shall simultaneously break all ~~the~~ <u>ungrounded</u> supply conductors to the power supply in accordance with 210.4(B).
Substantiation: Breaking the neutral is not required.
Panel Meeting Action: Reject
Panel Statement: See panel actions and statements on Comment 18-11 and 18-10a (Log #CC1800).
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

ARTICLE 396 — MESSENGER-SUPPORTED WIRING

7-16 Log #309 NEC-P07 **Final Action: Reject**
(396.10(A))

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 7-76
Recommendation: Revise the action on 7-76 as shown:
Power-limited tray cable Type PLTC ~~725.154(C) and~~ 725.179(E).

Substantiation: This is a correlating comment to our comment on proposal 3-154a to reorganize 725.154. If that comment is accepted, the current 725.154(C) will be deleted. Even if the comment on 3-154a is not accepted, referring to 725.179(E) for listing information on power-limited tray cable is sufficient information.
Panel Meeting Action: Reject
Panel Statement: CMP-7 chooses to retain reference to 725.154(C) regardless of any reorganization. The term "Type PLTC" was rejected at the ROP and therefore should not be considered in this revised comment. Any reference coordination will be reviewed by the Correlating Committee prior to final revisions.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
CYBULA, T.: Based on the action taken by CMP3 on 725.154 in comment 3-63. existing sub paragraph (C) has been deleted, and existing (I) has been renumbered as (C) Thermocouple Circuits. Therefore the reference to 725.154(C) from 396.10(A) will be incorrect. The Correlating Committee should review these comments to ensure correlation is maintained.

ARTICLE 399 — OUTDOOR, OVERHEAD CONDUCTORS, OVER 1000 VOLTS

7-17 Log #718 NEC-P07 **Final Action: Accept**
(399, Title)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 7-82
Recommendation: Continue to Accept in Principle.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.
The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.
The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.
Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.
Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.
If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

7-18 Log #1563 NEC-P07 **Final Action: Reject**
(399)

TCC Action: The Correlating Committee advises that article scopes, numbers, titles, and assignment of articles within Chapters are the responsibility of the Correlating Committee and the Correlating Committee accepts the panel action.
Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 7-83
Recommendation: The proposal should be accepted.
Substantiation: This is a companion comment to one submitted to include this material in Part III of Article 225. The submitter does strongly agree that this material belongs in the NEC and CMP 4 unanimously supported this relocation (Proposal 4-95) at the ROP meeting. The Correlating Committee should allow this relocation to move forward in the best interests of the NEC. Article 399 does not describe a wiring method; it describes how to engineer outdoor overhead medium voltage wiring. As such it does not belong in Chapter 3. In addition, it should not be a stand-alone article due to the nature of the coverage; it fits perfectly in Part III of Article 225. This portion of the NEC already covers overhead conductor clearances above open areas (225.60) and above buildings (225.61). This location not only fits editorially within an article entitled "Outdoor Feeders and Branch Circuits", it also assures the subject matter will be addressed by the most qualified panel to tackle the subject. The wiring employed for overhead medium voltage construction does not employ cable constructions and it would be necessary to provide additional personnel within CMP 7 to duplicate the expertise already present in CMP 4 in order to address this topic properly. Any one of these three reasons would be sufficient to justify the relocation; the three of them together make a solid case in terms of sound of code administration.
Panel Meeting Action: Reject
Panel Statement: CMP-7 reaffirms it's position on Proposal 7-83. This article covers a wiring method and therefore is appropriate for CMP-7. However, CMP-7 agrees that the removal of this article and its renumbering is beyond the scope of this panel's authority in accordance with Section 3.3.1.2 of The Regulations Governing Committee Projects.

7-19 Log #719 NEC-P07 **Final Action: Accept**
(399.1)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 7-84
Recommendation: Continue to Accept in Principle.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.
The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.
The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and

the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

(399.10)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 7-86
Recommendation: Revise text to read as follows:

~~**399.10 Uses Permitted.** Outdoor overhead conductors over 1000 volts, nominal, shall be permitted only for systems rated over 1000 volts, nominal, as follows: **[ROP 7–86]**~~
~~(1) Outdoors in free air **[ROP 7–87]**~~
~~(2) For service conductors, feeders, or branch circuits~~
399.10 Uses Permitted. Conductors supported by insulators, and insulated cables, rated over 1000 volts, nominal, shall be permitted for systems rated at or below the rated insulators or insulation, when outdoors in free air.

Substantiation: 1) The original first sentence is circular.
2) The original first sentence appears to exclude high-voltage outdoor cables.
3) The original first sentence appears to exclude the use of a circuit insulated for 7.2kV to be used for a 2.4kV circuit for no apparent reason. (It is common utility practice for 22kV lines to be used for 12.47kV with no apparent hazard.)
4) (2) Appears to list "all" circuits under the *NEC*, and therefore adds nothing to Section 399.10.
5) (2) Appears to inadvertently exclude non-utility-owned transmission lines such as 22kV lines owned by mining companies in WV.

Panel Meeting Action: Reject
Panel Statement: The submitter's text does not add clarity.

Article 399 is applicable to outdoor overhead installation. It does not exclude the examples expressed in the submitter's substantiation.

6-69 Log #1176 NEC-P06 **Final Action: Accept in Principle**

(400.4)

Submitter: Russel LeBlanc, The Peterson School of Engineering

Comment on Proposal No: 6-86

Recommendation: Accept proposal with revision as noted by the TCC.

Revise second sentence to read as follows:

Types of flexible cords and flexible cables other than those ~~(listed)~~(described) in ~~(the table)~~(Table 400.4) shall be ~~(the subject of special investigation)~~ (permitted only by special permission)

Or simply insert the sentence (Flexible cords and flexible cables shall be listed.) *and this will solve the question of whether or not cords and cables must be listed!*

Substantiation: Article 100 definition of word “Listed”. Equipment, materials, or services included in a list published by an organization that is acceptable to the authority having jurisdiction and concerned with evaluation of products or services, that maintains periodic inspection of production of listed equipment or materials of periodic evaluation of services, and whose listing states that either the equipment, material, or service meets appropriate designated standards or has been tested and found suitable for a specified purpose.

If the intent of Section 400.4 is to require flexible cords and flexible cables to be LISTED by a testing lab, then simply insert the sentence "Flexible cords and flexible cables shall be listed". But since there is presently no requirement as such, then the use of the word listed is not appropriate in the section. The layout of Table 400.4 is in fact a "list", but the term "LISTED" has a specific meaning in the NEC and it is not the correct term to be used here. The correct term to be used is "described" since the term "description" is being used in the first sentence.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

The use of flexible cords and flexible cables other than those in Table 400.4 shall require permission by the authority having jurisdiction.

Ballot Results: Affirmative: 10

6-70 Log #940 NEC-P06 **Final Action: Reject**

(400.7(A)(9))

Submitter: James F. Williams, Fairmont, WV

Comment on Proposal No: 6-103

Recommendation: Revise text to read as follows:

400.7 Uses Permitted.

(A) Uses. Flexible cords and cables shall be used only for the following:

(9) Connection of accessory equipment associated with mechanical equipment, alarms, or antennas using a listed non-detachable power supply cord 1.83 m (6 ft) or less; <u>or a listed power supply with an integral power plug</u>, above an accessible suspended or dropped ceiling where not prohibited by 300.22. **[ROP 6–103]**

Substantiation: The intent as I understand it is to allow equipment such as small condensate pumps, some alarm system, and WiFi points mounted above dropped ceilings to be plug and cord connected to receptacles also above dropped ceilings. Many, if not most, WiFi points use "wall warts" as power supplies. Adding the text would allow the use of Listed wall warts. Maybe there is a better description of a wall wart?

Panel Meeting Action: Reject

Panel Statement: CMP-6 recognizes that there may be situations that cords may need to be approved for use above these ceilings. These and can be addressed by the approval of the AHJ.

See panel action and statement on Comment 6-73 which rejects Proposal 6-103.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

6-71 Log #386 NEC-P06 **Final Action: Accept**

(400.7(A)(11) (New))

Submitter: Mario Xerri, UL LLC

Comment on Proposal No: 6-101

Recommendation: Add new text to read as follows:

<u>**400.7(A)(11)** Between an existing receptacle outlet and an inlet, where the inlet provides power to an additional single receptacle outlet. The wiring interconnecting the inlet to the single receptacle outlet shall be a Chapter 3 wiring method. The inlet, receptacle outlet, and Chapter 3 wiring method, including the flexible cord and fittings, shall be a listed assembly specific for this application.</u>

Substantiation: There are concerns with the use of an extension cord or a detachable power supply cord because a user can unknowingly substitute a cord set with a smaller AWG size which could result in an overheating condition of the flexible cord. The issue of users substituting a smaller AWG cord can be addressed in the listing of the assembly. The use of non-standard configuration inlets or the use of overcurrent protection at the inlet are two possible methods that could be provided in the listing of the assembly to address the hazard. Adding the specific wording to the proposed 400.7(11) helps the AHJs and installers to better understand what is allowed in this type of installation.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Accept

Number Eligible to Vote: 10

Ballot Results: Affirmative: 9 Negative: 1

Explanation of Negative:

STACEY, J.: The panel action should have been "Reject" There is no proof that this is a problem only concerns as stated by the submitter. As stated in ROP 6-101panel statement -The subject in this proposal and the submitter's concerns are adequately covered in section 406.7. The new language is not needed or understandable. This does not help this AHJ and could be handled by the product listing and 110.3(B). A user that installs a smaller AWG cord would not be looking at the NEC to see if it's OK nor would the AHJ be there to oversee the installation of equipment like TVs.

6-72 Log #100 NEC-P06 **Final Action: Accept**

(400.8(6))

Submitter: Technical Correlating Committee on National Electrical Code®

Comment on Proposal No: 6-103

Recommendation: It was the action of the Correlating Committee that this proposal be referred to Code-Making Panel 3 for comment.

The Correlating Committee directs that Panel 6 clarify the reference in the panel statement to Proposal 6-102 for changes made to 400.8(5), since Proposal 6-102 was rejected.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Panel Statement: CMP-6 accepts the direction of the Correlating Committee. The panel statement for Proposal 6-103 is incorrect in that the proposed changes in Proposal 6-103 were rejected and no changes were made to 400.8(5). The A2013 ROP Draft is correct.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

6-73 Log #266 NEC-P06 **Final Action: Accept**

(400.8(6))

Submitter: Code-Making Panel 3,

Comment on Proposal No: 6-103

Recommendation: Code-Making Panel 3 does not agree with the panel action. This proposal should have been rejected.

Substantiation: The modification made to the Accept in Pprinciple added by the panel should not have been accepted. The addition of the term "alarms" is too generic and does not clearly identify the type of alarm.

This comment was developed by a CMP-3 Task Group and balloted through the entire panel with the following ballot results:

15 Eligible to vote

13 Affirmative (See affirmative comment below)

2 Ballots Not Returned (A.D. Corbin and D.T. Mills)

The following Comments on Vote were received:

AFFIRMATIVE:

S.L. STENE: The issue is not whether the short cord is a fire load or not. The reason flexible cords are not permitted above the ceiling in a drop ceiling or any other hidden application is that the cord must be installed so it is visible at all times so any deterioration or other damage can be detected and is not hidden out of sight. The proposal should still be rejected but the reasoning is related to damage and deterioration.

Panel Meeting Action: Accept

Number Eligible to Vote: 10

Ballot Results: Affirmative: 9 Negative: 1

Explanation of Negative:

CLINE, S.: In opposition to the Panel's action:

This Comment should have been rejected.

The key limits in the allowances of Proposal 6-103 were: listed and limited length. CMP-3's Comment speaks to risk. All choices about electrical construction involve some sort of risk. Not passing the allowance we crafted in the Proposal leaves higher risks in place since the replacement of equipment is most likely to be done by a non-electrician.

P6-103 did not allow the use of cords above a suspended ceiling which is used for environmental air, since they could not currently comply with 300.22(C)(1). While CMP-3 could in the future consider doing as they did with cables, by adding cord which is ""specifically listed for use within an air-handling space", it is not within CMP-3's expertise to judge the use of the cords when the space is not used for environmental air.

A "listed non-detachable power supply cord" of limited length presents very little risk of becoming a hazard due to damage and deterioration. The cords and equipment involved are easily available for inspection and replacement. Indeed, that is why they need to be cord connected in the first place. They supply power to accessory equipment which MUST work at all times, which will by default constantly be monitored for function, and which must be easily exchanged.

These exchanges of damaged accessory equipment are very likely to be done by a mechanical contractor, an alarm technician, a plumber, or an I.T technician - not an electrician. All the more reason that they be cord connected for the safety of all. We DO NOT want "adaptive" wiring methods to be used in this space.

The limitations placed upon the uses allowed by Proposal 6-103 are far the lesser of evils compared to the existing situation of people jury-rigging solutions for necessary applications.

The reality is that the types of equipment P6-103 allowed for WILL exist above suspended ceilings. We need P6-103.

6-74 Log #835 NEC-P06 **Final Action: Reject**
(400.10, Informational Note)

Submitter: Robert Huddleston, American Chemistry Council
Comment on Proposal No: 6-104
Recommendation: Change Information Note to delete "knotting the cord" from the text. Leave the rest of the Proposal as submitted.
Substantiation: This proposal should have been accepted in part by the Panel. The submitter is correct in clarifying that fittings should be identified rather than designed for the purpose. However, the Informational Note also recommends "knotting the cord" as an acceptable method of strain relief. Knotting the cord? Huh? The Panel needs to recognize that many houses have burned to the ground from damage to cords that are kinked...and just what is a knot in the cord if not an excessive kink? Realizing the fact that many lamps and other cheaply made devices use the cord knotting technique does not justify the NEC condoning such a method of strain relief.
Panel Meeting Action: Reject
Panel Statement: Knotting of some types of cords is a recognized method to provide strain relief to the cord for terminal protection.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
HUDDLESTON, JR., R.: Panel statement says that "knotting of some types of cords is a recognized method to provide strain relief." Recognized or not, this is not an acceptable way to provide strain relief, and there are much better ways to do so rather than tying a UL knot or some other kind of knot in a cord. Many houses burn down when cords are kinked at the outlet due to furniture being pressed against the plug and cord, and yet the Panel condones tying a knot in the cord and says it is a "recognized method". Recognizing that this is an Information Note and not mandatory text does not relinquish the Panel from its responsibilities to promote safety.

ARTICLE 404 - SWITCHES

9-40 Log #729 NEC-P09 **Final Action: Accept**
(404.1)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 9-74
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.
The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.
The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.
Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.
Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.
If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1
Ballot Not Returned: 1 Coghill, P.
Explanation of Negative:
FERRARO, J.: It is recognized that increasing voltage from 600 volts to 1000 volts may be applicable to specific installations. However, adequate technical substantiation has not been provided to support the change in this Article.

9-41 Log #8 NEC-P09 **Final Action: Reject**
(404.2(C))

Submitter: Stephen L. Herman, Pittsburg, TX
Comment on Proposal No: 9-79
Recommendation: A grounded conductor shall be installed at any switch location that is supplied with a continuous ungrounded source of power.
Substantiation: I am writing concerning 404.2(C). I understand the concern about using grounding conductors as the return path for such electronic devices as motion detectors or occupancy sensors. I believe that the requirement concerning grounded conductors at a switch location can be solved in a much simpler way than the way that it is stated in the present code. As far as I am aware, electronic sensing devices must have a continuous power source to operate. A grounded conductor could be required at any switch location that is supplied with a continuous ungrounded source. This would require a grounded conductor at any single-pole switch and any three-way switch that contains a continuous source of power. In this way, a grounded conductor is not required in locations that cannot be connected to electronic devices because there is no continuous source of power to operate them.
Panel Meeting Action: Reject
Panel Statement: The proposal is too broad and incomplete. See panel action and statement on Comment 9-44.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Coghill, P.

