(D) Spacing Between Heating Cable and Metal Embedded in the Floor. Spacing shall be maintained between the heating cable and metal embedded in the floor, unless the cable ~~is a grounded metal-clad cable~~.<u>has a grounded metal sheath.</u>

Substantiation: It is unclear to me what is required to be grounded. If it is the sheath, then I suggest a change to the text. If something else is to be grounded, then perhaps other text is required.

Panel Meeting Action: Accept

Panel Statement: While it is arguable that this comment represents new material, CMP-17 notes that this amendment is necessary to properly describe the type of cable involved.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 1

Ballot Not Returned: 2 Pannock, J., Sweigart, R.

Explanation of Negative:

YASENCHAK, R.: Metal clad and metal sheath are two different types. The original proposal was editorial in nature and this is a technical change.

17-19 Log #1312 NEC-P17 **Final Action: Accept**
(424.66 (New))

Submitter: Mike Weitzel, Richland, WA

Comment on Proposal No: 17-75

Recommendation: Add new text to read as follows:

424.66 Installation.

<u>**(A)**</u> Duct Heaters shall be installed in accordance with the manufacturer's instructions in such a manner that operation does not create a hazard to persons or property. Furthermore, duct heaters shall be located with respect to building construction and other equipment so as to permit access to the heater. Sufficient clearance shall be maintained to permit replacement of controls and heating elements and for adjusting and cleaning of controls and other parts requiring such attention. See 110.26.

<u>**Working space about electrical enclosures for resistance heating element type duct heaters which are mounted on duct systems and contain equipment that requires examination, adjustment, servicing, or maintenance while energized shall comply with Section 424.66(B).**</u>

<u>**(B) Limited Access. Where the enclosure is located in a space above a ceiling, all of the following shall apply:**</u>

<u>**(1) The enclosure shall be accessible through a lay in type ceiling or access panel(s).**</u>

<u>**(2) The width of the working space shall be the width of the enclosure or a minimum of 762 mm (30 in.), whichever is greater.**</u>

<u>**(3) All doors or hinged panels shall open to at least 90 degrees.**</u>

<u>**(4) The space in front of the enclosure shall comply with Table 110.26(A)(1) depth requirements. Horizontal Ceiling T-bar is permitted in this space.**</u>

Substantiation: Acceptance of this revised text will improve safety for electrical workers, and provide enforceable *Code* language for those who enforce *Code* requirements.

Working up a ladder in a duct heater electrical enclosure mounted on the duct system while energized can be hazardous. This equipment is often supplied by 480-volt circuits, and installed above the floor level, close to the ceiling. Many of these types of enclosures have hinged doors, which must be able to open 90 degrees in order to access all components of the equipment. Electrical workers may be working on a ladder, and required to test or examine these units while energized. Metal piping or metal structural beams/cross members are often installed or located in front of this equipment enclosure, thereby creating an unsafe condition to electrical workers due to grounded metal parts in front of the equipment being worked on while energized. A working clearance violation of this type would not be permitted for a 480-volt switchboard or panel board installed at floor level. However, there appears to be no specific *Code* rule to address this situation.

This comment and revision includes comments and concerns voiced by CMP 12 in the ROP.

"This will protect electrical workers that are required to be put in harms way to perform servicing of this equipment. Suggest relocating this to Article 424." Therefore, I did just that.

And, "The Proposal raises a significant issue related to safe workspace around utilization equipment that will likely be maintained while energized. That (heating) equipment is currently installed across North America in spaces where the prescribed workspace in 110.26 is not provided."

In addition, "...the safety of those maintaining and troubleshooting that equipment while energized is certainly an electrical concern...."

AHJ's may decide to require 110.26 working space - at least in part, in accordance with Section 90.4. However, some *Code* users would consider this a 'gray area'. The purpose of the *Code* is to protect people and property.

Acceptance of this revised text will improve safety for electrical workers, and provide enforceable *Code* language for those who enforce *Code* requirements.

Panel Meeting Action: Accept

Number Eligible to Vote: 12

Ballot Results: Affirmative: 9 Negative: 1

Ballot Not Returned: 2 Pannock, J., Sweigart, R.

Explanation of Negative:

COOK, D.: While I support expanded protection of workers and acceptance of this comment could be viewed as a step toward safer installations, the text does not provide a complete solution for the concern raised for worker safety. Existing text in 424.66 already requires sufficient clearance for adjustment, servicing or maintaining duct heaters. That existing text is vague and probably leads to inconsistent enforcement. However, the following concerns lead enforcement to vote for rejection, and support any future effort to develop a

better solution for a legitimate concern for worker safety:
1) This comment specifically addresses duct heaters and recognizes this equipment is likely to require examination, adjustment, servicing, or maintenance while energized. A variety of other utilization equipment, subject to other NEC Articles and other CMP's, is typically installed in similar locations and conditions. Accepting this text provides multiple levels of worker safety based on the type of utilization equipment.
2) For that matter, utilization equipment located in equipment rooms are seldom provided with the workspace dimensioned in NEC 110.26. While Comment 17-19 addresses this very specific duct heater installation (above ceilings), the same duct heater could be installed in an equipment room or at an elevated location that does not include a ceiling and the dimensioned workspace is not required.
3) The utilization equipment is typically installed by other trades and in many cases the location of the equipment is driven by its function. Since the prescriptive space is not correlated with space requirements in the IMC, adopted in many building departments to regulate all HVAC equipment, enforcement could be problematic for electrical inspectors.
4) I'm not completely comfortable with the technical reason for allowing metal (potentially grounded) ceiling grid in the workspace, but understand the practical difficulty of prohibiting the grid from the space.
While I don't believe the specific text is ideal, it provides a start. Comment 17-19 identifies a concern for electrical safety where utilization equipment is installed at elevated locations and requires access and working space be provided and maintained to permit ready and safe operation and maintenance of that equipment.
Since the electrical concern (shock hazards) for workers while the equipment is examined, adjusted, serviced, or maintained is clearly within the scope of the NEC and seems to be identical regardless of the function of the utilization equipment (hazard is not unique to duct heaters), TCC may wish to develop task group to address the concern and develop correlated requirements throughout the NEC. As the 2014 NEC is adopted and enforced, if Comment 17-19 is accepted, it will bring this concern for electrical safety to the forefront and immediately raise questions why dimensioned workspace in crowded ceilings is needed for the duct heater and not needed for the water heater or the air handler located in the same space. It will also raise questions why duct heaters need dimensioned workspace in crowded areas above ceiling and not needed in crowded spaces without ceilings. Enforcement supports a consensus effort to develop consistent workspace requirements for all utilization equipment installations.

Comment on Affirmative:
YASENCHAK, R.: We are voting affirmative on the panel action to Accept comment 17-19. We agree that this action is a step in the right direction. Providing adequate working space about electrical equipment that is likely to require justified energized work is essential for the safety of installer/maintainers.
We agree with the comments made by Mr. Cook.
We also suggest that the Correlating Committee develop a task group to review all electrical equipment that is, or can be installed above a ceiling or in an elevated manner. This effort will include different types of equipment, installation methods, areas above ceilings and installations that are elevated for other reasons. We support a general requirement that will address all such installations and all equipment. Such a requirement must exist in Chapter 1 of the NEC.
General requirements for working space about all equipment that is, or can be, installed above a ceiling or in an elevated manner, should be included as a new first level subdivision in 110.26."

ARTICLE 426 — FIXED OUTDOOR ELECTRIC DEICING AND SNOW-MELTING EQUIPMENT

17-20 Log #688 NEC-P17 **Final Action: Reject**
(426.28)

Submitter: Christopher M. Jensen, North Logan City
Comment on Proposal No: 17-67
Recommendation: Accept the proposal as submitted:
426.28 ~~Ground Fault Protection of Equipment.~~ <u>Equipment Ground-Fault Protection.</u> ~~Ground fault protection of equipment~~ <u>Equipment ground-fault protection</u> shall be provided for fixed outdoor electric deicing and snow-melting equipment.
Substantiation: The term "Ground Fault Protection of Equipment" is used in 215.10, 230.95 and 426.28
The term "Ground Fault Protection of Equipment" as defined in Article 100 is most often associated with the requirements in 230.95 and 215.10. The UL White Book Category (KDAX) is cross referenced as the category used to cover devices used to comply with 230.95 and 215.10. These devices have a ground fault trip level between 1 and 1200 amperes.
The ground fault protection required by 426.28 is cross referenced and covered by UL White Book Category (DIYA) "Circuit breakers with equipment ground-fault protection." The trip levels for the devices covered by (DIYA) have a trip threshold of 30 to 50 milliamperes.
Because there are 2 distinct types of ground fault protection required in section 230.95 and 426.28 there should be 2 distinct terms used to identify the different protection types.
The term "Equipment ground fault protection" is the term used by UL in the product category used to identify the protection listed to comply with the requirements in 426.28.
The change of the term "Ground fault protection of Equipment" to "Equipment Ground Fault Protection" will help the code user select the proper type of ground fault protection for fixed outdoor electric deicing and snow-melting equipment.
I have made a companion proposal to include a new definition of "Equipment Ground Fault Protection"
Panel Meeting Action: Reject
Panel Statement: Implementing this comment will not attain the desired result as it is based, in part, on some inaccurate assumptions. The substantiation references the "UL White Book" categories KDAX and DIYA, indicating that there may be confusion between them when applying 426.28. These are different devices with unique identification: "ground fault sensing and relaying equipment" and "circuit breaker with equipment ground fault protection" (or "C.B. W/EQ.GFP"), respectively. They are distinguishable on that basis. Also, the DIYA devices are not limited to a trip threshold of 30-50 mA as stated in the substantiation. The trip threshold is specified by the manufacturer and marked on the devices. There is at least one such listed device marked with a 100 mA rating. There is another "UL White Book" category (FTTE) where listed devices are identified as "equipment ground-fault protective device" (or "EGFPD") and these are limited to the range above 6 mA to 50 mA. These devices more closely resemble devices described in the proposal.
GFPE is defined in Art 100. Using the undefined "equipment ground fault protection" in lieu of GFPE could itself introduce confusion. In addition, it could preclude use of the other acceptable protection and impose a trip threshold limit (50 mA) not currently in Article 426. With respect to the threshold limit, note that the IEEE standard (IEEE 515) for industrial heat tracing and the IEEE recommended practice (IEEE 515.1) for commercial heat tracing each indicate that ground fault protection of equipment be provided at a nominal 30 mA but allows higher values ("typically set 30 mA above any inherent capacitive leakage"). Listed FTTE, KDAX and DIYA protection could all meet these criteria depending upon the specific application and the marked threshold value. Changing GFPE to equipment ground-fault protection does not eliminate confusion and introduces technical changes unsupported by the substantiation.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Sweigart, R.

17-21 Log #249 NEC-P17 **Final Action: Accept**
(426.50)

Submitter: Edward G. Kroth, Verona, WI
Comment on Proposal No: 17-69
Recommendation: Revise text to read as follows:
The disconnecting means shall be of the indicating type and be <u>capable of being locked</u> ~~provided with a positive lockout~~ in the open "~~off~~" <u>(off)</u> position.
The remainder of this section is to remain unchanged.
Substantiation: This needs to be reconsidered as a safety issue for the person working on the roof top, especially where a circuit breaker is the sole means of disconnect and is not within sight of the person working on the snow melting and/or deicing equipment. This goes to providing what 90.1 calls for in that it would help to protect person(s) from a potential electrical shock hazard. Mr. Cook is correct in that there are commercially available lockouts that meet the intent of the newly proposed 110.25 (see proposal 1-130) made by several manufacturers. If you choose to continue to reject this proposal you should at least consider an explanation of what the phrase "positive lockout" means.
I will paraphrase my words from the original proposal. This is an attempt to standardize the concept of a lockable disconnect for the safety of the person working on the apparatus. I believe Mr. Yasenchak has picked up on this concept.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Sweigart, R.

ARTICLE 427 — FIXED ELECTRIC HEATING EQUIPMENT

17-22 Log #1440 NEC-P17 **Final Action: Accept in Principle**
(427.14 (New))

Submitter: Brian Myers, IBEW Local Union 98
Comment on Proposal No: 17-75
Recommendation: Revise text to read as follows:
424. XX Working Space and Clearance.
(A) General. Working space about electrical enclosures for resistance heating element type duct heaters which are mounted on duct systems and contain equipment that requires examination, adjustment, servicing, or maintenance while energized shall comply 110.26.

(B) Limited Access. Where the enclosure is located in a space above a ceiling, all of the following shall apply:
(1) The enclosure shall be accessible through a lay in type ceiling or access panel (s).
(2) The width of the working space shall be the width of the enclosure or a minimum of 762 mm (30. in.), whichever is greater.
(3) All doors or hinged panels shall open to at least 90 degrees.
(4) The space in front of the enclosure shall not contain ceiling supports or other material that would block access to the enclosure through the doors or hinged
panels.
Substantiation: It's obvious from the submitter's proposal this was meant for 424. This proposal is a safety issue that should be addressed and will protect the electrical workers that are required to be put in harm's way to perform servicing of this equipment. Suggest relocating this to article 424.
Panel Meeting Action: Accept in Principle
See action on Comment 17-19.
Panel Statement: The action on Comment 17-19 addresses the submitter's concerns.
Number Eligible to Vote: 11

ARTICLE 430 — MOTORS, MOTOR CIRCUITS, AND CONTROLLERS

11-11 Log #742 NEC-P11 **Final Action: Accept**
(430, Parts I through X)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 11-20
Recommendation: Continue to Accept in Principle in Part.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.
The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.
The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. Section 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 and 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure

that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

Panel Meeting Action: Accept
Number Eligible to Vote: 14

Explanation of Negative:
COLE, T.: See comment on 11-6.

11-12 Log #1310 NEC-P11 **Final Action: Reject**
(430.2 (New))

Submitter: Mike Weitzel, Bechtel
Comment on Proposal No: 11-23
Recommendation: Add new text to read as follows:

<u>**430.2 Motor Circuit Protector.** An instantaneous trip type circuit breaker designed to be used as part of a listed motor controller assembly, containing electronic or magnetic-hydraulic instantaneous trip and overload functions, no thermal trip elements, and short circuit protection.</u>

Substantiation: Thank you CMP 11 for your comments. My comments are provided in response to the panel statement. I maintain that adding a definition for Motor Circuit Protector will help the average *Code* user.

I'm trying to clarify what a Motor Circuit Protector is and how it should be used. There is misunderstanding in the field as to how these breakers are used and applied. Proper understanding of their purpose and use is important to the user.

Motor Circuit Protectors are overcurrent devices manufactured and intended for specific purposes.

Motor Circuit Protectors are intended to provide only branch-circuit, short-circuit, and ground-fault protection for individual motor branch circuits.

They may not be used to provide main, motor feeder, motor overload, and general branch-circuit or group motor protection.

NEC 430.52 requires that they shall only be used as part of a listed combination motor controller.

Motor Circuit Protectors (MCP's) are short-circuit tested only in combination with a motor controller and overload device.

Because of this, they are not labeled with an interrupting rating by themselves.

Per NEC 430.109, they may be used as a motor branch-circuit and controller disconnect, or "at the motor" disconnect only when part of a listed combination motor controller.

Another option is to add an informational Note to Section 430.52(C)(3), in a similar manner as was added to Section 430.52(C)(7) in the 2011 *Code* cycle.

Panel Meeting Action: Reject
Panel Statement: A new definition is not necessary in 430.2 as CMP 11 met the submitter's intent with the action and statement on Comment 11-17.

Submitter: Mike Weitzel, Richland, WA
Comment on Proposal No: 11-23
Recommendation: Add new text to read as follows:
<u>**Informational Note:** A motor circuit protector, as used in this section, is an instantaneous trip type circuit breaker designed to be used as part of a listed motor controller assembly, containing electronic or magnetic-hydraulic instantaneous trip and overload functions, no thermal trip elements, and short circuit protection.</u>
Substantiation: Thank you CMP 11 for your comments. My comments are provided in response to the panel statement. I maintain that adding a definition for Motor Circuit Protector will help the average *Code* user.

Please consider the option of adding an Informational Note to Section 430.52(C)(3), in a similar manner as an Informational Note was added to Section 430.52(C)(7) in the 2011 *Code* cycle.

I'm trying to clarify what a Motor Circuit Protector is and how it should be used. There is misunderstanding in the field as to how these breakers are used and applied. Proper understanding of their purpose and use is important to the user.

Motor Circuit Protectors are overcurrent devices manufactured and intended for specific purposes.

Motor Circuit Protectors are intended to provide only branch-circuit, short-circuit, and ground-fault protection for individual motor branch circuits.

They may not be used to provide main, motor feeder, motor overload, and general branch-circuit or group motor protection...

NEC 430.52 requires that they shall only be used as part of a listed combination motor controller.

Motor Circuit Protectors (MCP's) are short-circuit tested only in combination with a motor controller and overload device.

Because of this, they are not labeled with an interrupting rating by themselves.

Per NEC 430.109, they may be used as a motor branch-circuit and controller disconnect, or "at the motor" disconnect only when part of a listed combination motor controller.

Panel Meeting Action: Accept in Principle

Add a new informational note and renumber the existing informational note:

Informational Note No. 1: Instantaneous trip circuit breakers are also known as motor circuit protectors (MCPs).

Informational Note No. 2: For the purpose of this article, instantaneous trip circuit breakers may include a damping means to accommodate a transient motor inrush current without nuisance tripping of the circuit breaker.

Panel Statement: The panel understands that the ROP reference on this comment is incorrect; it should be 11-34, not 11-23. The intent of the submitter has been met by adding a new Informational Note No. 1 and renumber the existing informational note as Informational Note No. 2.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

11-18 Log #1315 NEC-P11 **Final Action: Reject**

(430.62(A)(1))

Submitter: Mike Weitzel, Richland, WA

Comment on Proposal No: 11-37

Recommendation: Section 430.62 Rating or Setting - Motor Load. … no change...

Add the acronym "MCP" after Instantaneous Trip Circuit Breaker where found in Section 430.62 Exception No. 1.

Exception No. 1: Where one or more instantaneous trip circuit breakers ***(MCP's)*** *or motor short-circuit protectors are used for motor branch-circuit short-circuit and ground-fault protection as permitted in 430.52(C), the procedure provided above for determining the maximum rating of the feeder protective device shall apply with the following provision: For the purpose of the calculation, each instantaneous trip circuit breaker* ***(MCP's)*** *or motor short-circuit protector shall be assumed to have a rating not exceeding the maximum percentage of motor full-load current permitted by Table430.52 for the type of feeder protective device employed.*

Substantiation: Please see my comments on Sections 430.2 and 430.52.

Panel Meeting Action: Reject

Panel Statement: The panel rejects the addition of "(MCP's)" as it is not necessary.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

11-19 Log #1270 NEC-P11 **Final Action: Reject**

(Table 430.97)

Submitter: Stanley J. Folz, Morse Electric, Inc.

Comment on Proposal No: 11-43

Recommendation: Reject the Panel action to accept Proposal 11-43.

Substantiation: The Chair of Code Making Panel 11 appointed a task group comprised of myself, Robert Fahey, James Fahey, Jeffery DesJarlais, Luis Bas and Vince Saporita to verify or amend the action taken on Proposal 11-43 where the panel amended Table 430.97 to change 600 volts nominal to 1000 volts nominal. As our research continued we asked Mark Ode to join our discussion. Table 430.97 first appeared in the 1993 NEC. That 1993 Panel rewrote Proposal 11-64 and although it was not stated it appears that the Panel used Table 384-26 (now 408.56) as a basis for Table 430.97.

Mr. Ode tracked 384-26 back to the 1959 NEC. It did not appear in either the 1956 or 1959 preprints. At this point the task group cannot determine what criteria were used to create this Table. This task group recommends that Proposal 11-43 be rejected and testing be done to verify that the current 600 volt spacing is sufficient if increased to 1000 volts. If not, then test to determine what spacing is sufficient for 1000 volts.

Panel Meeting Action: Reject

Panel Statement: The submitter's recommendation to reject Proposal 11-43 was already accomplished in the proposal stage.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

THOMPSON, J.: Products and applications demand guidance for applications above 600 volts, but believe that these are best provided in the end-product standards. If electrical spacing tables are to remain in the Code, then the proper spacings for field installed bus bars etc must be defined. The NFPA Research Foundation, in concert with third party safety certifiers should establish a research project to determine the appropriate spacing distances (through air and over surface) for 1000V applications. It should be noted that existing UL standards contain electrical spacing requirements for products used in applications in excess of 600V.

11-20 Log #601 NEC-P11 **Final Action: Hold**

(430.111(B)(3))

Submitter: James F. Williams, Fairmont, WV

Comment on Proposal No: 11-20

Recommendation: Revise text to read as follows:

430.111 Switch or Circuit Breaker as Both Controller and Disconnecting Means

(B) Type.

(3) Oil Switch. An oil switch used on a circuit whose rating does not exceed 1000 volts or 100 amperes, or by special permission on a circuit exceeding this capacity where under ~~expert~~ engineering supervision. The oil switch shall be permitted to be both power and manually operable.

-or-

430.111 Switch or Circuit Breaker as Both Controller and Disconnecting Means

(B) Type.

(3) Oil Switch. An oil switch used on a circuit whose rating does not exceed 1000 volts or 100 amperes, or by special permission on a circuit exceeding this capacity ~~where under expert supervision~~. in industrial installations where conditions of maintenance and supervision ensure that only qualified persons service the equipment. The oil switch shall be permitted to be both power and manually operable.

Substantiation: This is the only instance in the *NEC* that the term *expert* is used.

Panel Meeting Action: Hold

Panel Statement: The comment and proposed change is not related to the original proposal. It is new material.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

11-21 Log #164 NEC-P11 **Final Action: Accept**

(430.130 and 430.131)

TCC Action: The Correlating Committee directs that the last sentence of 430.131 read as follows: For the purposes of 430.53 and 430.131, power conversion equipment shall be considered a motor controller.

Submitter: Technical Correlating Committee on National Electrical Code®

Comment on Proposal No: 11-60a

Recommendation: The Correlating Committee directs that the panel correct the use of the term "may" in the Informational Note in 430.130, as it makes the Informational Note permissive.

The Correlating Committee directs that the action on this proposal be rewritten to either remove the requirement in the Informational Note for 430.131 or incorporate the text into the section.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Revise to read as follows:

430.130 Branch Circuit Short-Circuit and Ground-Fault Protection for single motor circuits containing power conversion equipment.

(A) Circuits containing power conversion equipment shall be protected by a branch circuit short-circuit and ground-fault protective device in accordance with the following:

(1) The rating and type of protection shall be determined by 430.52 (C) (1), (3), (5) or (6) using the full load current rating of the motor load as determined by 430.6.

(2) Where maximum branch-circuit short-circuit and ground-fault protective ratings are stipulated for specific device types in the manufacturers instructions with the power conversion equipment or are otherwise marked on the equipment, they shall not be exceeded even if higher values are permitted in 430.130 (A) (1).

(3) A self-protected combination controller shall only be permitted where specifically identified in the manufacturer's instructions with the power conversion equipment or otherwise marked on the equipment.

Informational note: The type of protective device, its rating and setting ~~may be~~ is often **marked on or provided with the power conversion equipment.**

(B) **Bypass Circuit/Device.** Branch circuit short-circuit and ground-fault protection shall also be provided for bypass circuit/device(s). Where a single branch-circuit short-circuit and ground-fault protective device is provided for circuits containing both power conversion equipment and a bypass circuit, the branch circuit protective device type and its rating or setting shall be in accordance with that determined for the power conversion equipment and for the bypass circuit/device(s) equipment.

430.131 Several motors or loads on one Branch Circuit including Power Conversion Equipment

For installations meeting all the requirements of 430.53 that include one or more power converters, the branch circuit short-circuit and ground-fault protective fuses or inverse time circuit breakers shall be of a type and rating or setting permitted for use with the power conversion equipment using the full load current rating of the connected motor load in accordance with 430.53. For the purposes of 430.53 and 430.131, power conversion equipment is considered a motor controller.

Panel Statement: CMP 11 accepts the direction of the Correlating Committee and modified the informational note to 430.130 and incorporated the informational note 430.131 into the text of 430.131.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

11-22 Log #1583 NEC-P11 **Final Action: Reject**
(430.130(B))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 11-60a
Recommendation: Revise text to read as follows:
430.130 Branch Circuit Short-Circuit and Ground-Fault Protection for Single Motor Circuits Containing Power Conversion Equipment.
(B) Bypass Circuit/Device. Branch circuit short-circuit and ground-fault protection shall also be provided for bypass circuit/device(s). Where a single branch-circuit short-circuit and ground-fault protective device is provided for circuits containing both power conversion equipment and a bypass circuit, the branch circuit protective device type and its rating or setting shall be in accordance with that <u>maximum</u> determined for the power conversion equipment and for the bypass circuit/device(s) equipment. **[ROP 11–60a]**
Substantiation: Can a single setting and amperage rating serve for both the power conversion equipment and the bypass? If not what settings are to be used?
Panel Meeting Action: Reject
Panel Statement: "In accordance with that determined for the power conversion equipment and for the bypass circuit/device(s) equipment" clearly states that the sizes or settings must meet the most restrictive requirement and must provide protection for both pieces of equipment. If one device cannot protect both pieces of equipment then separate protective devices must be used. The word "maximum" is not necessary.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

11-23 Log #743 NEC-P11 **Final Action: Accept**
(430, Part XI)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 11-61
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.
The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.
The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. Section 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 and 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.
Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.
Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.
If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
COLE, T.: See comment on 11-6.

11-24 Log #1256 NEC-P11 **Final Action: Reject**
(430, Part XI)

Submitter: John Masarick, Independent Electrical Contractors, Inc.
Comment on Proposal No: 11-61
Recommendation: I ask the panel to reject this proposal. The proposal would change 600 volts to 1000 volts.
Substantiation: Replacing 600 volts with 1000 volts will have a major impact on installers, component manufacturers, and industry standards. Increased spacing must be considered when going from 600 volts to 1000 volts. Personal safety must also be considered.
Because the proposer has not provided enough information to the public to justify and understand all the ramifications of the proposal, the committee should reject the submitters proposal.
Panel Meeting Action: Reject
Panel Statement: The change for Part XI of 430 does not create a major impact on the Industry, the change only allows higher voltages to be utilized if available and/or chosen to be used by the installer, there is no requirement higher voltages must be utilized.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
COLE, T.: Action should have been to accept. See comment on 11-6.

11-25 Log #1421 NEC-P11 **Final Action: Reject**
(430.233)

Submitter: Keith Fager, Bayer CropScience
Comment on Proposal No: 11-68
Recommendation: Panel action should have been Reject.
Substantiation: Paragraph 430.233 is used in conjunction with paragraph 430.232, which requires exposed live parts of motors and controllers operating at 50 volts or more to be guarded by enclosure or location. Paragraph 430.233 requires further protection if the parts are operating at 150 volts or more and the guarding required by 430.232 is by location.
Panel Meeting Action: Reject
Panel Statement: The panel agrees that voltages over 50 V are hazardous and that the requirements of 430.233 should apply. Two separate situations are addressed. Section 430.232 addresses accidental contact. Section 430.233 addresses worker's safety while adjusting energized equipment.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

11-26 Log #602 NEC-P11 **Final Action: Reject**
(Table 430.250)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 11-20
Recommendation: Revise text to read as follows:
Table 430.250 Full-Load Current, Three-Phase Alternating-Current Motors
The following values of full-load currents are typical for motors running at speeds usual for belted motors and motors with normal torque characteristics. The voltages listed are rated motor voltages. The currents listed shall be permitted for system voltage ranges of 110 to 120, 220 to 240, 440 to 480, ~~and~~ 550 to ~~1000~~ <u>600, and 690</u> volts.
Substantiation: Restore the previous value of 600 volts. The same current for motors that differ in voltage by about a factor of two is unlikely.
Adding a column may be appropriate for higher voltage motors (e.g.: 690).
It appears to be a case of search and replace run amuck.
Panel Meeting Action: Reject
Panel Statement: Proposal 11-20 covered Parts I through X. Proposal 11-61 covered Part XI. There were no proposals changing 600 volts to 1000 volts in Part XIV which includes Table 430.250. The voltages in the heading of Table 430.250 did not change. The draft was changed in error and will be corrected. It is anticipated that errata will be issued.
Number Eligible to Vote: 14

ARTICLE 440 — AIR CONDITIONING AND REFRIGERATING EQUIPMENT

11-27 Log #479 NEC-P11 **Final Action: Reject**
(440.2.Branch-Circuit Selection Current and 440.4 (New))

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 11-76
Recommendation: Revise text to read as follows:
Branch-Circuit Selection Current. The value in amperes to be used instead of the rated-load current in determining the ratings of motor branch-circuit conductors, disconnecting means, controllers, and branch-circuit short-circuit and ground-fault protective devices wherever the running overload protective device permits a sustained current greater than the specified percentage of the rated-load current. ~~The value of branch-circuit selection current will always be equal to or greater than the marked rated-load current.~~
440.4 Branch-circuit selection and rated load currents. The value of the branch-circuit selection current shall be equal to or greater than the marked rated-load current.
Renumber sections as needed from 440.4 through 440.9.
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains the defined term in the last sentence and also contains requirements and the NEC manual of style does not permit the definition to contain the defined term. Definitions are not requirements. The proposed changes eliminate the defined term and the requirements, by placing them in an alternate location in Article 440.
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Alternate approach, could be as follows (by eliminating the last sentence):
Informational Note: The value of branch-circuit selection current will always be equal to or greater than the marked rated-load current.
Panel Meeting Action: Reject
Panel Statement: The existing definition does not violate the intent of the NEC Style Manual. The proposed text does not add clarity nor improve readability.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

11-28 Log #557 NEC-P11 **Final Action: Reject**
(440.9 (New))

Submitter: Richard E. Loyd, Sun Lakes, AZ
Comment on Proposal No: 11-83
Recommendation: Reject Proposal 11-83 which will delete new Section 440.9 in its entirety.
Substantiation: I recognize that a seven member task group developed this proposal based on one of the task member's proposal and comment to the 2011 NEC. The proponent sighted concerns related to an electrocution incident which occurred August 2, 2007. However, their action to proceed with a new proposal leads me to believe they did not carefully study the supporting documentation provided.
I looked at this information and conveyed this in my negative comment to ROP 8-90 as follows;
1. The case cited occurred **August 2, 2007**, and although it lists a fatality related to an air conditioner in a residence and a metal fence, it does not state the details of why the shock occurred, however, the homeowner stated the air conditioner seemed to be working properly. A forensic investigation report has not been supplied. It does not identify or implicate any specific wiring method nor that it was defective or damaged and caused the accident.
2. The two pictures that were included were dated **October 31, 2008** almost 15 months after the accident occurred. These two pictures show that both the supply and load are installed in a flexible type raceway, however, it does not identify the type of flexible raceway or if the raceway was implicated. It does however prove that EMT was not used as the wiring method to supply the disconnection switch or the air-conditioner. EMT was not even involved.
3. Nothing in the records or the substantiation provided indicate that there was no ground fault path between the Air conditioner the overcurrent t protective device. Nothing in the report indicates this was a contributing factor to the accident.
4. The CPSC report provided is for electrocutions from 1992 through 2002 associated with consumer products more than 5 years before the accident occurred. Nothing in this report indicated EMT was not a reliable equipment grounding path per 250-118
5. Since the evidence presented was taken on three different dates, there is no indication that any corrective action was taken or necessary following the accident.