9-42 Log #244 NEC-P09 **Final Action: Reject**
(404.2(C))

Submitter: Stephen L. Herman, Pittsburg, TX
Comment on Proposal No: 9-79
Recommendation: Revise text to read as follows:
A grounded conductor shall be installed at any switch location that is supplied with a continuous ungrounded source of power.
Substantiation: At present, 404.2(C) requires a grounded conductor at any switch location. My understanding is that this requirement was made because of the practice of using grounding conductors to supply the neutral for electronic devices such as motion detectors or occupancy sensors. All of these devices require a continuous source of power to operate. If there is no continuous source of power, the electronic device cannot be installed. Therefore, the requirement for a grounded conductor to be present at any switch location could be amended to requiring a grounded conductor to be present at locations where there is a continuous source of power.
Panel Meeting Action: Reject
Panel Statement: The proposal is too broad and incomplete. See panel action and statement on Comment 9-44.
Number Eligible to Vote: 12

(404.2(C))

Submitter: Phil Simmons, Simmons Electrical Services
Comment on Proposal No: 9-82
Recommendation: Revise 404.2(C) in the 2014 NEC ROP Draft as follows:
(C) Switches Controlling Lighting Loads. <u>The grounded circuit conductor for the controlled lighting circuit shall be provided at the location</u> where switches control lighting loads that are supplied by a grounded general purpose branch circuit~~, the grounded circuit conductor for the controlled lighting circuit shall be provided at the switch location.~~ <u>for other than the following:</u>
<u>1. Where conductors enter the box enclosing the switch through a raceway, provided the raceway is large enough for all contained conductors, including a grounded conductor.</u>
<u>2. Where the box enclosing the switch is accessible</u>
<u>3. Snap switches with integral enclosures complying with 310.15(B)(3)(a)</u>
<u>4, Door jamb switches</u>
<u>5. For other than a single switch that can detect occupancy in a contiguous area</u>
<u>6. Where lighting in the area is controlled by automatic means.</u>
<u>5. Statement of Problem and Substantiation for Comment:</u>
Substantiation: An attempt is made to simplify the rule and eliminate the lengthy and confusing exceptions.
The opening paragraph is changed editorially to improve the structure and be complimentary to the list of exceptions that follow it.
The exceptions are rewritten into a simplified list format. The list includes door jamb switches since the Panel in its statement on Proposal 9-83 indicates a grounded conductor should not be required for them.
It is intended that the concepts in Exceptions 1 through 3 in the 2014 NEC ROP Draft be included in the list.
Panel Meeting Action: Accept in Principle in Part
Revise text to read as follows:
(C) Switches Controlling Lighting Loads. The grounded circuit conductor for the controlled lighting circuit shall be provided at the location where switches control lighting loads that are supplied by a grounded general purpose branch circuit, for other than the following:
1. Where conductors enter the box enclosing the switch through a raceway, provided the raceway is large enough for all contained conductors, including a grounded conductor.
2. Where the box enclosing the switch is accessible <u>for the installation of an additional or replacement cable without removing finish materials.</u>
3. Snap switches with integral enclosures complying with <u>300.15(E).</u>
4. <u>Where a switch does not serve a habitable room or bathroom.</u>
5. <u>Where multiple switch locations control the same lighting load such that the entire floor area of that room or space is visible from the single or combined switch locations.</u>
6. Where lighting in the area is controlled by automatic means.
7. <u>A switch controlling a receptacle load.</u>
Panel Statement: CMP-9 accepts the submitter's change to the list format and makes the following changes to cover existing requirements in proposal 9-89 which were omitted:
1. Added #7
2. In #5, the panel reverted to the exception text accepted as part of proposal 9-89 which allows for more than one location to be required to have the grounded circuit conductor.
The panel rejects the use of the term "door jamb switches" to cover switch locations that do not serve a habitable room and reverted to the current text. CMP-9 assumes the listing of the second #5 on the comment was an editorial error and deleted the text.
3. Corrected the reference in #3.
4. CMP 9 agrees that switch locations not in the illuminated area should have a grounded connection to support some dimmers and therefore the allowance was not included in the final panel action. See Proposal 9-89.

9-47 Log #357 NEC-P09 **Final Action: Accept**
(404.8(C))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 9-97
Recommendation: Revise text to read as follows:
(C) Multipole Snap Switches. A multipole, general-use snap switch shall not be permitted to be fed from more than a single circuit unless it is listed and marked as a two-circuit or three-circuit switch.~~, or unless its voltage rating is not less than the nominal line-to-line voltage of the system supplying the circuits.~~
Substantiation: NEMA respectfully requests the code panel to reconsider its action.
CMP 9 has taken a position on design and certification of switches by stating that the use being cited is ".. safe or ought to be". They have also stated ".. UL will have to revisit the Guide Card information, and the problem will disappear " and "that the majority of snap switches comply with all the requirements, and the provisions are routinely being used in the field without incident."
There may have been installations in the field that "worked", but that doesn't mean they were safe or complied with all the requirements. They were likely operating well below their maximum ratings and number of use cycles. The test standard for this product includes a high current overload test and 30,000 cycles of full load endurance. As requested by the panel, UL did revisit this subject through the STP process and determined that the products have NOT been tested for this application and may not be safe. This was determined by the manufacturers of the products and UL. These are certainly "experts" on the subject.
We must not lose site of the basic requirement for safety as stated in the initial sentence of article 404.8(C) that multipole, general-use snap-switches shall NOT be fed from more than one circuit. The requirement unless ".. listed and marked as a two-circuit or three-circuit switch" is the only safe use of these products.
It is now the responsibility of the code panel to provide for a safe installation. The fact that it was in the code unchallenged for one cycle is not a good reason to promote a practice that is not safe. It was simply "missed". It was responded to late in the 2011 cycle and again in the 2014. Delaying the removal of this practice because it was missed the first time around does not make it any safer. The UL requirements for listing and marking 2 and 3 circuit switches have been in existence a long time. They were recently reviewed and clarified at the request of the code panel. The NEC requires that these products be used within their listing.
Panel Meeting Action: Accept

Explanation of Negative:
HARTWELL, F.: Please refer to the Explanation of Negative Vote on Comment 9-49.
Comment on Affirmative:
RUPP, B.: NEMA supports the panel action on this Comment. This change will increase the level of safety in the use of multipole snap switches by ensuring that they are installed and used in accordance with their ratings and applications for which they are designed by their manufacturers and listed. This revision by Comment 9-47 will remove explicit and implicit correlation conflicts of existing NEC® 404.8(C) with NEC® 110.3(B), 404.14, and 404.15.

9-48 Log #1164 NEC-P09 **Final Action: Accept**
(404.8(C))

Submitter: Charles S. Kurten, UL LLC
Comment on Proposal No: 9-97
Recommendation: Revise text to read as follows:
(C) Multipole Snap Switches. A multipole, general-use snap switch shall not be permitted to be fed from more than a single circuit unless it is listed and marked as a two-circuit or three-circuit switch.~~, or unless its voltage rating is not less than the nominal line to line voltage of the system supplying the circuits.~~
Substantiation: UL does not support the panel action to reject proposal 9-97.
The Standards Technical Panel (STP) for ANSIIUL20, the Standard for General Use Snap Switches, unanimously supported the "2-circuit and 3-circuit" switch requirements, which were added to the Standard on February 17,2012. These requirements, which are provided below (in legislative format), require testing with multiple supplies and loads.
Switches suitable for such applications are marked to indicate suitability for use on "2-circuit and 3-circuit" installations:
2.18 TWO- OR THREE-CIRCUIT SWITCHES - Consists of up to a three pole switch. intended to be installed on multiple or multi-phase branch circuits controlling multiple or multi-phase loads of no more than 120 V to ground and 240 V line to line, 240 V total per circuit.
5.5.3 With reference to the requirement in Clause 5.5.1, it is impracticable to describe the details of connections that must be made in order to obtain all operating conditions because of the different arrangements of terminals of switches of various manufacturers. The connections to a switch in the test circuit shall be such that the load controlled will have the same position, relative to the switch and the supply that it will have in actual service.
Two- and three-circuit switches are tested simultaneously with multiple supply and loads present to represent actual service conditions and shall be marked in accordance with Clause 7.2.4.
7.2.4 A general-use switch that is intended for the control of two or three circuits shall be marked "(2 or 3) Circuit Switch - 240V max between circuits", or equivalent. In addition, a circuit diagram showing the intended multiple connections shall be provided either on the switch, the smallest carton in which the switch is packaged, on the card in the case of a blister pack, or on a stuffer sheet packaged with each individual switch.
UL supports the original proposal to remove the provision in 404.8(C), noting that the stated use is addressed by the product Standard, and is validated by ratings which are marked on the product.

9-49 Log #1437 NEC-P09 **Final Action: Accept**
(404.8(C))

Submitter: David Lutz, Hubbell Inc.
Comment on Proposal No: 9-97
Recommendation: Revise text to read as follows:
Hubbell requests that Code Panel 9 reconsider its action and Accept the proposal as written to delete the text as shown below.
(C) Multipole Snap Switches. A multipole, general-use snap switch shall not be permitted to be fed from more than a single circuit unless it is listed and marked as a two-circuit or three-circuit switch. ~~, or unless its voltage rating is not less than the nominal line-to-line voltage of the system supplying the circuits.~~
Substantiation: This 2 circuit allowance has been in the code in error for 2 cycles now and the problem must be corrected. Hubbell Incorporated produces multipole switches that are UL listed for single circuit use. We also have UL listing for 2 circuit multipole switches. I can assure you that the testing for a 2 circuit rating is very different than the test for single circuit listing. The 2 circuit device must demonstrate the ability to control 2 independent circuits and loads. Each set of contacts sees maximum load make and break operations with full potential to arc between circuits. A standard 1 circuit switch only breaks 1 load thus it shares the maximum load over 2 sets of contacts.
This panel has stated that ".. the majority of snap switches comply with all the requirements, and the provisions are routinely being used in the field without incident."
This code panel cannot possibly know how Hubbell switches are designed tested. Our single circuit mutipole switches have NOT been designed or tested for use on 2 circuits. This UL standard has required special marking and testing for 2 or 3 circuit switches for decades. Hubbell has a listed 2 circuit switch, properly tested and marked.
Just because a device was installed and appears to work without incident does not mean it is safe to do so. This code is founded on the premise of using products in accordance with the manufacturer's instructions and UL listing.
The panel asked UL to review the situation last cycle and they did. The results clearly indicated that 2 circuit switches were very different than single circuit and required special testing and marking. The manufacturers and UL have clearly stated that it is not safe to use a single circuit switch on multiple circuits. This is exactly what the code has always required except for this incorrectly added alternative.
There is overwhelming expert evidence that this practice is NOT safe verses anecdotal evidence of some use in the field without incident. Because some devices have been used in a manner that violates the code, the manufacturer's instructions and the product listing, that certainly does not mean it is safe.
Is this code panel overriding the manufacturer's specifications and the UL listings? Does this code panel have the knowledge regarding the design and testing of every multipole switch manufactured and will now assume liability for this action if there is an incident?
Hubbell strongly urges this code panel to reconsider its rejection and accept the proposal to return the code to it former "safe" requirement.
Panel Meeting Action: Accept
Panel Statement: See panel action on Comment 9-47.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1
Ballot Not Returned: 1 Coghill, P.

Explanation of Negative:

HARTWELL, F.: The comment should have been rejected. The entire point of the prior actions in the two previous code cycles was to compel a change in the product standard. Members of CMP 9 should bear in mind that a multipole switch can be used by right to control a load that includes a neutral connection. Such loads have loads on the poles of the switch that differ in degrees that cannot be known to the switch manufacturer. If the product standard does not take such unequal loading into account, then there is indeed a safety issue, one that can only be cured by making the requirements for 2- and 3-circuit listed switches, more fully described in this comment, mandatory for all multipole switches. If the comment is indeed rejected, then UL will be forced to make that change, even at the expense of a file review for the manufacturers covered by UL 20.

9-50 Log #427 NEC-P09 **Final Action: Hold**
(404.10(B))

TCC Action: The Correlating Committee directs that the Panel Action be reported as Hold because the comment introduces a new concept that has not had public review. This comment will be forwarded to Panel 1 for action during the 2017 revision cycle.
Submitter: Jerry Feagans, City of St. Louis
Comment on Proposal No: 9-89
Recommendation: Add new sentence to 110.13(A) to read:

Electrical equipment shall be secured with an approved fastening device. The use of drywall screws shall not be used to a accomplish the securing of electrical equipment.

Substantiation: The proposal was to add that drywall screws could not be used for securing switches. The information should be located in 110.13(A) for mounting and cooling of equipment. In this section it would apply to all equipment throughout the Code and would not be needed in each Article.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel cannot entertain this change. It needs to come in at the proposal stage and should be directed to Panel 1. See panel action on Comment 9-52 which meets the intent of the submitter as it relates to Chapter 4.

Ballot Not Returned: 1 Coghill, P.

9-51 Log #1175 NEC-P09 **Final Action: Reject**
(404.10(B))

Submitter: Dean C. Hunter, Menagha, MN
Comment on Proposal No: 9-98
Recommendation: Delete text as follows:

~~Screws used for the purpose of attaching a snap switch to a box, shall be either machine screws matching the thread gage or size that is integral to the box or in accordance with the manufacturer's instructions.~~

Substantiation: The proposal should be rejected.

The NEC has language to address the mounting of switches. Section 110.3(B) addresses the manufacturers listing and labeling requirements. NEC 404.9(B)(1) covers the provision for using the yoke of the switch with metal screws to a grounded metal box.

For many cycles the NEC has made it clear that grounding and bonding can NOT be accomplished with the use of a drywall screw (NEC 250.8(A)).

Accepting this proposal we will open the door for more proposals that mention every type of screw ever manufactured when it is very obvious to the installers and the AHJ that drywall screws may not be utilized. The submitter has stated that "drywall screws are not acceptable; they may cause damage to the box and inadequate support for the device". All these issues can be enforced by the current addition of the NEC for applicable installations.

A drywall screw may be accepted in certain installations (i.e.: non-metallic boxes with stripped out threads.) Let the discretion be based on the installation and judgment of the AHJ.

Panel Meeting Action: Reject
Panel Statement: The requirement in Section 110.3(B) does not address the problem identified by the Proposal 9-98 since the manufacturers listing and labeling requirements do not address screw replacement during installation.
Number Eligible to Vote: 12

Ballot Not Returned: 1 Coghill, P.

9-52 Log #1372 NEC-P09 **Final Action: Accept**
(404.10(B))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 9-98
Recommendation: 404.10(B) should be revised to read as follows:

<u>Screws used for the purpose of attaching a snap switch to a box, shall be of the type provided with a listed snap switch, or machine screws having 32 threads per inch, or part of listed assemblies or systems, in accordance with the manufacturer's instructions.</u>

Substantiation: NEMA supports the intent to eliminate the use of drywall screws for mounting receptacles, but the code text would eliminate other listed assemblies that do not use machine screws. Additionally, the revised text should correlate with CMP18 panel action and NEMA Comment on proposal 18-30. Therefore, NEMA would support the modified proposal above.

(404.13)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 9-99
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

ARTICLE 406 — RECEPTACLES, CORD CONNECTORS, AND ATTACHMENT PLUGS (CAPS)

18-13 Log #917 NEC-P18 **Final Action: Hold**
(406.3(E))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 18-15
Recommendation: Revise text to read as follows:
406.3 Receptacle Rating and Type.
(E) Controlled Receptacle Marking. All nonlocking-type, 125-volt, 15- and 20-ampere receptacles that are controlled by an automatic control device or incorporate control features that remove power from the outlet for the purpose of energy management or building automation shall be marked with the symbol shown below placed on the controlled receptacle outlet where visible after installation <u>or have</u> <u>clearly legible marking in letters not less than 6 mm (¼ in.) high reading “Controlled”. The label shall comply with 110.21.</u>
Substantiation: Allow these receptacles to be marked with text for both retrofit work and new work when specially marked receptacles are not available and the electrician does not have stickers with the designated icon and lacks artistic skills.
Unlike the other two receptacles which are marked with icons (isolated ground and hospital grade) a controlled receptacle may be that merely by virtue of the branch circuit that feeds it, not by any mechanical property of the receptacle itself. (Yes, I know about X-10 and its like.)
Indeed currently produced “controlled” receptacles are marked “CONTROLLED”. For example see “Leviton vizia rf+” (a random example).
Panel Meeting Action: Hold
Panel Statement: This comment was held because it would introduce a concept that has not had public review by being included in a related proposal as published in the Report on Proposals.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

18-14 Log #981 NEC-P18 **Final Action: Reject**
(406.4(D))

TCC Action: The Correlating Committee directs that the panel action on this comment be reported as “Reject” to correlate with the action of Code-Making Panel 1 on Comment 1-46 which rejects Proposal 1-131.
Submitter: Charles J. Palmieri, Town of Norwell
Comment on Proposal No: 18-18
Recommendation: Revise text to read as follows:

Arc-fault circuit-interrupter and ground-fault circuit-interrupter type receptacles shall be installed in ~~a readily accessible location~~ <u>in accordance with 110.25</u>.
Substantiation: I am providing suggested text for the panel to consider on this proposal if Code Panel 1 continues to accept P 1-131 (70-A2013-ROP) and create a new section 110.25 the recommended modification to panel action on P-18-18 should be considered.
Panel Meeting Action: Accept in Principle
Panel Statement: If CMP 1 continues to accept, then CMP-18 agrees and the Correlating Committee can make the correlation.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

18-15 Log #1309 NEC-P18 **Final Action: Accept in Principle in Part**
(406.4(D)(3))

Submitter: Mike Weitzel, Bechtel
Comment on Proposal No: 18-21
Recommendation: Revise text to read as follows:

406.4(D)

(3) Ground-Fault Circuit-Interrupters. Ground-fault circuit-interrupter protected receptacles shall be provided where replacements are made at receptacle outlets that are required to be so protected elsewhere in this *Code*.