I believe in absence of a forensic report and investigation we must assume the installation and the materials used to connect the air-conditioner was not the cause of the accident.
In addition to this, the negative voting and comments by committee members from various segments of the industry indicate this is not a good addition to the 2014 Edition of the NEC. It is not based on sound substantiation. Testing laboratories have retested fittings and the manufactures have improved them in recent years. Nothing has been submitted for public review that supports this proposed change.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 11-31.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 10 Negative: 4
Explanation of Negative:
MISSILDINE, JR., J.: See negative ballot statement for Comment 11-31.
POWELL, C.: The submitter adequately explained that insufficient evidence was presented by proposal 11-83 to justify the addition of the new requirements of 440.9 created by the proposal.
THOMPSON, J.: I support the position provided by the submitter.
WRIGHT, J.: It is not reasonable to simply require a grounding conductor on a product that has an excellent record of performance. Manufacturers of this product have not had issues or complaints about problems with either the armor opening or with grounding. The Code already addresses applications where the EMT or liquidtight may be subject to damage, in Sections 358.12 and 350.12. EMT is not permitted where subject to severe physical damage, and liquidtight is not permitted where subject to physical damage.

11-29 Log #1257 NEC-P11 **Final Action: Accept in Principle in Part**
(440.9)

Submitter: John Masarick, Independent Electrical Contractors, Inc.
Comment on Proposal No: 11-83
Recommendation: I ask the panel to continue to Accept in Principal this proposal. Article 440.9 including panel statements change is shown below.
440.9 Grounding and Bonding. Where equipment is installed outdoors with either Liquidtight Flexible Metal Conduit or Electrical Metallic Tubing, an equipment grounding conductor shall be provided as required per 350.60(B) and 358.60(B).
Substantiation: In a recent survey conducted by IEC over 50% of the respondents said they had observed or heard of non- threaded conduit, to HVAC and refrigerator equipment, that came apart after being installed on rooftops. Also, over 7% indicated they knew of or received a serious electrical shock as a result of the separation of the conduit.
Panel Meeting Action: Accept in Principle in Part
Panel Statement: See the action and statement on Comment 11-32. The references to 350.62(B) and 350.68(B) are not required.

Ballot Results: Affirmative: 10 Negative: 4
Explanation of Negative:
MISSILDINE, JR., J.: See negative ballot statement for Comment 11-32.
POWELL, C.: Without additional details regarding the survey used in the substantiation, it cannot be know whether the respondents were a representative sample.
THOMPSON, J.: See comment in 11-30.
WRIGHT, J.: See my negative comment on Comment 11-28.

11-30 Log #1313 NEC-P11 **Final Action: Accept in Principle in Part**
(440.9)

Submitter: Mike Weitzel, Richland, WA
Comment on Proposal No: 11-83
Recommendation: Add new text to read as follows:
440.9 Grounding and Bonding. Where equipment is installed outdoors with either Liquidtight Flexible Metal Conduit of Electrical Metallic Tubing, an equipment grounding conductor shall be provided as required per 350.60(B) and 358.60(B).
Substantiation: First of all, steel conduit and tubing raceways such as EMT are excellent wiring methods. No one disputes that fact.
With that being understood, and despite what our friends representing the steel conduit industry may say, there is still a problem with loose or damaged conduit connections on some installations in the field. Outdoor installations of these types of wiring methods are commonly used to supply electrically-powered air-conditioning equipment. Though not exclusively, AC units are most often installed at grade level, or on rooftops of buildings.
When installed in these locations outdoors, there can be a problem with physical damage. This is not a reflection on the steel conduit. The steel conduit itself is not the problem. And Liguidtight Flexible Metal Conduit is an excellent wiring method in its own right. However, there are issues in the field.
Sometimes, the problem is with the installation. AHJ's or their field inspector will typically provide a 'visual inspection' of the installation, and will not attempt to check the tightness of the fitting(s). (After all, this is the installer's or contractor's responsibility). The installer is responsible to perform the installation in a workmanlike manner, and in accordance with the manufacturer's instructions. [NEC 110.12, and 110.3(B)]. Obvious loose connections should be discovered at the time of installation or installation, if checked both visually, and in the manner described.
Other problems with the conduit installation may occur after installation. Because physical damage can occur, such as when a building rooftop is re-roofed, or when snow is removed, conduit or tubing buried under snow may be struck with a snow blower, and fittings may loosen and separate. when this

occurs, the equipment grounding capability of the conduit or tubing wiring method is lost. Roofing contractors hire laborers who don't show proper care for the installed electrical tubing on the roof, and merely 'pull things out of the way'. In order to remove the old roof and install the new one.

The NEC addresses physical damage in many sections. Consider why Schedule 80 PVC conduit is required in locations subject to physical damage. Is the conduit defective? No, of course not. However, the heavier, tougher grade of conduit is required where installed in a traffic area such as a driveway located on the side of a building, because we know that there is a possibility that physical damage may occur if people in vehicles aren't careful.

Also, in the case of Type NM Cable, nail plates are required where the NM Cable could possibly be damaged after wall covering is installed. Is this a problem with the NM Cable being defective? No, of course not. And, the cable industry does not take that the Code Panel is concerned about the quality of their product. Not at all. The concern is to protect good and properly installed cable from penetration from a screw or nail, after the cable is installed. We could go on to discuss buried conduits and cable requiring physical protection, but you get the point.

In the case of Health Care Facility Patient Care Areas, per Section 517.13(B), an insulated wire type equipment grounding conductor is required to be installed in the wiring method along with the branch-circuit conductors. Does this mean that the EMT tubing or the MC cable wiring method is not suitable for supplying power to electrical loads where a person is laying in a hospital bed? No, of course not. However, the issue is safety, and this rule that requires the additional or 'redundant' equipment grounding conductor has been in the *Code* for a long time.

Therefore, again, the steel conduit as a product is not being criticized. Nor is the PVC conduit, the NM Cable, nor the MC cable either.

What it does come down to is a matter of safety for personnel and property, which is the stated purpose of the *Code*. What has been proposed here is to simply assure that a wire type equipment grounding conductor be installed in the tubing or flex conduit to an air-conditioning unit installed outdoors, sized in accordance with Section 250.122, to provide a back-up plan, in the event that the equipment-grounding capability of the primary wiring method is not able to function as designed. That's all.

This wire type EGC is relatively inexpensive, and will greatly increase safety in installations, which is what the NEC is all about. I know that there are those who may offer opposing views, but I urge you to continue to accept and support this proposal.

Panel Meeting Action: Accept in Principle in Part

Panel Statement: See the action and statement on Comment 11-29.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 10 Negative: 4

Explanation of Negative:

MISSILDINE, JR., J.: See negative ballot statement for Comment 11-32.

POWELL, C.: See reason on 11-28.

THOMPSON, J.: I fully support the safe installation and maintenance of all connected equipment. The conduit currently allowed by the Code is evaluated for its ability to serve as the equipment grounding conductor in addition to the requirements for mechanical strength. Conduit has a long and firmly established safety record. Based on the comments of this submitter, the suitability of EMT and other conduit methods to act as a suitable ground path is not in dispute. Rather, the proposal is attempting to address installation and maintenance concerns. As a result, the proposal does not address what the submitter considers to be the root cause of the concern (e.g., maintenance or installation). The NFPA Research Foundation should consider a research project to determine if maintenance and installation practices need to be addressed.

WRIGHT, J.: See my negative comment on Comment 11-28.

11-31 Log #1374 NEC-P11 **Final Action: Reject**
(440.9)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Comment on Proposal No: 11-83

Recommendation: Reject proposal 11-83 and delete the text of the entire proposed new section 440.9.

~~440.9 Grounding and Bonding. Where equipment is installed outdoors with either Liquidtight Flexible Metal Conduit or Electrical Metallic Tubing, an equipment grounding conductor shall be provided as required per 350.60(B) and 358.60(B).~~

Substantiation: This proposal should be rejected. Nothing in the substantiation, in the CPSC report or in the report of the Chicago incident indicates the wiring method was the cause of the electrocution. The CPSC report is dated 2002 and only shows the number of consumer product-related electrocutions by specific products involved, not the specific cause. The report shows a greater number of electrocutions were related to other components of the installed household wiring than to the wiring method. In the case of damaged or exposed wiring, the "exact nature of the wiring was unspecified".

The substantiation submitted with the proposal provides a single incident and does not provide any information on the construction of the raceway, whether or not it was listed, or if listed fittings were used or properly installed.

The use of a supplemental equipment grounding conductor should be a design decision based on the wiring method to be used and the unique installation environment in which the equipment is being installed. Both EMT and FMC have excellent performance records. Manufacturers have not had issues or complaints about problems with either the armor opening (FMC) or with grounding for either product.

A Georgia Tech research study on grounding which is referenced in the Soares Book on Grounding validates that EMT is a proven equipment grounding conductor when installed in accordance with the NEC and with either set-screw or compression type fittings. The Georgia Tech report states that steel EMT, IMC and RIGID conduit, not exceeding the maximum allowable length, meets the requirements of Article 250 of the NEC. In fact, the performance of steel conduit sized in accordance with Chapter 9, Table 1 of the NEC, compared to the minimum size equipment grounding conductors in Article 250 allows the flow of higher fault current. This is due to the lower impedance of the steel conduit.

The construction of LFMC requires that it be provided with a bonding strip wound into the conduit convolutions throughout its entire length. It is required to withstand a 300 pound tension, and up to a 750 Amp fault current. The raceway is required to be terminated in listed fittings and required to be protected by overcurrent devices rated a maximum 20 or 60 amps, depending on the size of the raceway. In addition the use of the raceway as a ground fault path is limited to six feet.

The Panel 11 Technical Committee should require more substantive substantiation. There are many non-listed, off-shore sourced Liquid tight products in the marketplace. Was the product in this incident listed? Were the fittings used also listed for the application? Were all of the metal components properly bonded? Was the installation compliant with the NEC®?

In light of the construction, listing, and installation requirements in place for these wiring methods and the excellent record of performance when installed in accordance with the requirements of the NEC®, the requirement for an equipment grounding conductor in this application should not be required.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Comment 11-33. Previously submitted evidence, along with the substantiation provided in Comments 11-3 and 11-29, is sufficient to require the extra degree of safety that is intended by Proposal 11-83.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 10 Negative: 4

Explanation of Negative:

MISSILDINE, JR., J.: The panel's action should have been to accept this comment. I agree with the substantiation given in this comment and the substantiation given for comment 11-28 as reason for rejecting the requirement for a wire type ground conductor.

Requiring a wire type conductor for equipment ground rather than use of conduit or other means as described in 250.118 is not a substitute for proper conduit application, installation or maintenance.

This change would only correct the stated problem for air conditioning and refrigeration equipment. If this change is necessary, Article 440 is not the appropriate place since it should be for all outdoor equipment fed from EMT and/or LFMC. Even other HVAC equipment, such as air handling equipment is not covered by this change.

The justification for this change is the regular occurrence of damaged EMT and LFMC conduit on rooftops, possibly from snow removal or outdoor adjacent to buildings. Section 358.12(1), states that the use of EMT is not permitted where subject to "severe physical damage". The stated regular occurrence of damaged EMT should qualify as "severe physical damage".

Installation of a wire type equipment ground conductor in the outdoor portion of the EMT run would ground the load and provide a fault return path, but does not ground an intermediate section of EMT if two breaks are present in the run. The IEC survey in the Substantiation of Comment 11-29 states that over 50% of IEC respondents had seen separated EMT connections on rooftops and over 7% had received a serious shock by the conduit. This problem will not be corrected by the addition of a wire type equipment grounding conductor to bypass the outdoor conduit run if the short occurs in an isolated section of conduit.

Correcting a problem with the ground path does not correct the mis-application of material as specified in the Code. Whether or not a wire type equipment ground conductor is installed, the complete solution to the problem must include proper selection of raceways and maintenance.

POWELL, C.: See reason on 11-28.

THOMPSON, J.: I support the position provided by the submitter.

WRIGHT, J.: See my negative comment on Comment 11-28.

11-32 Log #1530 NEC-P11 **Final Action: Accept in Principle**
(440.9)

Submitter: Michael J. Johnston, National Electrical Contractors Association

Comment on Proposal No: 11-83

Recommendation: Revise proposed text as follows:

440.9 Grounding and Bonding. Where equipment is installed outdoors with either Liquidtight Flexible Metal Conduit or Electrical Metallic Tubing, ~~an~~ <u>wire-type</u> equipment grounding conductor shall be provided <u>in the outdoor portion of the raceway</u> as required per 350.60(B) and 358.60(B).

Substantiation: The proposed requirement is unclear as to where a required wire-tye equipment grounding conductor starts and stops. By inserting the words "wire-type" it is clear that only the type specified in 250.118(1) is what is required. As currently worded, the proposed text will be problematic not only for contractors but for inspectors. By adding the words "in the outdoor portion of the raceway" clearly establishes where the requirement applies and does not apply. Without the additional wording, the requirement applies to all portions of the raceway system, whether inside or outside. The proposed text only addresses outdoor installed equipment, and is not specific about the outdoor portion of the raceway upon which the substantiation appears to have been based.

Panel Meeting Action: Accept in Principle

Revise the proposed text to read as follows:

440.9 Grounding and Bonding. Where air-conditioning and refrigeration equipment is installed outdoors with wiring methods consisting of Liquidtight Flexible Metal Conduit or Electrical Metallic Tubing, a wire type equipment grounding conductor as specified in 250.118 (1) shall be provided in the outdoor portion of the raceway.

Panel Statement: The panel inserted text which adds clarity to the requirement and meets the submitter's intent. The Committee also inserted text to clarify the use of a wire type equipment grounding conductor. See the substantiation on Comment 11-29 for this revision.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 10 Negative: 4

Explanation of Negative:

MISSILDINE, JR., J.: This comment should have been rejected.
Requiring a wire type conductor for equipment ground rather than use of conduit or other means as described in 250.118 is not a substitute for proper conduit application, installation or maintenance.

This change would only correct the stated problem for air conditioning and refrigeration equipment. If this change is necessary, Article 440 is not the appropriate place since it should be for all outdoor equipment fed from EMT and/or LFMC. Even other HVAC equipment, such as air handling equipment is not covered by this change.

The justification for this change is the regular occurrence of damaged EMT and LFMC conduit on rooftops, possibly from snow removal or outdoor adjacent to buildings. Section 358.12(1), states that the use of EMT is not permitted where subject to "severe physical damage". The stated regular occurrence of damaged EMT should qualify as "severe physical damage".

Installation of a wire type equipment ground conductor in the outdoor portion of the EMT run would ground the load and provide a fault return path, but does not ground an intermediate section of EMT if two breaks are present in the run. The IEC survey in the Substantiation of Comment 11-29 states that over 50% of IEC respondents had seen separated EMT connections on rooftops and over 7% had received a serious shock by the conduit. This problem will not be corrected by the addition of a wire type equipment grounding conductor to bypass the outdoor conduit run if the short occurs in an isolated section of conduit.

Correcting a problem with the ground path does not correct the mis-application of material as specified in the Code. Whether or not a wire type equipment ground conductor is installed, the complete solution to the problem must include proper selection of raceways and maintenance.

POWELL, C.: See reason on 11-28.

THOMPSON, J.: See comment in 11-30.

WRIGHT, J.: See my negative comment on Comment 11-28.

11-33 Log #585 NEC-P11 **Final Action: Reject**
(440.9 Exception (New))

Submitter: Charles L. Powell, American Chemistry Council

Comment on Proposal No: 11-83

Recommendation: Add the following new text:

<u>Exception: Where Air Conditioning or Refrigerating Equipment is part of an industrial, commercial, or institutional installation operating under conditions of maintenance and supervision that ensure that only qualified persons monitor and supervise the system, LFMC or EMT shall be permitted to be used as an equipment grounding conductor when installed in accordance with 250.118(6).</u>

Substantiation: The supporting documentation of the original proposal identified that a problem exists with these residential and commercial installations but there was no evidence presented that the existing practices in industrial installations should be modified by this new code section. Typical industrial refrigeration units involve large motors whose installation does not require a local disconnect switch, (440.14 Exception No. 1), and therefore the substantiation in the original proposal does not apply.

Panel Meeting Action: Reject

Panel Statement: The panel recognizes the shock potential due to loss of ground continuity regardless of occupancy type. Requiring the equipment grounding conductor within conduits at all occupancies provides an additional level of safety.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 11 Negative: 3

Explanation of Negative:

MISSILDINE, JR., J.: The panel's action to should have been to accept this comment based on the panel's action on Comment 11-32. The conditions specified in the justification for a wire type ground conductor in outdoor EMT and LFMC does not apply to areas as stated in the exception proposed in this comment.

POWELL, C.: The original substantiation does not reference any problems in industrial locations. The panel statement does not say otherwise, it simply states "if" ground continuity is lost it is a hazard regardless of occupancy. Also, see reason on 11-28.

THOMPSON, J.: See comment in 11-30. If ROP 11-83 is to be accepted, the panel should accept the position of the submitter of ROC 11-33 to exempt Industrial, commercial or institutional installations that operate under maintenance and supervision.

Comment on Affirmative:

WRIGHT, J.: While NEMA votes affirmative on this Panel Action, NEMA does not agree that the requirement belongs in Article 440. The requirement should not be contained in either Section 358.60 or Article 440. It is not reasonable to simply require a grounding conductor on a product that has an excellent record of performance. Manufacturers of this product have not had issues or complaints about problems with either the armor opening or with grounding. The Code already addresses applications where the EMT or liquidtight may be subject to damage, in Sections 358.12 and 350.12. EMT is not permitted where subject to severe physical damage, and liquidtight is not permitted where subject to physical damage.

11-34 Log #621 NEC-P11 **Final Action: Reject**
(440.9 Exception (New))

Submitter: Travis K. Foster, American Chemistry Council

Comment on Proposal No: 11-83

Recommendation: Add the following:

Exception: Where Air Conditioning or Refrigerating Equipment is part of an industrial, commercial, or institutional installation operating under conditions of mantenance and supervision that ensure that only qualified persons monitor and supervise the system, LFMC or EMT shall be permitted to be used as an equipment grounding conductor when installed in accordance with 250.118(6).

Substantiation: The supporting documentation of the original proposal identified that a problem exists with these residential and commercial installations but there was no evidence presented that the existing practices in industrial installations should be modified by this new code section. Typical industrial refrigeration units involve large motors whose installation does not require a local disconnect switch, (440.14 Exception No. 1), and therefore the substantiation in the original proposal does not apply.

Panel Meeting Action: Reject

Panel Statement: See the panel action and statement on Comment 11-33.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 11 Negative: 3

Explanation of Negative:

MISSILDINE, JR., J.: See negative ballot statement for Comment 11-33.

POWELL, C.: The original substantiation does not reference any problems in industrial locations. The panel statement does not say otherwise, it simply states "if" ground continuity is lost it is a hazard regardless of occupancy. Also, see reason on 11-28.

THOMPSON, J.: See comment in 11-33.

Comment on Affirmative:

WRIGHT, J.: See my Affirmative comment on Comment 11-33.

ARTICLE 445 — GENERATORS

13-2 Log #177 NEC-P13 **Final Action: Accept**
(445.11)

Submitter: Technical Correlating Committee on National Electrical Code®

Comment on Proposal No: 13-11

Recommendation: It was the action of the Correlating Committee that the panel clarify the panel action on this proposal with respect to the redundant appearance of the phrase "time rating" in the accepted text.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Revise the panel action as follows:

445.11 Marking. Each generator shall be provided with a nameplate giving the manufacturer's name, the rated frequency, ~~power factor,~~ number of phases if of alternating current~~, the subtransient and transient impedances,~~ the rating in kilowatts or kilovolt amperes, the normal volts and amperes corresponding to the rating, rated revolutions per minute, ~~insulation system class~~ and rated ambient temperature or rated temperature rise~~, and time rating~~.
<u>Nameplates for all stationary generators and portable generators rated more than 15 kW, shall also give the power factor, the subtransient and transient impedances, insulation system class, and time rating.</u>

Panel Statement: CMP-13 accepts the direction of the Correlating Committee to clarify the panel action on proposal 13-11 with respect to the redundant appearance of the term "time rating." CMP-13 has revised the panel action.

Number Eligible to Vote: 21

Ballot Results: Affirmative: 21

13-3 Log #1512 NEC-P13 **Final Action: Reject**
(445.11)

Submitter: Donald R. Cook, Shelby County Department of Development Services
Comment on Proposal No: 13-10
Recommendation: Reconsider and accept proposed text for marking that indicates the location of system bonding location.
Substantiation: Since the NEC permits and includes provisions to modify the system bonding arrangement of a generator. based all selection of a transfer switch, it is critical that installers and AHJ's be able 10 find the system bonding location. That local ion is not universal from one generator manufacture!' or even consistent on variousgenerators from the same manufacturer. To properly make or break that bonding connection, persons working in the field must know where the connection is located.
Panel Meeting Action: Reject
Panel Statement: The text of the paragraph immediately preceding the additional sentences added by Proposal 13-10 indicates a generator nameplate is required where the marking will be provided. Some generators may not be designed so the system bonding jumper is accessible and, other generators may not have enough area on a nameplate to indicate the exact location within the generator of the system bonding jumper. The exact marking on the generator should remain a manufacturer's responsibility.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 21

13-4 Log #1272 NEC-P13 **Final Action: Accept**
(445.12)

Submitter: James L. Brown, Detroit Edison, DTE Energy
Comment on Proposal No: 13-12
Recommendation: Delete text to read as follows:
445.12 Overcurrent ~~and Overload~~ Protection. (A) Constant-Voltage Generators. Constant-voltage generators, except ac generator exciters, shall be protected from overload by inherent design, circuit breakers, fuses, protective relays, or other identified overcurrent protective means suitable for the conditions of use.
Substantiation: The panel's action does not meet the Proposal-submitter's intent and this proposal should have been rejected at the Proposal stage. The inclusion of "overload" in the section title does not address his concerns for short-circuit protection. The term "Overload" does not need to be included in the title since the present title "Overcurrent Protection" already encompasses overload protection. The body of the text 445.12(A) does specifically state that the protection by inherent design is for overload only. The intent of this comment is for the current code in 445.12 to remain as it is.
Panel Meeting Action: Accept
Number Eligible to Vote: 21
Ballot Results: Affirmative: 21

13-5 Log #1097 NEC-P13 **Final Action: Accept in Principle in Part**
(445.18)

Submitter: Linda J. Little, St. Louis, MO
Comment on Proposal No: 13-16
Recommendation: Continue to Accept in Principle revised as follows:
445.18 Disconnecting Means Required for Generators. Generators shall be equipped with disconnect(s), lockable in the open position, by means of which the generator and all protective devices and control apparatus are able to be disconnected entirely from the circuits supplied by the generator except where all of the following conditions apply:
<u>(1) The generator is listed.</u>
<u>(2)</u> The driving means for the generator can be readily shut down<u>, rendered incapable of restarting and is lockable in the OFF position in accordance with 110.25.</u>
<u>(3)</u> The generator is not arranged to operate in parallel with another generator or other source of voltage.
<u>Informational Note: See UL 2200 Standard for Safety of Stationary Engine Generator Assemblies.</u>
Substantiation: The action to accept in principle proposal 13-111 will permit the installation of a standby generator without a disconnecting means installed at any point from the generator terminals to the equipment supplied. A means to simply shut down the driving means for the generator, such as a diesel engine, is all that will be required. The panel action to accept proposal 13-111 is based partially on UL 2200 which mandates a means to stop the driving means, prevent restarting and requires this means to be lockable in the OFF position. The informational note points users to this reference. Not all generators are listed. The above modifications are needed for the safety of all installer/maintainers. It should be noted that OSHA does not permit an emergency stop button to be used to lockout electrical equipment. See CFR 29 1910.333(b)(2)(ii)(B). If a Nationally Recognized Testing Laboratory (NRTL) has listed such a device for lockout/tag-out, it may be considered by OSHA as an acceptable means of lockout/tag-out. The reference to 110.25 was accepted by panel action to correlate with the action on proposal 1-130.
This proposed revision does not constitute "new material." This proposed revision had public review in the ROP. See the affirmative comment on proposal l3-16 which included the suggested revision for public review.
Panel Meeting Action: Accept in Principle in Part
Panel Statement: See panel action on Comment 13-18a.
CMP 13 rejects proposed 445.18(1) because the action on Comment 13-18a addresses the concerns of the submitter without a listing requirement.

(445.20)

Submitter: Daniel J. Caron, Bard, Rao + Athanas Consulting Engineers, LLC
Comment on Proposal No: 13-18
Recommendation: Reconsider Proposal 13-18.
Substantiation: The Panel statement on Proposal 13-18 does not address the submitters substantiation. Generators arranged to operate in parallel to serve loads in hospitals, data centers, etc. are very common. The conductors, controls and equipment required to parallel the generator, including electrically operated circuit breakers and the common bus in the paralleling switchgear should be defined as a system. Rules for applying ground fault protection (700.6(D)) and selective coordination (700.27) are often misapplied, or as the submitter has indicated cannot be applied.
Panel Meeting Action: Reject
Panel Statement: The comment is dealing with installation requirements that are not within the scope of Article 445. The submitter is encouraged to submit a proposal on Articles 700, 701, or 702 as appropriate.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 20 Negative: 1
Explanation of Negative:
CARON, D.: My Comment may be dealing with installation requirements that are not within the scope of Article 445, however the original Proposal is within the scope of 445 and this Panel should address the original Submitters substantiation.

13-11 Log #967 NEC-P13 **Final Action: Reject**
(445.20 (New))

Submitter: Kenneth L. Box, Cummins Power Generation
Comment on Proposal No: 13-19
Recommendation: None given.
Substantiation: 445.20 is not necessary. The same verbiage already exists in article 590.6. Consequently, duplicating the article in another section of the code is not consistent with the NFPA style guide. Furthermore, the existing article 590.6 & the proposed new article are not consistent with existing standards for generators. Specifically, 445.20 & 590.6 are in conflict with the ISO 8528-6 standard with respect to requiring a bonded neutral to the frame of the generator set. 445.20 assumes an installation with a transfer switch, when in fact, most portables are used for recreational purposed not as emergency standby generators. In recreational use, the generator is used as a prime power machine and a nonemergency power source. For example, ice fisherman use portable generators to power home appliance type items in their fishing huts on a frozen lake or pond. In order for the GFCI interrupter to properly function, the genset neutral bonding strap must be connected to the generator frame and the generator must be grounded to earth. How does one drive a 6 ft. ground rod in a frozen lake or pond? The GFCI interrupter is non-functional and does nothing to increase safety. The potential for misapplication remains great. Safety should always be the paramount concern. However, adding this duplicated article does nothing to address unqualified personal, such as the average homeowner, from back feeding a dryer receptacle with an extension cord connected to the generator. By doing so, this potential creates a safety hazard for utility lineman. In addition, the average homeowner is ignorant of the NEC and does not use the services of a qualified person (licensed electrician) to properly install the portable generator. Consequently, the GFCI device nuisance trips because the genset has parallel paths to ground. A local utility in Georgia employs temporary staffs of "generator listeners" who ride around in residential neighborhoods during severe ice storms. Their sole purpose is to listen for generators running so they can investigate the potentially lethal hazard previously explained. The proper place for addressing the bonded neutral strap to the frame of the generator is in the portable generator owner's manual and UL2201 and not the NEC.
Panel Meeting Action: Reject
Panel Statement: This comment does not contain a recommendation as required by 4.4.5(c) in the NFPA Regulations Governing Committee Projects.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 20 Negative: 1
Explanation of Negative:
BOX, K.: The committee cites "safety concerns as the reason for rejecting the proposal. Yet, no historical evidence of safety concern or fire hazard was presented to the committee. In fact, evidence to the contrary was presented to the committee by the Portable Generator Manufacturer's Association. This issues should be addressed by UL2201 for small portable generators and not the NEC.