<u>*Exception: Where replacement of the receptacle type is impracticable, such as where the outlet box size will not permit the installation of the GFCI receptacle shall be permitted to be replaced with a new receptacle of the existing type, where GFCI protection is provided by a circuit breaker, and the receptacle wall plate is marked “GFCI protected”, in accordance with Section 406.4(D)(2) (a), (b), or (c).*</u>
Substantiation: The exception has been re-worded, and describes a practice that is already being done in the field every day. Receptacles are being replaced, but GFCI protection is sometimes being provided by a GFCI circuit breaker, and not by a GFCI receptacle.

Existing receptacle boxes enclosing existing old style two-wire receptacle outlets have a comparatively small cubic inch capacity by today's standards. GFCI receptacle outlets used to replace or 'update' the old, existing two-wire receptacle require approximately one and a half to two times the volume of the existing two-wire receptacle. This requires that the box be replaced, or a box extension be installed in order for the box to accept the installation of the larger GFCI receptacle.

The required GFCI protection is being provided by a GFCI circuit breaker, and not a GFCI receptacle. The old, existing – and often worn out – receptacle is being replaced with a exact same type receptacle, but a new one. This meets the objective of the *Code*, by protecting personnel from electric shock. Circuit breaker protection is an option that should be clearly permitted for this application, as both a GFCI circuit breaker and a GFCI receptacle are required to meet the standards for a Class A device per UL 943 standard.

This practice, though not specifically permitted in the *Code*, improves accessibility, in compliance with recent Section 210.8 requirements that all GFCI devices be installed in a readily accessible location. In this case, the GFCI protection will be located in a panelboard, which has clear requirements for accessibility in Section 240.24, and working space/access in Section 110.26. Accessibility for a receptacle box is only required to be accessible without removing part of the building. (Section 314.29).

As long as the receptacles are GFCI protected and marked as such, the practice of using a GFCI breaker in lieu of a GFCI receptacle should be clearly permitted in the *Code*, as it provides an equivalent level of safety.

Panel Meeting Action: Accept in Principle in Part

Revise text to read as follows:

Exception: Where replacement of the receptacle type is impracticable, such as where the outlet box size will not permit the installation of the GFCI receptacle, the receptacle shall be permitted to be replaced with a new receptacle of the existing type, where GFCI protection is provided ~~by a circuit breaker,~~ and the receptacle ~~wall plate~~ is marked "GFCI protected " and "no equipment ground ", in accordance with Section 406.4(D)(2) (a), (b), or (c).

Panel Statement: The panel made the changes to make the section technically correct and to correlate with 406.4(D)2c.

The words "wall plate" were removed as the receptacle is already required to be marked. The words "by a circuit breaker" were removed as GFCI protection is not limited to circuit breakers.

Submitter: Robert G. Wilkinson, IEC Texas Gulf Coast

Comment on Proposal No: 18-22

Recommendation: Accept proposal 18-22.

Substantiation: CMP 18 rejected my proposal 18-22 with the panel statement "Section 90.4 of this CODE allows the AHJ to revert to the previous Code if the device is unavailable at the time of inspection". This provision was added to 90.4 in the 1984 NEC and it was never intended to be applied to products that don't exist. This provision was added to 90.4 in the 1984 NEC and it was never intended to be applied to products that don't exist. The first electronic GFCI was developed in 1961 and the first requirement for GFCI protection in the NEC was in the 1968 edition and it was limited to protection of underwater lighting in swimming pools. Imagine what would have happened if the 1959 NEC required GFCI protection in light of the fact that the first circuit breaker type GFCI was not introduced until 1968 and the first receptacle type GFCI was not introduced until 1972. It is a disservice to the public to require a product that is not available to fulfill a requirement in the NEC. To continue to go down this path is to put the NEC in jeopardy of not being adopted. The credibility of the NEC is compromised by requiring products that do not exist. To take this matter to the ridiculous, I propose for the 2017 NEC to require a receptacle that I plan to develop that will provide AFCI, GFCI, ALCI, ELCI, IDCI, and LCDI protection. This receptacle will also be tamper resistant, weather resistant, and have the ability to change color to match the wall color. Since 90.4 permits requiring new products that may not be available at the time the Code is adopted, I'm sure my proposed magic receptacle will be accepted.

Panel Meeting Action: Reject

Panel Statement: Outlet branch circuit AFCI's exist and are available in the market.

15-3 Log #902 NEC-P15 **Final Action: Reject**
(406.5)

Submitter: Lawrence W. Forshner, Bard, Rao + Athanas Consulting Engineers LLC

Comment on Proposal No: 18-29

Recommendation: Add the following sentence at the end of 517.18(B) and 517.19(B)(2) Receptacles, required by this section, shall be supported by outlet boxes in metal stud partitions, by a bar type bracket, that supports the outlet box by engaging two or more framing members.

Substantiation: As designers of electrical systems in health care facilities, we have found that sheet metal type box supports that are bent at 90 degrees, attach to one stud and are intended to provide box and device support by being in contact with the opposite wall of the partition, to be inadequate. Head wall partitions in hospital patient rooms are often not of standard **depth**, the receptacles require more pressure to insert a plug and they get more use than office receptacles during normal hospital operations and especially during emergencies. The sheet metal brackets often do not reach the opposite wall or the sheet metal will deflect after installation requiring the wall to be opened to repair and properly fasten the box. Added language in this section to qualify and describe how to securely fasten outlet boxes used to support "hospital grade " receptacles is needed. Doctors and nurses are not very nice to these receptacles during a "code blue". Our experience has demonstrated that the brackets, clips and support schemes, that are available and designed to increase rough-in productivity, to be inadequate where used in a hospital bed location head wall.

Panel Meeting Action: Reject

Panel Statement: The National Electrical Code is not intended as a design specification. Chapters 1 through 4 provide for proscriptive installation requirements. Support of outlet boxes is covered in 300.11 and 314.23, and adequately addresses proscriptive installation requirements.

18-19 Log #1174 NEC-P18 **Final Action: Reject**
(406.5)

Submitter: Dean C. Hunter, Menagha, MN
Comment on Proposal No: 18-30
Recommendation: Delete text as follows:
~~Screws installed for the receptacles fastened to the box, shall be machine screws matching the thread gage or size that is integral to the box.~~
Substantiation: The proposal should be rejected.
The NEC has language to address the mounting of receptacles. Section 110.3(B) addresses the manufacturer's listing and labeling requirements, and receptacles are supplied with the appropriate hardware. This section already requires receptacles shall be mounted in boxes or assemblies designed for the purpose. Accepting this proposal opens the door for frivolous proposals to include every type and size screw ever manufactured.
The submitter has stated that "drywall screws are not acceptable; they may cause damage to the box and inadequate support for the device." While this is true, any such problems can be enforced by the current requirements of the NEC for applicable installations.
Also, this change is unenforceable, as the inspector doesn't see devices at the rough-in stage, and would have to remove every cover plate at the final inspection, to assure that the correct screw was used.
The Code needs to allow discretion. Today, it's possible that an AHJ could accept a case where a screw - other than the one provided with the device - is used in a non-metallic box with stripped-out threads, if the box isn't damaged and the device is adequately secured.
Panel Meeting Action: Reject
Panel Statement: See comment 18-20 which allows alternatives. Note that if mounting threads are stripped, the box is damaged and should be replaced.

18-20 Log #1378 NEC-P18 **Final Action: Accept**
(406.5)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 18-30
Recommendation: The third sentence of 406.5 should be revised to read as follows:
<u>Screws used for the purpose of attaching receptacles to a box, shall be of the type provided with a listed receptacle, or machine screws having 32 threads per inch, or part of listed assemblies or systems, in accordance with the manufacturer's instructions.</u>
Substantiation: NEMA supports the intent to eliminate the use of drywall screws for mounting receptacles, but the code text would eliminate other listed assemblies that do not use machine screws. Additionally, the revised text should correlate with CMP9 panel action on proposal 9-98. Therefore, NEMA would support the modified proposal above.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

18-21 Log #1540 NEC-P18 **Final Action: Accept in Principle**
(406.5(E))

Submitter: Brian E. Rock, Hubbell Incorporated
Comment on Proposal No: 18-32
Recommendation: To be consistent with wording accepted for listed assemblies by CMP 18 for 406.5(F) in Proposal 18-34, Proposal 18-32 should have been Accepted In Principle and 406.5(E) should be revised to read as follows:
(E) Receptacles in Countertops and Similar Work Surfaces. Receptacles<u>, unless listed as receptacle assemblies for countertop applications,</u> shall not be installed in a face<u>-</u>up position in countertops or similar work surfaces. <u>Where receptacles assemblies for countertop applications are required to provide ground-fault circuit-interrupter protection for personnel in accordance with 210.8, such assemblies shall be permitted to be listed as GFCI receptacle assemblies for countertop applications.</u>
Substantiation: Proposal 18-32's Substantiation is correctly predicated on spillage as a hazard. Nonetheless, Standard for Safety for Attachment Plugs and Receptacles, ANSI/UL 498-2012, in Sections 143, 144 and 146, and Standard for Safety for Ground-Fault Circuit-Interrupters, ANSI/UL 943-2012, in Sections 6.28 - 6.29, specifically evaluate and list for countertop applications receptacle assemblies and GFCI receptacle assemblies, respectively. The evaluation includes, where the assembly retracts into the coutertop, 6000 cycles of mechanical endurance of the retraction mechanism, followed by dielectric-voltage withstand (also leakage current if a GFCI receptacle), and a spill test using a 1/2 gallon of saline solution tipped onto the same assembly, followed again by dielectric-voltage withstand (also leakage current if a GFCI receptacle). Further, if the assembly depends upon a self-closing cover to achieve spill resistance and the receptacle (or GFCI receptacle) has more than one outlet, a single power supply cord is engaged in only one outlet and the cord exits the cover in its released natural resting position before conducting the spill test.
Some of these receptacle assemblies, whether they employ a cover or other means to exclude spillage, may be oriented SOMEWHAT face-up. In the absence of an allowance for listed countertop receptacle assemblies and countertop GFCI receptacle assemblies, the term "face-up position" may be arbitrarily interpreted to encompass ANY position other than outright face-out. Does a receptacle face angled back 15° or 30° or 63°15' 23" in such a listed countertop assembly constitute "face-up position" despite having excluded spillage of a 1/2 gallon of saline solution? Unlike for receptacles mounted in standard outlet boxes, allowance for such listed countertop receptacle assemblies is essential to avoid arbitrary decisions as to what consitutes "face-up".
Editorial: Proposal 18-32 was Accepted with "face up" unhyphenated. The original, unmodified wording reflected those words hyphenated as an adjective "face-up" modifying a noun "position". Further, "face-up position" is a standard term in Annex B (page 29) of the 2011 National Electrical Code® Style Manual.

18-22 Log #1205 NEC-P18 **Final Action: Accept in Principle**
(406.5(F) (New))

Submitter: Leo F. Martin, Sr., Martin Electrical Consulting
Comment on Proposal No: 18-34
Recommendation: Continue to accept in part.
Substantiation: Acceptance of this proposal will enhance electrical safety for receptacles installed in countertops and similar locations.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and comment on Comment 18-23.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

18-23 Log #1541 NEC-P18 **Final Action: Accept**
(406.5(F) (New))

Submitter: Brian E. Rock, Hubbell Incorporated
Comment on Proposal No: 18-34
Recommendation: *Proposal 18-34 should have been Accepted In Principle In Part, and 406.5(E) and new 406.5(F) should be revised to read as follows:*
(E) Receptacles in Countertops and Similar Work Surfaces. Receptacles<u>, unless listed as receptacle assemblies for countertop applications,</u> shall not be installed in a face-up position in countertops or similar work surfaces. <u>Where receptacles assemblies for countertop applications are required to provide ground-fault circuit-interrupter protection for personnel in accordance with 210.8, such assemblies shall be permitted to be listed as GFCI receptacle assemblies for countertop applications.</u>
(F) Receptacles in Seating Areas and Other Similar Surfaces. ~~Receptacles shall not be installed in a face-up position in~~ <u>In</u> seating areas or similar surfaces<u>,</u> ~~unless they are part of an assembly listed for the application~~ <u>receptacles shall not be installed in a face-up position unless the receptacle is any of the following:</u>
<u>(1) Part of an assembly listed as a furniture power distribution unit, if cord-and-plug-connected.</u>
<u>(2) Part of an assembly listed either as household furnishings or as commercial furnishings.</u>
<u>(3) Listed either as a receptacle assembly for countertop applications or as a GFCI receptacle assembly for countertop applications.</u>
<u>(4) Installed in a listed floor box.</u>
Renumbered 406.5(G) and 406.5(H) are retained as indicated in the Panel Action.
Substantiation: New 406.5(F): Proposal 18-34's Substantiation cites benches where receptacles are installed such that they could be sat upon and correctly identifies such as a potential hazard. (Accepted Proposal 18-32's Substantiation correctly identifies spillage hazard.) However, the wording accepted is ambiguous and may result in enforcement confusion, inconsistencies and discrepancies; NOT in compliance with Clause 3.2.1 in the 2011 National Electrical Code® Style Manual. The AHJ is not provided with definitive guidance as to hazard and enforcement criteria.
• "… Unless THEY are part of an ASSEMBLY LISTED for …" is ambiguous as to whether "they" refers to "similar surfaces", "seating areas", or "receptacles". To use the product categories in the UL "White Book", are we talking about assemblies that are listed Furnishings, Household and Commercial [IYQX, listed to UL 962], OR are we talking about more specific assemblies that are listed Furniture Power Distribution Units [IYNC, listed to UL 962A], OR are we talking about specific countertop receptacle assemblies [RTRT within UL 498] and countertop GFCI receptacle assemblies [KCXS within UL 943], OR are we talking about conventional receptacles [RTRT,

listed to UL 498] mounted on the raised seating area surfaces in assemblies of scrub-water-resistant listed floor boxes and covers [QCIT, listed to UL 514A, or QCMZ, listed to UL 514C]????

• 406.5(E) definitively encompasses FIXED countertops and permanent wiring connections, whereas 406.5(F) may be interpreted less consistently. The term "seating areas" is undefined. Are we talking about the seating surface itself, or does "seating areas" include adjacent table surfaces (such as airport gate passenger seating areas, doctor's waiting room seating areas, restaurant booth seating areas, etc.)??? If we are talking about that broader definition with adjacent table surfaces, are we talking about fixed seating (assemblies incorporating receptacles that are permanently connected) or movable furnishings (portable or stationary assemblies incorporating receptacles that are cord-and-plug-connected)??? Are foot wells (treated as floors) considered to be part of seating areas???

• In this accepted wording, how is "listed for the application" any less vague or potentially unenforceable than "designed [or listed] for the purpose" that is potentially rejected by Table 3.2.1 in the 2011 National Electrical Code® Style Manual??? The presently accepted 406.5(F) wording doesn't even identify what attributes are to be used by the AHJ in making the enforcement decision. Clearly, the AHJs need more specific direction to ascertain whether the "assembly" is in fact "listed for the application" by delineating what those assemblies are that are evaluated for spillage as a hazard criterion.