13-12 Log #1098 NEC-P13 **Final Action: Reject**

Submitter: Richard E. Loyd, Sun Lakes, AZ
Comment on Proposal No: 13-19
Recommendation: Reject proposal 13-19.
Substantiation: Adding this requirement may decrease the level of safety provided presently.
I agree with the negative voting comments of Degnan and Czarnecki There has been no substantiation of a safety problem and the submitter did not cite any safety issues that were not appropriately addressed in the 2008 edition proposal and comment meetings. 90.1(A) states the purpose of this code is the safeguarding of persons for the use of electricity. If this change is accepted it does not always assure this safety will be achieved. I believe the extensive discussions held in this committee and all documented literature has confirmed that both the floating neutral and bonded neutral types of generators perform safely when installed to the manufacturer's instructions that are provided with the generator when purchased and available from each manufacturer..
Based on the ECOA/IBEW study both types can be safe or not so safe based on the conditions of use.
In 1997 the construction safety association of Ontario (ECAO) in conjunction with the IBEW, with the assistance of Kubota Canada completed a in-depth

study on the use of GFCIs on portable generators. They tested both types the following are the analysis and conclusions of that study:

Analysis: It is clear that when generators of the floating-neutral or bonded-neutral type sit on dry surfaces in dry environments, they behave similarly In both cases, the GFCIs failed to trip In addition, the reading of little or no current on the multimeter indicated that there was not enough electricity leaking to ground to constitute a hazard In both cases, the GFCI did not trip when there was only one ground fault in the system. When effective grounding was established, GFCIs performed as expected Testing also proved that wet surfaces can create grounding for bonded-neutral generators When a bonded-neutral generator was placed on wet ground, the GFCI tripped under the prescribed current leakage

However, testing also showed that grounding can vary from one place to another, even when both are relatively close In one test, a variation in ground elevation yielded different results When the screwdriver was inserted in wet ground, the GFCI tripped When the screwdriver was moved 100 feet to a slope that had better drainage, the GFCI did not trip

The second series of tests showed that the placement of the GFCI in the circuit is critical to a floating-neutral system.

When the GFCI was plugged directly to the generator, the GFCI failed to detect any imbalance in the current As a result, it did not trip even when the current leak reached a higher than acceptable level When the GFCI was placed at the tool, however, it tripped at the prescribed level

Conclusions: Since the GFCI test button functioned regardless of the generator's grounding property, GFCI test buttons cannot and should not be used to test the effectiveness of GFCIs as personnel protection or the grounding of portable generators The test button should only be used to test GFCIs after grounding has been established.

Portable generators with established ground must be treated the same way as any grounded utility system Workers must be protected by GFCIs to prevent electrocution by ground fault Ground should be established and verified only by competent workers trained to do so and using specialized instruments. Generators with established ground allow a GFCI mounted at the generator outlet to work effectively when there is a current leak, the current goes to ground to complete the circuit. This creates an imbalance, causing the GFCI to trip When generators with established ground are being used, GFCIs should be located closest to the generator, protecting all workers from ground faults, not just the generator user. Construction people complain that GFCIs trip unnecessarily, especially with extension cords As a result, personnel often consider GFCIs a nuisance and don't use them But GFCIs trip for a reason. These trips should be treated as a warning that there is a ground fault in the system When a GFCI trips, tools, cords, and plugs should be inspected for defects and, where necessary, replaced before work continues. When the electrical system does not have reference to ground, GFCIs mounted on the generator do not work With one fault, not enough current leaks to ground to be considered a hazard Thus, in a floating-neutral circuit, workers are not endangered by electrocution from current going to ground as long as there is only ONE fault in the system However, with two faults in the system, one on the neutral and one on the hot side, it is possible that the floating-neutral system can become grounded In that case, workers without properly located GFCIs can be electrocuted Two faults can be produced by a defective generator, poorly insulated or defective extension cord, defective tool, or defective plug, to name just a few causes Other conditions such as wet ground, rain, or high humidity can increase the risk that the electrical system will become grounded.

Testing showed that in a two-fault system, the placement of the GFCI is critical The GFCI must be placed between the two faults in order to function Since the likely locations for faults are tool cord, tool plug, and extension cord, the GFCI should be placed closest to the tool.

Last but not least, the hazards of electrocution can be minimized by using only double-insulated tools in good working order and well-insulated cords.

Panel Meeting Action: Reject

Panel Statement: CMP 13 has taken this action to address safety concerns but recognizes that alternate solutions to the product standard, UL 2201, should be developed to address these issues.

Number Eligible to Vote: 21

Ballot Results: Affirmative: 17 Negative: 4

Explanation of Negative:

BOX, K.: See my explanation of negative vote on Comment 13-11.

BROWN, J.: This comment should have been accepted since the acceptance of Proposal 13-19 can introduce an additional electrical shock hazard that currently does not exist with floating neutral generators.

CZARNECKI, N.: The original proposal seeks to add GFCI protection to all 125v generator outlets without any substantiation that an issue exists at all levels. In order to establish a functional GFCI configuration on the generator, the generator is forced to be of the bonded neutral variety. Therefore, the original proposal would have the effect of eliminating floating neutral generators used to power structures, non-separately derived standby systems, and transfer switches for non-separately derived systems. Eliminating such equipment will not enhance safety, but obsolete safe infrastructure already in place. Enhanced safety has not been accomplished and potentially compromised with users defeating the system by removing grounding connections to find a means to get power on in their home.

DEGNAN, J.: See my response to Comment 13-13.

13-13 Log #1295 NEC-P13 **Final Action: Reject**
(445.20 (New))

Submitter: Joseph Harding, Portable Generator Manufacturers Association
Comment on Proposal No: 13-19
Recommendation: This proposed new section should not be published in NEC 2014.
Substantiation: Proposal 13-19 should have been rejected since it indirectly introduces an electrical shock hazard that currently does not exist (disallowing isolated output portable
generators), and will lead to nuisance tripping of the proposed GPCI on bonded neutral portable generators and electric shock in the event of failure of the GPCI.

In the Report on Proposals, members of Code-Making Panel 13 agree that acceptance of the proposal will require all portable generators to be of the bonded neutral
type. This is because a GPCI will not function properly on an isolated output (non-bonded neutral) portable generator.

According to a recent PGMA survey, approximately 50% of all portable generators sold in the U.S. are the isolated output type, with no connection of the neutral conductor to the generator frame. Portable generators that are used in "stand alone" mode are not normally connected to a grounding electrode (as allowed in 250J4(A»). In this configuration, isolated output generators pose no risk of a shock hazard (please refer to the presentation and videos associated with this comment).

It is also the experience of the portable generator industry that there have been no reported incidents of electrical shock associated with these generators over at least the last five years for which data is readily available. Requiring the neutral conductor to be connected to the portable generator frame only serves to increase the risk of electrical shock (again please refer to the presentation and videos associated with this comment). This proposal was rejected during the 2008 and 2011 Codemaking cycles and is now being re-introduced with no additional information or evidence that it will improve the safety of portable generators without introducing unintended consequences.

Additionally, if isolated output generators are 110 longer allowed, then all generators used for backup power during power outages would need to be connected as separately derived systems. This is required because not doing so would result in the system having two points where the neutral is bonded to the grounding electrode (the main bonding jumper and the generator). The dual bonding points allow neutral current to flow on equipment bonding conductors under normal conditions, resulting in nuisance tripping of GPCIs, etc. Connecting a generator as a separately derived system requires the use of an extra pole in the transfer switch in order to switch the neutral conductor. According to industry sources, 99% or more of portable generators used for home backup power are connected as non-separately derived systems by using single or dual pole transfer switches. If this proposal is accepted, it will then force those owners who subsequently replace their portable generator to also replace their current transfer switch at considerable expense and without any real-world safety benefit. If the owner chooses to operate a new portable generator with the existing transfer switch, the system will not be in compliance with the NEC. Considering the significant expense of replacing a transfer switch, it is the belief of PGMA members that some owners would then attempt to modiJY their new generator or their existing transfer switch and this would then pose significant safety risks where one would not otherwise exist. It is finally noted that the Code currently has a provision for connecting generators as non-separately derived systems (250.30 Informational Note 1).

In the case of bonded neutral generators, the requirement for integral OPCI on the portable generator will lead to nuisance tripping and unintended consequences. It has already been the experience of the portable generator industry that users attempt to bypass the GPCl with the associated risk of also bypassing other systems such as overcurrent protection devices, etc.

PGMA members represent a significant majority of the portable generator industry. OUf member companies include:

- American Honda Motor Co.
- Briggs &. Stratton Home Power Products
- Champion Power Equipment
- Generac Power Systems
- Pramac America
- Subaru Industrial Power
- Techtronic Industries North America
- Wacker NeusonProduction
- Yamaha Motor Corp USA

Panel Meeting Action: Reject

Panel Statement: CMP 13 has taken this action to address safety concerns but recognizes that alternate solutions to the product standard, UL 2201, should be developed to address these issues.

Number Eligible to Vote: 21

Ballot Results: Affirmative: 17 Negative: 4

Explanation of Negative:

BOX, K.: See my explanation of negative vote on Comment 13-11.

BROWN, J.: This comment should have been accepted since the acceptance of Proposal 13-19 can introduce an additional electrical shock hazard that currently does not exist with floating neutral generators.

CZARNECKI, N.: The original proposal seeks to add GFCI protection to all 125v generator outlets without any substantiation that an issue exists at all levels. In order to establish a functional GFCI configuration on the generator, the generator is forced to be of the bonded neutral variety. Therefore, the original proposal would have the effect of eliminating floating neutral generators used to power structures, non-separately derived standby systems, and transfer switches for non-separately derived systems. Eliminating such equipment will not enhance safety, but obsolete safe infrastructure already in place. Enhanced safety has not been accomplished and potentially compromised with users defeating the system by removing grounding connections to find a means to get power on in their home.

DEGNAN, J.: The submitter's substantiation for adding GFCI's to portable generators does not contain any statistical data to verify that the identified safety issues have actually resulted in injury or death. In opposition, PGMA identifies that mandating bonded neutral generators and GC
I receptacles is likely to create other safety issues that could result in injury or death. The general public is likely to recognize if a portable generator does or does not have GFCIs and understand the consequences. The general public is much less likely to understand the requirements for correctly connecting portable generators to a grounding electrode and the hazards of sharing neutral currents between the interconnection of two bonded systems. This requirement appears to solve a problem that doesn't exist and is likely to create an unwanted hazard.
Panel members that support the addition of this code requirements should address each item of the submitter's concerns in their comments.

13-14 Log #1301 NEC-P13 **Final Action: Reject**
(445.20)

Submitter: James Jongkind, American Honda Motor Co., Inc.
Comment on Proposal No: 13-19
Recommendation: Please reject the proposal.
Substantiation: This proposal is as unnecessary today as it was in the 2011 code cycle where it was rejected due to lack of consensus. Being that no new information or data to support such a requirement has been provided, I encourage you to vote to reject the proposal. I Most of the portable generators that Honda has sold for the past 40 years are of the floating neutral design (without GFCl) and are used safely everyday by millions of consumers. To require that all newly produced portable generators be equipped with GFCI is unjustified by the lack of incident data and would result in added complexity with potentially increased risk should the GFCI fail. The output on these floating neutral generators is isolated so there is no path back to the source through which users can be shocked. This is a well established and proven safety strategy for this type of product and should not be arbitrarily replaced with a much less ideal system that introduces a shock hazard (bonding) and the installation of a device (GFCI) that can fail to protect against it.
Panel Meeting Action: Reject

13-16 Log #1465 NEC-P13 **Final Action: Accept in Principle**
(445.20)

TCC Action: The Correlating Committee directs that the Panel Action on Comment 13-16 be reported as "Accept in Principle" and the text revised as follows to comply with the NEC Style Manual and for editorial revisions to the punctuation:
"445.20 Ground-Fault Circuit Interrupter Protection for Receptacles on 15 kW or Smaller, Portable Generators.
All 125-volt, single-phase, 15-and 20 ampere receptacle outlets, that are a part of a 15 kW or smaller, portable generator, either shall have ground-fault circuit interrupter protection for personnel integral to the generator or receptacle, or shall not be available for use when the 125/250 volt locking-type receptacle is in use. If the generator does not have a 125/250 volt locking-type receptacle, this requirement shall not apply"
Submitter: Michael O. Flegel, Reliance Controls Corporation
Comment on Proposal No: 13-1
Recommendation: Revise text to read as follows:

445.20 (New) Ground-Fault Circuit Interrupter Protection for Receptacles on 15 kW or Smaller, Portable Generators. All 125-volt, single-phase, 15-and 20~~-, and 30~~-ampere receptacle outlets, that are a part of a 15 kW or smaller, portable generator, either shall have ground-fault circuit interrupter protection for personnel integral to the generator or receptacle or shall not be allowed to be available for use when the 125/250 volt locking receptacle is in use. If the generator does not have a 125/250 volt locking receptacle, then this requirement does not apply.
Substantiation: GFCI protection is not necessary on systems that are not grounded for the reasons given in my comment to reject this proposal. However, when the generator is connected to a premises wiring system, whether it is has a floating or bonded neutral, it becomes part of a bonded and grounded system. This has not been a safety problem because nobody uses the duplex receptacles when powering their house because they want as much power to the house as possible through the locking 125/250 volt receptacle which is the one they use to power their house. If the panel is still concerned, then protecting the duplex receptacles with a GFCI is one way to improve the situation but is not the only way. The generator could be built with a simple system to make the duplex receptacles unavailable when the 125/250 volt locking receptacle is being used. This would be more effective and economical than GFCI protection. If the panel is going to force a change in the design of a portable generator, the panel should allow the manufacturers the freedom to create better solutions. They are the ones that are familiar with the applications and will ultimately be responsible for product liability, not the code making panel.

I have eliminated the GFCI protection on the 30A-125V receptacles because there are 125 volt generators up to 3000 watts that use a 30A locking receptacle. These are used primarily for camping and are floating neutral generators. They already have protection from ground faults. Since all premises wiring is 125/250 volts, these generators are not generally used for home standby power and never become part of a bonded and grounded system.
Panel Meeting Action: Accept
Panel Statement: CMP 13 does not agree with all of the submitter's substantiation.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 21
Comment on Affirmative:

DEGNAN, J.: The revised text alleviates some fo the concerns identified in comment 13-13.

ODE, M.: This Comment should have been an accept in principle by adding a comma after "receptacle" and before "or shall not" and delete the text "allowed to be" as redundant, and replace the word "does" with the word "shall in the final sentence to comply with the NEC Style Manual:
445.20 (New) Ground-Fault Circuit Interrupter Protection for Receptacles on 15 kW or Smaller, Portable Generators.

All 125-volt, single-phase, 15-and 20-ampere receptacle outlets, that are a part of a 15 kW or smaller, portable generator, either shall have ground-fault circuit interrupter protection for personnel integral to the generator or receptacle, or shall not be ~~allowed to be~~ available for use when the 125/250 volt locking receptacle is in use. If the generator does not have a 125/250 volt locking receptacle, then this requirement ~~does~~ shall not apply.

13-17 Log #1466 NEC-P13 **Final Action: Reject**
(445.20)

Submitter: Michael O. Flegel, Reliance Controls Corporation
Comment on Proposal No: 13-19
Recommendation: Reject the proposal.
Substantiation: Statement of Problems

1. It is impossible to have a ground fault back to the generator if it is not bonded and grounded so GFCI protection on the generator doesn't make sense since no requirement exists for bonding and grounding. In complex systems and in harsh environments, neutrals can be pulled to ground beyond the generator. GFCI protection on generators that are not bonded and grounded does not protect people against these ground faults but they will believe it does. This will encourage bad safety practices and/or discourage people from taking further steps to protect themselves against ground faults.

2. The bonding and grounding needed in Comment 1 will create ground fault hazards. Why intentionally create a hazard and then have to add a device to protect against it? Especially when the added device is an electronic device on a piece of hot, vibrating equipment which adds to the likelihood of its failure. It makes more sense to float the system. A floating neutral portable generator without GFCI protection is safer than a bonded neutral portable generator with GFCI protection in stand alone applications even if the latter is properly grounded. There is no need to have GFCI protection built into a floating neutral generator.

3. Article 90.2 of the National Electrical Code states that the Code only covers the installation of electrical conductors, equipment, and raceways, etc. It does not cover the design of equipment such as having GFCI protection built into a portable generator. The Code can and does address the following installation aspects of a portable generator:

a. Adding downstream GFCI protection - Article 590 (2008)

b. Bonded or not bonded – There are several sections addressing Separately and Non-separately derived systems

c. Receptacles connected to the frame – Article 250.34

In each case the Code does not dictate that the generator has these design features but rather it instructs on how to install it when a generator has these features. The NEC does not develop product standards for the equipment that is installed. The NEC can specify how to install a bonded neutral generator with GFCI protection, or a floating neutral generator without GFCI protection but it shouldn't require that the generator have the protection built in.

4. The proposal has not substantiated a safety problem; it just incorrectly states there is one. GFCI protection on the generator would ensure that people would use it but is only effective if people properly bond and ground the generator and is not as effective as other alternatives as stated above in Comments 1 and 2. If you don't electrify the ground by tying the neutral of the generator to it, you have no ground path for a ground fault to occur. People are safer in all the conditions stated in the substantiation of the proposal with a floating neutral generator without GFCI protection.

Does the panel have information that the current safety record isn't due to the fact that very few portable generators are grounded and many of them 5kW and less are floating neutral generators? Are you sure adding GFCI protection will make things better and not worse? Isolation is a powerful safety device and should not be ignored. Has somebody provided data to show that what is being done now is not safe?

Bonding and Grounding – Utility vs. Portable Generators

OSHA requires bonded neutral generators in their regulations for construction sites. In reading these regulations, they appear to be identical to the NEC requirements except for this bonding requirement. The interpretation in Appendix A explains their position. To completely understand OSHA's response, please read the request letter by Mr. Iwasa. It appears OSHA incorrectly interprets the NEC. OSHA says a generator in stand-alone use is a separately derived system (see Article 100) and as such needs to be bonded. However, the NEC definition of a separately derived system says it is a premises wiring system. A generator in stand-alone use is not a premises wiring system so it is not separately derived. Please note the interpretation does not have any safety arguments other than misinterpreting the NEC which leaves it with no technical merit. As such it has no relevance in this discussion.

Generators used in simple stand-alone applications, operate in a much different environment than a premises wiring system being feed from the utility. There is no huge generator capable of outputting high fault current, no transformers and switchgear, and no large, elevated distribution system subject to lightning strikes all of which can create surges in the system. Such surges must be addressed through bonding and grounding rather than having them go through appliances and endanger safety. The reason for bonding and grounding is substantially reduced when utility power is removed. As a matter of fact, Article 250 agrees and does not require a ground connection to earth for a generator in stand-alone applications. This allows a floating system using either floating neutral generators or bonded-neutral generators that are not grounded.

Bonding and grounding have some pitfalls that are tolerated in order to get the desired protection described above from utility systems. A bonded and grounded system creates numerous pathways for current to flow back to the power source. These include the ground, and any metal object connected to the ground such as plumbing fixtures and pipes and heating ducts. If someone comes in contact with a hot wire from the power source and one of these objects, the circuit is completed with disastrous results to the individual. In fact, people did realize that these pitfalls created very dangerous situations for premises wiring systems. Products and systems were developed to mitigate the safety risks. Grounding wires were added to appliance plugs and grounding terminals were added to receptacles so that a hot wire faulting to the case of an appliance would cause a short, tripping the circuit breaker. This protected the user in case he touched the case and one of the extensive return paths to the power source created by bonding and grounding the system. The GFCI was invented to interrupt the current flow when the current out of a receptacle isn't the same amount as the returning current. If it isn't returning through the receptacle, then it probably is returning through a person that is touching one of those many objects that have a path back to the power source, again, as a result of bonding and grounding the system.

Why create a more dangerous situation by connecting multiple objects to a return path back to the source if there are no advantages in doing so? Stand-alone portable generator applications provide excellent opportunity to do just that. Some people would argue that the devices used to protect people in bonded and grounded systems no longer would work in a floating situation. **This is true but they fail to understand they are not necessary.** The circuit breaker tripping in the fault-to-case example above and the GFCI protection are two of the safety devices in bonded and grounded systems mentioned earlier. In a floating system, the fault to the case represents only a connection of the person to one wire from the source. Because there is no path back to the source, the individual holding the tool is not injured. Similarly, a GFCI would never trip because there is never a ground path available back to the generator i.e. a ground fault can never occur back to the source. **This truly is a paradigm shift in the way we think about electrical systems and it is important for people to understand they have to look at portable generator applications differently.**

Stand Alone Installations

For the casual user such as a camper or home owner working in the back yard, the floating neutral generator is the safest and most cost effective application that does not require additional ground fault protection using GFCIs. Multipoint failures are extremely unlikely to occur but what if they do? **The floating system without GFCI protection still seems to be the safer of the two alternatives as shown in Appendix B.** GFCI protection is needed on a bonded neutral generator that is properly grounded but grounding the generator is unlikely since the NEC does not require it. If not grounded, the protection is unnecessary on the generator because you have a system that does not intentionally create any paths back to the source. However, it is more likely that the neutral in a bonded neutral generator is pulled to ground at the source since the frame is already bonded to the neutral. The solution to that is not to connect the neutral to the frame which results in the floating neutral generator. Look at the electrical safety record for portable generators. If the record is good, then please understand the elements that contribute to that record BEFORE you make changes that you think will improve safety but, in fact, will decrease safety. The fact that the presence of a GCFI on the generator will give people the impression they are safe when they may not be is a bad idea.

Premises Wiring Installations

When the generator is connected to a premises wiring system, whether it is has a floating or bonded neutral, it becomes part of a bonded and grounded system. This has not been a safety problem because nobody uses the duplex receptacles when powering their house because they want as much power to the house as possible through the locking 125/250 volt receptacle. That is why they use it to power their house. There is no data to support this is an unsafe condition.

Portable generators are unique because they can be used in different applications. They are portable and are cord connected the same as any appliance but they supply power instead of use power. They are delivered as a finished product and have the same product liability to the manufacturers as appliances yet the code making panel feels the need to dictate what features are built into a portable generator rather than telling people how to install them. I believe this is outside the scope of the NEC and that the generator should be covered by a product standard that involves the generator manufacturers and other interested parties. Such a group already exists, STP2201, and they continually raise the red flag that this proposal doesn't make sense for all applications. UL has a mission to get what they want from the STP (they are upset they only get one vote on the STP) and is attempting to use the code making process to suit them.

Panel Meeting Action: Reject

Panel Statement: CMP 13 has taken this action to address safety concerns but recognizes that alternate solutions to the product standard, UL 2201, should be developed to address these issues.

Number Eligible to Vote: 21

Ballot Results: Affirmative: 17 Negative: 4

Explanation of Negative:

BOX, K.: See my explanation of negative vote on Comment 13-11.

BROWN, J.: This comment should have been accepted since the acceptance of Proposal 13-19 can introduce an additional electrical shock hazard that currently does not exist with floating neutral generators.

CZARNECKI, N.: The original proposal seeks to add GFCI protection to all 125v generator outlets without any substantiation that an issue exists at all levels. In order to establish a functional GFCI configuration on the generator, the generator is forced to be of the bonded neutral variety. Therefore, the original proposal would have the effect of eliminating floating neutral generators used to power structures, non-separately derived standby systems, and transfer switches for non-separately derived systems. Eliminating such equipment will not enhance safety, but obsolete safe infrastructure already in place. Enhanced safety has not been accomplished and potentially compromised with users defeating the system by removing grounding connections to find a means to get power on in their home.

DEGNAN, J.: See my response to Comment 13-13. Panel members that support the addition of this code requirements should address each item of the submitter's concerns in their comments.

13-18 Log #1483 NEC-P13 **Final Action: Reject**
(445.20)

Submitter: Richard Torine, BR Forbes
Comment on Proposal No: 13-19
Recommendation: Delete text to read as follows:

~~Ground-fault circuit interrupter protection for receptacles on 15 kW or smaller, portable generators. All 125-volt, single-phase, 15-20, and 30 ampere receptacle outlets, that are part of a 15 kW or smaller portable generator, shall have ground-fault circuit interrupter protections for personnel integral to the generator or receptacle.~~

Substantiation: The substantiation for this proposal points out that the TCC rejected a similar proposal in the 2011 code cycle due to a lack of consensus. This new proposal is virtually the same and does nothing to address the real problems associated with placing GFCls on portable generators, including:

1. A GFCI will not operate at all on a floating neutral generator. It is impossible for a ground fault to occur when the neutral is not bonded to the generator ground.

2. Even when the neutral is bonded to the generator ground, a GFCI will not operate properly unless the generator is solidly connected to earth ground. The NEC does not require grounding of a generator frame and this is seldom done in practice, especially on camping trips and during natural disasters as described in the substantiation.

Nothing has changed in the last three years. Portable generators continue to be available with and without GFCI protection, and the user can choose which is right for his or her application. It should remain this way.

There is no data that shows that the current practice is in any way unsafe.

Panel Meeting Action: Reject
Panel Statement: CMP 13 has taken this action to address safety concerns but recognizes that alternate solutions to the product standard, UL 2201, should be developed to address these issues.

Explanation of Negative:

BOX, K.: See my explanation of negative vote on Comment 13-11.

BROWN, J.: This comment should have been accepted since the acceptance of Proposal 13-19 can introduce an additional electrical shock hazard that currently does not exist with floating neutral generators.

CZARNECKI, N.: The original proposal seeks to add GFCI protection to all 125v generator outlets without any substantiation that an issue exists at all levels. In order to establish a functional GFCI configuration on the generator, the generator is forced to be of the bonded neutral variety. Therefore, the original proposal would have the effect of eliminating floating neutral generators used to power structures, non-separately derived standby systems, and transfer switches for non-separately derived systems. Eliminating such equipment will not enhance safety, but obsolete safe infrastructure already in place. Enhanced safety has not been accomplished and potentially compromised with users defeating the system by removing grounding connections to find a means to get power on in their home.

DEGNAN, J.: See my response to Comment 13-13.

ARTICLE 450 — TRANSFORMERS AND TRANSFORMER VAULTS (INCLUDING SECONDARY TIES)

9-70 Log #734 NEC-P09 **Final Action: Accept**
(450)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 9-135
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1
Ballot Not Returned: 1 Coghill, P.
Explanation of Negative:

FERRARO, J.: It is recognized that increasing voltage from 600 volts to 1000 volts may be applicable to specific installations. However, adequate technical substantiation has not been provided to support the change in this Article.

9-71 Log #1258 NEC-P09 **Final Action: Reject**
(450)

Submitter: John Masarick, Independent Electrical Contractors, Inc.
Comment on Proposal No: 9-135
Recommendation: I ask the panel to reject this proposal. The proposal would change 600 volts to 1000 volts.
Substantiation: Replacing 600 volts with 1000 volts will have a major impact on installers, component manufacturers, and industry standards. Increased spacing must be considered when going from 600 volts to 1000 volts. Personal safety must also be considered.
Because the proposer has not provided enough information to the public to justify and understand all the ramifications of the proposal, the committee should reject the submitter's proposal.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 9-68.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1
Ballot Not Returned: 1 Coghill, P.
Explanation of Negative:

FERRARO, J.: It is recognized that increasing voltage from 600 volts to 1000 volts may be applicable to specific installations. However, adequate technical substantiation has not been provided to support the change in this Article.

9-71a Log #839 NEC-P09 **Final Action: Reject**
(450.3 (New))

Submitter: Gaylan Bishop, The University of North Carolina - Chapter Hill
Comment on Proposal No: 9-136
Recommendation: It may come as a surprise to users of the NEC that the NEC does not contain any straightforward guidance on specifying the kVA-rating of transformers even though the kVA rating of a transformer determines the ampere-rating of everything downstream from it. Thus, we would like to modify our original approach in Proposal 9-136 by taking the recommendation of the only vote in support of our original proposal (cast by B. Breitkreutz) and submit for the committee's consideration the following language:
<u>**(NEW) 450.15. Capacity**. Transformer load, ampacity, rated KVA, and capacity shall be permitted to be determined by a licensed professional engineer considering load demand factor appropriate for the application and ambient temperature.</u>
Substantiation: The University of North Carolina supports the effort by the education facilities industry, represented by APPA.ORG's Standards Council, to bring the 2014 NEC in step with rapidly evolving energy codes by reducing the amount of energy brought into building. Most transformers in the United States are underloaded (as shown by the significant quantity of data presented to NEC committees by our industry during the proposal stage) and this over-sizing is a significant safety hazard, and it wastes material and energy.
The committee's own statement: <u>Load and transformer size may not directly correlate</u>" confirms the crux of the safety problem and its statement in related proposal 9-155 acknowledges correlation problems between Chapter 2 and Chapter 4. We believe the language we propose, allowing a professional engineer to make case-by-case judgments to the same degree that Authorities Having Jurisdiction are permitted to use their professional judgment, is an acceptable, near-term resolution to the safety and waste problems originating in Article 220 prescriptive requirements.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its original statement in rejection of pProposal 9-136.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1
Ballot Not Returned: 1 Coghill, P.
Explanation of Negative:
BREITKREUTZ, B.: Panel action should be to accept. The code should be amended to add permissive language for transformer sizing. Now, the code has no information at all about transformer sizing and some users are wrongly assuming that transformers must be sized per the same rules as for conductors. Transformers have a kVA rating based on 24 hour average temperature and should be sized based on 24 hour average load.

9-72 Log #1298 NEC-P09 **Final Action: Accept in Principle**
(450.5)

Submitter: Tony Hoevenaars, Mirus International Inc.
Comment on Proposal No: 9-142
Recommendation: I submitted an earlier proposal for this Section and received initial comment that it has been rejected for the following reason. *CMP 9 requires additional information to evaluate the technical merits of the proposal. If the submitter provides data as part of a public comment, CMP 9 will create a task group to further review available information prior to the meeting all public comments. The Panel is concerned that this requirement may create an opportunity for a proprietary product and the panel is concerned this may violate the NFPA Patent Policy. The submitter should provide information to NFPA that indicates that the NFPA Patent Policy is not violated.* For my response to this, please see Item 5 below.
Substantiation: I provided quite a bit of background information with my original submission and have expanded on it for resubmission. I hope that this provides the information required to complete the technical assessment on the merits of the proposal. In addition, I am prepared to present at the next ROC Meeting in San Diego if that is possible. As for the issue with the NFPA Patent Policy, I have reviewed the policy and I do not believe that it would be violated. I understand why the NEC cannot mandate the use of a patented product but I do not see why it should exclude the use of a patented product if it is only one possible way of meeting the code requirement. My proposal does not restrict the use of any methods for complying. It simply allows the use of another approach that is equally as safe and would allow savings in energy among other benefits. Surely that is not a violation of the Patent Policy.
Note: Supporting Material is available for review at NFPA headquarters.
Panel Meeting Action: Accept in Principle
Accept the original Proposal 9-142 reworded as follows:
Exception: An auto transformer with a wye configuration on its line side and a zigzag configuration on its load side that does not permit neutral or ground-fault current to return over the line connection shall be permitted on the load side of a system grounding connection. This exception shall not apply to a connection made from a high resistance grounded system applied in accordance with 250.36.
Panel Statement: CMP 9 agrees that the concept has merit, but is unwilling to apply it to high resistance grounded systems without further investigation relative to whether it would impair the functionality of such systems. CMP 9 does not want to place specific impedance percentages in the NEC, nor use the word "special" because it could unreasonable restrict free application of the concept. This wording meets the objectives of the submitter. CMP 9 notes that the comment was not in correct form, but has decided to continue to act on the technical merit of the concept.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Coghill, P.
Comment on Affirmative:
BREITKREUTZ, B.: I agree with the panel action to add the exception as stated but am not convinced that the transformers presented by Mr. Hoevenaars will actually meet that exception.
HARTWELL, F.: CMP 9 understood the comment as requesting that the underlying proposal be accepted, and acted on the technical merits accordingly. The proposal submitter was in the room and made a technical presentation on the topic, so there was no doubt as to the intent. Note that the underlying proposal was a companion proposal to one offered in 210.9 by the same submitter. Although the submitter is highly qualified in terms of electrical design, the overall approach should have included a better understanding of the NEC. For example, it became clear in a conversation with this voter that the usual application involved to supply of a panelboard in a data center. As such, the usual companion application was to a feeder, necessitating an amendment to 215.11, and the proposal to 210.9 is largely irrelevant. Unfortunately this cannot be entertained at this point, other than through the TIA process.

(450.21(A))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 9-135
Recommendation: Revise text to read as follows:
450.21 Dry-Type Transformers Installed Indoors.(A) Not over 112-½ kVA.
Exception: This rule shall not apply to transformers rated for 1000 volts, nominal, or less that are completely enclosed~~, with or without~~ <u>except for</u> ventilating openings.
Substantiation: The new text does not parallel the text in:
450.21 Dry-Type Transformers Installed Indoors.
(B) Over 112-½kVA.
Exception No. 2: Transformers with Class 155 or higher insulation systems and completely enclosed except for ventilating openings.
And in:
450.22 Dry-Type Transformers Installed Outdoors.
Dry-type transformers installed outdoors shall have a weatherproof enclosure. Transformers exceeding 112-½kVA shall not be located within 300 mm (12 in.) of combustible materials of buildings unless the transformer has Class 155 insulation systems or higher and is completely enclosed except for ventilating openings.
Using the same text for the same meaning reduces confusion.

ARTICLE 455 — PHASE CONVERTERS

13-19 Log #1452 NEC-P13 **Final Action: Reject**
(455.5)

Submitter: Arnoldo L. Rodriguez, American Chemistry Council
Comment on Proposal No: 13-20
Recommendation: Replace the phrase "equipment grounding conductor" with the phrase "Equipment bonding conductor" in the Article 455.5.
Substantiation: Proposal 13-20 should have been approved. Grounding electrode conductors are the connection to the earth and accomplish grounding. In the present NEC, Equipment Grounding Conductors and bonding jumpers provide a "path back" to the source. Both are always performing a bonding function. If the Grounding Electrode connection is removed or broken, the bonding function remains intact.
Section 250.4 does not permit the earth (ground) to be used as an effective ground fault current path but the term equipment grounding conductor inherently incorrectly contains the word "ground".
Visualize equipment supplied by a portable generator. The generator frame is not required to be connected to the earth.
The "green" wire in the flexible cord is not performing a grounding function but is performing a bonding function.
Visualize building one supplied by a service, having the grounded conductor connected to the grounding electrode system by a grounding electrode conductor. A feeder supplies a second building and a grounding electrode conductor is required for grounding any equipment in the second building. An equipment grounding conductor is required to be installed from building 1 to building 2. Not for grounding, but for bonding, providing an effective fault current path.
Making this change has the added benefit of being more harmonized with other international standards and usage of terminology.
Experienced NEC users have to ignore other concepts in other definitions and requirements to use the existing term.
This does not help the future NEC user or provide clarity in the existing NEC. Changing the term is the right thing to do and should be supported.
Panel Meeting Action: Reject
Panel Statement: This issue was addressed in great detail in the 2005 NEC revision cycle. These terms are well understood. There is no confusion.
The Correlating Committee (CC) should carefully review actions on this issue across all committees. Any action to change these long standing, well understood terms would create confusion.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 19 Negative: 2
Explanation of Negative:
RODRIGUEZ, A.: It is understood that this item was discussed in past NEC cycles. This comment should have been approved by the committee because it is our (ACC) belief that the term "equipment grounding conductor" is confusing to new and experienced users.
SPINA, M.: The panel should accept the original proposal. The Panel is incorrect in stating that this change will add confusion. The proposed language improves the technical accuracy of the use of the terms "equipment grounding conductor" and "equipment bonding conductor" and will reduce the confusion. The IEEE has reviewed all the statements on this subject by various panels. The following represents the IEEE position on the issue of equipment grounding conductor or equipment bonding conductor. There is no justification for retaining an incorrect and potentially hazardous electrical installation just because this definition has been used in the NEC for many years. Not all electrical practitioners are knowledgeable in the main intent of this conductor. The intent of the proposed change is to provide a descriptive name to a construction element that has resulted in much misunderstanding with possible hazardous operating conditions in electrical installations. The use of the term "grounding" implies that grounding is its principal function. Although grounding may be desirable, providing an effective fault current path (i.e. bonding) is and should be the emphasis. There are many who assert that a connection to a water pipe meets the needs of equipment grounding, however, this connection does not perform the necessary effective fault current path back to the source. There are two conductors described in the Code performing the same function but named differently. The "bonding jumper" is a short conductor that insures the electrical integrity of enclosure to raceway. The longer conductor, intended to provide a low impedance path to the source, is presently named a "grounding" conductor instead of its real function as a "bonding" conductor. Technically, the definition in Article 100 may be adequate for Panel members and those that teach. Practically, the definition is confusing if the terminology does not fit the function performed. The equipment bonding conductor, as it should be called, provides its primary function whether or not it is grounded. For a grounded system, it is grounded because the system is grounded. For an ungrounded system, it is grounded to limit the voltage due to a lightning strike or contact with a higher voltage system. Changing the name will assist in educating users of the Code as to why they are installing a conductor that needs to be continuous all of the way back to the source.

ARTICLE 460 — CAPACITORS

11-35 Log #744 NEC-P11 **Final Action: Accept**
(460, Part I)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 11-93
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.
The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.
The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. Section 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 and 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.
Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.
Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.
If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

11-38 Log #747 NEC-P11 **Final Action: Accept**
(470, Part II)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 11-98
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. Section 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 and 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

ARTICLE 480 — STORAGE BATTERIES

13-20 Log #536 NEC-P13 **Final Action: Hold**
(480.2)

TCC Action: The Correlating Committee directs that the panel action be reported as "Hold" because this comment contains new material that has not received public review.
Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions (ATIS)
Comment on Proposal No: 13-33
Recommendation: Add the following definition to 480.2: "**Prime Mover.** A machine that transforms potential energy, such as electrical or thermal, to mechanical energy, typically an engine, turbine or electric motor."
Substantiation: The term "prime mover" is used in 480.5 as well as numerous other Articles in the NEC without definition. The term should be defined per the NEC Style Manual, Section 2.2.2.1.
Panel Meeting Action: Reject
Panel Statement: The definition of prime mover is technically incorrect. This comment contains new material that has not received public review.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 21

13-21 Log #857 NEC-P13 **Final Action: Accept in Principle**
(480.5)

Submitter: Stephen McCluer, Schneider Electric / Rep. IEEE Stationary Battery Committee
Comment on Proposal No: 13-33
Recommendation: Add text to read as follows:
480.5 DC Disconnect Methods
(A) Disconnecting Means. A disconnecting means shall be provided for all ungrounded conductors derived from a stationary battery system with a nominal voltage over 50 volts. A disconnecting means shall be readily accessible and located within sight of the battery system.
(B) Remote Actuation. Where controls to activate the disconnecting means of a battery are not located within sight of a stationary battery system, the disconnecting means shall be capable of being locked in the open position and the location of the controls shall be field marked on the disconnecting means.
(C) Busway. Where a DC busway system is installed, the disconnecting means shall be permitted to be incorporated into the busway.
(D) Notification. A label shall be installed on or adjacent to the disconnect containing the maximum available short circuit current. The label shall be placed in a conspicuous location near the battery if a disconnect is not provided.
Informational Note: Battery equipment suppliers can provide information about short circuit current on any particular battery model.
Substantiation: We support the comment on the affirmative by Linda Little. Further modifications to this section is necessary. The above text revisions had been submitted in a proposal not acknowledged or published by NFPA staff. The text had been developed through a joint effort by the NEC Task Force of the Technical Correlating Committee and the IEEE Stationary Battery Committee.

645.10(A) requires remote activation for disconnects serving ITE rooms. The disconnect serving the ITE room must be capable of being locked open to prevent the remote actuation from occurring when it will jeopardize safety of personnel.

DC busway is common in large UPS installations in which there are multiple strings of batteries. Each cell in a string is connected in series to create the necessary dc voltage and each string has a disconnecting means &/or overcurrent protective device. The strings are connected in parallel to a common dc bus which may also have a disconnecting means. The individual string disconnects allow manual disconnecting so that maintenance can be performed on a redundant battery string while the remaining battery strings support the load. It also functions as an OCPD to prevent the energy from other strings from feeding into a faulted cell in one string. The disconnect on a DC busway system can allow for a single point of shutdown for the entire dc supply.

The stored energy in a battery system is a potential hazard to personnel maintaining the system. The labeling requirement attests this hazard and aids in determining the arc-flash protection boundary and required PPE.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
480.5 DC Disconnect Methods
(A) Disconnecting Means. A disconnecting means shall be provided for all ungrounded conductors derived from a stationary battery system with a nominal voltage over 50 volts. A disconnecting means shall be readily accessible and located within sight of the battery system.
(B) Remote Actuation. Where controls to activate the disconnecting means of a battery are not located within sight of a stationary battery system, the disconnecting means shall be capable of being locked in the open position, in accordance with 110.25, and the location of the controls shall be field marked on the disconnecting means.
(C) Busway. Where a DC busway system is installed, the disconnecting means shall be permitted to be incorporated into the busway.
(D) Notification. A label, containing the maximum available short circuit current, shall be installed on or adjacent to the disconnecting means. ~~containing the maximum available short circuit current.~~ The label shall be placed in a conspicuous location near the battery if a disconnecting means is not provided.
Informational Note: Battery equipment suppliers can provide information about short circuit current on any particular battery model.
(D) Notification. A label, containing the maximum available short circuit current, shall be installed on or adjacent to the disconnecting means. ~~containing the maximum available short circuit current.~~ The label shall be placed in a conspicuous location near the battery if a disconnecting means is not provided.
Panel Statement: This text in this comment was provided by the affirmative vote of Linda Little to Proposal 3-33 so the text has had public review. Added "ing" to "disconnect" and "means" after "disconnect" in two places in the text to make it more technically correct. The remainder of the changes in text in (D) was strictly editorial. In 480.5(B) a reference to 110.25 was added for correlation and clarity.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 21
Comment on Affirmative:
LITTLE, L.: We are voting affirmative on the panel action to "Accept in Principle" comment 13-21. Comment 13-21 incorrectly lists first level subdivision (D) twice. Additionally, it is important to note for the Correlating Committee and the public that this action is modified by the panel action on comment 13-22.

13-22 Log #856 NEC-P13 **Final Action: Hold**
(480.5(A) and (B))

TCC Action: The Correlating Committee directs that the items identified in the panel action be reported as "Hold" per the panel action.
Submitter: Stephen McCluer, Schneider Electric / Rep. IEEE Stationary Battery Committee
Comment on Proposal No: 13-36
Recommendation: Accept the proposed text in principle with the following revisions:
480.5 Disconnecting Means. A disconnecting means shall be provided for all ungrounded conductors derived from a stationary battery system over nominal 50 volts.
(A) Accessibility ~~A~~ The disconnecting means shall be readily accessible to qualified personnel for inspection and maintenance and shall be located as close as practicable and within sight of the battery ~~system~~ terminals.
(B) Remote Operation Where controls to activate the disconnecting means of a battery are located in a remote location, the disconnecting means shall be lockable in the open position and the location of the controls shall be field marked on the disconnecting means.
~~(B)~~(C) Field Marking.
The disconnecting means shall be legibly marked in the field in accordance with 110.24. ~~the nominal battery system voltage and maximum available fault~~

~~current derived from the stationary battery system.~~, The field marking(s) shall:
(1) include the nominal battery voltage and the maximum available short circuit current derived from the stationary battery;
INFORMATIONAL NOTE: NFPA 70E-2012 states in Annex D-8 that the value to be used for calculating maximum direct current incident energy is the bolted fault current in amperes, which is the same as the battery short circuit current. "Short circuit current" is the term generally used within the battery industry. The short circuit current values for individual cells or units can be obtained from the battery manufacturer.
(2) be calculated at the terminals of the battery where the arc flash potential is highest;
(3) be determined by the owner or owner's agent responsible for the battery installation;
(4) include the date the ~~fault current~~ calculation was performed; and
(5) be of sufficient durability to withstand the environment involved.
(D) Modifications. When modifications to the electrical installation occur that affect the maximum available fault current, the maximum available fault current shall be verified or recalculated as necessary to ensure the necessary updates are made to reflect new available fault current at the terminals of the battery.

Substantiation: The panel rejected the original proposal because it lacked "technical substantiation to require a calculation for dc fault current. The text is revised and additional bullets are provided to match the manual of style. The revised text correlates with other sections of the Code.

480.5: The word "nominal" is added to be consistent with 480.2 and to clarify that battery voltages are charged within a range that can exceed 50 volts.

480.5(A): We support the explanations of negative ballots by Little and Spina. For safety purposes, the disconnecting means must be as close as reasonably possible to the terminals of the battery (where the voltage and short circuit current is at its highest). "Within sight" could allow a disconnect to be as far as 50 feet away from the battery terminals, thereby creating an unnecessary hazard. Conversely, while it may be theoretically possible to put the disconnect only inches away from the terminal, such practice is seldom reasonable and prudent. The term "as close as practicable" satisfies both issues. The term "as close as practicable" is used elsewhere in the NEC and is added to the requirement for the disconnecting means to be within sight of the battery. This proposed revision correlates with the present requirement in 240.21(H), which requires overcurrent protection to be installed as "close as practicable" to the battery terminals.

The intent of 480.5(A) is to identify the hazard potential precisely at the point of maximum arc flash potential at the battery terminals and the adjacent battery disconnect. Because the value will change depending upon where the measurement is taken, the Code needs to specify where the calculation is to be determined.

Regarding the deletion of the word "system" we note that, by Article 480's own definition, a "battery system" encompasses "Interconnected battery subsystems consisting of one or more storage batteries and battery chargers, and can include inverters, converters, and associated electrical equipment." The word "system" is too vague, so it is replaced with the word "terminals" to harmonize with 240.21(H) and to precisely identify where the disconnecting means should be located.

480.5(B): Article 645 requires remote activation for battery disconnects serving ITE rooms. The disconnect serving an ITE room must be capable of being locked open to prevent the remote actuation from occurring when it will jeopardize safety of personnel. The text is similar to that used elsewhere in the Code, such as in 450.14.

480.5(C): The text is modified to correlate with section 110.24. An editorial change puts the requirements in bullet form per the manual of style. The purpose of posting the battery short circuit current in bullet (1) is to allow maintenance personnel to determine the required PPE by using the guidance provided in NFPA 70E. Annex D.8 in NFPA 70E provides guidance for the user to calculate the arcing current from the system bolted fault current. NFPA 70E Table 130.7(c)(15)(b) provides the recommend PPE provided that the user can determine the arcing current. If the system bolted fault current is not provided, it is unlikely that a worker will have the ability to determine the arcing current, thereby making Table 130.7(c)(15)(b) useless to the people who really need it. The present requirement for labeling of ac equipment already allows field technicians to determine PPE from the ac tables (see Table 130.7(c)(15)(a)). This text for dc-output batteries is consistent with the requirements for ac equipment. We note that proposals have been submitted to NPFA 70E that will likely change Table 130.7(c)(15)(b) to be based on system bolted fault current only, thereby making the text in 480.4(C) even more useful.

Short circuit on individual cells or units can be obtained from the battery manufacturer. However, the short-circuit current of an entire battery must factor in such things as the number of cells, line impedance within intercell and intertier connectors and other conductors, cable length, parallel battery strings, etc. Bullet (3) stipulates that such calculations are to be performed by the owner or owner's agent who is ultimately responsible for the system/installation design. This is consistent with equipment marking requirements in NFPA 70E.

An informational note is added to 480.5(C)(1) to clarify possible confusion over terms. In this context, the battery's bolted fault current and battery short circuit current are synonymous. "Short circuit current" is the term used and the value that will be provided by battery manufacturers.

480.5(D): Text is necessary to explain what needs to be done when equipment is modified. The text correlates with 110.24, but it clarifies that the value is to be calculated for the potential at the battery terminals and no place else.

Panel Meeting Action: Accept in Principle in Part
CMP-13 accepts in principle:
The concept of "nominal" voltage in the first sentence of 480.5;
The concepts of "readily accessible" and "within sight" in 480.5(A);
And 480.5(B)
CMP-13 Holds the following new material:
The phrase "to qualified personnel for inspection and maintenance" in 480.5(A);
480.5(C)(1), Informational Note
480.5(C)(2);
480.5(C)(3);
And 480.5(D)
CMP-13 Rejects the reference to 110.24 in 480.5(C)
CMP-13 Accepts in Principle language providing requirements for field marking of the disconnecting means including: Voltage, Fault current, date of the calculation, and durability to withstand the environment.
For clarity and to correlate with action on Comment 13-21 revise 480.5(D) as follows:
(D) Notification. The disconnecting means shall be legibly marked in the field. A label with the marking shall be placed in a conspicuous location near the battery if a disconnecting means is not provided. The marking shall be of sufficient durability to withstand the environment involved and shall include:
(1) the nominal battery voltage
(2) the maximum available short circuit current derived from the stationary battery system, and
(3) the date the calculation was performed.
Informational Note: Battery equipment suppliers can provide information about short circuit current on any particular battery model.

Panel Statement: The concepts of remote operation, "nominal" volts, "readily accessible" and "within sight" are accepted in principle in the panel action on comment 13-21. CMP-13 accepts in principle the requirements for field marking but modifies the language to incorporate the changes into text accepted by Comment 13-21.

CMP-13 holds new material that has not had the opportunity for public review. CMP-13 rejects the reference to 110.24 in 480.5(C) since 110.24 gives field marking requirements for service equipment.

Number Eligible to Vote: 21
Ballot Results: Affirmative: 21
Comment on Affirmative:
LITTLE, L.: We are voting affirmative on the panel action to "Accept in Principle in Part" comment 13-22. It is important to note for the Correlating Committee and the public that this action clarifies the final text for 480.5(D). See our affirmative statement on comment 13-21.

13-23 Log #858 NEC-P13 **Final Action: Accept in Principle**
(480.9(A))

Submitter: Stephen McCluer, Schneider Electric / Rep. IEEE Stationary Battery Committee
Comment on Proposal No: 13-39
Recommendation: Revise existing NEC-2011 text to read as follows per the proposal carried over from the 2010 annual meeting:
480.9 Battery Locations. Battery locations shall conform to 480.9(A),(B), and (C).
(A) Ventilation. Provisions appropriate to the battery technology shall be made for sufficient diffusion and ventilation of ~~the~~ gases from the battery, if present, to prevent the accumulation of an explosive mixture.
Revise the proposed text that would add a new Informational Note to read as follows:
Informational Note: See ~~IEEE/ASHRAE Std. 1635, Guide for the Ventilation and Thermal Management of Stationary Battery Installations.~~ NFPA 1 Chapter 52 for ventilation considerations for specific battery chemistries.

Substantiation: The proposal originally appeared as a comment in the 2010 Annual Meeting NEC ROP and was held for further study during the process of the 2014 NEC cycle.

480.9(A): Delete the word "the" and add the phrases "appropriate to the battery technology" and "if present", The statement, "ventilation of the gases from the battery" is too strong because it suggests that there are always gases, which is simply not a true statement. The revised text recognizes that some batteries emit gas and others do not. In other words, special ventilation is not required for all battery types.

Informational Note: The note is revised. The appropriate source for guidance regarding proper ventilation would be the Fire Code (NFPA 1). NFPA 1 identifies ventilation requirements for several types of batteries in Chapter 52. We note that ventilation requirements are normally beyond the scope of the National Electrical Code.

We also wish to note that the publication date for IEEE 1635/ASHRAE 22, *Guide for the Ventilation and Thermal Management of Stationary Battery Installations*, is October 2012. This document, jointly developed and published by ASHRAE and IEEE, provides detailed information about how to design ventilation of most battery systems.

Panel Meeting Action: Accept in Principle
Revise existing NEC-2011 text to 480.9(A) read as follows:
(A) Ventilation. Provisions <u>appropriate to the battery technology</u> shall be made for sufficient diffusion and ventilation of ~~the~~ gases from the battery, <u>if present,</u> to prevent the accumulation of an explosive mixture.
Revise the proposed text that would add a new Informational Notes to read as follows:
Informational Note <u>1</u>: See ~~IEEE/ASHRAE Std. 1635, Guide for the Ventilation and Thermal Management of Stationary Battery Installations.~~ <u>NFPA 1 Chapter 52 for ventilation considerations for specific battery chemistries.</u>
<u>**Informational Note 2:** Some battery technologies do not require ventilation.</u>
Note no other changes were made to the remainder of this section in this action.
Panel Statement: Informational Note 2 was added for clarity. The committee does not agree with all of the submitter's substantiation.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 21

13-24 Log #1527 NEC-P13 **Final Action: Reject**
(480.9(C))

TCC Action: The Correlating Committee directs that the Action on this comment be reported as "Reject" because, per the Action on Comment 1-81, 110.26 was not changed to 110.27.
Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 13-42
Recommendation: Revise text to read as follows:
480.9 Battery Locations.
(C) Spaces About Battery Systems. Spaces about battery systems shall comply with ~~110.26~~ <u>110.27</u>. Working space shall be measured from the edge of the battery cabinet, racks, or trays.
Substantiation: 600 volt clearance has moved from 110.26 to 110.27.
Panel Meeting Action: Accept
Panel Statement: The only change to proposed (C) is to revise 110.26 to 110.27 based on a change in the 2014 ROP.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 21

13-25 Log #859 NEC-P13 **Final Action: Accept in Principle**
(480.9(C), Informational Note (New))

TCC Action: The Correlating Committee directs that "110.26" not be changed to "110.27" because of the Action taken on comment 1-81. The Correlating Committee further directs that "may be" be replaced with "is often." This is an editorial correction.
Submitter: Stephen McCluer, Schneider Electric / Rep. IEEE Stationary Battery Committee
Comment on Proposal No: 13-41
Recommendation: Proposal was to add a new informational note:
480.9(C) Working Space. Working space about the battery systems shall comply with 110.26. Working clearance shall be measured from the edge of the battery rack, <u>tray, or cabinet.</u>
<u>**Informational Note:** Additional space may be needed to accommodate battery hoisting equipment, tray removal, or spill containment.</u>
Substantiation: The panel rejected the proposal on the basis that "this information does not provide for the practical safeguarding of persons and property from hazards arising from the use of electricity." We disagree and we concur with the explanations of negative by Degnan and Little.
The informational note is not for the electrician doing the work; it's for the engineer who designs the room to comply with existing code without factoring in *additional* space for service equipment. The Code provides minimum requirements. The proposed informational note is designed to inform the code user that additional space may be required. Where adequate space is not provided to permit the hoisting, removal or replacement of batteries, serious safety concerns exist. The intent is to create a safer working environment.
Batteries can never de-energized. Mishandling because space was not allowed for battery handling can result it electrical shorts, dropped and broken battery units (e.g., acidic or alkaline hazardous material spill), etc.
The section should also note that the physical point of measurement should begin from the furthest point of protrusion into the working space. Many batteries are installed in cabinets, not in racks. There might also be spill containment barriers which extend around the battery rack and thereby reduce the working space.
Panel Meeting Action: Accept in Principle
CMP-13 accepts addition of the Informational Note but retains the original text for 480.9(C) as presented in the ROP Draft and modified by Comment 13-24 as follows:
(C) Spaces About Battery Systems. Spaces about battery systems shall comply with 110.27. Working space shall be measured from the edge of the battery cabinet, racks, or trays.
<u>**Informational Note:** Additional space may be needed to accommodate battery hoisting equipment, tray removal, or spill containment.</u>
Panel Statement: The panel notes that the existing text of 480.9(C) was not duplicated in this comment. The panel retains the text that was accepted in Proposal 13-41. The reference to 110.26 was changed to 110.27 by Comment 13-24 based on an action in the ROP.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 21

13-26 Log #860 NEC-P13 **Final Action: Accept in Principle in Part**
(480.9(D) (New))

Submitter: Stephen McCluer, Schneider Electric / Rep. IEEE Stationary Battery Committee
Comment on Proposal No: 13-43
Recommendation: Revise text to read as follows:
480.9(D) <u>Marking for</u> Personnel access to energized batteries. Each battery space shall be marked ~~"Battery room restricted to authorized personnel" or "Area restricted to authorized personnel~~ <u>in accordance with 110.27(C)</u>
<u>Informational Note: NFPA 70E includes guidance in 320.3(A)(4) for warning signs to be posted in battery rooms.</u>
Substantiation: 110.27**(C)** says: "Entrances to rooms and other guarded locations that contain exposed live parts shall be marked with conspicuous warning signs forbidding unqualified persons to enter."
This new paragraph 480.9(D) is for "marking of the space", whereas existing 480.9(B) (which references the same section) is for "guarding of live parts"'.
An informational note is added to reference NFPA 70E where, in addition to limited access, warning signs are also required for electrical hazard warnings, chemical hazard warnings, and PPE.
Panel Meeting Action: Accept in Principle in Part
Accept in Principle the revised language. Reject addition of the informational note.
Panel Statement: Panel action on Comment 13-24 has met the submitter's intent for the revised language and reference to Section 110.27.
Warning sign requirements exist in many places of the NEC and they are not accompanied by informational notes referencing NFPA 70E, *Standard for Electrical Safety in the Workplace*. The warning sign requirement is sufficiently clear without the additional informational note.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 21

13-27 Log #617 NEC-P13 **Final Action: Accept in Principle**
(480.9(E))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 13-45
Recommendation: Revise text to read as follows:
480.9 Battery Locations.
(E) Egress. Personnel door(s) intended for entrance to and egress from rooms designated as battery rooms shall be equipped with door(s) that open in the direction of egress and shall be equipped with <u>listed</u> panic <u>hardware</u> ~~bars, pressure plates, or other devices that are normally latched but open under simple pressure~~.
Substantiation: See for example:
110.27 Spaces About Electrical Equipment.
(C) Entrance to and Egress from Working Space.
(3) Personnel Doors. Where equipment rated 800 A or more that contains overcurrent devices, switching devices, or control devices is installed and there is a personnel door(s) intended for entrance to and egress from the working space less than 7.6 m (25 ft) from the nearest edge of the working space, the door(s) shall open in the direction of egress and be equipped with listed panic hardware.
Using the same text for the same meaning reduces confusion.
Panel Meeting Action: Accept in Principle
Revise 480.9(E) as follows:
(E) Egress. Personnel door(s), intended for entrance to and egress from rooms designated as battery rooms, shall ~~be equipped with door(s) that~~ open in the direction of egress and shall be equipped with listed panic hardware. ~~hardware bars, pressure plates, or other devices that are normally latched but open under simple pressure.~~
Panel Statement: The proposed revision has been modified for clarity.

13-28 Log #861 NEC-P13 **Final Action: Accept**
(480.9(F) (New))

Submitter: Stephen McCluer, Schneider Electric / Rep. IEEE Stationary Battery Committee
Comment on Proposal No: 13-46
Recommendation: Add new revised text as proposed in 13-46 item 3.
<u>**480.9(F) Piping in Battery Rooms**</u>
<u>Gas piping shall not be permitted in dedicated battery rooms.</u>
Substantiation: The panel could have accepted Proposal 13-46 in part because the proposal has three parts, only one of which was addressed in the committee comment; i.e., "submitter did not provide adequate substantiation." We withdraw parts (1) and (2), but we recommend that the panel accept the proposal as submitted for part (3).
Gas piping proposes three possible hazards in a battery room: (1) The gas itself, if accidentally released into the room, could have a damaging effect on

the battery containers and/or connections; or (2) The gas (which is presumed to be flammable), could be ignited by the battery system, which is always energized (although we acknowledge that a battery will not spontaneously spark); or

(3) In the event of overcharging and/or thermal runaway on a battery system, atomized electrolyte could corrode or otherwise impair the integrity of metallic gas piping over time.