The following listed assemblies are specifically evaluated for liquid spillage, and usage of such SPECIFIC assemblies can be enforced consistently and nonarbitrarily by the AHJ:

• cord-and-plug-connected furniture power distribution assemblies [IYNC] for installation in portable and stationary furnishings:

- Standard for Safety for Furniture Power Distribution Units, UL 962A, in Section 36

-- 8 ounces of saline solution tipped towards the assembly, followed by dielectric-voltage withstand

-- if a self-closing cover over more than one outlet, a single power supply cord plugged into only one outlet before spill test

• convenience outlets of household and commercial furnishings [IYQX]:

- Standard for Safety for Household and Commercial Furnishings, UL 962, in Clause 22.9 and Section 49A

-- 8 ounces of saline solution tipped towards the assembly, followed by dielectric-voltage withstand

-- if a self-closing cover over more than one outlet, a single power supply cord plugged into only one outlet before spill test

• countertop receptacle assemblies [RTRT]:

- Standard for Safety for Attachment Plugs and Receptacles, ANSI/UL 498-2012, in Sections 143, 144 and 146

• countertop GFCI receptacle assemblies [KCXS]:

- Standard for Safety for Ground-Fault Circuit-Interrupters, ANSI/UL 943-2012, in Sections 6.28 - 6.29

-- 6000 cycles of mechanical endurance of retraction mechanism, followed by dielectric-voltage withstand (also leakage current if GFCI)

-- 1/2 gallon of saline solution tipped towards the assembly, followed by dielectric-voltage withstand (also leakage current if GFCI)

-- if a self-closing cover over more than one outlet, a single power supply cord plugged into only one outlet before spill test

• conventional receptacle or GFCI receptacle [RTRT or KCXS] mounted within an assembly of a metal floor box [QCIT] and associated floor-box cover [QCIT]:

- Standard for Safety for Metallic Outlet Boxes, ANSI/UL 514A-2010, in Section 12.16

• conventional receptacle or GFCI receptacle [RTRT or KCXS] mounted within an assembly of a plastic floor box [QCMZ] and associated floor-box cover [QCMZ]:

- Standard for Safety for Nonmetallic Outlet Boxes, Flush-Device Boxes, and Covers, ANSI/UL 514C-2011, in Sections 16 - 16A

-- floor box support: 50 pounds of force applied to the floor box for 5 minutes, no more than 1/8-inch displacement of floor box 1 minute after force removal

-- scrub-water ingress-resistance (floor box+cover if for tile, vinyl or impermeable surface): 1 gallon of soap-water solution poured within 10 seconds to a depth of 1/8 inch over the unplugged, closed floor-box cover, standing for 1 minute, followed by visual examination

-- scrub-water ingress-resistance (floor box+cover if for carpeted surface): 1 quart of soap-water solution poured within 10 seconds over the unplugged, closed floor-box cover, followed by visual examination

-- floor-box cover loading: 300 pounds of force applied to the floor-box cover for 1 minute, no more than 1/8-inch displacement of floor-box cover 1 minute after force removal, no more than 1/32-inch displacement of floor-box cover 1 hour after force removal 406.5(E): See separate Comment for Proposal 18-32 for 406.5(E); also applies to wording accepted in Panel Action for Proposal 18-34.

Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

18-24 Log #1020 NEC-P18 **Final Action: Reject**
(406.9(B))

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 18-35
Recommendation: Accept the proposal in principal as follows:
(1) 15- and 20-Ampere Receptacles in a Wet Location.
15- and 20-ampere, 125- and 250-volt receptacles installed in a wet location shall have an enclosure that is weatherproof when the receptacle is covered (attachment plug cap not inserted and receptacle covers closed). ~~whether or not the attachment plug cap is inserted. For other than one- or two-family dwellings, an outlet box hood installed for this purpose shall be listed, and where installed on an enclosure supported from grade as described in 314.23(B) or as described in 314.23(F) shall be identified as "extra-duty."~~ All 15- and 20-ampere, 125- and 250-volt nonlocking-type receptacles shall be listed weather-resistant type.
Substantiation: The panel needs to come to grips with the fact the "in-use" cover was a failed experiment. The amount of broken in-use covers is nothing short of alarming. This is evidenced by the fact that we are now requiring "extra-duty" hoods (whatever they are) for some locations and are now considering expanding these enigmatic extra-duty covers. The in-use concept looks good on paper and sounds like a great idea, but it's time we cut our losses and forget we ever heard of these abominations.
If the panel needs additional substantiation, stop reading this, walk outside (wherever you may be), and look at the next ten in-use covers that you see. Odds are at least one-third of them are broken, regardless of whether or not they are supported by grade.
Panel Meeting Action: Reject
Panel Statement: In-use was not a failed experiment. Like all standards, the requirements evolve and the "extra-duty" requirements should address the submitter's concerns.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

18-25 Log #1021 NEC-P18 **Final Action: Accept**
(406.12)

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 18-41a
Recommendation: Revise the section by inserting an opening statement, such as:
406.12 Tamper Resistant Receptacles. Tamper resistant receptacles shall be installed as follows.
Substantiation: This proposal is intended only to maintain consistency in the Code. Typically an opening statement precedes a numbered or alphabetized list.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

18-26 Log #455 NEC-P18 **Final Action: Reject**
(406.12 Exception No. 4)

Submitter: Earl W. Roberts, REPTEC
Comment on Proposal No: 18-41a
Recommendation: Delete Exception (4) to 406.12.
Substantiation: Approximately 30% of the homes in the USA have 2-wire, 120v systems with no equipment grounding conductors. Exception (4) discourages manufacturers from producing 2-wire TR receptacles. To justify this because "none exist" helps to deprive people in 2-wire homes from receiving the safety advantages of TR receptacles.
This is similar to not requiring auto seat belts on the basis that initially, the seat belts did not exist in autos.
Producing 2-wire TR receptacles is a simple matter and they could easily be made by the wiring device manufacturers. This would offer people with 2-wire homes the same safety opportunities as the people with 3-wire homes.
Panel Meeting Action: Reject
Panel Statement: While it is true that two-wire tamper resistant receptacles could be manufactured, none are currently found in the market. The replacement use of a 3-wire device is allowed when GFCI protected and tamper resistant GFCI receptacles exist today.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

ARTICLE 408 — SWITCHBOARDS, SWITCHGEAR AND PANELBOARDS

9-55 Log #149 NEC-P09 **Final Action: Accept**
(408)

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 9-103a
Recommendation: It was the action of the Correlating Committee that this proposal be reconsidered and correlated with the panel action on Proposal 9-110.

See the Correlating Committee action on Proposal 9-110.

It was also the action of the Correlating Committee that the list in 408.3(F) be numbered consecutively, i.e., (1) through (5).

In addition, the Correlating Committee directs that the panel clarify whether the action was to delete the existing Informational Note after (E), Exception, since both proposals have not included the Informational Note from the existing Code.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

The changes to the text within Proposal 9-103a at this time, and responses to the Correlating Committee reservations, are as follows:

I. CMP 9 confirms that the exception following 408.3(E)(1) is correct, including the insertion of the word "switchgear."

II. CMP 9 agrees that the Informational Note that now follows 408.3(E) in the 2011 edition shall remain, located after 408.3(E)(1) Exception and ahead of 408.4(E)(2).

III. In 408.3(E)(2), revise the first sentence to read as follows: "DC ungrounded buses shall be permitted to be in any order."

IV. CMP 9 agrees that the numbered paragraphs in 408.3(F) should be numbered (1) through (5). CMP 9 notes that NFPA staff already corrected this error in preparing the ROP Draft.

V. In 408.3(G), revise the order of terms to read: "… provided in switchboards, switchgear, and panelboards…".

Panel Statement: CMP 9 calls attention to the concluding sentence of the panel statement on Proposal 9-103a, which reads as follows: "In the event of any editorial differences between the actions taken on this proposal and actions taken on the various public proposals submitted in Article 408, CMP 9 intends the action on this proposal to be the final result." Therefore, CMP 9 is including the text of all changes or corrections in its response to this comment. The final wording of any changes in this cycle to sections within Article 408 that are affected by the inclusion of the term "switchgear" will be found in Proposal 9-103a as modified in this comment.

9-56 Log #732 NEC-P09 **Final Action: Accept**

(408.1)

Submitter: James T. Dollard, Jr., IBEW Local 98

Comment on Proposal No: 9-106

Recommendation: Continue to Accept in Principle.

Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 1

Ballot Not Returned: 1 Coghill, P.

Explanation of Negative:

FERRARO, J.: It is recognized that increasing voltage from 600 volts to 1000 volts may be applicable to specific installations. However, adequate technical substantiation has not been provided to support the change in this Article.

9-57 Log #584 NEC-P09 **Final Action: Accept**

(408.3(A)(2))

Submitter: Donald A. Ganiere, Ottawa, IL

Comment on Proposal No: 9-108

Recommendation: This proposal should be accepted.

Substantiation: The following part of the panel comment is really the basis for this proposal: "Equipment should not be worked on while energized unless requirements of NFPA 70E are followed and appropriate precautions are taken."

There is no provision in 70E that would permit an electrician to work in the enclosure that contains the service disconnect if the line side of the service disconnect is energized and exposed. The only permitted method of working in the service enclosure without the acceptance of this proposal would be to have the utility disconnect the service conductors at a point before they enter the service equipment.

Panel Meeting Action: Reject

OSBORNE, R.: See my affirmative statement for Comment 9-60.

9-60 Log #1516 NEC-P09 **Final Action: Reject**
(408.3(A)(2))

Submitter: Donald R. Cook, Shelby County Department of Development Services
Comment on Proposal No: 9-108
Recommendation: Reconsider and accept in part. Accept proposed revision in title and first sentence.
Substantiation: Barrier enhances safety for both personnel and equipment by reducing the change of contact with live parts. This requirement is already in place in Canada making the equipment available.
Panel Meeting Action: Reject
Panel Statement: Canadian and US requirements are different in many ways including the US allowance for six service disconnects, which is not allowed in Canada. No substantiation of field issues has been provided. Switchboards, switchgear and panelboards have different constructions. Because of the small size of panelboards barriers would restrict cable entry and exit. Appropriate personnel protective equipment would still be required regardless of the inclusion of the barriers. Requirements in place in Canada would not allow load cables to exit the same endwall or barriered area as service cable. Equipment should not be worked on while energized unless requirements of NFPA 70E, *Standard for Electrical Safety in the Workplace*, are followed and appropriate precautions are taken. The utility can and should disconnect the service. Equipment that meets Canadian requirements may not be available for all us applications such as meter panelboards with provisions for a utility meter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 8 Negative: 3
Ballot Not Returned: 1 Coghill, P.
Explanation of Negative:
BELISLE, R.: Comment 9-60 should have been accepted. There was a lengthy discussion among the panel members regarding the benefits of this proposal and the associated comments. The panel could not provide any negative impact of this change, with the exception of “We are not sure how the manufacturer will do it”, yet it is currently in effect in Canada and being done. One manufacturer, as a guest to the panel, spoke to the ability of the manufacturers to make it work if it were to be required, given some time. The panel then discussed a possible 3-year delayed implementation, which would have accomplished that. The panel statement relied on the fact that the U.S. has a 6 disconnect rule, which doesn’t exist in Canada, yet Mr. Dollard provided a solution to this concern in his comment 9-61 to accept the proposal with a new exception addressing this situation. The panel statement further noted that there is no documentation of field issues and voiced concerns over cable entry logistics, yet all of the members of the panel that have actually worked on an energized service voiced the obvious benefit to covering exposed live parts. The panel members appeared to get caught up in the mechanics of how the components would be constructed rather than work on code language that would direct manufacturers to do what they do best, which is provide solutions to industry problems in producing safe products. The intent of this comment was never intended to eliminate the need for safe Electrical Work Practices or PPE, but to further reduce the risk of an Arc Flash and Arc Blast by engineering means by reducing the hazard of energized parts.
BRINKMEYER, W.: See Comment 9-61 for my reason for Negative vote.
HUMPHREY, D.: Adding barriers around the ungrounded line terminals of the service disconnecting means at panelboards would provide enhanced safety at these locations. Additional research, and the substantiation derived from the additional research could serve to make the need for such barriers apparent.
Comment on Affirmative:
OSBORNE, R.: Discussion among panel members indicated an interest in providing “additional barriers” to address concerns with inadvertent contact with live parts. However, such barriers are not likely to provide “shock and arc flash protection” as originally proposed in ROP 9-108 (text that was removed as part of comment 9-60). Consideration should be given to the level of protection provided by barriers, and as noted by the panel Chair, additional research (possibly by the Fire Protection Research Foundation) could serve to qualify the need for these barriers. The appropriate level of protection, the timeframe for implementation, and the details of construction should be driven by the product Standard. The panel’s interest in this proposal should be translated to a proposal to the Standards Technical Panel with responsibility for Panelboards (STP 67). Adoption of construction requirements, including barriers within the equipment, should be decided by the STP.

9-61 Log #1539 NEC-P09 **Final Action: Reject**
(408.3(A)(2))

TCC Action: The Correlating Committee directs the Comment remain as Reject because less than 2/3 of the members eligible to vote have voted in the affirmative.
Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 9-108
Recommendation: This proposal should be Accepted in Principal. Accept the proposed revision and add the following exception:
Exception: Where more than one service disconnect within a single enclosure is used as permitted in 230.71, a barrier shall not be required.
Substantiation: A review of the panel statement to reject this proposal reveals the following reasons in italics:
There are differences between the US requirements and Canadian requirements, most notably the permissive text in 230.71 that allows up to six disconnecting means. CMP-9 is correct. This difference is easily handled with the proposed exception in this comment.
No substantiation of field issues has been provided. The submitter clearly stated the reason for the proposed requirement. When an employee works on service equipment such as a panelboard, there is no means to create an electrically safe work condition (ESWC). Even when the main OCPD is opened, there are still exposed energized parts on the line side of the main OCPD. This proposed revision will allow installer maintainers to create an ESWC. If the committee wants a body count it is readily available. Arc flash injuries and fatalities are well documented. The amount time an arcing fault occurs is directly proportional to the amount of incident energy created. Service conductors are typically not protected with fast acting OCPD’s by the serving utility. This is all about safety.
PPE is still required. CMP-9 is correct. After opening the main OCPD an employee must wear appropriate PPE for shock and arc flash hazards while he/she verifies an ESWC. Once this is completed, there would be no exposure to energized parts because the barrier as required in the proposed text would provide the same level of protection as the cabinet. An ESWC would exist.
The last sentence of the panel statement is in complete agreement with the submitters proposed revision and substantiation.
As a member of the NFPA 70E committee, I ask CMP-9 to take a seriously look at this issue and reconsider their position. The main goal of NFPA 70E is to deenergize, shut it off, and remove the hazard by creating an ESWC. In service equipment it is infeasible to have the utility deenergize. Canada has had this rule in place since before 1950. All major manufacturers have equipment to meet this proposed revision because they sell it in Canada. We need to provide installers and maintainers the ability to create an ESWC in service equipment. It is practical, feasible and will dramatically increase safety by allowing employees to create an ESWC in service equipment
Panel Meeting Action: Reject
Panel Statement: The intent of NFPA 70E, *Standard for Electrical Safety in the Workplace*, is to de-energized equipment to create a safe working condition before working on the equipment. The only alternative is to show that there is increased hazard if the equipment is not de-energized. There may be an arc flash hazard even with barriers installed. If switchboards, switchgear and panelboards are worked on while the service is energized appropriate personnel protective equipment would still be required regardless of the inclusion of the barriers as noted in the proposal as these barriers do not provide “arc protection.” Since the serving utility may not have a fast acting overcurrent protective device protecting the equipment it is even more important to have the utility disconnect the line side power. The utility should disconnect the line side power to the equipment whether there is one or more than one service disconnect to create a safe working condition. Equipment that meets Canadian requirements may not be available for all us applications such as meter panelboards with provisions for a utility meter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 7 Negative: 4
Ballot Not Returned: 1 Coghill, P.
Explanation of Negative:
BELISLE, R.: Comment 9-61 should have been accepted in Principle, by accepting comment 9-60 and the exception cited in this comment. See my negative statement on comment 9-60
BRINKMEYER, W.: I voted to reject Proposal 9-108 in the ROP, primarily because I concurred with the panel statement differentiating between Canadian and US requirements relative to the US allowance for six service disconnects and the condition where barriers would not provide the protection the submitter was seeking in that application. Otherwise, the submitter of the proposal provided a number of good arguments to support the placement of the barriers to provide a safer environment for the protection of electrical workers. Mr. Dollard’s recommendation to add the exception for panelboards containing more than one service disconnect is a good first step toward providing greater safety for electrical workers in those applications. Since 90.1(A) states that the purpose of this code is the practical safeguarding of persons and property from hazards arising from the use of electricity, I believe Proposal 9-108 as modified by Comment 9-61 is an initial first step in providing greater safety.

HUMPHREY, D.: Adding barriers around the ungrounded line terminals of the service disconnecting means at panelboards would provide enhanced safety at these locations. Additional research, and the substantiation derived from the additional research could serve to make the need for such barriers apparent.

YOUNG, R.: This comment should have been accepted. The submitter provided a good case for making this change to require these barriers and a good case was provided in the original proposal. The barriers would go a long way towards reducing the probability of contact with energized parts which would result in less shock hazards and lower probability of getting an arc started. This equipment is available in Canada and US product standards could be changed and products made available in a reasonable amount of time (like one Code Cycle).

Comment on Affirmative:

OSBORNE, R.: See my affirmative statement on Comment 9-60.

9-62 Log #150 NEC-P09 **Final Action: Accept**
(408.3(E))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 9-110
Recommendation: The Correlating Committee directs that the panel clarify the panel action on this proposal by rephrasing the new (2) in accordance with 3.3.1 of the NEC Style Manual.

In addition, the Correlating Committee directs the panel to reconsider this proposal and correlate it with the action taken on Proposal 9-103a with respect to the word "switchgear" in the first sentence of (E)(1), the inclusion or exclusion of the Exception following (E)(1), and the inclusion or exclusion of the Informational Note contained in the 2011 Edition.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: Refer to the actions itemized within the response to Comment 9-55 for the actions to be taken.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Coghill, P.