Battery systems, by their very nature, are used for critical and or emergency applications. Therefore, battery rooms should be designed to a somewhat higher standard than other occupancies to ensure the highest level of safety. The probability of mixing stored energy with flammable gas is quite low, but the risk could be eliminated (i.e., probability could be zero) if the space is designed for safety and fire prevention

Panel Meeting Action: Accept

Ballot Results: Affirmative: 21

13-29 Log #862 NEC-P13 **Final Action: Accept in Principle**
(480.9(X), Informational Note (New))

Submitter: Stephen McCluer, Schneider Electric / Rep. IEEE Stationary Battery Committee
Comment on Proposal No: 13-47
Recommendation: Add new text to read as follows:
<u>480.9(X) Illumination. Spaces containing battery systems shall comply with 110.26(D). The location of luminaires shall not:</u>
<u>(1) expose personnel to energized battery components when performing maintenance on the luminaires; or</u>
<u>(2) create a hazard to the battery upon failure of the luminaire.</u>
Substantiation: The committee's action should have been to accept in principle in part. In rejecting the proposal the panel stated that "Referencing Section 110.26(D) is incorrect since this section applies to service equipment, switchboards, panelboards, or motor control centers, not to battery rooms or areas containing batteries.' This COMMENT deletes the reference.

The panel also stated, "If illumination is required, that text needs to be provided in Article 480." We agree. We acknowledge that it is difficult to quantify how much lighting is sufficient to safely work on energized equipment. NFPA 70E requires lighting to be sufficient for a worker to be able to read documents. Because batteries cannot be de-energized, placement of luminaires in aisles addresses the law of gravity and minimizes the risk of short circuits or other hazards created by maintenance and/or equipment failure.

Panel Meeting Action: Accept in Principle
Revise text to read as follows:

480.9(G<u>) Illumination.</u> <u>Illumination shall be provided for working</u> spaces ~~Spaces~~ containing battery systems<u>. The lighting outlets shall not be controlled by automatic means only.</u> <u>Additional lighting outlets shall not be required where the work space is illuminated by an adjacent light source.</u> ~~shall comply with 110.26(D)~~. The location of luminaires shall not:

(1) expose personnel to energized battery components <u>while</u> ~~when~~ performing maintenance on the luminaires <u>in the battery space</u>; or

(2) create a hazard to the battery upon failure of the luminaire.

Note CMP 13 requests this new first level subdivision be the last subdivision in 480.9.

Panel Statement: The text used in this comment is based on the existing text in 110.26(D) but references battery spaces, rather than service equipment, switchboards, panelboards and motor control centers.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 21

13-30 Log #863 NEC-P13 **Final Action: Accept**
(480.11 (New))

Submitter: Stephen McCluer, Schneider Electric / Rep. IEEE Stationary Battery Committee
Comment on Proposal No: 13-48
Recommendation: No new text.
Substantiation: We concur with the panel's action to reject the proposal to add a new paragraph 480.11, which would require all batteries and accessories to be "listed." The proposal is too broad; Listing standards do not exist for all elements in a battery system. Furthermore, battery "systems" are usually customized and assembled at site, so this requirement would mandate site inspection and field marking on almost every installation, thereby creating unnecessary expense and time. Submitter has not demonstrated that a problem exists today that would be fixed with the listing requirement.
Panel Meeting Action: Accept
Number Eligible to Vote: 21
Ballot Results: Affirmative: 21

ARTICLE 490 — EQUIPMENT, OVER 1000 VOLTS, NOMINAL

9-77 Log #735 NEC-P09 **Final Action: Accept**
(490)

TCC Action: The Correlating Committee advises that article titles are the responsibility of the Correlating Committee and the Correlating Committee accepts the Panel Action.
Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 9-153
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1
Ballot Not Returned: 1 Coghill, P.
Explanation of Negative:

FERRARO, J.: It is recognized that increasing voltage from 600 volts to 1000 volts may be applicable to specific installations. However, adequate technical substantiation has not been provided to support the change in this Article.

9-78 Log #154 NEC-P09 **Final Action: Accept**
(490.48 (New))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 9-179
Recommendation: The Correlating Committee directs that the panel clarify the panel action on this proposal pertaining to the last phrase in the Exception to comply with the permissive language requirement of the NEC Style Manual.
The Correlating Committee notes that the Exception is not written in mandatory language.
It was the action of the Correlating Committee that further consideration be given to the comments expressed in the voting relating to Proposal 9-171.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: Refer to Comment 9-79 for the required changes in text.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Coghill, P.

9-79 Log #1567 NEC-P09 **Final Action: Accept**
(490.48)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 9-179
Recommendation: Accept the proposal in principle; delete the word “legible” from the opening clause and reword the final clause of the exception to read “diagrams shall not be required.”
Substantiation: This comment addresses the Correlating Committee concerns about alleged lack of mandatory text in the exception and the inconsistency relative to the decision to delete the word “legible” in another location.
Panel Meeting Action: Accept
Panel Statement: CMP 9 notes that the changes are also included in the action on Comment 9-9.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Coghill, P.

9-80 Log #599 NEC-P09 **Final Action: Accept**
(490.53)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 9-180
Recommendation: Revise text to read as follows:
490.53 Enclosures. All energized switching and control parts shall be enclosed in grounded metal cabinets or enclosures. These cabinets or enclosures shall be marked
“DANGER — HIGH VOLTAGE — KEEP OUT”
and shall be locked so that only authorized and qualified persons can enter. The danger marking(s) or labels shall comply with 110.21(B). Circuit breakers and protective equipment shall have the operating means projecting through the metal cabinet or enclosure so these units can be reset without opening locked doors. With doors closed, ~~reasonable~~ safe access for normal operation of these units shall be provided.
Substantiation: This is the only place in the *Code* that *safe* is modified by *reasonable*. This adjective could be construed to reduce the safety factor.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Coghill, P.

ARTICLE 500 — HAZARDOUS (CLASSIFIED) LOCATIONS, CLASSES I, II, AND III, DIVISIONS 1 AND 2

14-1 Log #392 NEC-P14 **Final Action: Accept in Principle**
(500.2, 504.2, 505.2, 506.2, 513.2, 515.2, and 516.2)

TCC Action: Definition of “Mobile Equipment” Retain in Article 513.
Definition of “Portable Equipment” Retain in Article 513.
Definition of “Flash-Off Area” Place in Article 516 as seen in Comment 14-1.
Definition of “Limited Finishing Workstation” Place in Article 516 as seen in Comment 14-1.
Definition of “Resin Application Area” Place in Article 516 as seen in Comment 14-1.
Definition of “Spray Area” Retain in Article 516 as revised.
Definition of “Spray Booth” Retain in Article 516 as revised.
Definition of “Spray Room” Retain in Article 516 as revised.
Definition of “Unenclosed Spray Area” Place in Article 516 as seen in Comment 14-1.
Submitter: John L. Simmons, Florida East Coast Electrical JATC
Comment on Proposal No: 14-3
Recommendation: Revise the text found in Sections 500.2, 504.2, 505.2, 506.2, 513.2, 515.2 and 516.2 as follows:
● Revise the parent text of 500.2 to include all definitions in Articles 500 – 516 that appear in more than one article. A new last sentence is added to make it clear that 500.2 may have definitions that apply to Articles 505 and 506 but that no other sections of Article 500 apply to 505 or 506 unless they are specifically referenced in the article. This will clarify the intent of CMP14 that Articles 505 and 506 are not a part of the hazardous locations protection methods prescribed in Article 500.
● Relocate the term “associated apparatus” from 504.2 to 500.2. The term is used in Articles 500, 504, 505 and 506.
● Include the new term “cord connector” which was introduced in Proposal 14-11b and accepted by CMP14.
● Update the standard dates in the informational note for dust-ignitionproof.
● Change the term dusttight to dusttight (as applied to Hazardous (Classified) Locations). This will in essence remove the conflict between the definition in 500.2 and Article 100 and it is consistent with the format used in Article 100 to allow two definitions for accessible (accessible (as applied to equipment) and accessible (as applied to wiring methods).
● Dusttight Informational Note – see panel action on Proposal 14-10.
● Electrical and Electronic Equipment Informational Note – see panel action on Proposal 14-10.
● Change the term explosionproof equipment to explosionproof equipment (as applied to Hazardous (Classified) Locations). This will in essence remove the conflict between the definition in 500.2 and Article 100 and it is consistent with the format used in Article 100 to allow two definitions for accessible (accessible (as applied to equipment) and accessible (as applied to wiring methods).
● Hermetically Sealed Informational Note – see panel action on Proposal 14-10.
● Relocate the definition of “intrinsically safe apparatus” from 504.2 to 500.2. The term is found in Articles 500, 503, 504, 505 and 506.
● Nonincendive Circuit Informational Note – see panel action on Proposal 14-10.
● Nonincendive Component Informational Note – see panel action on Proposal 14-10.
● Nonincendive Equipment Informational Note – see panel action on Proposal 14-10.
● Nonincendive Field Wiring Apparatus Informational Note – see panel action on Proposal 14-10.
● Delete the Informational Note for Oil Immersion. UL 698 has been withdrawn.
● Relocate the definition of “pressurized” and the Informational Note for the definition from 506.2 to 500.2. The term is found in Articles 501, 505 and 506. Since the term is also used in Article 326, the phrase “as applied to Hazardous (Classified) Locations” has been added to make it perfectly clear that this definition is not intended to define the term as used in that article.
● Relocate the definition of “simple apparatus” and the Informational Note for the definition from 504.2 to 500.2. The term is found in Articles 500, 501, 502, 503, 504, 505 and 506.
● Create new section 501.2 Definitions and refer back to 500.2. This will add clarity to the use of definitions in Articles 500 – 516.
● Create new section 502.2 Definitions and refer back to 500.2. This will add clarity to the use of definitions in Articles 500 – 516.
● Create new section 503.2 Definitions and refer back to 500.2. This will add clarity to the use of definitions in Articles 500 – 516.
● Create new parent text for 504.2. The new text will make it perfectly clear that the defined terms in the section apply specifically to Article 504.
● Delete the definition of “associated apparatus” from 504.2 and relocate it to 500.2. The term is used in Articles 500, 504, 505 and 506.
● Delete the control drawing reference to 500.2. With the proposed restructuring of the definitions in Article 500 – 516 it is perfectly clear that defined terms will be found in one of two locations; 500.2 if the term is used in more than one article and the dot 2 section of the article it appears in, if it is only used in that article.
● Delete the definition of “intrinsically safe apparatus” from 504.2 and relocate it to 500.2. The term is used in Articles 500, 503, 504, 505, and 506.
● Update the standard date in the Informational Note for “intrinsically safe circuit”.
● Delete the definition of “simple apparatus” from 504.2 and relocate it to 500.2. The term is used in Articles 500, 501, 502, 503, 504, 505, and 506.
● Revise the parent text for 505.2 to make it consistent with the new parent text of 504.2.
● Delete the definition of “combustible gas detection system” from 505.2. The term is defined in 500.2 and 505.2 in the current version of the NEC (2008). The term is used Articles 500 and 505. Under the proposed restructure, definitions of terms used in more than one article (500 – 516) are being placed in 500.2.
● Delete the definition of “electrical and electronic equipment” and its Informational Note from 505.2. The term is defined in 500.2 and 505.2 in the current version of the NEC (2008). The term is used Articles 500, 501, 502, 503, 505, and 506. Under the proposed restructure, definitions of terms used in more than one article (500 – 516) are being placed in 500.2.
● Revise Informational Note 1 and Note 2 for “encapsulation ‘m’.” See the panel action on Proposal 14-131.

● Revise the standard information in the Informational Note for “flameproof “d”. See the panel action on Proposal 14-129.

● Revise the standard information in the Informational Note for “intrinsic safety ‘i’”. See the panel action on Proposal 14-129.

● Oil Immersion “o” Informational Note: insert the standard date.

● Powder Filling “q” Informational Note: insert the standard date.

● Revise the standard information in the Informational Note for “pressurization “p””. See the panel action on Proposal 14-129.

● Revise the standard information in the Informational Note for “type of protection “n””. See the panel action on Proposal 14-129.

● Delete the definition of “unclassified locations” from 505.2. The term is defined in 500.2 and 505.2 in the current version of the NEC (2008). The term is used Articles 500, 501, 502, 503, 504, 505, 506, 513, 514, and 516. Under the proposed restructure, definitions of terms used in more than one article (500 – 516) are being placed in 500.2.

● Revise the parent text for 506.2 to make it consistent with the new parent text of 504.2.

● Delete the definition of “associated nonincendive field wiring apparatus” from 506.2. The term is defined in 500.2 and 506.2 in the current version of the NEC (2008). The term is used Articles 500, and 506. Under the proposed restructure, definitions of terms used in more than one article (500 – 516) are being placed in 500.2.

● Delete the definition of “combustible dust” from 506.2. The term is defined in 500.2 and 505.2 in the current version of the NEC (2008). The term is used Articles 500, 502, 504, 505, 506, and 516. Under the proposed restructure, definitions of terms used in more than one article (500 – 516) are being placed in 500.2.

● Delete the definition of “dust-ignitionproof” and its Informational Note from 506.2. The term is defined in 500.2 and 505.2 in the current version of the NEC (2008). The term is used Articles 500, 502, and 506. (Other than the definition in 506.2 the term is only used one other time in 506 and that is in an informational note.) Under the proposed restructure, definitions of terms used in more than one article (500 – 516) are being placed in 500.2.

● Delete the definition of “dusttight” from 506.2. The term is defined in Article 100 and sections 500.2 and 505.2 in the current version of the NEC (2008). The term is used Articles 500, 502, 503, and 506. Under the proposed restructure, definitions of terms used in more than one article (500 – 516) are being placed in 500.2.

● Delete the definition of “nonincendive circuit” and its Informational Note from 506.2. The term is defined in 500.2 and 506.2 in the current version of the NEC (2008). The term is used in Articles 500, 501, 502, 503, and 506.

● Delete the definition of “nonincendive equipment” and its Informational Note from 506.2. The term is defined in 500.2 and 506.2 in the current version of the NEC (2008). The term is used in Articles 500, 506, and 516.

● Delete the definition of “nonincendive field wiring” from 506.2. The term is defined in 500.2 and 506.2 in the current version of the NEC (2008). The term is used in Articles 500, 501, 502,503, 504, and 506.

● Delete the definition of “nonincendive field wiring apparatus” and its Informational Note from 506.2. The term is defined in 500.2 and 506.2 in the current version of the NEC (2008). The term is used in Articles 500, 501, 502, 503, and 506.

● Delete the definition of “pressurized” and its Informational Note from 506.2. The term is defined in 500.2 and 506.2 in the current version of the NEC (2008). The term is used in Articles 501, 505 and 506.

● Change protection by encapsulation “mD” to protection by encapsulation “m” and revise the standard in the Informational Note No. 1. Revise Informational Note No. 2. See panel action on Proposal 14-196.

● Change protection by enclosure “tD” to protection by encapsulation “t” and revise the standard in the Informational Note No. 1. Add new Informational Note No. 2. See panel action on Proposal 14-198.

● Revise the parent text for 513.2 to make it consistent with the new parent text of 504.2.

● Change the term portable equipment to portable equipment (as applied to Article 513). The term portable equipment appears in Articles 250,368, 430, 490, 511, 513, 516, 517, 518, 520, 525, 530, 540, 640, 668, 675, and 680. The term is defined in Articles 513, 520, 530, 640, and 680. This proposed change makes it clear that the definition found in 513.2 is specific to Article 513.

● Delete 515.2 in its entirety. See Proposal 14-241.

● Revise the parent text for 516.2 to make it consistent with the new parent text of 504.2.

A copy of the NEC code text with proposed changes follows:

500.2 Definitions. The definitions found in this section are specific to the Hazardous (Classified) Locations found in ~~For purposes of~~ Articles 500 through ~~504 and Articles 510 through~~ 516 ~~the following definitions apply~~. No other section of this Article shall apply to Article 505 or 506 unless it is specifically referenced in that article.

Associated Apparatus. Apparatus in which the circuits are not necessarily intrinsically safe themselves but that affect the energy in the intrinsically safe circuits and are relied on to maintain intrinsic safety. Associated apparatus may be either of the following:

(1) Electrical apparatus that has an alternative-type of protection for use in the appropriate hazardous (classified) location

(2) Electrical apparatus not so protected that shall not be used within a hazardous (classified) location

Informational Note No. 1: Associated apparatus has identified intrinsically safe connections for intrinsically safe apparatus and also may have connections for nonintrinsically safe apparatus.

Informational Note No. 2: An example of associated apparatus is an intrinsic safety barrier, which is a network designed to limit the energy (voltage and current) available to the protected circuit in the hazardous (classified) location, under specified fault conditions.

Associated Nonincendive Field Wiring Apparatus. Apparatus in which the circuits are not necessarily nonincendive themselves but that affect the energy in nonincendive field wiring circuits and are relied upon to maintain nonincendive energy levels. Associated nonincendive field wiring apparatus may be either of the following:

(1) Electrical apparatus that has an alternative type of protection for use in the appropriate hazardous (classified) location

(2) Electrical apparatus not so protected that shall not be used in a hazardous (classified) location Informational Note: Associated nonincendive field wiring apparatus has designated associated nonincendive field wiring apparatus connections for nonincendive field wiring apparatus and may also have connections for other electrical apparatus.

Combustible Dust. Any finely divided solid material that is 420 microns (0.017 in.) or smaller in diameter (material passing a U.S. No. 40 Standard Sieve) and presents a fire or explosion hazard when dispersed and ignited in air. [**499,** 2008]

Combustible Gas Detection System. A protection technique utilizing stationary gas detectors in industrial establishments.

Control Drawing. A drawing or other document provided by the manufacturer of the intrinsically safe or associated apparatus, or of the nonincendive field wiring apparatus or associated nonincendive field wiring apparatus, that details the allowed interconnections between the intrinsically safe and associated apparatus or between the nonincendive field wiring apparatus or associated nonincendive field wiring apparatus.

Cord Connector. A fitting intended to terminate a cord to a box or similar device and reduce the strain at points of termination and may include an explosionproof, a dust-ignition proof, or a flameproof seal.

Dust-Ignitionproof. Equipment enclosed in a manner that excludes dusts and does not permit arcs, sparks, or heat otherwise generated or liberated inside of the enclosure to cause ignition of exterior accumulations or atmospheric suspensions of a specified dust on or in the vicinity of the enclosure.

Informational Note: For further information on dustignitionproof enclosures, see Type 9 enclosure in ANSI/NEMA 250-~~1991~~ 2008, *Enclosures for Electrical Equipment*, and ANSI/UL 1203-~~1994~~ 2009, *Explosionproof and Dust-Ignitionproof Electrical Equipment for Hazardous (Classified) Locations*.

Dusttight (as applied to Hazardous (Classified) Locations). Enclosures constructed so that dust will not enter under specified test conditions.

Informational Note: See ~~ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations*.~~ ANSI/ISA-12.12.01-2011, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*

Electrical and Electronic Equipment. Materials, fittings, devices, appliances, and the like that are part of, or in connection with, an electrical installation.

Informational Note: Portable or transportable equipment having self-contained power supplies, such as battery-operated equipment, could potentially become an ignition source in hazardous (classified) locations. See ~~ISA-RP12.12.03-2002, *Recommended Practice for Portable Electronic Products Suitable for Use in Class I and II, Division 2, Zone 2 and Class III, Division 1 and 2 Hazardous (Classified) Locations.*~~ ANSI/ISA-12.12.03-2011, *Standard for Portable Electronic Products Suitable for Use in Class I and II, Division 2, Zone 2 and Class III, Division 1 and 2 Hazardous (Classified) Locations*.

Explosionproof Equipment (as applied to Hazardous (Classified) Locations). Equipment enclosed in a case that is capable of withstanding an explosion of a specified gas or vapor that may occur within it and of preventing the ignition of a specified gas or vapor surrounding the enclosure by sparks, flashes, or explosion of the gas or vapor within, and that operates at such an external temperature that a surrounding flammable atmosphere will not be ignited thereby.

Informational Note: For further information, see ANSI/UL 1203-~~1994~~ 2009, *Explosion-Proof and Dust- Ignition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations*.

Hermetically Sealed. Equipment sealed against the entrance of an external atmosphere where the seal is made by fusion, for example, soldering, brazing, welding, or the fusion of glass to metal.

~~Informational Note: For further information, see ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Division 1 and 2 Hazardous (Classified) Locations*.~~ ANSI/ISA-12.12.01-2011, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*

Intrinsically Safe Apparatus. Apparatus in which all the circuits are intrinsically safe.

Nonincendive Circuit. A circuit, other than field wiring, in which any arc or thermal effect produced under intended operating conditions of the equipment, is not capable, under specified test conditions, of igniting the flammable gas–air, vapor–air, or dust–air mixture.

Informational Note: Conditions are described in ~~ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and*~~

~~*Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*~~ ANSI/ISA-12.12.01-2011, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*

Nonincendive Component. A component having contacts for making or breaking an incendive circuit and the contacting mechanism is constructed so that the component is incapable of igniting the specified flammable gas–air or vapor–air mixture. The housing of a nonincendive component is not intended to exclude the flammable atmosphere or contain an explosion.

Informational Note: For further information, see ~~ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*~~ ANSI/ISA-12.12.01-2011, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*

Nonincendive Equipment. Equipment having electrical/electronic circuitry that is incapable, under normal operating conditions, of causing ignition of a specified flammable gas–air, vapor–air, or dust–air mixture due to arcing or thermal means.

Informational Note: For further information, see ~~ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*~~ ANSI/ISA-12.12.01-2011, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*

Nonincendive Field Wiring. Wiring that enters or leaves an equipment enclosure and, under normal operating conditions of the equipment, is not capable, due to arcing or thermal effects, of igniting the flammable gas–air, vapor–air, or dust–air mixture. Normal operation includes opening, shorting, or grounding the field wiring.

Nonincendive Field Wiring Apparatus. Apparatus intended to be connected to nonincendive field wiring.

Informational Note: For further information, see ~~ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*~~ ANSI/ISA-12.12.01-2011, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*

Oil Immersion. Electrical equipment immersed in a protective liquid in such a way that an explosive atmosphere that may be above the liquid or outside the enclosure cannot be ignited.

~~Informational Note: For further information, see ANSI/UL 698-1995, *Industrial Control Equipment for Use in Hazardous (Classified) Locations*.~~

Pressurized (as applied to Hazardous (Classified) Locations). The process of supplying an enclosure with a protective gas with or without continuous flow at sufficient pressure to prevent the entrance of combustible dust or ignitable fibers/flyings.

Informational Note: For further information, see ANSI/NFPA 496-2008, *Standard for Purged and Pressurized Enclosures for Electrical Equipment.*

Purged and Pressurized. The process of (1) purging, supplying an enclosure with a protective gas at a sufficient flow and positive pressure to reduce the concentration of any flammable gas or vapor initially present to an acceptable level; and (2) pressurization, supplying an enclosure with a protective gas with or without continuous flow at sufficient pressure to prevent the entrance of a flammable gas or vapor, a combustible dust, or an ignitable fiber.

Informational Note: For further information, see ANSI/NFPA 496-2008, *Purged and Pressurized Enclosures for Electrical Equipment*.

Simple Apparatus. An electrical component or combination of components of simple construction with well defined electrical parameters that does not generate more than 1.5 volts, 100 milliamps, and 25 milliwatts, or a passive component that does not dissipate more than 1.3 watts and is compatible with the intrinsic safety of the circuit in which it is used.

Informational Note: The following apparatus are examples of simple apparatus:
a) Passive components, for example, switches, junction boxes, resistance temperature devices, and simple semiconductor devices such as LEDs
b) Sources of stored energy consisting of single components in simple circuits with well-defined parameters, for example, capacitors or inductors, whose values are considered when determining the overall safety of the system
c) Sources of generated energy, for example, thermocouples and photocells, which do not generate more than 1.5 V, 100 mA milliamps, and 25 mW milliwatts

Unclassified Locations. Locations determined to be neither Class I, Division 1; Class I, Division 2; Class I, Zone 0; Class I, Zone 1; Class I, Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2; Zone 20; Zone 21; Zone 22; or any combination thereof.

501.2 Definitions. See 500.2.

502.2 Definitions. See 500.2.

503.2 Definitions. See 500.2.

504.2 Definitions. Definitions found in this section are specific to this Article.

~~**Associated Apparatus.** Apparatus in which the circuits are not necessarily intrinsically safe themselves but that affect the energy in the intrinsically safe circuits and are relied on to maintain intrinsic safety. Associated apparatus may be either of the following:~~
~~(1) Electrical apparatus that has an alternative-type protection for use in the appropriate hazardous (classified) location~~
~~(2) Electrical apparatus not so protected that shall not be used within a hazardous (classified) location~~

~~Informational Note No. 1: Associated apparatus has identified intrinsically safe connections for intrinsically safe apparatus and also may have connections for nonintrinsically safe apparatus.~~

~~Informational Note No. 2: An example of associated apparatus is an intrinsic safety barrier, which is a network designed to limit the energy (voltage and current) available to the protected circuit in the hazardous (classified) location, under specified fault conditions.~~

~~**Control Drawing.** See the definition in 500.2.~~

Different Intrinsically Safe Circuits. Intrinsically safe circuits in which the possible interconnections have not been evaluated and identified as intrinsically safe.

~~**Intrinsically Safe Apparatus.** Apparatus in which all the circuits are intrinsically safe.~~

Intrinsically Safe Circuit. A circuit in which any spark or thermal effect is incapable of causing ignition of a mixture of flammable or combustible material in air under prescribed test conditions.

Informational Note: Test conditions are described in ANSI/UL 913-~~1997~~ 2006, *Standard for Safety, Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II, and III, Division 1, Hazardous (Classified) Locations*.

Intrinsically Safe System. An assembly of interconnected intrinsically safe apparatus, associated apparatus, and interconnecting cables, in that those parts of the system that may be used in hazardous (classified) locations are intrinsically safe circuits.

Informational Note: An intrinsically safe system may include more than one intrinsically safe circuit.

~~**Simple Apparatus.** An electrical component or combination of components of simple construction with well defined electrical parameters that does not generate more than 1.5 volts, 100 milliamps, and 25 milliwatts, or a passive component that does not dissipate more than 1.3 watts and is compatible with the intrinsic safety of the circuit in which it is used.~~

~~Informational Note: The following apparatus are examples of simple apparatus:~~
~~d) Passive components, for example, switches, junction boxes, resistance temperature devices, and simple semiconductor devices such as LEDs~~
~~e) Sources of stored energy consisting of single components in simple circuits with well-defined parameters, for example, capacitors or inductors, whose values are considered when determining the overall safety of the system~~
~~f) Sources of generated energy, for example, thermocouples and photocells, which do not generate more than 1.5 V, 100 mA, and 25 mW~~

505.2 Definitions. ~~For purposes of this article, the following definitions apply.~~ Definitions found in this section are specific to this Article.

~~**Combustible Gas Detection System.** A protection technique utilizing stationary gas detectors in industrial establishments.~~

~~**Electrical and Electronic Equipment.** Materials, fittings, devices, appliances, and the like that are part of, or in connection with, an electrical installation.~~

~~Informational Note: Portable or transportable equipment having self-contained power supplies, such as battery operated equipment, could potentially become an ignition source in hazardous (classified) locations.~~

Encapsulation "m." Type of protection where electrical parts that could ignite an explosive atmosphere by either sparking or heating are enclosed in a compound in such a way that this explosive atmosphere cannot be ignited.

Informational Note No. 1: See ANSI/ISA-60079-18 (12.23.01)-2009, ~~*Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection — Encapsulation "m";*~~ *Explosive atmospheres - Part 18: Equipment protection by encapsulation "m",* ~~IEC 0079-18-1992, *Electrical apparatus for explosive gas atmospheres — Part 18: Encapsulation "m";*~~ and ANSI/UL 60079-18~~, *Electrical Apparatus for Explosive Gas Atmospheres — Part 18: Encapsulation "m"*~~ -2009, Explosive atmospheres - Part 18: Equipment protection by encapsulation "m".

Informational Note No. 2: Encapsulation is designated type of protection "ma" for use in Zone 0 locations. Encapsulation is designated type of protection "m" or "mb" for use in Zone 1 locations. Encapsulation is designated type of protection "mc" for use in Zone 2 locations.

Flameproof "d." Type of protection where the enclosure will withstand an internal explosion of a flammable mixture that has penetrated into the interior, without suffering damage and without causing ignition, through any joints or structural openings in the enclosure, of an external explosive gas atmosphere consisting of one or more of the gases or vapors for which it is designed.

Informational Note: See ~~ANSI/ISA-60079-1 (12.22.01)-2008, *Explosive Atmospheres, Part 1: Equipment protection by flameproof enclosures "d"*;~~ ANSI/ISA-60079-1-2009 (12.22.01), *Explosive Atmospheres, Part 1: Equipment protection by flameproof enclosures "d"* and ANSI/UL 60079–1-2009, *Electrical Apparatus for Explosive Gas Atmospheres — Part 1: Flameproof Enclosures"d."*

Increased Safety "e." Type of protection applied to electrical equipment that does not produce arcs or sparks in normal service and under specified abnormal conditions, in which additional measures are applied so as to give increased security against the possibility of excessive temperatures and of the occurrence of arcs and sparks.

Informational Note: See ANSI/ISA-60079-7 (12.16.01) - 2008, *Explosive Atmospheres, Part 7: Equipment protection by increased safety "e"*; and ANSI/UL 60079-7-2008, *Electrical Apparatus for Explosive Gas Atmospheres — Part 7:Increased Safety "e."*

Intrinsic Safety "i." Type of protection where any spark or thermal effect is incapable of causing ignition of a mixture of flammable or combustible material in air under prescribed test conditions.

Informational Note No. 1: See ANSI/UL 913-~~1997~~ 2006, *Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II, and III, Hazardous*

Locations; ~~ANSI/ISA-60079-11 (12.02.01)-2009, *Explosive Atmospheres, Part 11: Equipment protection by intrinsic safety "i"*~~; ANSI/ISA-60079-11-2011 (12.02.01), *Explosive Atmospheres: Part 11: Equipment protection by intrinsic safety"i"* and ANSI/UL 60079-11-2011, *Explosive Atmospheres, Part 11: Equipment protection by intrinsic safety "i."*

Informational Note No. 2: Intrinsic safety is designated type of protection "ia" for use in Zone 0 locations. Intrinsic safety is designated type of protection "ib" for use in Zone 1 locations. Intrinsic safety is designated type of protection "ic" for use in Zone 2 locations.

Informational Note No. 3: Intrinsically safe associated apparatus, designated by [ia], [ib], or [ic], is connected to intrinsically safe apparatus ("ia," "ib," or "ic," respectively) but is located outside the hazardous (classified) location unless also protected by another type of protection (such as flameproof).

Oil Immersion "o." Type of protection where electrical equipment is immersed in a protective liquid in such a way that an explosive atmosphere that may be above the liquid or outside the enclosure cannot be ignited.

Informational Note: See ANSI/ISA-60079-6 (12.00.05)-2009, *Explosive Atmospheres, Part 6: equipment protection by oil immersion "o"*; and ANSI/UL 60079-6-2009, *Electrical Apparatus for Explosive Gas Atmospheres — Part 6: Oil-Immersion "o."*

Powder Filling "q." Type of protection where electrical parts capable of igniting an explosive atmosphere are fixed in position and completely surrounded by filling material (glass or quartz powder) to prevent the ignition of an external explosive atmosphere.

Informational Note: See ANSI/ISA-60079-5 (12.00.04)-2009, *Explosive Atmospheres, Part 5: Equipment protection by powder filling "q"*; and ANSI/UL 60079-5-2009, *Electrical Apparatus for Explosive Gas Atmospheres — Part 5: Powder Filling "q."*

Pressurization "p." Type of protection for electrical equipment that uses the technique of guarding against the ingress of the external atmosphere, which may be explosive, into an enclosure by maintaining a protective gas therein at a pressure above that of the external atmosphere.

Informational Note: See ~~ANSI/ISA-60079-2 (12.04.01)-2004, *Explosive Atmospheres, Part 2: Equipment protection by pressurized enclosures "p"*~~; ANSI/ISA-60079-2-2010 (12.04.01), *Explosive Atmospheres, Part 2: Equipment protection by pressurized enclosures "p"* and IEC 60079-13-2010, *Electrical apparatus for explosive gas atmospheres — Part 13: Construction and use of rooms or buildings protected by pressurization*.

Type of Protection "n." Type of protection where electrical equipment, in normal operation, is not capable of igniting a surrounding explosive gas atmosphere and a fault capable of causing ignition is not likely to occur.

Informational Note: See ANSI/UL 60079-15, *Electrical Apparatus for Explosive Gas Atmospheres Part 15: Type of Protection "n"*; and ~~ANSI/ISA-60079-15 (12.12.02)-2008, *Electrical Apparatus for Use in Class I, Zone 2 Hazardous (Classified) Locations: Type of Protection "n."*~~ ANSI/ISA-60079-15-2009 (12.12.02)-2009, *Explosive Atmospheres – Part 15: Equipment protection by type of protection "n"*.

~~**Unclassified Locations.** Locations determined to be neither Class I, Division 1; Class I, Division 2; Class I, Zone 0; Zone 1; Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2; or any combination thereof.~~

506.2 Definitions. ~~For purposes of this article, the following definitions apply.~~ Definitions found in this section are specific to this Article.

~~**Associated Nonincendive Field Wiring Apparatus.** Apparatus in which the circuits are not necessarily nonincendive themselves but that affects the energy in nonincendive field wiring circuits and are relied upon to maintain nonincendive energy levels. Associated nonincendive field wiring apparatus may be either of the following:~~

~~(1) Electrical apparatus that has an alternative type of protection for use in the appropriate hazardous (classified) location~~

~~(2) Electrical apparatus not so protected that shall not be used in a hazardous (classified) location~~

~~Informational Note: Associated nonincendive field wiring apparatus has designated associated nonincendive field wiring apparatus connections for nonincendive field wiring apparatus and may also have connections for other electrical apparatus.~~

~~**Combustible Dust.** Any finely divided solid material that is 420 microns (0.017 in.) or smaller in diameter (material passing a U.S. No. 40 Standard Sieve) and presents a fire or explosion hazard when dispersed and ignited in air. [**499:**3.3.3]~~

Dust-Ignitionproof. ~~Equipment enclosed in a manner that excludes dusts and does not permit arcs, sparks, or heat otherwise generated or liberated inside of the enclosure to cause ignition of exterior accumulations or atmospheric suspensions of a specified dust on or in the vicinity of the enclosure.~~

~~Informational Note: For further information on dustignitionproof enclosures, see Type 9 enclosure in ANSI/NEMA 250-1991, *Enclosures for Electrical Equipment*, and ANSI/UL 1203-1994, *Explosionproof and Dust-Ignitionproof Electrical Equipment for Hazardous (Classified) Locations*.~~

~~**Dusttight.** Enclosures constructed so that dust will not enter under specified test conditions.~~

~~**Nonincendive Circuit.** A circuit, other than field wiring, in which any arc or thermal effect produced under intended operating conditions of the equipment, is not capable, under specified test conditions, of igniting the flammable gas–air, vapor–air, or dust–air mixture.~~

~~Informational Note: Conditions are described in ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations*.~~

~~**Nonincendive Equipment.** Equipment having electrical/electronic circuitry that is incapable, under normal operating conditions, of causing ignition of a specified flammable gas–air, vapor–air, or dust–air mixture due to arcing or thermal means.~~

~~Informational Note: Conditions are described in ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*~~

~~**Nonincendive Field Wiring.** Wiring that enters or leaves an equipment enclosure and, under normal operating conditions of the equipment, is not capable, due to arcing or thermal effects, of igniting the flammable gas–air, vapor–air, or dust–air mixture. Normal operation includes opening, shorting, or grounding the field wiring.~~

~~**Nonincendive Field Wiring Apparatus.** Apparatus intended to be connected to nonincendive field wiring.~~

~~Informational Note: Conditions are described in ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*~~

~~**Pressurized.** The process of supplying an enclosure with a protective gas with or without continuous flow at sufficient pressure to prevent the entrance of combustible dust or ignitable fibers/flyings.~~

~~Informational Note: For further information, see ANSI/NFPA 496-2008, *Standard for Purged and Pressurized Enclosures for Electrical Equipment*.~~

Protection by Encapsulation "m~~D~~." Type of protection where electrical parts that could cause ignition of a mixture of combustible dust or fibers/flyings in air are protected by enclosing them in a compound in such a way that the explosive atmosphere cannot be ignited.

Informational Note No. 1: For additional information, see ~~ANSI/ISA-61241-18 (12.10.07)-2006, *Electrical Apparatus for Use in Zone 20, Zone 21 and Zone 22 Hazardous (Classified) Locations — Protection by Encapsulation "mD"*~~ ANSI/ISA-60079-18 (12.23.01)-2009, *Explosive atmospheres - Part 18: Equipment protection by encapsulation "m"*, ANSI/UL 60079-18-2009, *Explosive atmospheres - Part 18: Equipment protection by encapsulation "m"*, and ANSI/ISA-61241-18 (12.10.07)-2011, *Electrical Apparatus for Use in Zone 20, Zone 21 and Zone 22 Hazardous (Classified) Locations — Protection by Encapsulation "mD"*.

Informational Note No. 2: Encapsulation is designated level of protection "maD" or "ma" for use in Zone 20 locations. Encapsulation is designated level of protection "mbD" or "mb" for use in Zone 21 locations. Encapsulation is designated type of protection "mc" for use in Zone 22 locations.

Protection by Enclosure "t~~D~~." Type of protection for explosive dust atmospheres where electrical apparatus is provided with an enclosure providing dust ingress protection and a means to limit surface temperatures.

Informational Note 1: For additional information, see ANSI/ISA-60079-31 (12.10.03)-~~2006~~ 2009, *Explosive Atmospheres – Part 31: Equipment Dust Ignition Protection by Enclosure "t"* ~~ANSI/ISA-61241-0 (12.10.02)-2006, *Electrical Apparatus for Use in Zone 20, Zone 21 and Zone 22 Hazardous (Classified) Locations — General Requirement*~~, and ANSI/ISA-61241-1 (12.10.03)-~~2006~~ 2011, *Electrical Apparatus for Use in Zone 21 and Zone 22 Hazardous (Classified) Locations — Protection by Enclosure "tD"*.

Informational Note No. 2: Protection by Enclosure is designated level of protection "ta" for use in Zone 20 locations. Protection by Enclosure is designated level of protection "tb" or "tD" for use in Zone 21 locations. Protection by Enclosure is designated level of protection "tc" or "tD" for use in Zone 22 locations.

Protection by Intrinsic Safety "iD." Type of protection where any spark or thermal effect is incapable of causing ignition of a mixture of combustible dust, fibers, or flyings in air under prescribed test conditions.

Informational Note: For additional information, see ANSI/ISA-61241-11 (12.10.04), *Electrical Apparatus for Use in Zone 20, Zone 21 and Zone 22 Hazardous (Classified) Locations — Protection by Intrinsic Safety "iD."*

Protection by Pressurization "pD." Type of protection that guards against the ingress of a mixture of combustible dust or fibers/flyings in air into an enclosure containing electrical equipment by providing and maintaining a protective gas atmosphere inside the enclosure at a pressure above that of the external atmosphere.

Informational Note: For additional information, see ANSI/ISA-61241-2 (12.10.06), *Electrical Apparatus for Use in Zone 21 and Zone 22 Hazardous (Classified) Locations — Protection by Pressurization "pD*."

Zone 20 Hazardous (Classified) Location. An area where combustible dust or ignitable fibers/flyings are present continuously or for long periods of time in quantities sufficient to be hazardous, as classified by 506.5(B)(1).

Zone 21 Hazardous (Classified) Location. An area where combustible dust or ignitable fibers/flyings are likely to exist occasionally under normal operation in quantities sufficient to be hazardous, as classified by 506.5(B)(2).

Zone 22 Hazardous (Classified) Location. An area where combustible dust or ignitable fibers/flyings are not likely to occur under normal operation in quantities sufficient to be hazardous, as classified by 506.5(B)(3).

513.2 Definitions. ~~For the purpose of this article, the following definitions shall apply.~~ Definitions found in this section are specific to this Article.

Aircraft Painting Hangar. An aircraft hangar constructed for the express purpose of spray/coating/dipping applications and provided with dedicated ventilation supply and exhaust.

Mobile Equipment. Equipment with electrical components suitable to be moved only with mechanical aids or is provided with wheels for movement by person(s) or powered devices.

Portable Equipment (as applied to Article 513). Equipment with electrical components suitable to be moved by a single person without mechanical aids.

~~**515.2 Definition.**~~

~~**Bulk Plant or Terminal.** That portion of a property where liquids are received by tank vessel, pipelines, tank car, or tank vehicle and are stored or blended in bulk for the purpose of distributing such liquids by tank vessel, pipeline, tank car, tank vehicle, portable tank, or container. [**30:**3.3.32.1]~~

~~Informational Note: For further information, see NFPA 30-2008, *Flammable and Combustible Liquids Code*.~~

516.2 Definitions. ~~For the purpose of this article, the following definitions shall apply.~~ Definitions found in this section are specific to this Article.

Spray Area. Normally, locations outside of buildings or localized operations within a larger room or space. Such are normally provided with some local vapor extraction/ventilation system. In automated operations, the area limits shall be the maximum area in the direct path of spray operations. In manual operations, the area limits shall be the maximum area of spray when aimed at 180 degrees to the application surface.

Spray Booth. An enclosure or insert within a larger room used for spray/coating/dipping applications. A spray booth may be fully enclosed or have open front or face and may include separate conveyor entrance and exit. The spray booth is provided with a dedicated ventilation exhaust but may draw supply air from the larger room or have a dedicated air supply.

Spray Room. A purposefully enclosed room built for spray/coating/dipping applications provided with dedicated ventilation supply and exhaust. Normally the room is configured to house the item to be painted, providing reasonable access around the item/process. Depending on the size of the item being painted, such rooms may actually be the entire building or the major portion thereof.

Substantiation: This comment is the product of the task group request by the TCC (reference Proposal 14-3). The group was appointed by the panel chair Robert Jones. The task group chair is John Simmons. Panel members are: William Lawrence, Edward Briesch, Jack Jamison, Mark Goodman, Larry Burns, and David Wechsler.

The suggested changes resolve the issues surrounding any duplicate or conflicting definitions within the purview of CMP14. The revisions that are made involve relocating any definition used in more than one article (500-516) to 500.2. Definitions specific to any article remain in the article where they are used. Definitions found in Articles 500-516 that are found in articles other than 500-516 have been revised by changing the defined term (i.e. Dusttight (as applied to Hazardous (Classified) Locations)). The reorganization of the Article 500 – 516 definitions will add clarity to the code.

Panel Meeting Action: Accept in Principle

Revise the text found in Sections 500.2, 504.2, 505.2, 506.2, 513.2, 515.2 and 516.2 as follows:

500.2 Definitions. The definitions found in this section are specific to the Hazardous (Classified) Locations found in ~~For purposes of~~ Articles 500 through ~~504 and Articles 510 through~~ 516 ~~the following definitions apply~~. No other section of this Article shall apply to Article 505 or 506 unless it is specifically referenced in that article.

Associated Apparatus. Apparatus in which the circuits are not necessarily intrinsically safe themselves but that affect the energy in the intrinsically safe circuits and are relied on to maintain intrinsic safety. ~~Associated~~ Such apparatus ~~may be either~~ are one of the following:

(1) Electrical apparatus that has an alternative-type of protection for use in the appropriate hazardous (classified) location

(2) Electrical apparatus not so protected that shall not be used within a hazardous (classified) location

Informational Note No. 1: Associated apparatus has identified intrinsically safe connections for intrinsically safe apparatus and also may have connections for nonintrinsically safe apparatus.

Informational Note No. 2: An example of associated apparatus is an intrinsic safety barrier, which is a network designed to limit the energy (voltage and current) available to the protected circuit in the hazardous (classified) location, under specified fault conditions.

Associated Nonincendive Field Wiring Apparatus. Apparatus in which the circuits are not necessarily nonincendive themselves but that affect the energy in nonincendive field wiring circuits and are relied upon to maintain nonincendive energy levels. ~~Associated nonincendive field wiring~~ Such apparatus are one ~~may be either~~ of the following:

(1) Electrical apparatus that has an alternative type of protection for use in the appropriate hazardous (classified) location

(2) Electrical apparatus not so protected that shall not be used in a hazardous (classified) location Informational Note: Associated nonincendive field wiring apparatus has designated associated nonincendive field wiring apparatus connections for nonincendive field wiring apparatus and may also have connections for other electrical apparatus.

~~**Combustible Dust.** Any finely divided solid material that is 420 microns (0.017 in.) or smaller in diameter (material passing a U.S. No. 40 Standard Sieve) and presents a fire or explosion hazard when dispersed and ignited in air. [**499,** 2008]~~

Combustible Dust. Dust particles that are 500 microns or smaller (material passing a U.S. No. 35 Standard Sieve as defined in ASTM E 11, Standard Specification for Wire Cloth and Sieves for Testing Purposes) and present a fire or explosion hazard when dispersed and ignited in air.

Informational Note: See ASTM E 1226, Standard Test Method for Explosibility of Dust Clouds, or ISO 6184-1, Explosion protection systems - Part 1: Determination of explosion indices of combustible dusts in air, for procedures for determining the explosibility of dusts.

Combustible Gas Detection System. A protection technique utilizing stationary gas detectors in industrial establishments.

Control Drawing. A drawing or other document provided by the manufacturer of the intrinsically safe or associated apparatus, or of the nonincendive field wiring apparatus or associated nonincendive field wiring apparatus, that details the allowed interconnections between the intrinsically safe and associated apparatus or between the nonincendive field wiring apparatus or associated nonincendive field wiring apparatus.

Cord Connector. Cord Connector. A fitting intended to terminate a cord to a box or similar device and reduce the strain at points of termination and may include an explosionproof, a dust-ignition proof, or a flameproof seal.

Dust-Ignitionproof. Equipment enclosed in a manner that excludes dusts and does not permit arcs, sparks, or heat otherwise generated or liberated inside of the enclosure to cause ignition of exterior accumulations or atmospheric suspensions of a specified dust on or in the vicinity of the enclosure.

Informational Note: For further information on dustignitionproof enclosures, see Type 9 enclosure in ANSI/NEMA 250-~~1991~~ 2008, *Enclosures for Electrical Equipment*, and ANSI/UL 1203-~~1994~~ 2009, *Explosionproof and Dust-Ignitionproof Electrical Equipment for Hazardous (Classified) Locations*.

Dusttight (as applied to Hazardous (Classified) Locations). Enclosures constructed so that dust will not enter under specified test conditions.

Informational Note: See ~~ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*~~ ANSI/ISA-12.12.01-2012, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*

Electrical and Electronic Equipment. Materials, fittings, devices, appliances, and the like that are part of, or in connection with, an electrical installation.

Informational Note: Portable or transportable equipment having self-contained power supplies, such as battery-operated equipment, could potentially become an ignition source in hazardous (classified) locations. See ~~ISA-RP12.12.03-2002, *Recommended Practice for Portable Electronic Products Suitable for Use in Class I and II, Division 2, Zone 2 and Class III, Division 1 and 2 Hazardous (Classified) Locations.*~~ **ANSI/ISA-12.12.03-2011, *Standard for Portable Electronic Products Suitable for Use in Class I and II, Division 2, Zone 2 and Class III, Division 1 and 2 Hazardous (Classified) Locations.***

Explosionproof Equipment (as applied to Hazardous (Classified) Locations). Equipment enclosed in a case that is capable of withstanding an explosion of a specified gas or vapor that may occur within it and of preventing the ignition of a specified gas or vapor surrounding the enclosure by sparks, flashes, or explosion of the gas or vapor within, and that operates at such an external temperature that a surrounding flammable atmosphere will not be ignited thereby.

Informational Note: For further information, see ANSI/UL 1203-~~1994~~ 2009, *Explosion-Proof and Dust- Ignition-Proof Electrical Equipment for Use in Hazardous (Classified) Locations*.

Hermetically Sealed. Equipment sealed against the entrance of an external atmosphere where the seal is made by fusion, for example, soldering, brazing, welding, or the fusion of glass to metal.

~~Informational Note: For further information, see ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Division 1 and 2 Hazardous (Classified) Locations.*~~ ANSI/ISA-12.12.01-2012, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*

Intrinsically Safe Apparatus. Apparatus in which all the circuits are intrinsically safe.

Nonincendive Circuit. A circuit, other than field wiring, in which any arc or thermal effect produced under intended operating conditions of the equipment, is not capable, under specified test conditions, of igniting the flammable gas–air, vapor–air, or dust–air mixture.

Informational Note: Conditions are described in ~~ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*~~ ANSI/ISA-12.12.01-2012, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*

Nonincendive Component. A component having contacts for making or breaking an incendive circuit and the contacting mechanism is constructed so that the component is incapable of igniting the specified flammable gas–air or vapor–air mixture. The housing of a nonincendive component is not intended to exclude the flammable atmosphere or contain an explosion.

Informational Note: For further information, see ~~ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*~~ ANSI/ISA-12.12.01-201**2**, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*

Nonincendive Equipment. Equipment having electrical/electronic circuitry that is incapable, under normal operating conditions, of causing ignition of a specified flammable gas–air, vapor–air, or dust–air mixture due to arcing or thermal means.

Informational Note: For further information, see ~~ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*~~ ANSI/ISA-12.12.01-201**2**, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*

Nonincendive Field Wiring. Wiring that enters or leaves an equipment enclosure and, under normal operating conditions of the equipment, is not capable, due to arcing or thermal effects, of igniting the flammable gas–air, vapor–air, or dust–air mixture. Normal operation includes opening, shorting, or grounding the field wiring.

Nonincendive Field Wiring Apparatus. Apparatus intended to be connected to nonincendive field wiring.

Informational Note: For further information, see ~~ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*~~ ANSI/ISA-12.12.01-201**2**, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*

Oil Immersion. Electrical equipment immersed in a protective liquid in such a way that an explosive atmosphere that may be above the liquid or outside the enclosure cannot be ignited.

~~Informational Note: For further information, see ANSI/UL 698-1995, *Industrial Control Equipment for Use in Hazardous (Classified) Locations*.~~

Pressurized (as applied to Hazardous (Classified) Locations). The process of supplying an enclosure with a protective gas with or without continuous flow at sufficient pressure to prevent the entrance of combustible dust or ignitable fibers/flyings.

Informational Note: For further information, see ANSI/NFPA 496-2013, *Standard for Purged and Pressurized Enclosures for Electrical Equipment.*

Purged and Pressurized. The process of (1) purging, supplying an enclosure with a protective gas at a sufficient flow and positive pressure to reduce the concentration of any flammable gas or vapor initially present to an acceptable level; and (2) pressurization, supplying an enclosure with a protective gas with or without continuous flow at sufficient pressure to prevent the entrance of a flammable gas or vapor, a combustible dust, or an ignitable fiber.

Informational Note: For further information, see ANSI/NFPA 496-2013~~2008~~, *Purged and Pressurized Enclosures for Electrical Equipment*.

Simple Apparatus. An electrical component or combination of components of simple construction with well defined electrical parameters that does not generate more than 1.5 volts, 100 milliamps, and 25 milliwatts, or a passive component that does not dissipate more than 1.3 watts and is compatible with the intrinsic safety of the circuit in which it is used.

Informational Note: The following apparatus are examples of simple apparatus:

a) Passive components, for example, switches, junction boxes, resistance temperature devices, and simple semiconductor devices such as LEDs
b) Sources of stored energy consisting of single components in simple circuits with well-defined parameters, for example, capacitors or inductors, whose values are considered when determining the overall safety of the system
c) Sources of generated energy, for example, thermocouples and photocells, which do not generate more than 1.5 V, 100 ~~mA~~ milliamps, and 25 ~~mW~~ milliwatts

Unclassified Locations. Locations determined to be neither Class I, Division 1; Class I, Division 2; Class I, Zone 0; Class I, Zone 1; Class I, Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2; Zone 20; Zone 21; Zone 22; or any combination thereof.

501.2 Definitions. See 500.2.
502.2 Definitions. See 500.2.
503.2 Definitions. See 500.2.

504.2 Definitions. Definitions found in this section are specific to this Article.

Associated Apparatus. ~~Apparatus in which the circuits are not necessarily intrinsically safe themselves but that affect the energy in the intrinsically safe circuits and are relied on to maintain intrinsic safety. Associated apparatus may be either of the following:~~

~~(1) Electrical apparatus that has an alternative-type protection for use in the appropriate hazardous (classified) location~~
~~(2) Electrical apparatus not so protected that shall not be used within a hazardous (classified) location~~

~~Informational Note No. 1: Associated apparatus has identified intrinsically safe connections for intrinsically safe apparatus and also may have connections for nonintrinsically safe apparatus.~~

~~Informational Note No. 2: An example of associated apparatus is an intrinsic safety barrier, which is a network designed to limit the energy (voltage and current) available to the protected circuit in the hazardous (classified) location, under specified fault conditions.~~

~~**Control Drawing.** See the definition in 500.2.~~

Different Intrinsically Safe Circuits. Intrinsically safe circuits in which the possible interconnections have not been evaluated and identified as intrinsically safe.

~~**Intrinsically Safe Apparatus.** Apparatus in which all the circuits are intrinsically safe.~~

Intrinsically Safe Circuit. A circuit in which any spark or thermal effect is incapable of causing ignition of a mixture of flammable or combustible material in air under prescribed test conditions.

Informational Note: Test conditions are described in ANSI/UL 913-~~1997~~ 2006, *Standard for Safety, Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II, and III, Division 1, Hazardous (Classified) Locations*.

Intrinsically Safe System. An assembly of interconnected intrinsically safe apparatus, associated apparatus, and interconnecting cables, in that those parts of the system that may be used in hazardous (classified) locations are intrinsically safe circuits.

Informational Note: An intrinsically safe system may include more than one intrinsically safe circuit.

~~**Simple Apparatus.** An electrical component or combination of components of simple construction with well defined electrical parameters that does not generate more than 1.5 volts, 100 milliamps, and 25 milliwatts, or a passive component that does not dissipate more than 1.3 watts and is compatible with the intrinsic safety of the circuit in which it is used.~~

~~Informational Note: The following apparatus are examples of simple apparatus:~~

d) ~~Passive components, for example, switches, junction boxes, resistance temperature devices, and simple semiconductor devices such as LEDs~~
e) ~~Sources of stored energy consisting of single components in simple circuits with well-defined parameters, for example, capacitors or inductors, whose values are considered when determining the overall safety of the system~~
f) ~~Sources of generated energy, for example, thermocouples and photocells, which do not generate more than 1.5 V, 100 mA, and 25 mW~~

505.2 Definitions. ~~For purposes of this article, the following definitions apply.~~ Definitions found in this section are specific to this Article.

~~**Combustible Gas Detection System.** A protection technique utilizing stationary gas detectors in industrial establishments.~~

~~**Electrical and Electronic Equipment.** Materials, fittings, devices, appliances, and the like that are part of, or in connection with, an electrical installation.~~

~~Informational Note: Portable or transportable equipment having self-contained power supplies, such as battery operated equipment, could potentially become an ignition source in hazardous (classified) locations.~~

Encapsulation "m." Type of protection where electrical parts that could ignite an explosive atmosphere by either sparking or heating are enclosed in a compound in such a way that this explosive atmosphere cannot be ignited.

Informational Note No. 1: See ANSI/ISA-60079-18 (12.23.01)-2009, ~~*Electrical Apparatus for Use in Class I, Zone 1 Hazardous (Classified) Locations, Type of Protection — Encapsulation "m";*~~ *Explosive atmospheres - Part 18: Equipment protection by encapsulation "m",* ~~IEC 0079-18-1992, *Electrical apparatus for explosive gas atmospheres — Part 18: Encapsulation "m";*~~ and ANSI/UL 60079-18~~, *Electrical Apparatus for Explosive Gas Atmospheres — Part 18: Encapsulation "m"*~~ -2009, Explosive atmospheres - Part 18: Equipment protection by encapsulation "m".

Informational Note No. 2: Encapsulation is designated type of protection "ma" for use in Zone 0 locations. Encapsulation is designated type of protection "m" or "mb" for use in Zone 1 locations. Encapsulation is designated type of protection "mc" for use in Zone 2 locations.

Flameproof "d." Type of protection where the enclosure will withstand an internal explosion of a flammable mixture that has penetrated into the interior, without suffering damage and without causing ignition, through any joints or structural openings in the enclosure, of an external explosive gas atmosphere consisting of one or more of the gases or vapors for which it is designed.

Informational Note: See ~~ANSI/ISA-60079-1 (12.22.01)-2008, *Explosive Atmospheres, Part 1: Equipment protection by flameproof enclosures "d";*~~ ANSI/ISA-60079-1-2009 (12.22.01), *Explosive Atmospheres, Part 1: Equipment protection by flameproof enclosures "d"* and ANSI/UL 60079–1-2009, *Electrical Apparatus for Explosive Gas Atmospheres — Part 1: Flameproof Enclosures"d."*

Increased Safety "e." Type of protection applied to electrical equipment that does not produce arcs or sparks in normal service and under specified abnormal conditions, in which additional measures are applied so as to give increased security against the possibility of excessive temperatures and of the occurrence of arcs and sparks.

Informational Note: See ANSI/ISA-60079-7 (12.16.01) - 2008, *Explosive Atmospheres, Part 7: Equipment protection by increased safety "e"*; and ANSI/UL 60079-7 - 2008, *Electrical Apparatus for Explosive Gas Atmospheres — Part 7:Increased Safety "e."*

Intrinsic Safety "i." Type of protection where any spark or thermal effect is incapable of causing ignition of a mixture of flammable or combustible material in air under prescribed test conditions.

Informational Note No. 1: See ANSI/UL 913-~~1997~~ 2006, *Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II, and III, Hazardous Locations*; ~~ANSI/ISA-60079-11 (12.02.01)-2009, *Explosive Atmospheres, Part 11: Equipment protection by intrinsic safety "i"*;~~ ANSI/ISA-60079-11-2011 (12.02.01), *Explosive Atmospheres: Part 11: Equipment protection by intrinsic safety"i"* and ANSI/UL 60079-11-2011, *Explosive Atmospheres, Part 11: Equipment protection by intrinsic safety "i."*

Informational Note No. 2: Intrinsic safety is designated type of protection "ia" for use in Zone 0 locations. Intrinsic safety is designated type of protection "ib" for use in Zone 1 locations. Intrinsic safety is designated type of protection "ic" for use in Zone 2 locations.

Informational Note No. 3: Intrinsically safe associated apparatus, designated by [ia], [ib], or [ic], is connected to intrinsically safe apparatus ("ia," "ib," or "ic," respectively) but is located outside the hazardous (classified) location unless also protected by another type of protection (such as flameproof).

Oil Immersion "o." Type of protection where electrical equipment is immersed in a protective liquid in such a way that an explosive atmosphere that may be above the liquid or outside the enclosure cannot be ignited.

Informational Note: See ANSI/ISA-60079-6 (12.00.05)-2009, *Explosive Atmospheres, Part 6: equipment protection by oil immersion "o"*; and ANSI/UL 60079-6-2009, *Electrical Apparatus for Explosive Gas Atmospheres — Part 6: Oil-Immersion "o."*

Powder Filling "q." Type of protection where electrical parts capable of igniting an explosive atmosphere are fixed in position and completely surrounded by filling material (glass or quartz powder) to prevent the ignition of an external explosive atmosphere.