9-63 Log #1524 NEC-P09 **Final Action: Accept in Principle**
(408.3(E)(2) and 408.3(F))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 9-110
Recommendation: Revise text to read as follows:
408.3 Support and Arrangement of Busbars and Conductors.
(E) Bus Arrangement.
(2) DC Bus Arrangement. There shall be no specific bus arrangement required of DC ungrounded buses. Arrangement of DC buses shall be field marked as to polarity, grounding system, and nominal voltage.
~~Caution sign(s) or label(s) provided in accordance with items (1) through (5) shall comply with 110.21(B).~~
(F) Switchboard, Switchgear or Panelboard Identification.
Caution sign(s) or label(s) provided in accordance with items (1) through (5) shall comply with 110.21(B).
(1) High-Leg Identification. A switchboard, switchgear, ….
Substantiation: The second paragraph of 408.3(E)(2) should be the text for 408.3(F).
Panel Meeting Action: Accept in Principle
Refer to Proposal 9-103a, as modified by Comment 9-55 for the final text, which agrees with the submitter's comment.
Panel Statement: CMP 9 notes that the order of text in the draft is incorrect.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Coghill, P.

9-64 Log #151 NEC-P09 **Final Action: Accept**
(408.3(F))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 9-111
Recommendation: The Correlating Committee directs that the panel clarify the panel action on this proposal as it relates to Proposal 9-103a to the order of "switchboard, switchgear, or panelboard" or "switchboard, panelboard, or switchgear."
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: Refer to the panel action on Comment 9-55 for the final text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Coghill, P.

9-65 Log #406 NEC-P09 **Final Action: Reject**
(408.18(B))

Submitter: Russel LeBlanc, The Peterson School of Engineering
Comment on Proposal No: 9-120
Recommendation: This proposal should be accepted with the following revisions:

"Clearances around switchboards (and switchgear) shall comply with the provisions of 110.26 (for 0-600 volts, and section 110.32 for over 600 volts.)"
Substantiation: With the upcoming change in scope of Article 408 and addition of the term "switchgear" (see proposals 9-103a Log #CP901 NEC-P09 and 9-104a Log #CP900 NEC-P09), this proposal is needed since the clearance requirements for equipment operating over 600 volts are different than equipment operating at lower voltages. There were no other proposals addressing this issue with the wording and changes in Article 408. This proposal will just consolidate what is already required.
Panel Meeting Action: Reject
Panel Statement: The proposal is not within the scope of Article 408 which does not cover medium voltage.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Coghill, P.

9-66 Log #1523 NEC-P09 **Final Action: Reject**
(408.18(B))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 9-103a
Recommendation: Revise text to read as follows:
408.18 Clearances.
(B) Around Switchboards and Switchgear. Clearances around switchboards and switchgear shall comply with the provisions of ~~110.26~~ 110.27 or 110.34.
Substantiation: 600 volt clearance has moved from 110.26 to 110.27. Article 408 is 0 – 1000 volts, thus 11.34 needs to be referenced as well.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 9-65.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Coghill, P.

17-2 Log #152 NEC-P17 **Final Action: Accept in Part**
(408.36(E) (New))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 9-124
Recommendation: The Correlating Committee directs that this proposal be forwarded to Code-Making Panel 17 for action in Article 680.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept in Part
Panel Statement: CMP-17 accepts the direction from the Correlating Committee to review Proposal 9-124. However, it does not accept the proposed changes. The substantiation asserts that a (swimming pool) "panelboard can be installed without regard for mounting height". However, installation height of panelboard enclosures is already specified in 680.24. There was no substantiation for why the panelboard height requirements specified in Article 550.32(F) should be applied to swimming pool installations.
Number Eligible to Vote: 9
Ballot Results: Affirmative: 9
Comment on Affirmative:

COOK, D.: I support the panel action to accept the TCC direction and the action to reject proposed revision. However, panel statement indicates installation height of panelboard enclosures is already specified in 680.24. I don't find that requirement in 680.24.

9-67 Log #733 NEC-P09 **Final Action: Accept**
(Table 408.56)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 9-132
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1
Ballot Not Returned: 1 Coghill, P.
Explanation of Negative:

FERRARO, J.: It is recognized that increasing voltage from 600 volts to 1000 volts may be applicable to specific installations. However, adequate technical substantiation has not been provided to support the change in this Article.

9-68 Log #1269 NEC-P09 **Final Action: Reject**
(Table 408.56)

Submitter: Stanley J. Folz, Morse Electric, Inc.
Comment on Proposal No: 9-132
Recommendation: Reject the Panel action to accept Proposal 9-132.
Substantiation: The Chair of Code Making Panel 11 appointed a task group comprised of myself, Robert Fahey, James Fahey, Jeffery DesJarlais, Luis Bas and Vince Saporita to verify or amend the action taken on Proposal 11-43 where the panel amended Table 430.97 to change 600 volts nominal to 1000 volts nominal. As our research continued we asked Mark Ode to join our discussion. Table 430.97 first appeared in the 1993 NEC. That 1993 Panel rewrote Proposal 11-64 and although it was not stated it appears that the Panel used Table 384-26 (now 408.56) as a basis for Table 430.97.

Mr. Ode tracked 384-26 back to the 1959 NEC. It did not appear in either the 1956 or 1959 preprints. At this point the task group cannot determine what criteria were used to create this Table. This task group recommends that Proposal 11-43 be rejected and testing be done to verify that the current 600 volt spacing is sufficient if increased to 1000 volts. If not, then test to determine what spacing is sufficient for 1000 volts.

This comment is submitted to be consistent with the task group's action on R11-43.

Panel Meeting Action: Reject
Panel Statement: The comment provides no basis for reversal of the previous action. The HV task group evaluated each instance individually and determined that no negative impact will occur.

Product Standards for equipment rated in the 1000 volt range have existed for decades. For example, UL 508, the Standard for Industrial Control Equipment, has covered equipment rated 1500 V or less for at least 20 years. Void of other spacing requirements, use of these creepage and clearance distances are appropriate, as they have a proven record. Other considerations, such as insulating material properties, should be addressed in product Standards.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1
Ballot Not Returned: 1 Coghill, P.
Explanation of Negative:

FERRARO, J.: It is recognized that increasing voltage from 600 volts to 1000 volts may be applicable to specific installations. However, adequate technical substantiation has not been provided to support the change in this Article.

9-69 Log #597 NEC-P09 **Final Action: Accept in Principle**
(408.58)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 9-134
Recommendation: Revise text to read as follows:

408.58 Panelboard Marking. Panelboards shall be durably marked by the manufacturer with the voltage and the current rating and the number of AC phases or DC ~~phases~~ <u>ungrounded conductors</u> for which they are designed and with the manufacturer's name or trademark in such a manner so as to be visible after installation, without disturbing the interior parts or wiring.

Substantiation: DC (direct current) has no "phases". I could find the term used nowhere on the internet except for "DC phases out…" where DC referred to District of Columbia.

Panel Meeting Action: Accept in Principle
Make no change in the approved ROP text of Proposal 9-134
Panel Statement: The panel notes that there is an error in the draft. The proposal uses the phrase "DC buses" which is correct. However the text was mis-transcribed in the draft as "DC phases". The panel action meets the objectives of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Coghill, P.

ARTICLE 409 — INDUSTRIAL CONTROL PANELS

11-5 Log #1283 NEC-P11 **Final Action: Reject**
(409, 430, 440, 460, and 470)

Submitter: Elliot Rappaport, Electro Technology Consultants
Comment on Proposal No: 11-9
Recommendation: Accept proposal.
Substantiation: The "equipment grounding conductor" is used properly by many but not by all. This is evidenced by the number of questions raised at inspectors' code sessions and at code classes.

The term "equipment grounding conductor" has a definite purpose that is not uniquely expressed in the term, i.e. "bond the equipment to a terminal at the source of voltage". As a result, there is a misconception that "grounding", without bonding to the source, will make a system safe. On the contrary, connecting equipment to ground without providing the bonding connection back to the source can make equipment less safe by increasing the time to clear the fault.

There is generally insufficient significance placed on the importance of bonding over grounding. Bonding provides sufficient ground fault current back to the source of voltage to operate an overcurrent device and clear the fault quickly. Connection to ground limits the voltage to ground on normally non-current-carrying parts during non-fault conditions. During fault conditions, the value of grounding is minimal since the primary safety concern is to remove the fault voltage as quickly as possible. A path to ground for fault current is not necessary since ground fault current must return to the source of voltage, not to ground.

Renaming this conductor as an "Equipment Bonding Conductor (EBC)" will clarify that the primary purpose of this conductor is to bond to the source in order to provide a known path for ground fault current that will facilitate rapid fault clearing.

It is recognized that the term "EGC" has been in use for a long time and that changing it to EBC will cause some concerns including changing written literature that uses the EGC term. After the initial period of understanding, users will correctly understand the purpose of this conductor and this will enhance the safety of personnel.

The fundamental purpose of this and companion proposals is to clearly state that "systems" are "grounded" and "equipment" is "bonded". The fact that the bonding conductor may be grounded also is secondary to the primary function of bonding.

Panel Meeting Action: Reject
Panel Statement: The panel continues to reject Proposal 11-9 in correlation with the action taken by CMP 5 on Proposal 5-3. Acceptance of this comment would add confusion and reduce usability.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2

Explanation of Negative:

POWELL, C.: "The term ""equipment grounding conductor"" needs to be replaced with ""equipment bonding conductor"" throughout the NEC. Yes, the term equipment grounding conductor in Article 100 would need to be changed to the term equipment bonding conductor. The use of the term ""equipment grounding conductor"" is confusing both for those new to the electrical industry and even for some experienced users. The problem is compounded when dealing with other international standards. No technical rebuttal has been provided for not making the change. This conductor always provides a bonding function but does not always provide a grounding function.

SMITH, III, A.: The panel should accept the original proposal. The Panel is incorrect in stating that this will add confusion and reduce usability. The proposed language improves the technical accuracy of the use of the terms "equipment grounding conductor" and "equipment bonding conductor". The IEEE has reviewed all the statements on this subject by various panels. The following represents the IEEE position on the issue of equipment grounding conductor or equipment bonding conductor. There is no justification for retaining an incorrect and potentially hazardous electrical installation just because this definition has been used in the NEC for many years. Not all electrical practitioners are knowledgeable in the main intent of this conductor. The intent of the proposed change is to provide a descriptive name to a construction element that has resulted in much misunderstanding with possible hazardous operating conditions in electrical installations. The use of the term "grounding" implies that grounding is its principal function. Although grounding may be desirable, providing an effective fault current path (i.e. bonding) is and should be the emphasis. There are many who assert that a connection to a water pipe meets the needs of equipment grounding, however, this connection does not perform the necessary effective fault current path back to the source. There are two conductors described in the Code performing the same function but named differently. The "bonding jumper" is a short conductor that insures the electrical integrity of enclosure to raceway. The longer conductor, intended to provide a low impedance path to the source, is presently named a "grounding" conductor instead of its real function as a "bonding" conductor. Technically, the definition in Article 100 may be adequate for Panel members and those that teach. Practically, the definition is confusing if the terminology does not fit the function performed. The equipment bonding conductor, as it should be called, provides its primary function whether or not it is grounded. For a grounded system, it is grounded because the system is grounded. For an ungrounded system, it is grounded to limit the voltage due to a lightning strike or contact with a higher voltage system. Changing the name will assist in educating users of the Code as to why they are installing a conductor that needs to be continuous all of the way back to the source.

11-6 Log #741 NEC-P11 **Final Action: Accept**
(409.1)

TCC Action: The Correlating Committee advises that article scope statements are the responsibility of the Correlating Committee and the Correlating Committee Accepts the panel action.
Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 11-10
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. Section 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 and 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:

COLE, T.: Replacing 600 volts with 1000 volts will have a major impact on installers, component manufacturers, and industry standards. Increased spacing must be considered when going from 600 volts to 1000 volts. Personal safety must also be considered. It seems as though the cart is before the horse. In this situation might it be better to have standards written first before we adopt the unknown. Because the proposer has not provided enough information to the public to justify and understand all the ramifications of the proposal, the committee should reject the submitters proposal until standards are adopted.

11-7 Log #162 NEC-P11 **Final Action: Accept**
(409.1 and 409.110(4), Informational Note)

TCC Action: The Correlating Committee directs that the dates of the latest referenced standards in 409.1 and 409.110(4) Informational Note will be included in the Code.
Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 11-11
Recommendation: The Correlating Committee directs that the panel include the publication date of the referenced standards in the Informational Note in accordance with the Section 3.3.7.4 of the NFPA Regulations Governing Committee Projects.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

11-8 Log #478 NEC-P11 **Final Action: Reject**
(409.2.Industrial Control Panel and 409.4 (New))

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 11-12
Recommendation: Revise text to read as follows:
Industrial Control Panel. An assembly of two or more components consisting of one of the following:
(1) Power circuit components only, such as motor controllers, overload relays, fused disconnect switches, and circuit breakers
(2) Control circuit components only, such as pushbuttons, pilot lights, selector switches, timers, switches, control relays
(3) A combination of power and control circuit components
~~These components, with associated wiring and terminals, are mounted on or contained within an enclosure or mounted on a subpanel. The industrial control panel does not include the controlled equipment.~~
<u>**409.4 Industrial Control Panel Components.**</u>
<u>**409.4.1** Industrial control panel components, with associated wiring and terminals, shall be mounted on or contained within an enclosure or they shall be mounted on a subpanel.</u>
<u>**409.4.2:** Industrial control panels shall not include the controlled equipment.</u>
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains the defined term in the last sentence and also contains requirements and the NEC manual of style does not permit the definition to contain the defined term. Definitions are not requirements. The proposed changes eliminate the defined term and the requirements, by placing them in an alternate location in Article 409.
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain

requirements or recommendations.
Alternate approach, could be as follows (by eliminating the last two sentences):
Informational Note 1: These components, with associated wiring and terminals, are mounted on or contained within an enclosure or mounted on a subpanel.
Informational Note 2: The industrial control panel does not include the controlled equipment.
Panel Meeting Action: Reject
Panel Statement: The existing definition does not violate the intent of the NEC Style Manual. The proposed text does not add clarity nor improve readability.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

11-9 Log #565 NEC-P11 **Final Action: Reject**
(409.110(2))

Note: When the ballot result does not confirm the TC action on a Proposal by a two-thirds affirmative vote, the Report on Proposals shall be published with a specific request for public comment on that Proposal. The Proposal is now being reconsidered by the TC as a public comment.
Submitter: Richard A. Janoski, Finleyville, PA
Comment on Proposal No: 11-16
Recommendation: Revise as follows:
409.110 Marking. An industrial control panel shall be marked with the following information that is plainly visible after installation:
(2) Supply voltage of all power supplies, location of all power supply circuit disconnecting means, number of phases, frequency, and full-load current for each incoming supply circuit.
Substantiation: A new rule in Section 409.110(3) requires that the industrial control panel is to be marked with a label notifying of the presence of multiple power source disconnecting means. I am recommending an addition to the wording in the first part of the sentence of 409,110(2), that "Supply voltage of all power supplies" be listed on the label.
Also, by placing this label on the enclosure, an individual servicing an industrial control panel will be aware of the electrical hazards present. To eliminate these electrical hazards when servicing the equipment, all of the power sources need to be disconnected. Without a requirement to label to location of all of the power supply disconnects, work must be done to determine their location. It can be the case that locating numerous power supply disconnects in an unfamiliar facility can be a difficult task.
To further aid the technician in creating the safest work environment, I am recommending that the location of all power source disconnects should be labeled on the cabinet. Disconnecting all of the power sources while servicing the panel equipment is the safest work practice. With no voltage present on the interior of the cabinet, both the arc-flash and shock hazards will be eliminated.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 11-10.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
SMITH, III, A.: IEEE supports the panel action to reject comments 11-9 and 11-10
The concept of listing the location of all power supply circuit disconnecting means on a control panel is idealistic but not practical. Control panels can have multiple sources which make marking each source infeasible due to various reasons such as availability of free space for marking. This may also lead to errors and unsafe conditions because nameplate markings may be difficult to keep up to date. A safer method employed by industry is to indicate drawing number(s) for reference and up to date information on sources supplying the panel.
Information on full load current is impractical for all incoming supply circuits to be indicated on the panel due to possible number of sources that may include power, control, communication and signaling circuits.
Power source, power supplies and incoming supply circuits are not clearly defined. Definition is needed to add clarity and prevent misinterpretation between power supply circuits and other sources of voltage.