Informational Note: See ANSI/ISA-60079-5 (12.00.04)-2009, *Explosive Atmospheres, Part 5: Equipment protection by powder filling "q"*; and ANSI/UL 60079-5-2009, *Electrical Apparatus for Explosive Gas Atmospheres — Part 5: Powder Filling "q."*

Pressurization "p." Type of protection for electrical equipment that uses the technique of guarding against the ingress of the external atmosphere, which may be explosive, into an enclosure by maintaining a protective gas therein at a pressure above that of the external atmosphere.

Informational Note: See ~~ANSI/ISA-60079-2 (12.04.01)-2004, *Explosive Atmospheres, Part 2: Equipment protection by pressurized enclosures "p"*;~~ ANSI/ISA-60079-2-2010 (12.04.01), *Explosive Atmospheres, Part 2: Equipment protection by pressurized enclosures "p"* and IEC 60079-13-2010, *Electrical apparatus for explosive gas atmospheres — Part 13: Construction and use of rooms or buildings protected by pressurization*.

Type of Protection "n." Type of protection where electrical equipment, in normal operation, is not capable of igniting a surrounding explosive gas atmosphere and a fault capable of causing ignition is not likely to occur.

Informational Note: See ANSI/UL 60079-15, *Electrical Apparatus for Explosive Gas Atmospheres Part 15: Type of Protection "n"*; and ~~ANSI/ISA-60079-15 (12.12.02)-2008, *Electrical Apparatus for Use in Class I, Zone 2 Hazardous (Classified) Locations: Type of Protection "n."*~~ ANSI/ISA-60079-15-2009 (12.12.02)-2009, *Explosive Atmospheres – Part 15: Equipment protection by type of protection "n".*

~~**Unclassified Locations.** Locations determined to be neither Class I, Division 1; Class I, Division 2; Class I, Zone 0; Zone 1; Zone 2; Class II, Division 1; Class II, Division 2; Class III, Division 1; Class III, Division 2; or any combination thereof.~~

506.2 Definitions. ~~For purposes of this article, the following definitions apply.~~ Definitions found in this section are specific to this Article.

~~**Associated Nonincendive Field Wiring Apparatus.** Apparatus in which the circuits are not necessarily nonincendive themselves but that affects the energy in nonincendive field wiring circuits and are relied upon to maintain nonincendive energy levels. Associated nonincendive field wiring apparatus may be either of the following:~~

~~(1) Electrical apparatus that has an alternative type of protection for use in the appropriate hazardous (classified) location~~

~~(2) Electrical apparatus not so protected that shall not be used in a hazardous (classified) location~~

~~Informational Note: Associated nonincendive field wiring apparatus has designated associated nonincendive field wiring apparatus connections for nonincendive field wiring apparatus and may also have connections for other electrical apparatus.~~

~~**Combustible Dust.** Any finely divided solid material that is 420 microns (0.017 in.) or smaller in diameter (material passing a U.S. No. 40 Standard Sieve) and presents a fire or explosion hazard when dispersed and ignited in air. [**499:**3.3.3]~~

~~**Dust-Ignitionproof.** Equipment enclosed in a manner that excludes dusts and does not permit arcs, sparks, or heat otherwise generated or liberated inside of the enclosure to cause ignition of exterior accumulations or atmospheric suspensions of a specified dust on or in the vicinity of the enclosure.~~

~~Informational Note: For further information on dustignitionproof enclosures, see Type 9 enclosure in ANSI/NEMA 250-1991, *Enclosures for Electrical Equipment*, and ANSI/UL 1203-1994, *Explosionproof and Dust-Ignitionproof Electrical Equipment for Hazardous (Classified) Locations*.~~

~~**Dusttight.** Enclosures constructed so that dust will not enter under specified test conditions.~~

~~**Nonincendive Circuit.** A circuit, other than field wiring, in which any arc or thermal effect produced under intended operating conditions of the equipment, is not capable, under specified test conditions, of igniting the flammable gas–air, vapor–air, or dust–air mixture.~~

~~Informational Note: Conditions are described in ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations*.~~

~~**Nonincendive Equipment.** Equipment having electrical/electronic circuitry that is incapable, under normal operating conditions, of causing ignition of a specified flammable gas–air, vapor–air, or dust–air mixture due to arcing or thermal means.~~

~~Informational Note: Conditions are described in ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*~~

~~**Nonincendive Field Wiring.** Wiring that enters or leaves an equipment enclosure and, under normal operating conditions of the equipment, is not capable, due to arcing or thermal effects, of igniting the flammable gas–air, vapor–air, or dust–air mixture. Normal operation includes opening, shorting, or grounding the field wiring.~~

~~**Nonincendive Field Wiring Apparatus.** Apparatus intended to be connected to nonincendive field wiring.~~

~~Informational Note: Conditions are described in ANSI/ISA-12.12.01-2007, *Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.*~~

~~**Pressurized.** The process of supplying an enclosure with a protective gas with or without continuous flow at sufficient pressure to prevent the entrance of combustible dust or ignitable fibers/flyings.~~

~~Informational Note: For further information, see ANSI/NFPA 496-2008, *Standard for Purged and Pressurized Enclosures for Electrical Equipment*.~~

Protection by Encapsulation "m~~D~~." Type of protection where electrical parts that could cause ignition of a mixture of combustible dust or fibers/flyings in air are protected by enclosing them in a compound in such a way that the explosive atmosphere cannot be ignited.

Informational Note No. 1: For additional information, see ~~ANSI/ISA-61241-18 (12.10.07)-2006, *Electrical Apparatus for Use in Zone 20, Zone 21 and Zone 22 Hazardous (Classified) Locations — Protection by Encapsulation "mD"*~~ ANSI/ISA-60079-18 (12.23.01)-2009, *Explosive atmospheres - Part 18: Equipment protection by encapsulation "m"*, ANSI/UL 60079-18-2009, *Explosive atmospheres - Part 18: Equipment protection by encapsulation "m"*, and ANSI/ISA-61241-18 (12.10.07)-2011, *Electrical Apparatus for Use in Zone 20, Zone 21 and Zone 22 Hazardous (Classified) Locations — Protection by Encapsulation "mD"*.

Informational Note No. 2: Encapsulation is designated level of protection "maD" or "ma" for use in Zone 20 locations. Encapsulation is designated level of protection "mbD" or "mb" for use in Zone 21 locations. Encapsulation is designated type of protection "mc" for use in Zone 22 locations.

Protection by Enclosure "t~~D~~." Type of protection for explosive dust atmospheres where electrical apparatus is provided with an enclosure providing dust ingress protection and a means to limit surface temperatures.

Informational Note 1: For additional information, see ANSI/ISA-60079-31 (12.10.03)-~~2006~~ 2009, *Explosive Atmospheres – Part 31: Equipment Dust Ignition Protection by Enclosure "t"* ~~ANSI/ISA-61241-0 (12.10.02)-2006, *Electrical Apparatus for Use in Zone 20, Zone 21 and Zone 22 Hazardous (Classified) Locations — General Requirement*~~, and ANSI/ISA-61241-1 (12.10.03)-~~2006~~ 2011, *Electrical Apparatus for Use in Zone 21 and Zone 22 Hazardous (Classified) Locations — Protection by Enclosure "tD"*.

Informational Note No. 2: Protection by Enclosure is designated level of protection "ta" for use in Zone 20 locations. Protection by Enclosure is designated level of protection "tb" or "tD" for use in Zone 21 locations. Protection by Enclosure is designated level of protection "tc" or "tD" for use in Zone 22 locations.

Protection by Intrinsic Safety "iD." Type of protection where any spark or thermal effect is incapable of causing ignition of a mixture of combustible dust, fibers, or flyings in air under prescribed test conditions.

Informational Note: For additional information, see ANSI/ISA-61241-11 (12.10.04), *Electrical Apparatus for Use in Zone 20, Zone 21 and Zone 22 Hazardous (Classified) Locations — Protection by Intrinsic Safety "iD."*

Protection by Pressurization "pD." Type of protection that guards against the ingress of a mixture of combustible dust or fibers/flyings in air into an enclosure containing electrical equipment by providing and maintaining a protective gas atmosphere inside the enclosure at a pressure above that of the external atmosphere.

Informational Note: For additional information, see ANSI/ISA-61241-2 (12.10.06), *Electrical Apparatus for Use in Zone 21 and Zone 22 Hazardous (Classified) Locations — Protection by Pressurization "pD."*

Zone 20 Hazardous (Classified) Location. An area where combustible dust or ignitable fibers/flyings are present continuously or for long periods of time in quantities sufficient to be hazardous, as classified by 506.5(B)(1).

Zone 21 Hazardous (Classified) Location. An area where combustible dust or ignitable fibers/flyings are likely to exist occasionally under normal operation in quantities sufficient to be hazardous, as classified by 506.5(B)(2).

Zone 22 Hazardous (Classified) Location. An area where combustible dust or ignitable fibers/flyings are not likely to occur under normal operation in quantities sufficient to be hazardous, as classified by 506.5(B)(3).

513.2 Definitions. ~~For the purpose of this article, the following definitions shall apply.~~ Definitions found in this section are specific to this Article.

Aircraft Painting Hangar. An aircraft hangar constructed for the express purpose of spray/coating/dipping applications and provided with dedicated ventilation supply and exhaust.

Mobile Equipment. Equipment with electrical components suitable to be moved only with mechanical aids or is provided with wheels for movement by person(s) or powered devices.

Portable Equipment (as applied to Article 513. Equipment with electrical components suitable to be moved by a single person without mechanical aids.

~~515.2 Definition.~~

~~Bulk Plant or Terminal. That portion of a property where liquids are received by tank vessel, pipelines, tank car, or tank vehicle and are stored or blended in bulk for the purpose of distributing such liquids by tank vessel, pipeline, tank car, tank vehicle, portable tank, or container. [**30:**3.3.32.1]~~

~~Informational Note: For further information, see NFPA 30-2008, *Flammable and Combustible Liquids Code*.~~

516.2 Definitions. ~~For the purpose of this article, the following definitions shall apply.~~ Definitions found in this section are specific to this Article.

Flash-Off Area. An open or enclosed area after a spray application process where vapors are released due to exposure to ambient air or a heated atmosphere. [33:3.3.1.1]

Limited Finishing Workstation. An apparatus that is capable of confining the vapors, mists, residues, dusts, or deposits that are generated by a spray application process and that meets the requirements of Section 14.3 of NFPA 33, *Standard for Spray Application Using Flammable or Combustible Materials*, but does not meet the requireme: ents of a spray booth or spray room, as herein defined. [33:3.3.15.1]

Resin Application Area. Any area in which polyester resins or gelcoats are spray applied. [33:3.3.1.2]

Spray Area. Any fully enclosed, partly enclosed, or unenclosed area in which ignitable quantities of flammable or combustible vapors, mists, residues, dusts, or deposits are present due to the operation of spray processes, including

(1) any area in the direct path of a spray application process;

(2) the interior of a spray booth or spray room or limited finishing workstation, as herein defined;

(3) the interior of any exhaust plenum, eliminator section, or scrubber section;

(4) the interior of any exhaust duct or exhaust stack leading from a spray application process;

(5) the interior of any air recirculation filter house or enclosure, including secondary recirculation particulate filters;

(6) any solvent concentrator (pollution abatement) unit or solvent recovery (distillation) unit.

The following are not considered to be a part of the spray area:

(1) fresh air make-up units;

(2) air supply ducts and air supply plenums;

(3) recirculation air supply ducts downstream of secondary filters; (4) exhaust ducts from solvent concentrator (pollution abatement) units. [33: 3.3.2.3]

Informational Note: Unenclosed spray areas are ~~normally~~ locations outside of buildings or are localized operations within a larger room or space. Such are normally provided with some local vapor extraction/ventilation system. In automated operations, the area limits are ~~shall be~~ the maximum area in the direct path of spray operations. In manual operations, the area limits are the maximum area of spray when aimed at ~~180~~ 90 degrees to the application surface.

Spray Booth. A power-ventilated enclosure for a spray application operation or process that confines and limits the escape of the material being sprayed, including vapors, mists, dusts, and residues that are produced by the spraying operation and conducts or directs these materials to an exhaust system. [33:3.3.14]

Informational Note: A spray booth is an enclosure or insert within a larger room used for spray/coating/dipping applications. A spray booth may be fully enclosed or have open front or face and may include separate conveyor entrance and exit. The spray booth is provided with a dedicated ventilation exhaust but may draw supply air from the larger room or have a dedicated air supply.

Spray Room. A power-ventilated fully enclosed room ysed exclusively for open spraying of flammable or combustible materials. A spray room is a purposefully enclosed room built for spray/coating/dipping applications provided with dedicated ventilation supply and exhaust. Normally the room is configured to house the item to be painted, providing reasonable access around the item/process. Depending on the size of the item being painted, such rooms may actually be the entire building or the major portion thereof. [33:3.3.15]

Unenclosed Spray Area. Any spray area that is not confined by a limited finishing workstation, spray booth, or spray room, as herein defined. [33:3.3.2.3.2]

Also, change the edition date of NFPA 496 from 2008 to 2013 wherever NFPA 496 is referenced in Chapter 5.

Panel Statement: CMP-14 has reorganized the definitions in Article 500 through 516, as directed by the Correlating Committee. CMP-14 notes that the amended text reflects other actions taken by the panel, as reflected elsewhere in the ROC. These include the actions on Comments 14-4, 14-6, 14-34, 14-51, 14-52, 14-54, 14-55, and 14-67.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 2

Explanation of Negative:

MCBRIDE, W.: IEEE statement opposing the panel action:

The term "cord connector" should not be defined as CMP14 has accepted. The term cord connector is commonly used in the field to describe a wiring device that is connected to a cord. Wiring device manufacturer's websites indicate that cord connectors are used to describe wiring devices. Other locations in the NEC use the term cord connector where referring to a wiring device and 626.2 actually defines it as such. Using the same term to define different items in the NEC should not be done, is inconsistent, will create confusion and likely misinterpretation of the associated requirements.

The term fitting as suggested by a commenter includes the concept of it primarily performing a mechanical function. If CMP14 does not like the use of the term fitting then a different term should be chosen, although Article 400 uses the term fitting when referring to products used to secure cords to enclosures.

Users of Chapter 5 are not exempt from the requirements in Chapters 1 through 4, Chapter 5 requirements can supplement or modify the general rules.

WECHSLER, D.: [1] Defined Term 'Cord Connector'. This issue needs to be addressed by the NEC Correlating Committee.

As stated in 90.3 Chapter 5 Articles can supplement or modify the general rules but Chapters 1 through 4 apply except as amended by Chapter 5 for the particular conditions. Cord Connector is a term commonly used to describe a wiring device and is used that way in wiring device manufacturers publications. Additionally the term cord connector is used in 210.50 as a wiring device and even defined that way in 626.2.

The term fitting is typically used in Article 400 to describe a product that is used secure cords and cables to enclosures. It is also presently used that way in portions of Chapter 5 for both cords and cables.

The term cord connector or anything similar should not be re-defined in Chapter 5 to mean something different than what it does in the rest of the NEC. Some product standards do not appear to use constant terminology related to this issue and it is better to revise those to be consistent with the NEC not create confusion and inconsistency within the NEC.

A better approach is to modify the sections in Chapter 5, such as 501.140, related to flexible cord terminations to state that fittings that include strain relief are required for securing cords to enclosures.

This problem began in the 2011 NEC when CMP14 used the term cord connector for what the industry refers to as a fitting.

[2] Other definitions located in 500.2 and modified with additional language "(as applied to Hazardous (Classified) Locations)." This issue also needs to be addressed by the NEC Correlating Committee.

CMP 14 chose to copy some definitions that are presently in Article 100, add the additional language (as applied to Hazardous (Classified) Locations) and locate them in 500.2. It appears that other wording changes were also sometimes made. Some definitions would now appear in Article 100 and in 500.2. For example Dusttight (as applied to Hazardous (Classified) Locations) will be in 500.2 and Dusttight will be in Article 100, each with slightly different wording. This was apparently done to have definitions in 500.2 that were used in Articles 500 through 516. Why is there a need to have a different definition or a duplicated definition other than to get around the provision that if a term is used in more than one article it can be located in Article 100. Who now has the responsibility for the definitions in Article 100 with slightly different wording? This is likely to create confusion and should not be permitted.

14-2 Log #885 NEC-P14 **Final Action: Reject**

(500.2, 501.140(B)(4), 502.140(B)(4), 503.140(B)(4), 505.2, 505.17(5), 506.2, 506.17(5))

Submitter: David Wechsler, American Chemical Council

Comment on Proposal No: 14-11b

Recommendation: Do not add a new definition to 500.2, 505.2 and 506.2 reading:

~~Cord Connector. A fitting intended to terminate a cord to a box or similar device and reduce the strain at points of termination and may include an explosionproof, a dust ignition proof, or a flameproof seal.~~

Under 501.140 (B) (4) change cord connector to cord fitting as shown below:

(4) In Division 1 locations or in Division 2 locations where the boxes, fittings, or enclosures are required to be explosionproof, the cord shall be terminated with a cord fitting ~~connector~~ or attachment plug listed for the location or a cord fitting ~~connector~~ installed with a seal listed for the location. In Division 2 locations where explosionproof equipment is not required, the cord shall be terminated with a listed cord fitting ~~connector~~ or listed attachment plug.

Under 502.140 (B) (4) change cord connector to fitting as shown below:

(4) In Division 1 locations, the cord shall be terminated with a cord fitting ~~connector~~ listed for the location or a listed cord fitting ~~connector~~ installed with a seal listed for the location. In Division 2 locations, the cord shall be terminated with a listed dusttight cord fitting ~~connector~~.

Under 503.140 (B) (4) change cord connector to fitting as shown below:

(4) Be terminated with a listed dusttight cord fitting ~~connector~~.

Under 505.17(5) change cord connector to fitting as shown below:

(5) Be terminated with a listed cord fitting ~~connector~~ that maintains the type of protection where the flexible cord enters boxes, fittings, or enclosures that are required to be explosionproof or flameproof.

Under 506.17(5) change cord connector to fitting as shown below:

(5) Be terminated with a listed cord fitting ~~connector~~ that maintains the protection technique of the terminal compartment.

NOTE: Separate comments were submitted for each of the respective sections shown above to comply with the Style Manual.

Substantiation: This proposal was offered to attempt to correct the incorrect use of the term ‘connector’. However the action taken simply makes this problem more unclear as the term ‘cord connector’ is not appropriate in this case and a different term that includes the word “fitting” should be used as part of the term, not to describe something different. The action addressed in the proposed text revisions provides appropriate solutions.

ANSI/UL 514B is not limited for use in hazardous (classified) areas. The term fitting is widely used in UL product standards to refer to these and other types of products that are used to secure wiring methods and cords to equipment. The actual title of UL 514B uses the term fittings, not connectors “Conduit, Tubing, and Cable Fittings”. Section 1.2 of UL 514B uses the phrase “fittings for flexible cord” Interestingly 1.4 states “These requirements do not cover FITTINGS intended for use in hazardous locations as defined in the National Electrical Code, ANSI/NFPA 70, the Canadian Electrical Code (CEC), Part I, CSA C22.1, and the Standard for Electrical Installations, NOM-001-SEDE.”

The term cord connector is used in other places in the NEC as a wiring device such as in 210.50(A) where it permits a “cord connector” to be considered a receptacle outlet. Section 626.2 defines a cord connector as a device for establishing a connection. The term fitting is commonly used in the NEC and product standards related to flexible cords products that are attached to enclosures. Section 400.7(B) uses the term cord connector body as device used to energize an attachment plug.

The term “cord fitting” as indicated should be used in sections 501.140(B)(4), 502.140(4), 503.140(4), 505.17(5), 506.17(5) and anywhere else the term is used to describe the fitting.

As presently used in these articles the term cord connector is confusing whether the term is defined differently (for no good reason) or not. The term “cord connector” is commonly used in the field to describe a wiring device that is connected to a cord.

Users of Chapter 5 are not exempt from the requirements in Chapters 1 through 4, chapter 5 requirements can supplement or modify the general rules but creating using the same term to define different items should not be done and will create confusion and likely misinterpretation of the associated requirements.

The term “fitting” is used in many other NEC sections to describe the product used to secure a cord to an enclosure.

Panel Meeting Action: Reject

Panel Statement: The definition of “connector” in UL 514B includes cord and cable, but the definition of “fitting” does not include cord. For this reason, CMP-14 affirms that the definition for the term “cord connector” is appropriate and does not agree that it should be replaced by the term “fitting”. The term “fitting” is defined in Article 100 and is a generic term that includes locknuts and bushings. The use of the term “connector” emphasizes the need to provide strain relief at the point of termination of the cord and the need to reduce the risk of the termination being compromised due to excess strain on the connection. The use of the term “cord connector”, without the definition, does not make the strain relief requirement explicit.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 2

Explanation of Negative:

MCBRIDE, W.: IEEE statement opposing the panel action:

The term “cord connector” should not be defined as CMP14 has accepted. The term cord connector is commonly used in the field to describe a wiring device that is connected to a cord. Wiring device manufacturer’s websites indicate that cord connectors are used to describe wiring devices. Other locations in the NEC use the term cord connector where referring to a wiring device and 626.2 actually defines it as such. Using the same term to define different items in the NEC should not be done, is inconsistent, will create confusion and likely misinterpretation of the associated requirements.

The term fitting as suggested by a commenter includes the concept of it primarily performing a mechanical function. If CMP14 does not like the use of the term fitting then a different term should be chosen, although Article 400 uses the term fitting when referring to products used to secure cords to enclosures.

Users of Chapter 5 are not exempt from the requirements in Chapters 1 through 4, Chapter 5 requirements can supplement or modify the general rules.

WECHSLER, D.: See my negative comment related to “[1] cord connector” in Comment 14-1. This issue needs to be addressed by the NEC Correlating Committee.

Additionally, the Panel Statement states “CMP-14 affirms that the definition for the term ‘cord connector’ {presented in Comment 14-1} is appropriate and does not agree that it should be replaced by the term ‘fitting’.” However the Comment 14-1 term “cord connector” is defined as a ‘fitting’ as follows: “Cord Connector. A fitting intended to terminate a cord to a box or similar device and reduce the strain at points of termination and may include an explosionproof, a dust-ignition proof, or a flameproof seal.” Therefore since the term ‘fitting’ is used in many other NEC sections to describe the product used to secure a cord to an enclosure, rather than creating different terms within the NEC, perhaps it is the product standard which needs to be revised accordingly and not one chapter of the NEC.

(500.2)

Submitter: Eliana Brazda, ISA

Comment on Proposal No: 14-10

Recommendation: Revise text to read as follows:

ANSI/ISA-12.12.01-201~~1~~2, Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.

Substantiation: Change the ISA standards date of publication to the current publication date.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-5 Log #489 NEC-P14 **Final Action: Reject**
(500.2.Combustible Dust)

Submitter: Marcelo M. Hirschler, GBH International

Comment on Proposal No: 14-11a

Recommendation: Revise text to read as follows:

Combustible Dust. Finely divided solid particles that present a dust fire or dust explosion hazard when dispersed and ignited in air. (499-2013)

~~**Combustible Dust.** Any finely divided solid material that is 420 microns (0.017 in.) or smaller in diameter (material passing a U.S. No. 40 Standard Sieve) and presents a fire or explosion hazard when dispersed and ignited in air. [**499,** 2008]~~

Substantiation: Standards Council issued 499-2013 and it includes the updated definition of "combustible dust" as indicated in this comment. This definition was adopted as a result of a successful NITMAM at the June 2012 Annual Meeting and the resulting Standards Council decision D#12-13 upholding the action of the assembly. The NEC should adopt the updated definition of a key concept.

The existing definition in the NEC (and the proposed definition in the ROP) contains requirements that are unacceptable in NEC definitions. Note that the NEC TCC highlights one of the problems with the ROP proposed definition (use of ASTM and ISO standards).

Panel Meeting Action: Reject

Panel Statement: Acceptance of this comment would create confusion for users of the Code because there are multiple NFPA definitions for what constitutes a combustible dust, as found in NFPA 61, *Standard for the Prevention of Fires and Dust Explosions in Agricultural and Food Processing Facilities*; NFPA 499, *Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*; NFPA 654, *Standard for the Prevention of Fire and Dust Explosions from the Manufacturing, Processing*; and their respective annexes. See CMP-14's action on Comment 14-6 for its resolution to this problem.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-6 Log #573 NEC-P14 **Final Action: Accept in Principle**
(500.2.Combustible Dust)

TCC Action: See Correlating Committee Action on Comment 14-1.
Note: When the ballot result does not confirm the TC action on a Proposal by a two-thirds affirmative vote, the Report on Proposals shall be published with a specific request for public comment on that Proposal. The Proposal is now being reconsidered by the TC as a public comment.

Submitter: Code-Making Panel 14,

Comment on Proposal No: 14-11a

Recommendation: In 500.2 replace the current definition of Combustible Dust with the following:

Combustible Dust. Dust particles of 500 microns or smaller (material passing a U.S. No. 35 Standard Sieve as defined in ASTM E 11, Standard Specification for Wire Cloth and Sieves for Testing Purposes) are considered to present a dust fire or dust explosion hazard unless determined otherwise. (See ASTM E 1226 or ISO 6184/1). [499:3.3.3]

Substantiation: Definition is extracted from NFPA 499 and the definition in the 2012 Edition of NFPA 499 has been revised.

Panel Meeting Action: Accept in Principle

Replace the current definition of Combustible Dust in 500.2 with the following:

Combustible Dust. Dust particles that are 500 microns or smaller (material passing a U.S. No. 35 Standard Sieve as defined in ASTM E 11, Standard Specification for Wire Cloth and Sieves for Testing Purposes) and present a fire or explosion hazard when dispersed and ignited in air.

Informational Note: See ASTM E 1226, Standard Test Method for Explosibility of Dust Clouds, or ISO 6184-1, Explosion protection systems - Part 1: Determination of explosion indices of combustible dusts in air, for procedures for determining the explosibility of dusts.

Panel Statement: CMP-14 has adopted a new definition for combustible dust because the definition published in NFPA 499, *Recommended Practice for the Classification of Combustible Dusts and of Hazardous (Classified) Locations for Electrical Installations in Chemical Process Areas*, 2013 is not usable for an enforceable Code. The particle size in this new definition is specified as 500 microns to harmonize with national and international area classification standards and their annexes. The reference previously incorporated in the proposed definition has been moved to an Informational Note, in accordance with the National Electrical Code Style Manual. In adopting this new definition, CMP-14 affirms that particle size is necessary to properly classify and to not overclassify a location where combustible dust is present. See also the panel statement to Comment 14-5.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-7 Log #898 NEC-P14 **Final Action: Reject**
(500.2.Electrical and Electronic Equipment)

Submitter: David Wechsler, American Chemical Council

Comment on Proposal No: 14-111

Recommendation: Revise the definition of Electrical and Electronic Equipment as follows:

Electrical and Electronic Equipment. Materials, fittings, devices, appliances, and the like that are part of, or in connection with, an electrical installation, or portable or transportable equipment having self-contained power supplies, such as battery-operated equipment, which could potentially become an ignition source in hazardous (classified) locations.

FPN: ~~Portable or transportable equipment having self-contained power supplies, such as battery-operated equipment, could potentially become an ignition source in hazardous (classified) locations.~~ See ISA-RP12.12.03-2002, Portable Electronic Products Suitable for Use in Class I and II, Division 2, Class I Zone 2 and Class III, Division 1 and 2 Hazardous (Classified) Locations.

Substantiation: This comment was developed on the basis of existing texts in the current NEC and the CMP-14 Technical substantiation to Proposal Log 14-111 Log #1754 stating in part "The proposed language belongs in a product standard, not in an installation Code." While an argument may be made that overall the intent of the NEC is to address installations, as in the general requirements of Chapters 1-4, Chapter 5 addresses special occupancies and these encompass a different scope. The NEC Chapter 5 states "500.1 Scope — Articles 500 Through 504

Articles 500 through 504 cover the requirements for electrical and electronic equipment and wiring for all voltages in Class I, Divisions 1 and 2; Class II, Divisions 1 and 2; and Class III, Divisions 1 and 2 locations where fire or explosion hazards may exist due to flammable gases, flammable liquid–

produced vapors, combustible liquid–produced vapors, combustible dusts, or ignitible fibers/flyings."

This scope does not state 'installation only'. Additionally the defined equipment protection methods say nothing about the designs being only for fixed/connected by cord or cable installations or usage and not applicable to portable or transportable equipment having power supplies.

If the position of the Panel is that portables and transportable having self contained power supplies are not addressed under Chapter 5, then where are the requirements and the protection designs for portable electrical/electronic equipment found? What basis can there be to have portable devices marked in accordance with the requirements of the NEC, if the NEC has no requirements? How can listings/approvals be made for unregulated equipment designs?

The revision provided addresses this important issue. Please also see the NEC structure as contained on page 5 (Figure 90.3) of the 2011 NEC Handbook which properly reflects that Chapter 5 is either supplements or modifies the basic Chapters 1-4 of the NEC with the requirement in Chapter 5 beginning with essentially locations shall be classified… for electrical and electronic equipment and wiring for all voltages in Class I,.... where fire or explosion hazards may exist..:

Panel Meeting Action: Reject

Panel Statement: The NEC is an installation document that does not address equipment having self-contained power supplies. Chapter 5 addresses special occupancies and can modify Chapters 1 through 4; however, it cannot modify the scope of Article 90.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

WECHSLER, D.: This issue of "hazardous area classification" and "installation" needs to be reviewed by the NEC Correlating Committee to address the hazardous classified location requirement found in Article 500 and the validity of the Panel Statement that "Chapter 5 addresses special occupancies and can modify Chapters 1 through 4; however, it cannot modify the scope of Article 90."