11-10 Log #999 NEC-P11 **Final Action: Reject**
(409.110(2))

Submitter: Richard A. Janoski, Finleyville, PA
Comment on Proposal No: 11-16
Recommendation: Accept the revised text.
(2) Supply Voltage of all power supplies, location of all power supply circuit disconnecting means 50 volts or less, number, of phases, frequency, and full-load current for each incoming supply circuit.
Substantiation: I am recommending that this Proposal be accepted on the basis of personal safety of the technician servicing an industrial control panel. I understand the concerns of the CMP members regarding the voltage limitations, I have revised the text to reflect this concern. Also, the new text "of all power supplies" was not underlined in the proposal document, this would address the inclusion of; this requirement, acknowledging the presence of multiple power sources.
Panel Meeting Action: Reject
Panel Statement: CMP 11 recommends following safe work practices as outlined in NFPA 70E for establishing an electrically safe work condition. The concern is that markings added during installation are more difficult to maintain than drawings and may also be impractical to adequately describe all the sources of voltage.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
SMITH, III, A.: IEEE supports the panel action to reject comments 11-9 and 11-10
The concept of listing the location of all power supply circuit disconnecting means on a control panel is idealistic but not practical. Control panels can have multiple sources which make marking each source infeasible due to various reasons such as availability of free space for marking. This may also lead to errors and unsafe conditions because nameplate markings may be difficult to keep up to date. A safer method employed by industry is to indicate drawing number(s) for reference and up to date information on sources supplying the panel.
Information on full load current is impractical for all incoming supply circuits to be indicated on the panel due to possible number of sources that may include power, control, communication and signaling circuits.
Power source, power supplies and incoming supply circuits are not clearly defined. Definition is needed to add clarity and prevent misinterpretation between power supply circuits and other sources of voltage.

ARTICLE 410 — LUMINAIRES, LAMPHOLDERS, AND LAMPS

18-27 Log #502 NEC-P18 **Final Action: Reject**
(410.2.Closet Storage Space, 410.15 (New), and 410.16)

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 18-58
Recommendation: Revise text to read as follows:
410.2 Definitions
~~**Closet Storage Space.** The volume bounded by the sides and back closet walls and planes extending from the closet floor vertically to a height of 1.8 m (6 ft) or to the highest clothes-hanging rod and parallel to the walls at a horizontal distance of 600 mm (24 in.) from the sides and back of the closet walls, respectively, and continuing vertically to the closet ceiling parallel to the walls at a horizontal distance of 300 mm (12 in.) or the width of the shelf, whichever is greater; for a closet that permits access to both sides of a hanging rod, this space includes the volume below the highest rod extending 300 mm (12 in.) on either side of the rod on a plane horizontal to the floor extending the entire length of the rod. See Figure 410.2.~~
Figure 410.2: Renumber as Figure 410.15
410.15 Closet Storage Space Closet storage space shall be the volume bounded by the sides and back closet walls and planes extending from the closet floor vertically to a height of 1.8 m (6 ft) or to the highest clothes-hanging rod and parallel to the walls at a horizontal distance of 600 mm (24 in.) from the sides and back of the closet walls, respectively, and continuing vertically to the closet ceiling parallel to the walls at a horizontal distance of 300 mm (12 in.) or the width of the shelf, whichever is greater. For a closet that permits access to both sides of a hanging rod, this space shall include the volume below the highest rod extending 300 mm (12 in.) on either side of the rod on a plane horizontal to the floor extending the entire length of the rod. See Figure 410.16.
410.16 Luminaires in Clothes Closets. (A) Luminaire Types Permitted. Only luminaires of the following types shall be permitted in a closet:
(1) Surface-mounted or recessed incandescent or LED luminaires with completely enclosed light sources
(2) Surface-mounted or recessed fluorescent luminaires
(3) Surface-mounted fluorescent or LED luminaires identified as suitable for installation within the closet storage space
(B) Luminaire Types Not Permitted. Incandescent luminaires with open or partially enclosed lamps and pendant luminaires or lampholders shall not be permitted.
(C) Location. The minimum clearance between luminaires installed in clothes closets and the nearest point of a closet storage space (in accordance with 410.15) shall be as follows:
(1) 300 mm (12 in.) for surface-mounted incandescent or LED luminaires with a completely enclosed light source installed on the wall above the door or on the ceiling.
(2) 150 mm (6 in.) for surface-mounted fluorescent luminaires installed on the wall above the door or on the ceiling.
(3) 150 mm (6 in.) for recessed incandescent or LED luminaires with a completely enclosed light source installed in the wall or the ceiling.
(4) 150 mm (6 in.) for recessed fluorescent luminaires installed in the wall or the ceiling.
(5) Surface-mounted fluorescent or LED luminaires shall be permitted to be installed within the closet storage space where identified for this use.

Substantiation: I accept the point made by the CMP that the NEC Manual of Style does not require definitions to be in single sentences. However, section 2.2.2 of the NEC Manual of Style states that "Definitions shall not contain requirements or recommendations." The comment deletes the definition altogether because it simply presents a requirement. The comment also deletes the associated Figure and inserts both into a new section of the NEC in Article 410, in a way that it can be required by the code. Thus, section 410.16, which uses the requirements associated with closet storage space, can refer to the new section 410.15. This does not change requirements but makes the section comply with the NEC Manual of Style.
Panel Meeting Action: Reject
Panel Statement: "Clothes closet" is a definition per the NEC Style Manual section 2.2.2.2 and is in the correct location.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-28 Log #949 NEC-P18 **Final Action: Reject**
(410.9)

Submitter: Ed Larsen, Schneider Electric USA
Comment on Proposal No: 18-62
Recommendation: Accept the revised text as follows:
410.9 FCC Compliance. Fluorescent and high intensity discharge luminaires, LED lighting power supplies and self ballasted lamps installed in dwelling units shall comply with the requirements for an FCC Part 15 Class B Digital Device or the Part 18 limits for Consumer ISM Equipment. Compliance with the FCC Part 15 requirements shall be indicated by "Class B Digital Device" marked on the luminaire, power supply or lamp ~~as required by the FCC~~. Compliance with the FCC Part 18 requirements shall be indicated by "Consumer ISM Equipment" marked on the luminaire, power supply or lamp. Luminaires, power supplies or lamps that do not comply shall be marked "Not for use in dwellings".
Substantiation: The statement that, "The use of the term 'dwelling unit' does not correlate with the FCC requirements" is incorrect. The term "dwelling unit" must be used here as it is used in 210.12 to define where AFCIs are required. Article 100 clearly defines what a dwelling unit is. FCC Parts 15 and 18 both use the term "residential environment". Can there be any disagreement that a "dwelling unit" is a "residential environment"?
The statement was made that, "There are commercial dwellings, such as extended stay hotels and assisted living facilities", but such occupancies do not require AFCIs unless they meet the Article 100 definition of a dwelling unit. If they do, then from an NEC perspective, and thus the perspective of an AHJ, they are dwelling units, not commercial dwellings.
The suggestion was made that this is not a luminaire issue but rather an AFCI compatibility issue. This suggestion is understandable, however, field experience has indicated that compatibility in the lab does not always equate to compatibility in the field, often due to the unique mix of loads and the nature of the electrical system in the dwelling. Further, the unique characteristics of a particular AFCI manufacturers design combined with the unique characteristics of a particular ballast or power supply means that adding additional tests or redefining tests in the UL 1699 standard may not totally address the problem. What is know, however, is that all AFCI manufacturers have experienced some degree of problems with non-compliant ballasts and power supplies and that these problems have often been solved by replacing the ballast with a compliant model.
This proposal does nothing more than ask that the correct type of ballast, power supply or lamp be installed in accordance with FCC requirements and that these products be appropriately marked. Using the right product for the application is already required. The marking, which is the only new requirement, will assist installers in purchasing the right product and AHJs in verifying that the right product is installed. The benefit will be a cleaner RF environment in dwellings, resulting in less AFCI unwanted tripping, less radio interference and less interference with other electronic devices in the home that may also be susceptible to RF interference.
Panel Meeting Action: Reject
Panel Statement: The Article 100 definition of "dwelling unit" may apply to commercial installations such as extended stay hotels, dormitories, nursing homes and the like. The FCC does not use the term dwelling unit, rather they use "residential environment". The FCC distinction is intended to separate commercial locations where there is professional maintenance from residential locations where maintenance may be carried out by untrained homeowners. The commenter noted that compatibly in the lab does not always equate to compatibility in the field. Since FCC ratings are based on laboratory measurements, it seems that the commenter is indicating that the FCC emissions measurements will not ensure compatibility. The commenter also stated that problems were often solved by installing FCC compliant ballasts and power supplies. The qualifier "often" infers that this action did not always resolve the problem.
The commenter noted that adding compatibility tests to UL1699 may not totally address the problem. This is counter intuitive since the commenter is proposing that an immunity test, as required for FCC rated power supplies and ballasts, will help resolve the problem. Without corresponding testing done on AFCIs, this cannot be ensured. Currently, UL1699 does not contain test criteria addressing FCC requirements. IEC 61000-4-3 and IEC 61000-4-6 are not used by the FCC. The radiated and conducted emission limits differ between the FCC & IEC test standards.
The commenter states that the benefit of his proposal will be a cleaner RF environment & less interference with electronic devices in the home. These attributes are not part of the purpose of the Code as defined in Article 90.1. The commenter also states that his proposal will result in less unwanted AFCI tripping, which implies that there will still be some unwanted AFCI tripping.
The panel recommends that AFCI immunity parameters be defined and that appropriate immunity testing should be applied to eliminate unwanted tripping. The FCC mandated testing, ratings and markings for lighting electronics are already law, there is no need to reiterate them in the Code.

(410.9)

Submitter: Michael S. O'Boyle, Philips Lightolier
Comment on Proposal No: 18-62
Recommendation: I support the panel action to reject the proposal.
Substantiation: The simple fact is that there is no direct correlation between FCC ratings on lighting equipment and AFCI immunity. UL1699 does not contain immunity test requirements for AFCls based on FCC ratings and there is no other standard testing that proves ArCI immunity based on FCC ratings. Accordingly. there is no assurance that requiring luminaires be provided with additional FCC related labeling will be a solution to false tripping.

(410.20)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 18-68
Recommendation: Accept the proposal in principle. Revise text to read as follows:

The internal volume of a canopy, where marked, shall be applied in accordance with 314.16(A)(3).
Substantiation: CMP 9 reviewed this proposal (18-68) and created a panel proposal (9-37a) to address it. CMP 9 concluded that Proposal 18-68 was acceptable only to a limited extent. The CMP 18 wording has now created a direct conflict with the CMP 9 action and must be modified. This is not an issue that bears on the construction of a luminaire, other than the fact of a marking. This issue addresses box fill, which is squarely within the jurisdiction of CMP 9. This comment permanently resolves the issue by returning the jurisdiction to the appropriate article and code making panel.
It should be noted that CMP 9 returned the favor. It also reviewed Proposal 18-69 on 410.25 which directly conflicts with 314.25(B). In this case, CMP 9 determined that the question was properly within the scope of CMP 18's authority and (see Panel 9 Proposal 9-55a) it amended Article 314 so as to preclude any conflict with how CMP 18 might decide to rewrite the rule regarding exposure of combustible surfaces to luminaire canopies.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on comment 18-32. Returning the text to the 2011 NEC language will eliminate any conflict with 314.16.

(410.62(C))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 18-74
Recommendation: Accept the proposal as written, but change the title and parent text to read as follows:
(C) Electric-Discharge and LED Luminaires. Electric discharge and LED luminaires shall comply with (1), (2), and (3) as applicable.
Substantiation: The panel statement regarding the independent applicability of the three numbered paragraphs is correct and this comment makes the required correction. The increased usability and clarity of the remainder of the proposal is self-evident. The Correlating Committee should review the current syntax and if it finds that it does not flagrantly violate Section 3.3.1 of the NEC Style Manual, then nothing in the entire NEC does and the manual should delete that provision for lack of relevance.
Panel Meeting Action: Reject
Panel Statement: Proposed 410.62(C)(1)(c) states that only listed assemblies can be cord connected via manufactured wiring system connectors. As currently written, 410.62(C) allows listed luminaires to be cord connected using listed assemblies that incorporate manufacturing wiring system connectors.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-31 Log #411 NEC-P18 **Final Action: Accept**
(410.130(G)(1) Exception No. 4)

Submitter: Roger Zieg, Zieg Electric
Comment on Proposal No: 18-78
Recommendation: Delete Exception No. 4 as follows:
~~Exception No. 4: A disconnecting means shall not be required in industrial establishments with restricted public access where conditions of maintenance and supervision ensure that only qualified persons service the installation by written procedures.~~
Substantiation: I believe the action of the committee should be to accept this proposal. The purpose of the Code is the practical safeguarding of persons and property from hazards arising from the use of electricity. Several on the Code Making Panel, in the Explanation of the Negative during the proposal stage, made reference to the safe working practices found in NFPA 70E. To make an exception to a safety related feature makes no sense. There are disconnecting means that have been developed in direct response to this requirement when it was added to the Code in 2005. The purpose of the exception for industrial establishments at that time seems to be the cost factor of the disconnecting means and not the protection of the worker. This exception was a development of the Code making process and was not a part of the original proposal. With the development of the "in-line" disconnecting means and other safety features provided by the manufacturers, this exception needs to be deleted. I have attached a NIOSH FACE incident in which a worker was electrocuted while working on a florescent light. The company he was working for had safety rules and regulations in place. Do not give the worker or his/her employer a choice when it comes to safety. There should be no exceptions to disconnecting means for qualified people.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 2
Explanation of Negative:
CARPENTER, F.: The NIOSH report referenced in the comment's substantiation does not speak about the required written procedures that should address safety methods for this electrical work. No information has been provided to show that a hazard exists "where conditions of maintenance and supervision ensure that only qualified persons service the installation by written procedure". NEMA continues to support maintenance being performed on equipment where the circuit is de-energized.
O'BOYLE, M.: The comment provided no data to demonstrate that a hazard exists where conditions of maintenance and supervision ensure that only qualified persons service the installation by written procedure. To ensure safety, the circuit must be de-energized or appropriate personal protective equipment & procedures must be used when performing electrical service work.

18-35 Log #1005 NEC-P18 **Final Action: Accept**
(410.130(G)(1) Exception No. 4)

Submitter: David Clements, International Association of Electrical Inspectors
Comment on Proposal No: 18-80
Recommendation: Reconsider this proposal and accept it.
Substantiation: The purpose of the *Code* is the practical safeguarding of persons and property from hazards arising from the use of electricity. Qualified person is defined in the *Code*, but the meaning is certainly open to interpretation. Some states and/or local jurisdictions do not require the licensing of industrial electricians and leave it to the individual establishment to define the meaning of a qualified person. It is my belief that this exception should be deleted because it does not provide practical safeguarding for those persons likely to open luminaries for maintenance purposes.
Not all authorities having jurisdiction require licensing and in industrial establishments, as in other occupancies, do not always use qualified persons to perform maintenance on lighting, especially in general office area. Therefore the same hazards exist to the worker as in other occupancies.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 9 Negative: 2
Explanation of Negative:
CARPENTER, F.: Please see the explanation of my negative vote on Comment 18-31.
O'BOYLE, M.: The comment provided no data to demonstrate that a hazard exists where conditions of maintenance and supervision ensure that only qualified persons service the installation by written procedure. To ensure safety, the circuit must be de-energized or appropriate personal protective equipment & procedures must be used when performing electrical service work.

ARTICLE 411 — LIGHTING SYSTEMS OPERATING AT 30 VOLTS OR LESS AND LIGHTING EQUIPMENT CONNECTED TO CLASS-2 POWER SOURCES

18-39 Log #237 NEC-P18 **Final Action: Accept**
(411 Title, 411.1, 411.2, 411.3, 411.3(B)(3), and 411.6)

TCC Action: The Correlating Committee understands that the revisions accepted in Proposal 18-85 have not been revised by the action on this comment except as follows:
411.2 and the two definitions are deleted.
A new 411.3 was added and the Correlating Committee adds first level subdivision titles in accordance with the NEC Style Manual as follows:
411.3 Low Voltage Lighting Systems
(A) General. Lighting systems operating at 30 Volts or less shall consist of an isolating power supply, low-voltage luminaires and associated equipment that are all identified for the use. The output circuits of the power supply shall be rated for 25 amperes and 30 volts (42.4 volts peak) maximum under all load conditions.
(B) Class 2. Listed Class-2 lighting equipment shall be rated in conformance with Chapter 9 Table 11(A) or 11(B).
The Correlating Committee directs the following items be renumbered:
Existing 411.3 (as modified in Proposal 18-85) moves to 411.4.
Existing 411.4 moves to 411.5.
Existing 411.5 moves to 411.6.
Existing 411.6 (as modified in Proposal 18-85) moves to 411.7.
Existing 411.7 moves to 411.8.
Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 18-85
Recommendation: The Correlating Committee advises that article scope statements and titles are the responsibility of the Correlating Committee and the Correlating Committee Accepts the panel action.
The Correlating Committee directs the panel to modify the new definition in compliance with the NEC Style Manual or remove it.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise text as follows and renumber the remaining sections.
411.2 Definitions
~~Lighting systems operating at 30 Volts or less shall consist of an isolating power supply, low-voltage luminaires and associated equipment that are all identified for the use. The output circuits of the power supply shall be rated for 25 amperes and 30 volts (42.4 volts peak) maximum under all load conditions.~~
411.3.Low Voltage Lighting Systems
(A) Lighting systems operating at 30 Volts or less shall consist of an isolating power supply, low-voltage luminaires and associated equipment that are all identified for the use. The output circuits of the power supply shall be rated for 25 amperes and 30 volts (42.4 volts peak) maximum under all load conditions.
(B) Listed Class-2 lighting equipment shall be rated in conformance with Chapter 9 Table 11(A) or 11(B).

(411.2)

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 18-85
Recommendation: Reject the proposed definition of "**Lighting Equipment Connected to Class 2 Power Sources.**"
Substantiation: This definition is so unnecessary and obvious that it is laughable. The only way that it can be defined is the way that the panel has defined it—which tells the Code user nothing! The definition violates the style manual as every single word of the defined term is included in the definition, but that's because the definition is so obvious that you could define it no other way. Article 411 is in desperate need of help, and I applaud those that are trying to fix it, but this definition doesn't help. Furthermore the definition contains a requirement (for marking), which is not permitted in a definition.
Panel Meeting Action: Accept in Principle
Panel Statement: See Panel action and statement on Comment 18-39. The Panel concludes that the text is required to describe the appropriate level of power for low voltage lighting systems.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-42 Log #950 NEC-P18 **Final Action: Reject**
(411.8)

Submitter: Ed Larsen, Schneider Electric USA
Comment on Proposal No: 18-88
Recommendation: Accept the revised text as follows:
411.8 FCC Compliance. Power supplies installed in dwelling units ~~shall comply with the requirements for an~~ subject to the FCC Part 15 requirements shall be marked "Class B Digital Device". Power supplies installed in dwelling units subject to the FCC ~~or the~~ Part 18 requirements ~~limits for~~ shall be marked "Consumer ISM Equipment". ~~Compliance with the FCC requirements shall be marked on the power supply as required by the FCC~~. Power supplies that do not comply shall be marked "Not for use in dwellings".
Substantiation: The statement that, "The use of the term 'dwelling unit' does not correlate with the FCC requirements" is incorrect. The term "dwelling unit" must be used here as it is used in 210.12 to define where AFCIs are required. Article 100 clearly defines what a dwelling unit is. FCC Parts 15 and 18 both use the term "residential environment". Can there be any disagreement that a "dwelling unit" is a "residential environment"?
The statement was made that, "There are commercial dwellings, such as extended stay hotels and assisted living facilities", but such occupancies do not require AFCIs unless they meet the Article 100 definition of a dwelling unit. If they do, then from an NEC perspective, and thus an AHJs perspective, they are dwelling units, not commercial dwellings.
The suggestion was made that this is not a luminaire issue but rather an AFCI compatibility issue. This suggestion is understandable, however, field experience has indicated that compatibility in the lab does not always equate to compatibility in the field, often due to the unique mix of loads and the nature of the electrical system in the dwelling. Further, the unique characteristics of a particular AFCI manufacturers design combined with the unique characteristics of a particular ballast or power supply means that adding additional tests or redefining tests in the UL 1699 standard may not totally address the problem. What is know, however, is that all AFCI manufacturers have experienced some degree of problems with non-compliant ballasts and power supplies and that these problems have often been solved by replacing the ballast with a compliant model.
This proposal does nothing more than ask that the correct type of ballast, power supply or lamp be installed in accordance with FCC requirements and that these products be appropriately marked. Using the right product for the application is already required. The marking, which is the only new requirement, will assist installers in purchasing the right product and AHJs in verifying that the right product is installed. The benefit will be a cleaner RF environment in dwellings, resulting in less AFCI unwanted tripping, less radio interference and less interference with other electronic devices in the home that may also be susceptible to RF interference.
Panel Meeting Action: Reject
Panel Statement: No study or fact finding report has been offered to support a correlation between the consumer and non-consumer FCC emissions limits and nuisance tripping of AFCI breakers. The submitter states that when nuisance tripping has occurred, changing a ballast or power supplies "often" solves the problem. This suggests that the proposed solution doesn't always work, which further suggests that a correlation between FCC limits and nuisance tripping may not exist.
The submitter states that "the marking, which is the only new requirement, will assist installers in purchasing the right product...". The panel does not agree that consumers will understand markings such as "Class B Digital Device" and "Consumer ISM Equipment" and concludes that these marking would only add confusion to the consumer.
Additionally, the proposal does not distinguish between consumer and non-consumer limits, so would require all power supplies to be marked "Class B Digital Device" even if the device did not comply with the FCC consumer limits. This practice would contradict the FCC regulations. Although the proposal suggests that some power supplies are subject to FCC Part 18, FCC Part 18 is not an applicable regulation for power supplies.
Requiring all power supplies to carry an additional marking when a definitive relationship between AFCI nuisance tripping and FCC emissions limits has not been established is not justified.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

ARTICLE 422 — APPLIANCES

17-3 Log #256 NEC-P17 **Final Action: Reject**
(422.2)

Submitter: Code-Making Panel 17,
Comment on Proposal No: 17-18a
Recommendation: Continue to Accept this proposal.
Substantiation: We are not opposed to locating this new definition in Article 100. This product is relatively new to the NEC and We are sure that a significant number of those that use the Code are not familiar with the operation of a Portable GFCI as opposed to a conventional Ground Fault Circuit Interrupter. As described in the 2010 ROP Proposal 15-127 these devices are unique and provide a level of protection that is significantly different from that of the conventional GFCI's. The submitter of that proposal makes a point that these two types of protection should not be indiscriminately substituted for each other and a conveniently located definition should promote a heightened awareness of their availability and conditions of use.
This comment was developed by a CMP-7 Task Group and balloted through the entire panel with the following ballot results:
14 Eligible to vote
12 Affirmative (See voting comment below)
1 Negative (See voting Comment below)
1 Ballot Not Returned (C.J. Fahrenhold)
The following Comments on Vote were received:
AFFIRMATIVE:
S.R. LaDART: I am not opposed to locating this new definition to Article 100. I agree with the substantiation that CMP-17 submitted.
NEGATIVE:
T.H. CYBULA: Accept Proposal 17-18a in principle. Relocate the definition to Article 100 with the following underlined text addition and with strikeouts as follows: "Ground Fault Circuit Interrupter (GFCI), Portable. ~~(as applied to ground-fault circuit interrupter protection).~~ A plug-in type of ground fault circuit interrupter (GFCI) provided with male blades or an integral power supply cord for connection to a receptacle outlet. ~~Indicating that the~~ The ground-fault circuit interrupter is intended to protect personnel from fault current to ground on equipment or circuits supplied by plug-and-cord-connections or by temporary wiring installations and additionally functions to de-energize a circuit or portion thereof when one or more of the following defects occurs:
(1) ~~the~~ The grounded conductor to the power supply is opened;
(2) ~~the~~ The grounded conductor is transposed with an ungrounded conductor to the power supply;
(3) ~~one~~ One of the ungrounded conductors to the power supply on a polyphase system or on a single-phase, 3-wire system is opened.
Explanation: The text as accepted in the proposal was not clear in describing that the portable GFCI device can either be a plug in device with blades or with a flexible cord connection. The added text in this comment was extracted from the 2011 UL White Book on page 206 describing portable GFCIs. This new suggested text makes the definition totally clear as to the type of GFCI device being used in a portable application.
Panel Meeting Action: Reject
Panel Statement: The impetus for the original CMP-17 Proposal 17-18a was a separate proposal that a "portable equipment" definition be added to Article 100 (Proposal 1-57). Proposal 1-57 was unanimously rejected by Panel 1. Since there were no subsequent comments on that proposal, there no longer is need for the original CMP-17 proposal and it is withdrawn. CMP-17 notes that the comment submitter was CMP-7, not CMP-17.

(422.2, 422.49, and 422.51)

TCC Action: The Correlating Committee directs that the last sentence of the panel statement on Comment 17-4 be removed based on affirmative ballot comment.
Submitter: Code-Making Panel 15,
Comment on Proposal No: 17-18a
Recommendation: If relocated to Article 100, revise the proposed definition as follows:
Portable (as applied to ground-fault circuit interrupter protection). Indicating that the ground-fault circuit interrupter is
intended to protect personnel from fault current to ground on equipment or circuits supplied by
plug-and-cord-connections or by temporary wiring installations and additionally functions to de-energize a circuit or
portion thereof when one or more of the following defects occurs:
(1) the grounded conductor to the power supply is opened;
(2) the grounded conductor is transposed with an ungrounded conductor to the power supply;
(3) one of the ungrounded conductors to the power supply on a polyphase system or on a single-phase, 3-wire system is opened.
Ground-Fault Circuit-Interrupter Protection Listed for Portable Use: A type of ground-fault circuit-interrupter intended to provide additional protection for personnel by de-energizing the downstream portion of the circuit if a supply circuit conductor opens or reverse polarity is detected.
Substantiation: This Comment is CMP-15's response to the direction of the NEC Correlating Committee regarding Proposal 17-18a; Log # CP1700.
Articles under the purview of CMP-15 do include requirements for the use of listed portable GFCI protection of personnel either explicitly [e.g., 518.3(B)] or implicitly [e.g. the proposed change to 525.23(A)] but none of the Articles presently contain a definition.
Although the concept of the portable GFCI is found in other Articles throughout the Code, there is no existing definition of "ground-fault circuit-interrupter protection listed for portable use" (or similar) elsewhere in the NEC, therefore, there is no reason to insert the definition into Article 100 in accordance with 2.2.2.1 of the 2011 National Electrical Code Style Manual.
Defining the word "portable" in Article 100, even as applied to GFCI, may create conflict and enforcement issues with existing requirements in other Articles including, but not limited to, Articles 518, 520, 525 and 530.
Nonetheless, if comments by CMP-3 or CMP-7 result in correlating action to locate a common definition in Article 100, CMP-15 submits the above revision to that definition.
The proposed changes to 422.49 and 422.51 are not addressed by this Comment.
This comment was developed by a CMP-15 Task Group and balloted through the entire panel with the following ballot results:
19 Eligible to vote
13 Affirmative
2 Negative (See comments below)
4 Ballots Not Returned (K. Jones, G.J. Krupa, S.M. Lipster and M.D. Skinner)
NEGATIVES:
K.J. Gilbert: The word "if" at the beginning of CMP-15's Comment is a problem. It creates a reliance upon other actions not required in the comment.
CMP-15's Comment should have proposed that CMP-17 "Accept in Principle" Proposal 17-18a and adopt the adjusted language shown in CMP-15's comment (after removing the sentence "If relocated to Article 100, revise the proposed definition as follows:"), then place the language into Article 100.
D.J. Talka: The definition offered by the task force of CMP 15 is incorrect. Portable GFCIs are not required to de-energize under reverse polarity conditions or open neutral conditions. They are required to continue to provide protection. The original definition more closely defines the performance of a portable GFCI. I suggest that the definition be revised as follows:
"Ground-Fault Circuit-Interrupter Protection Listed for Portable Use: A ground-fault circuit interrupter intended to protect personnel from fault current to ground on equipment or circuits supplied by plug-and-cord-connections including temporary wiring installations. Protection of personnel is maintained when one or more of the following conditions occur:
(1) the grounded conductor to the power supply is opened;
(2) the grounded conductor is transposed with an ungrounded conductor to the power supply;
(3) one of the ungrounded conductors to the power supply on a polyphase system or on a single-phase, 3-wire system is opened."
Panel Meeting Action: Reject
Panel Statement: The impetus for the original CMP-17 Proposal 17-18a was a separate proposal that a "portable equipment" definition be added to Article 100 (Proposal 1-57). Proposal 1-57 was unanimously rejected by Panel 1. Since there were no subsequent comments on that proposal, there no longer is need for the original CMP-17 proposal and it is withdrawn. CMP-17 notes that the comment submitter was CMP-7, not CMP-17.

(422.2.Portable)

Submitter: James F. Williams, Fairmont, WV

Comment on Proposal No: 17-18a

Recommendation: Revise text to read as follows:

422.2 Definition.

~~**Portable (as applied to ground-fault circuit interrupter protection)**~~

Appliance Ground Fault Circuit Interrupter. ~~Indicating that the~~ A ground-fault circuit interrupter that is intended to protect personnel from fault current to ground on equipment or circuits supplied by plug-and-cord connections or by temporary wiring installations and additionally functions to de-energize a circuit or portion thereof when one or more of the following defects occurs:

(1) The grounded conductor to the power supply is opened;

(2) The grounded conductor is transposed with an ungrounded conductor to the power supply;

(3) One of the ungrounded conductors to the power supply on a polyphase system or on a single-phase, 3-wire system is opened.

422.49 High-Pressure Spray Washers. All single-phase cord-and-plug-connected high-pressure spray washing machines rated at 250 volts or less shall be provided with factory-installed appliance ground-fault circuit-interrupter protection for personnel. ~~The ground-fault circuit interrupter shall be identified for portable use.~~ The ground-fault circuit interrupter shall be an integral part of the attachment plug or shall be located in the supply cord within 300 mm (12 in.) of the attachment plug

422.50 Vending Machines.

(A) Cord- and Plug Connected. Cord-and-plug connected vending machines manufactured or remanufactured on or after January 1, 2005, shall include an appliance ground-fault circuit interrupter ~~identified for portable use~~ as an integral part of the attachment plug or be located within 300 mm (12 in.) of the attachment plug. Older vending machines manufactured or remanufactured prior to January 1, 2005, shall be connected to a GFCI-protected outlet.

Substantiation: I am concerned that existing "portable GFCIs" may not have the 3 properties listed in the definition. I believe these additional properties deserve a more distinctive name.

(WORD auto formatting ran amock in this document)

Panel Meeting Action: Reject

Panel Statement: The comment proposes a new term "listed appliance ground-fault circuit-interrupter protection for personnel" that is not used in the product safety standard (ANSI/UL 943) nor is it marked on listed devices. In addition, the substantiation expresses concern that "existing 'portable GFCIs' may not have the 3 properties listed in the definition." However, these properties are applicable to existing listed portable ground-fault circuit-interrupters per the product safety standard.

17-8 Log #947 NEC-P17 **Final Action: Reject**

(422.5)

Submitter: Ed Larsen, Schneider Electric USA

Comment on Proposal No: 17-20

Recommendation: Accept the revised text as follows:

422.5 FCC Compliance. Appliances installed in dwelling units ~~shall comply with the requirements for an~~ subject to the FCC Part 15 requirements shall be marked "Class B Digital Device". Appliances installed in dwelling units subject to ~~or~~ the FCC Part 18 requirements ~~limits for~~ shall be marked "Consumer ISM Equipment". ~~Compliance with the FCC requirements shall be marked on the appliance as required by the FCC.~~ Appliances that do not comply shall be marked "Not for use in dwellings".

Substantiation: The revised text satisfies the concern expressed in the Panel Statement on ROP 17-45 regarding the inability of AHJs to enforce the FCC requirements by placing the responsibility on the appliance manufacturer who should be well aware of the pertinent FCC requirements. All the AHJ need do is to look for the "Class B Digital Device" or "Consumer ISM Equipment" marking, or the absence of a marking on a device which is not an RF radiator. If the "Not for use in dwellings" marking is present, then the AHJ will know that the appliance is not suitable for installation in a dwelling. This text also satisfies the concern expressed regarding the marking required by the FCC and the exemption stated in 47CFR15.103d.

The size of appliances installed in a dwelling unit at the time of inspection is typically such that there should be adequate room for this marking, thus reliance on the presence of the operating manual at the time of inspection should not be a concern.

Panel Meeting Action: Reject

Panel Statement: CMP-17 rejects the original Proposal 17-20 and the revisions in Comment 17-8 for the following reasons:

(1) The substantiation provided by the submitter suggests that it is the obligation of the authority having jurisdiction to enforce the FCC regulations. This is not true; there is an entire federal agency charged with this responsibility. The authority having jurisdiction should be assured that all products covered by the requirements of FCC Part 15 are compliant. If they believe otherwise, then that concern should be addressed with the Agency.

(2) The proposal is in contradiction with the FCC Part 15 and Part 18 requirements. FCC regulations under Part 15 cover unintentional radiators that are "digital devices" only. Therefore, not all products are considered to be a source of interference nor require testing and marking. In addition, there are categories of devices that the FCC has deemed to be not likely to produce harmful interference and they have been exempted. All covered devices are required by law to comply.

(3) The Part 15 FCC regulations were designed to prevent the interference from computing devices to television and radio receivers, not prevent the unwanted functioning of other devices that share the same electromagnetic environment. Based upon the intended purpose of the regulations, the tested frequency ranges are those of broadcast frequencies and the limits are very low to ensure that nearby receivers, which are by design especially sensitive to these frequencies, are unaffected. The frequency ranges and limits of the FCC regulations are therefore wholly not suited to address the concern of interference with AFCI operation.

(4) The regulations already require information to be provided to the consumer regarding compliance. This information may be on the product or in the instruction manual in a prominent location. Adding additional or conflicting information would be inappropriate and puts the authority having jurisdiction in the position of having to determine if the marking is correct, if the product is in compliance, if the product is subject to exemptions, or if the product contains a digital device.

(5) Products that are unmarked are not non-compliant. They may either not be digital devices or not be covered. To claim that these products are sources of electromagnetic interference is inconsistent with the regulation. To claim that these products are not suitable for dwellings is completely incorrect and should not be marked as such.

(6) There is absolutely no evidence to suggest that there are Part 15 noncompliant products being installed in dwellings and that these illegal products are the source of regular misfiring of AFCI's.

(7) The frequencies and amplitudes of emissions that limited by the Part 15 FCC regulations are entirely out of the range of the frequencies and amplitudes that AFCI's are intended to respond to.

(8) AFCI's, through compliance with UL 1699, are required to demonstrate immunity to electromagnetic disturbances of a variety of types and at relatively higher severity levels. Specifically, the susceptibility of AFCI's are tested at

much higher levels of radiated and conducted EMI than that limits of Part 15. If these immunity tests are insufficient, we encourage the maker of the proposal to make proposals to the STP of UL 1699.

(9) The substantiation for this proposal states that finding adequate room for the marking because "The size of the appliances installed in a dwelling unit at the time of inspection is typically such that there should be adequate room for this marking…" would seem to indicate that the submitter is principally addressing permanently installed appliances, such as fluorescent fixtures or HVAC systems, and not, for example, cord connected appliances. If this is the intent, then the language of the proposal fails to express this limitation.

(10) If additional requirements are needed in the FCC regulations, proposals should be made to that agency.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 10
Ballot Not Returned: 2 Pannock, J., Sweigart, R.
Comment on Affirmative:

COOK, D.: I support the panel action to reject. However, I don't completely agree with the panel statement. In item 1, the statement indicates all products covered by the FCC requirements are compliant. Several compliant AFCI installations in Shelby County, AL functioned until products were connected to the branch circuits by consumers. At that point, the AFCI devices tripped. Similar products from different manufacturers were installed on the same circuit and the circuit functions properly today. While I am uncertain how to resolve the unwanted tripping, it is not the consumer and AHJ's responsibility to resolve an issue of compatibility between two products when each is certified to the applicable US product standard. At this point I don't see any harmonized effort between equipment manufacturers to resolve the issues.

17-9 Log #1566 NEC-P17 **Final Action: Reject**
(422.19 (New))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 17-30
Recommendation: Accept the proposal in principle. Revise text to read as follows:

The internal volume of a canopy shall be applied in accordance with 314.16(A)(3).

Substantiation: CMP 9 reviewed a similar proposal (18-68) and created a panel proposal (9-37a) to address it. CMP 9 concluded that Proposal 18-68 was acceptable only to a limited extent, and had this proposal been reviewed similarly the conclusion would undoubtedly been the same. The CMP 17 wording has now created a direct conflict with the concept of the CMP 9 action on its proposal 9-37a and must be modified. This is not an issue that bears on the construction of a ceiling-suspended (paddle) fan, other than the fact of a marking. This issue addresses box fill, which is squarely within the jurisdiction of CMP 9. This comment permanently resolves the issue by returning the jurisdiction to the appropriate article and code making panel. A companion comment has been made to CMP 9 to directly reference paddle fans along with luminaires in the new Section 314.16(A)(3).
Panel Meeting Action: Reject
Panel Statement: The comment proposes reference to a new 314.16(A)(3) that relates to luminaires, not paddle fans, and cites "fixture wires" that are not typically employed in paddle fans. See panel action and panel statement on Comment 17-10.

Comment on Proposal No: 17-37
Recommendation: It was the action of the Correlating Committee that further consideration be given to the comments expressed in the voting.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: CMP-17 accepts the direction of the Correlating Committee to give further consideration to the comments expressed in the vote on Proposal 17-37. See Comment 17-14.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10
Ballot Not Returned: 2 Pannock, J., Sweigart, R.

Comment on Affirmative:

COOK, D.: I support the panel action to support the TCC direction. However, the committee action on 17-14 includes an action not addressed in the original proposal, the comments expressed in the voting, nor in Comment 17-14. The Committee action on 17-14 revised a recommendation to provide GFCI protection for personnel for three-phase high-pressure spray washing machines rated 208Y/120 volts, 60 amperes or less to a requirement that requires the proposed GFCI protection to be located in the attachment plug or the cord of the appliance. While the product standard may permit attachment plug or cord type (probably a portable type device), three-phase GFCI, it is not obvious that product exist today. While having the protection in the cord will better ensure the GFCI protection is provided at any location the appliance is used, it will obviously require a revision to the product standard for high-pressure spay washing machines and require a GFCI manufacturer to develop that specific product. Based on past actions with vending machines, a revision and implementation of the revision to another product standard could take years to complete. Meanwhile, designers, contractors, electricians, and AHJ's will be forced to revise or ignore this requirement as they wait for the product to become available. Panel action on Comment 17-14 should be accept.

17-14 Log #948 NEC-P17 **Final Action: Accept in Principle in Part**
(422.49)

Submitter: Ed Larsen, Schneider Electric USA
Comment on Proposal No: 17-37
Recommendation: Revise text to read as follows:

422.49 High-Pressure Spray Washers.

<u>**(A) Single-phase.**</u> All single-phase cord-and-plug-connected high-pressure spray washing machines rated at 250 volts or less shall be provided with factory-installed ground-fault circuit-interrupter protection for personnel. The ground-fault circuit interrupter shall be an integral part of the attachment plug or shall be located in the supply cord within 300 mm (12 in.) of the attachment plug.

<u>**(B) Three-phase.** All three-phase high-pressure spray washing machines rated at 208Y/120 volts 60 amperes or less shall be provided with groundfault circuit-interrupter protection for personnel.</u>

Substantiation: The Panel statement rejecting ROP 17-37 was correct in that there are no three-phase 240 volt listed GFCIs. Three-phase 208Y/120 volt GFCIs are recognized in UL 943 and UL 489. Listed products are on the market that meet this requirement.

Panel Meeting Action: Accept in Principle in Part

422.49 is revised as follows, with amendments to the 2011 NEC indicated by strikeout and underline:

422.49 High-Pressure Spray Washers. ~~All single-phase~~ Cord-and plug-connected high-pressure spray washing machines ~~rated at 250 volts or less~~ <u>as specified in (1) or (2)</u> shall be provided with factory-installed ground-fault circuit-interrupter protection for personnel ~~the ground-fault circuit interrupter shall be~~ <u>that is</u> an integral part of the attachment plug or ~~shall be~~ located in the supply cord within 300 mm (12 in.) of the attachment plug.
<u>(1) All single-phase equipment rated 250 volts or less</u>
<u>(2) All three-phase equipment rated 208Y/120 volts and 60 amperes or less.</u>

Panel Statement: The panel agrees that, where available, GFCI protection should be provided for 3-phase high-pressure spray washers. However, the original proposal and comment are unclear as to whether the GFCI protection is intended for all three-phase equipment or just cord-and-plug-connected equipment. Since the comment recommendation retained the cord-and-plug-connected condition for single-phase equipment, the same cord-and-plug-connected condition would logically be applicable to three-phase cord-and-plug connected equipment.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 7 Negative: 3
Ballot Not Returned: 2 Pannock, J., Sweigart, R.
Explanation of Negative:

COOK, D.: I support the panel action to expand GFCI protection to three-phase spray washing machines at the voltage and current levels expressed. However, the committee action on 17-14 to Accept in Principle in Part includes an action not addressed in the original proposal, the comments expressed in the voting, nor in Comment 17-14. The Committee action on 17-14 revised a recommendation to provide GFCI protection for personnel for three-phase high-pressure spray washing machines rated 208Y/120 volts, 60 amperes or less to a requirement that requires the proposed GFCI protection to be located in the attachment plug or the cord of the appliance. While the product standard may permit attachment plug or cord type (probably a portable type device), three-phase GFCI, it is not obvious that product exist today. While having the protection in the cord will better ensure the GFCI protection is provided at any location the appliance is used, it will obviously require a revision to the product standard for high-pressure spay washing machines and require a GFCI manufacturer to develop that specific GFCI product. Based on past actions with vending machines, a revision and implementation of the revision to another product standard could take years to complete. Meanwhile, designers, contractors, electricians, and AHJ's will be forced to revise or ignore this requirement as they wait for the product to become available. Panel action on Comment 17-14 should be accept.

SCHAPP, R.: I agree with the comments of D. Cook and R. Yasenchek.

YASENCHAK, R.: We should afford the same protection to hard wired as well as cord and plug connected.

17-15 Log #923 NEC-P17 **Final Action: Reject**
(422.51)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 17-38
Recommendation: Revise text to read as follows:
422.51 Vending Machines.
(A) Cord- and Plug Connected. Cord-and-plug-connected vending machines manufactured or remanufactured on or after January 1, 2005, shall include a ground-fault circuit interrupter identified for portable use as an integral part of the attachment plug or be located within 300 mm (12 in.) of the attachment plug. Older vending machines manufactured or remanufactured prior to January 1, 2005, shall be connected to a GFCI-protected outlet. <u>The GFCI protecting a vending machine shall meet the requirements of 110.26.</u>

Substantiation: Unlike portable pressure washers vending machines are often difficult to move, so required the GFCI to be readily accessible is appropriate. Note another comment modified other text in 422.51(A), those changes are separate and not shown here.

Panel Meeting Action: Reject

Panel Statement: The GFCI protecting a vending machine" can be located in a panel, outlet, or supply cord. The only "examination, adjustment, servicing, or maintenance while energized" is actuation of the test / reset buttons of the GFCI. Requiring that the working space requirements of 110.26 be met for such actuation is unnecessary and inconsistent with the numerous other GFCI installation requirements throughout the Code.

Number Eligible to Vote: 12
Ballot Results: Affirmative: 10
Ballot Not Returned: 2 Pannock, J., Sweigart, R.
Comment on Affirmative:

COOK, D.: I agree with the Panel action to reject Comment 17-15. However the first sentence of the Panel Statement indicates the GFCI protecting the vending machine can be located in a panel, outlet, or supply cord. Based on the text in 422.51, the location of the GFCI protection is based on the date the vending machine was manufactured or remanufactured and the location of the GFCI protection is not optional, but prescriptive based on that date. The first sentence of the Panel statement should be deleted.

ARTICLE 424 — FIXED ELECTRIC SPACE-HEATING EQUIPMENT

17-16 Log #1314 NEC-P17 **Final Action: Reject**
(424)

Submitter: Mike Weitzel, Richland, WA
Comment on Proposal No: 17-46
Recommendation: Revise text to read as follows:

ARTICLE 424

Fixed Electric Space<u> and Process Heating Equipment</u>

424.1 Scope. This article covers fixed electric equipment used for space heating <u>or</u> <u>**industrial process heating**</u>. For the purpose of this article, heating equipment shall include heating cable, unit heaters, duct heaters, boilers, central systems, or other approved fixed electric space <u>**or industrial process heating**</u> equipment. This article shall not apply to electric deicing and snow melting equipment, pipelines and vessels, or room air conditioning.

<u>**Section 424.2 Definitions.**</u>

<u>**Industrial Process Heating Equipment: Equipment such as duct heaters, vessel type strip heaters, tank-type heaters, resistance-type boilers, and electrode type boilers used in industrial processes.**</u>

<u>**Section 424.3**</u> **Other Articles. Fixed electric space heating equipment incorporating a hermetic refrigerant motor compressor shall also comply with Article 440.**

<u>**Section 424.4 Branch Circuits.**</u> (Section is renumbered, but otherwise, remains the same).

(A) Branch-Circuit Requirements. (text remains the same).

(B) Branch-Circuit Ratings. (text remains the same).

<u>**New Part X. Industrial Process Heating Equipment**</u>

<u>**424.100 Installation. Industrial control panels and power disconnecting means for industrial process heating equipment shall have sufficient clearance maintained to permit replacement of controls and heating elements and for adjusting and cleaning the controls other parts requiring such attention. See 110.26.**</u>

Substantiation: The original proposal has been revised based upon CMP 12 statements in the ROP.

Article 422 - Appliances does not appear to be the correct article to cover large, heavy duty industrial process heating equipment. Section 422.11 limits overcurrent protection to 50 amperes. How many industrial boilers have overcurrent protection to limited to only 50 amperes – even for individual banks of elements? Most industrial process heating equipment require hundreds or thousands of amperes to operate. Even in Section 424.22(B), for fixed electric space heating equipment, it is realized that the overcurrent protection supplying electric power to space heating elements through a contactor, is permitted to be sized at a maximum of 60 amperes. There are often a large number of contactors within an industrial process heating equipment control panel, not just one.

In addition, Section 422.14 speaks about infrared lampholders operated in series. While some industries undoubtedly use this equipment, there are much larger installations with duct heaters, strip heaters, tank heaters, and industrial boilers that are being ignored by the NEC. Technically, as heating equipment, why is Section 110.26 specifically referenced in Section 424.66? Based upon the panel statement, mention of 110.26 in Section 424.66 should not be necessary. Instead, I believe that past members of CMP 12 saw that there truly is a need for working space in front of heating equipment panels, and hence added the language in 424.66.

Again, having installed, maintained, and inspected heating installations; I see the need for specific requirements, all for protection of the electrical worker, and the ability to safely examine the equipment, which includes Zero Energy Checks. I would hope that labor and inspector members of CMP 12 would support this proposal for these reasons alone.

Panel Meeting Action: Reject

Panel Statement: CMP-17 affirms its prior action and statement on Proposal 17-46. The comment substantiation misunderstood the intent of the panel statement citing 422.14. It was cited to illustrate that industrial equipment was covered by Article 422, not to say that the specific requirements were applicable to all industrial equipment. Similarly, the substantiation makes reference to the requirement of 422.11(C) when, instead, the equipment described would be covered by 422.11(E) or 422.11(F)(1).

With respect to the continuing need for 424.66 when 110.26 is generally applicable, CMP-17 notes that 110.26 requirements are applicable where equipment "require examination, adjustment, servicing, or maintenance while energized." The panel determined that the additional considerations of "replacement of controls and heating elements and for adjusting and cleaning of controls and other parts" were appropriate for duct heaters and therefore also sought adequate working space for these purposes not appearing in 110.26. It may be the case that similar considerations are appropriate for certain process heater installations. As previously stated, these could be addressed by adding requirements to Article 422.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10

Ballot Not Returned: 2 Pannock, J., Sweigart, R.

Comment on Affirmative:

COOK, D.: I agree with the Panel action to reject Comment 17-16. However the Panel Statement indicates process heating is within the scope of Article 422. As stated in the IAEI ballot for proposal 17-46, I don't agree that process heating equipment is an appliance.

17-17 Log #1025 NEC-P17 **Final Action: Accept**
(424.19)

Submitter: Mike Holt, Mike Holt Enterprises

Comment on Proposal No: 17-48

Recommendation: Revise the proposal (and 17-48 and 17-50) by moving the "lockable" language into the parent text of the section, as follows:

424.19 Disconnecting Means. Means shall be provided to simultaneously disconnect the heater, motor controller(s), and supplementary overcurrent protective device(s) of all fixed electric space-heating equipment from all ungrounded conductors. Where heating equipment is supplied by more than one source, feeder, or branch circuit, the disconnecting means shall be grouped and marked. The disconnecting means specified in 424.19(A) and (B) shall have an ampere rating not less than 125 percent of the total load of the motors and the heaters <u>and shall be lockable in accordance with 110.25</u>. ~~The provision for locking or adding a lock to the disconnecting means shall be installed on or at the switch or circuit breaker used as the disconnecting means and shall remain in place with or without the lock installed.~~

Remove the references to lockable disconnects in the rest of the section.

Substantiation: This section refers to a lockable disconnect multiple times, but is the accepted proposal language only addresses some of the instances (not the instance indicated above). By accepting this proposal the redundant language in the rest of the section can be removed.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10

Ballot Not Returned: 2 Pannock, J., Sweigart, R.

17-18 Log #922 NEC-P17 **Final Action: Hold**
(424.44(D))

TCC Action: The Correlating Committee directs that the panel action on Comment 17-18 be reported as "Hold " to comply with the NFPA Regulations Governing Committee Projects as this comment contains new material that has not had public review.

Submitter: James F. Williams, Fairmont, WV

Comment on Proposal No: 17-55

Recommendation: Revise text to read as follows:

424.44 Installation of Cables in Concrete or Poured Masonry Floors.