Essentially the critical issue is does the hazardous area classification requirement found in Article 500.1 Scope, only apply to the '90-2 Scope covered installations' or does it apply as a 90.3 modification or supplement to the location containing electrical and electronic equipment and wiring for all voltages as determined to exist in Class I, Divisions 1 and 2; Class II, Divisions 1 and 2; and Class III, Divisions 1 and 2 locations where fire or explosion hazards may exist due to flammable gases, flammable liquid - produced vapors, combustible liquid -produced vapors, combustible dusts, or ignitible fibers/flyings?

The Committee as evidenced by the FPN found under 500.2, has for some time recognized that portable or transportable equipment having self contained power supplies, such as battery operated equipment, could potentially become an ignition source in hazardous classified locations which are those hazardous classified locations defined within this Article. This then infers that the hazardous area classification applies to the location and not just the installation. The hazardous area classification would be applicable to portable or transportable equipment used. The design of this equipment could be addressed in other standards.

Therefore as a minimum the Panel Statement should be revised to include a statement that the special hazards potentially associated with locations addressed by the hazardous area classification found in the Scope of 500.1 is required.

Comment on Affirmative:

SIMMONS, J.: My support of the panel action on this comment does not indicate that portable equipment used in Hazardous (Classified) Locations should not be evaluated for fire or explosion hazards that may exist in the location. All portable electrical and electronic equipment used in hazardous locations should be evaluated to determine that such use is safe and does not pose a hazard. I am in full agreement with the panel statement.

ARTICLE 501 — CLASS 1 LOCATIONS

14-10 Log #313 NEC-P14 **Final Action: Accept**
(501.10(A)(1)(e))

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 14-32
Recommendation: Revise text to read as follows:

(e) ~~Fiber~~ Optical fiber cables ~~of the~~ types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC shall be permitted to be installed in raceways as stated in 501.10(A). These ~~Fiber Optic~~ optical fiber cables shall be sealed in accordance with 501.15.

Substantiation: This is an editorial comment. Terminology should be consistent throughout the code. Article 770 covers optical fiber cables not fiber optic cables. There are many places this change needs to be made to correlate with Article 770.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-11 Log #1343 NEC-P14 **Final Action: Accept in Principle**
(501.10(A)(1)(e) (New))

Submitter: William E. McBride, Northern Electric Company
Comment on Proposal No: 14-33
Recommendation: Modify existing Text:

(I) General. In Class I, Division I locations, the wiring methods in (a) through (e) shall be permitted.

Add new text

(g) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the
installation, and where the cable is not subject to physical damage listed Type TC-ER-HL Cable, up to I inch in diameter, that complies with the crush and impact
requirements of Type MC HL cable, and is identified for such use with the marking Type TC-ER-HL shall be permitted. The cable shall contain separate equipment
bonding conductor(s) in accordance with 250.122, and terminated with fittings listed for the application. Type TC-ER-HL Cable shall be installed in accordance with
the provisions of TC-ER Cable in Article 336.

Substantiation: Existing small diameter MC-HL cables that arc run between enclosures and instruments are easily kinked during initial installation and routine maintenance. The risk
of ignition is not from the middle of cables, but from the devices and terminations of cables where the conductor is exposed.

If the Code Making panel thinks it necessary they might further restrict the circuit voltage of these TGER-J-IL Cables to be restricted to less than half of the conductor
insulation voltage rating. The application is mostly for 24 volt instrumentation, but may also include some 120 volt utilization devices, yet the cable is rated for 600
volts.

Panel Meeting Action: Accept in Principle

Revise the suggested text as shown below and relocate to 501.10(A)(2):

501.10(A)(2) Flexible Connections. Where necessary to employ flexible connections, as at motor terminals, the following shall be permitted:

(a) flexible fittings listed for the location or

(b) flexible cord in accordance with the provisions of 501.140 terminated with cord connectors listed for the location ~~shall be permitted~~ or

(c) in industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, for applications limited to 600 volts nominal or less, and where protected from damage by location or a suitable guard, listed Type

TC-ER-HL cable with an overall jacket and a separate equipment grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the location.

Panel Statement: CMP-14 has determined that this issue can be addressed in a manner similar to that which has been used to address Comment 14-43. However, CMP-14 has relocated the new text to 501.10(A)(2) to limit its usage to those locations where flexibility is required. As the wiring method is only allowed for flexible connections, the requirement to install the cable in accordance with Article 336 has been removed. The “1 in. or less” restriction has been removed because motor conductors are often larger in size. The prior text has been editorially amended to accommodate the new text.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

BRIESCH, E.: The recorded panel action does not accurately reflect the intent of the Panel. The original intent of the introduction of Type TC-ER-HL cable in Comment 14-43 was for Type TC-ER-HL cable to be permitted in Zone 1 locations and be listed for Zone 1 locations. This concept was then broadened by the submitter of Comment 14-11 and the Panel Action on Comment 14-11 to permit its use in Division 1 locations when there is a need for flexibility. When restricted to installation per 501.10(A)(2) only, listing Type TC-ER-HL cable for Division 1 is unnecessary. It should be noted that flexible cord as permitted in 501.10(A)(2)(b) is not required to be listed for Division 1 locations. The panel action should read as follows:

Revise the suggested text as shown below and relocate to 501.10(A)(2):

501.10(A)(2) Flexible Connections. Where necessary to employ flexible connections, as at motor terminals, the following shall be permitted:

(a) flexible fittings listed for the location or

(b) flexible cord in accordance with the provisions of 501.140 terminated with cord connectors listed for the location

~~shall be permitted~~ or

(c) in industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, for applications limited to 600 volts nominal or less, and where protected from damage by location or a suitable guard, listed Type TC-ER-HL cable with an overall jacket and a separate equipment grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the location.

LAWRENCE, JR., W.: The recorded panel action does not accurately reflect the intent of the Panel. The original intent of the introduction of Type TC-ER-HL cable in Comment 14-43 was for Type TC-ER-HL cable to be permitted in Zone 1 locations and be listed for Zone 1 locations. This concept was then broadened by the submitter of Comment 14-11 and the Panel Action on Comment 14-11 to permit its use in Division 1 locations when there is a need for flexibility. When restricted to installation per 501.10(A)(2) only, listing Type TC-ER-HL cable for Division 1 is unnecessary. It should be noted that flexible cord as permitted in 501.10(A)(2)(b) is not required to be listed for Division 1 locations. The panel action should read as follows:

Revise the suggested text as shown below and relocate to 501.10(A)(2):

501.10(A)(2) Flexible Connections. Where necessary to employ flexible connections, as at motor terminals, the following shall be permitted:

(a) flexible fittings listed for the location or

(b) flexible cord in accordance with the provisions of 501.140 terminated with cord connectors listed for the location~~ shall be permitted or~~

(c) in industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, for applications limited to 600 volts nominal or less, and where protected from damage by location or a suitable guard, listed Type TC-ER-HL cable with an overall jacket and a separate equipment grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the location.

MASSEY, L.: The recorded panel action does not accurately reflect the intent of the Panel. The original intent of the introduction of Type TC-ER-HL cable in Comment 14-43 was for Type TC-ER-HL cable to be permitted in Zone 1 locations and be listed for Zone 1 locations. This concept was then broadened by the submitter of Comment 14-11 and the Panel Action on Comment 14-11 to permit its use in Division 1 locations when there is a need for flexibility. When restricted to installation per 501.10(A)(2) only, listing Type TC-ER-HL cable for Division 1 is unnecessary. It should be noted that flexible cord as permitted in 501.10(A)(2)(b) is not required to be listed for Division 1 locations. The panel action should read as follows:

Revise the suggested text as shown below and relocate to 501.10(A)(2):

501.10(A)(2) Flexible Connections. Where necessary to employ flexible connections, as at motor terminals, the following shall be permitted:

(a) flexible fittings listed for the location or

(b) flexible cord in accordance with the provisions of 501.140 terminated with cord connectors listed for the location

~~shall be permitted~~ or

(c) in industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, for applications limited to 600 volts nominal or less, and where protected from damage by location or a suitable guard, listed Type TC-ER-HL cable with an overall jacket and a separate equipment grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the location.

MCBRIDE, W.: The language needs to be modified to avoid a conflict with the TC-ER-HL requirements for Class I, Zone 1 installations and the UL Standard 2225. The cable will not be listed for Division 1 locations, but only for Zone 1 locations. Without revision the cable will not be able to be listed for Zone 1 locations if it is over 1 inch diameter.

The proposed text should be modified as follows:

(c) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, for applications limited to 600 volts or less, and where protected from damage by location or a suitable guard, Type TC-ER-HL Cable, listed for use in Class I, ~~Division~~ Zone1 locations with an overall jacket and a separate equipment bonding conductor(s) in accordance with 250.122, and terminated with fittings listed for the location.

14-12 Log #314 NEC-P14 **Final Action: Accept**
(501.10(B)(1)(7))

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.

Comment on Proposal No: 14-37

Recommendation: Revise text to read as follows:

~~Fiber~~ Optical fiber cables~~ of the~~ types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC shall be permitted to be installed in cable trays or any other raceway as stated in 501.10(B). ~~Fiber~~ Optical fiber cables shall be sealed in accordance with 501.15.

Substantiation: This is an editorial comment. Terminology should be consistent throughout the code. Article 770 covers optical fiber cables not fiber optic cables. There are many places this change needs to be made to correlate with Article 770.

Panel Meeting Action: Accept

Comment on Proposal No: 14-37a

Recommendation: The Correlating Committee directs that the panel reconsider the language in this proposal and Proposal 14-38 and correlate the language.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Revise text to read as follows:

(2) Flexible Connections. Where provision must be made for flexibility, one or more of the following shall be permitted:

(1) Listed flexible metal fittings.

(2) Flexible metal conduit with listed fittings.

(3) Interlocked armor Type MC cable with listed fittings.

(4) Liquidtight flexible metal conduit with listed fittings.

(5) Liquidtight flexible nonmetallic conduit with listed fittings.

(6) Flexible cord listed for extra-hard usage and terminated with listed fittings. A conductor for use as an equipment grounding conductor shall be included in the flexible cord.

(7) For elevator use, an identified elevator cable, type EO, ETP, or ETT, and as shown under the “use” column in Table 400.4 for “Hazardous (classified) locations” and terminated with listed fittings.

Informational Note: See 501.30(B) for grounding requirements where flexible conduit is used.

Panel Statement: CMP-14 affirms the revisions made in Proposals 14-37a and 14-38 and as shown in the draft of the 2014 NEC. The revised section, as presented in the draft is shown here.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise 501.15 as follows:
501.15 Sealing and Drainage. Seals in conduit and cable systems shall comply with 501.15(A) through (F). Sealing compound shall be used in Type MI cable termination fittings to exclude moisture and other fluids from the cable insulation.
Informational Note No. 1: Seals are provided in conduit and cable systems to minimize the passage of gases and vapors and prevent the passage of flames from one portion of the electrical installation to another through the conduit. Such communication through Type MI cable is inherently prevented by construction of the cable. Unless specifically designed and tested for the purpose, conduit and cable seals are not intended to prevent the passage of liquids, gases, or vapors at a continuous pressure differential across the seal. Even at differences in pressure across the seal equivalent to a few inches of water, there may be a slow passage of gas or vapor through a seal and through conductors passing through the seal. ~~See 501.15(E)(2).~~ Temperature extremes and highly corrosive liquids and vapors can affect the ability of seals to perform their intended function. ~~See 501.15(C)(2).~~
Informational Note No. 2: Gas or vapor leakage and propagation of flames may occur through the interstices between the strands of standard stranded conductors larger than 2 AWG. Special conductor constructions~~, for example,~~ such as compacted strands or sealing of the individual strands~~,~~ are means of reducing leakage and preventing the propagation of flames.
(A) Conduit Seals, Class I, Division 1. In Class I, Division 1 locations, conduit seals shall be located in accordance with 501.15(A)(1) through (A)(4).
(1) Entering Enclosures. ~~In each~~ Each conduit entry into an explosionproof enclosure shall have a conduit seal where either~~ of the following apply~~:
(1)~~ The~~ the enclosure contains apparatus, such as switches, circuit breakers, fuses, relays, or resistors~~,~~ that may produce arcs, sparks, or ~~high~~ temperatures that exceed 80 percent of the auto ignition temperature, in degrees Celsius, of the gas or vapor involved ~~that are considered to be an ignition source~~ in normal operation~~.~~
Exception to 501.15(A)(1)(1): Seals shall not be required for conduit entering an enclosure ~~where such switches, circuit breakers, fuses, relays, or resistors comply with one of the following:~~ under any one of the following conditions:
(1) ~~Are~~ The switch, circuit breaker, fuse, relay or resistor is enclosed within a chamber hermetically sealed against the entrance of gases or vapors
(2) ~~Are~~ The switch, circuit breaker, fuse, relay or resistor is immersed in oil in accordance with 501.115(B)(1)(2)
(3) ~~Are~~ The switch, circuit breaker, fuse, relay or resistor is enclosed within a factory-sealed explosionproof chamber located within the enclosure, identified for the location, and marked "factory sealed" or equivalent, ~~unless the enclosure entry is metric designator 53 (trade size 2) or larger~~
(4) ~~Are~~ The switch, circuit breaker, fuse, relay or resistor is part of a ~~in~~ nonincendive circuit~~s~~.
(2) ~~The~~ the entry is metric designator 53 (trade size 2) or larger and the enclosure contains terminals, splices, or taps.
~~For the purposes of this section, high temperatures shall be considered to be any temperatures exceeding 80 percent of the auto ignition temperature in degrees Celsius of the gas or vapor involved.~~
~~Exception to 501.15(A)(1)(1): Seals shall not be required for conduit entering an enclosure where such switches, circuit breakers, fuses, relays, or resistors comply with one of the following: under any of the following conditions.~~
Factory-sealed enclosures shall not be considered to serve as a seal for another adjacent explosionproof enclosure that is required to have a conduit seal.
Conduit seals shall be installed within 450 mm (18 in.) from the enclosure. Only explosionproof unions, couplings, reducers, elbows, capped elbows, and conduit bodies similar to L, T, and Cross types that are not larger than the trade size of the conduit shall be permitted between the sealing fitting and the explosionproof enclosure.
(2) Pressurized Enclosures. Conduit seals shall be installed within 450 mm (18 in.) of the enclosure in ~~In~~ each conduit entry into a pressurized enclosure where the conduit is not pressurized as part of the protection system. ~~Conduit seals shall be installed within 450 mm (18 in.) from the pressurized enclosure.~~
Informational Note No. 1: Installing the seal as close as possible to the enclosure will reduce problems with purging the dead airspace in the pressurized conduit.
Informational Note No. 2: For further information, see NFPA 496-2013, *Standard for Purged and Pressurized Enclosures for Electrical Equipment.*
(3) Two or More Explosionproof Enclosures. Where two or more explosionproof enclosures ~~for~~ which require conduit seals ~~are required under 501.15(A)(1)~~ are connected by nipples or ~~by~~ runs of conduit not more than 900 mm (36 in.) long, a single conduit seal in each such nipple connection or run of conduit shall be considered sufficient if the seal is located not more than 450 mm (18 in.) from either enclosure.
(4) Class I, Division 1 Boundary. A conduit seal shall be required in ~~In~~ each conduit run leaving a ~~Class I,~~ Division 1 location. The sealing fitting shall be permitted to be installed on either side of the boundary ~~of such location~~ within 3.05 m (10 ft) of the boundary and it shall be designed and installed ~~so as~~ to minimize the amount of gas or vapor within the ~~Division 1~~ portion of the conduit installed in the Division 1 location ~~from being~~ that can be communicated ~~to the conduit~~ beyond the seal. The conduit run between the conduit seal and the point at which the conduit leaves the Division 1 location shall contain no union, coupling, box or other fitting except for a listed explosionproof reducer installed at the conduit seal. ~~Except for listed explosionproof reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Division 1 location.~~
Exception No. 1: Metal conduit that contains no unions, couplings, boxes, or fittings, ~~and~~ that passes completely through a ~~Class I,~~ Division 1 location with no fittings installed within ~~less than~~ 300 mm (12 in.) ~~beyond each~~ of either side of the boundary, shall not require a conduit seal if the termination points of the unbroken conduit are located in unclassified locations.
Exception No. 2: For underground conduit installed in accordance with 300.5 where the boundary is below grade, the sealing fitting shall be permitted to be installed after the conduit emerges from below grade, but there shall be no union, coupling, box, or fitting, other than listed explosionproof reducers at the sealing fitting, in the conduit between the sealing fitting and the point at which the conduit emerges from below grade
(B) Conduit Seals, Class I, Division 2. In Class I, Division 2 locations, conduit seals shall be located in accordance with 501.15(B)(1) and (B)(2).
(1) Entering Enclosures. For connections to enclosures that are required to be explosionproof, a conduit seal shall be provided in accordance with 501.15(A)(1)(1) and (A)(3). All portions of the conduit run or nipple between the seal and ~~such~~ enclosure shall comply with 501.10(A).
(2) Class I, Division 2 Boundary. A conduit seal shall be required in ~~In~~ each conduit run leaving a Class I, Division 2 location. The sealing fitting shall be permitted to be installed on either side of the boundary ~~of such location~~ within 3.05 m (10 ft) of the boundary and it shall be designed and installed ~~so as~~ to minimize the amount of gas or vapor within the ~~Division 1~~ portion of the conduit installed in the Division 2 location ~~from being~~ that can be communicated ~~to the conduit~~ beyond the seal. Rigid metal conduit or threaded steel intermediate metal conduit shall be used between the sealing fitting and the point at which the conduit leaves the Division 2 location, and a threaded connection shall be used at the sealing fitting. The conduit run between the conduit seal and the point at which the conduit leaves the Division 2 location shall contain no union, coupling, box or other fitting except for a listed explosionproof reducer installed at the conduit seal. ~~In each conduit run passing from a Class I, Division 2 location into an unclassified location. The sealing fitting shall be permitted on either side of the boundary of such location within 3.05 m (10 ft) of the boundary. Rigid metal conduit or threaded steel intermediate metal conduit shall be used between the sealing fitting and the point at which the conduit leaves the Division 2 location, and a threaded connection shall be used at the sealing fitting. Except for listed reducers at the conduit seal, there shall be no union, coupling, box, or fitting between the conduit seal and the point at which the conduit leaves the Division 2 location. Conduits shall be sealed to minimize the amount of gas or vapor within the Division 2 portion of the conduit from being communicated to the conduit beyond the seal.~~ Such seals shall not be required to be explosionproof but shall be identified for the purpose of minimizing the passage of gases to the rate permitted for seal fittings [200 cm3/hr (0.007 ft3/hr) of air at a pressure of 1500 pascals (6 in. of water)] ~~permitted~~ under normal operating conditions and shall be accessible.
Informational Note: For further information, refer to ANSI/UL 514B-2012, Conduit, Tubing, and Cable Fittings.
Exception No. 1: Metal conduit that contains no unions, couplings, boxes, or fittings, ~~and~~ that passes completely through a ~~Class I,~~ Division 2 location with no fittings installed within ~~less than~~ 300 mm (12 in.) ~~beyond each~~ of either side of the boundary, shall not be required to be sealed if the termination points of the unbroken conduit are located in unclassified locations.
Exception No. 2: Conduit systems terminating ~~at~~ in an unclassified location where ~~a wiring method~~ the metal conduit transitions ~~is made~~ to cable tray, cablebus, ventilated busway, Type MI cable, or to cable not installed in any cable tray or raceway system shall not be required to be sealed where passing from the ~~Class I,~~ Division 2 location into the unclassified location under the following conditions. ~~The unclassified location shall be outdoors or, if the conduit system is all in one room, it shall be permitted to be indoors. The unclassified location shall be~~ is ~~outdoors or, if the conduit system is all in one room, it shall be permitted to be indoors.~~

(1). The unclassified location ~~shall be~~ is outdoors or, the unclassified location is indoors and ~~if~~ the conduit system is all in one room, ~~it shall be permitted to be indoors.~~

(2). The conduits shall not terminate at an enclosure containing an ignition source in normal operation.

Exception No. 3: Conduit systems passing from an enclosure or a room that is unclassified, as a result of pressurization, into a ~~Class I,~~ Division 2 location shall not require a seal at the boundary.

Informational Note: For further information, refer to NFPA 496-2008, *Standard for Purged and Pressurized Enclosures for Electrical Equipment*.

Exception No. 4: Segments of aboveground conduit systems shall not be required to be sealed where passing from a ~~Class I,~~ Division 2 location into an unclassified location if all of the following conditions are met:

(1). No part of the conduit system segment passes through a ~~Class I,~~ Division 1 location where the conduit segment contains unions, couplings, boxes, or fittings that are located within 300 mm (12 in.) of the ~~Class I,~~ Division 1 location.

(2). The conduit system segment is located entirely in outdoor locations.

(3). The conduit system segment is not directly connected to canned pumps, process or service connections for flow, pressure, or analysis measurement, and so forth, that depend on a single compression seal, diaphragm, or tube to prevent flammable or combustible fluids from entering the conduit system.

(4). The conduit system segment contains only threaded metal conduit, unions, couplings, conduit bodies, and fittings in the unclassified location.

(5). The conduit system segment is sealed at its entry to each enclosure or fitting ~~housing~~ located in the ~~Class I,~~ Division 2 location that contains terminals, splices, or taps ~~in Class I, Division 2 locations~~.

(C) Class I, Divisions 1 and 2. Seals installed in Class I, Division 1 and Division 2 locations shall comply with 501.15(C)(1) through (C)(6).

Exception: Seals that are not required to be explosionproof by 501.15(B)(2) or 504.70 shall not be required to comply.

(1) Fittings. Enclosures ~~for~~ that contain connections or equipment shall be provided with an integral ~~means for~~ sealing means, or sealing fittings listed for the location shall be used. Sealing fittings shall be listed for use with one or more specific compounds and shall be accessible.

(2) Compound. The compound shall provide a seal ~~against~~ to minimize the passage of gas and/or vapors through the sealing fitting, and shall not be affected by the surrounding atmosphere or liquids~~,~~. ~~and~~ The melting point of the compound shall not ~~have a melting point of~~ be less than 93°C (200°F).

(3) Thickness of Compounds. The thickness of the sealing compound installed in completed seals, ~~except for~~ other than listed cable sealing fittings ~~Except for listed cable sealing fittings, the thickness of the sealing compound in a completed seal~~ shall not be less than the metric designator (trade size) of the sealing fitting expressed in the units of measurement employed~~, and~~ however in no case shall the thickness of the compound be less than 16 mm (5⁄8 in.).

(4) Splices and Taps. Splices and taps shall not be made in fittings intended only for sealing with compound, nor shall other fittings in which splices or taps are made be filled with compound.

(5) Assemblies. ~~In an~~ An entire assembly shall be identified for the location where the equipment that may produce arcs, sparks, or high temperatures is located in a compartment that is separate from the compartment containing splices or taps, and an integral seal is provided where conductors pass from one compartment to the other~~, the entire assembly shall be identified for the location~~. ~~Seals~~. In ~~Class I,~~ Division 1 locations, seals shall be provided in conduit ~~connections~~ connecting to the compartment containing splices or taps ~~shall be provided in Class I, Division 1 locations~~ where required by 501.15(A)(1)(2).

(6) Conductor or Optical Fiber Fill. The cross-sectional area of the conductors or optical fiber tubes (metallic or nonmetallic) permitted in a seal shall not exceed 25 percent of the cross-sectional area of a rigid metal conduit of the same trade size unless ~~it~~ the seal is specifically identified for a higher percentage of fill.

(D) Cable Seals, Class I, Division 1. In ~~Class I,~~ Division 1 locations, cable seals shall be located according to 501.15(D)(1) through (D)(3).

(1) At Terminations. Cables shall be sealed with sealing fittings that comply with 501.15(C) at all terminations. ~~The sealing fitting shall comply with 501.15(C). Multiconductor~~ Type MC-HL cables with a gas/vaportight continuous corrugated metallic sheath and an overall jacket of suitable polymeric material shall be sealed with a listed fitting after ~~removing~~ the jacket and any other covering has been removed so that the sealing compound can surround~~s~~ each individual insulated conductor in such a manner as to minimize the passage of gases and vapors.

Exception: Shielded cables and twisted pair cables shall not require the removal of the shielding material or separation of the twisted pairs, provided the termination is sealed by an approved means to minimize the entrance of gases or vapors and prevent propagation of flame into the cable core.

(2) Cables Capable of Transmitting Gases or Vapors.

Cables ~~in conduit~~ with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core, installed in conduit, shall be sealed in the Class I, Division 1 location after ~~removing~~ the jacket and any other coverings has been removed so that the sealing compound ~~will~~ can surround each individual insulated conductor or optical fiber tube and the outer jacket.

Exception: Multiconductor cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall be permitted to be considered as a single conductor by sealing the cable in the conduit within 450 mm (18 in.) of the enclosure and the cable end within the enclosure by an approved means to minimize the entrance of gases or vapors and prevent the propagation of flame into the cable core, or by other approved methods. ~~For shielded cables and twisted pair cables, it~~ It shall not be required to remove the shielding material or separate the twisted pairs ~~for~~ of shielded cables and twisted pair cables.

(3) Cables Incapable of Transmitting Gases or Vapors.

Each multiconductor cable installed in conduit shall be considered as a single conductor if the cable is incapable of transmitting gases or vapors through the cable core. These cables shall be sealed in accordance with 501.15(A).

(E) Cable Seals, Class I, Division 2. In ~~Class I,~~ Division 2 locations, cable seals shall be located in accordance with 501.15(E)(1) through (E)(4).

Exception: Cables with an unbroken gas/vaportight continuous sheath shall be permitted to pass through a Division 2 location without seals.

(1)Terminations. Cables entering enclosures that are required to be explosionproof shall be sealed at the point of entrance. The sealing fitting shall comply with 501.15(B)(1) or be explosionproof. Multiconductor or optical multifiber cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core that are installed in a Division 2 location shall be sealed ~~in~~ with a listed fitting ~~in the Division 2 location~~ after ~~removing~~ the jacket and any other coverings have been removed so that the sealing compound can surround~~s~~ each individual insulated conductor or optical fiber tube in such a manner as to minimize the passage of gases and vapors. Multiconductor or optical multifiber cables installed in conduit shall be sealed as described in 501.15(D).

Exception No. 1: Cables ~~passing from~~ leaving an enclosure or room that is unclassified as a result of Type Z pressurization and entering into a ~~Class I,~~ Division 2 location shall not require a seal at the boundary.

Exception No. 2: Shielded cables and twisted pair cables shall not require the removal of the shielding material or separation of the twisted pairs, provided the termination is by an approved means to minimize the entrance of gases or vapors and prevent propagation of flame into the cable core.

(2) Cables That Do Not Transmit Gases or Vapors. Cables that have a gas/vaportight continuous sheath and do not transmit gases or vapors through the cable core in excess of the quantity permitted for seal fittings shall not be required to be sealed except as required in 501.15(E)(1). The minimum length of such a cable run shall not be less than ~~that~~ the length ~~that~~ needed to limit~~s~~ gas or vapor flow through the cable core, not including the interstices of the conductor strands, to the rate permitted for seal fittings ~~[~~200 cm3/hr (0.007 ft3/hr) of air at a pressure of 1500 pascals (6 in. of water)].

~~Informational Note: The cable core does not include the interstices of the conductor strands.~~

(3) Cables Capable of Transmitting Gases or Vapors. Cables with a gas/vaportight continuous sheath capable of transmitting gases or vapors through the cable core shall ~~not be required to~~ be sealed ~~except~~ as required in 501.15(E)(1), unless the cable is attached to process equipment or devices that may cause a pressure in excess of 1500 pascals (6 in. of water) to be exerted at a cable end, in which case a seal, barrier, or other means shall be provided to prevent migration of flammables into an unclassified location.

~~*Exception: Cables with an unbroken gas/vaportight continuous sheath shall be permitted to pass through a Class I, Division 2 location without seals.*~~

(4) Cables Without Gas/Vaportight Sheath. Cables that do not have gas/vaportight continuous sheath shall be sealed at the boundary of the Division 2 and unclassified location in such a manner as to minimize the passage of gases or vapors into an unclassified location.

(F) Drainage.

(1) Control Equipment. Where there is a probability that liquid or other condensed vapor may be trapped within enclosures for control equipment or at any point in the raceway system, approved means shall be provided to prevent accumulation or to permit periodic draining of such liquid or condensed vapor.

(2) Motors and Generators. Where ~~the authority having jurisdiction judges that there is a probability that~~ liquid or condensed vapor may accumulate within motors or generators, joints and conduit systems shall be arranged to minimize the entrance of liquid. If means to prevent accumulation or to permit periodic draining are ~~judged~~ necessary, such means shall be provided at the time of manufacture and shall be considered an integral part of the machine.

Panel Statement: CMP-14 has reviewed and editorially revised the entirety of 501.15 to comply with the directive of the Correlating Committee. The revised text shown here also incorporates amendments effected via Comments 14-16 and 14-17.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-16 Log #449 NEC-P14 **Final Action: Accept in Principle in Part**

(501.15(B)(2))

Submitter: William Fiske, Intertek

Comment on Proposal No: 14-46

Recommendation: Reverse CMP-14 action on Proposal 14-46 and return to the language in NEC 2011.

Substantiation: The authority having jurisdiction would not be able to determine whether or not a seal complies with the proposed requirements, as AHJs do not possess the equipment or the expertise needed to test seals in the field. As stated in NEC 90.7, [listing] "avoids the necessity for repetition of examinations by different examiners, frequently with inadequate facilities for such work …" Adding a leak rate specification for seals would create a de facto requirement for listing, yet the submitter's substantiation does not indicate that listing of seals is necessary. Note also that the existing language of 501.15(A)(4), covering seals at a Class I Division 1 boundary, does not include a requirement for listed seals, does not contain a leak rate specification, and none has been proposed for 501.15(A)(4).

Panel Meeting Action: Accept in Principle in Part

Revise the last sentence of 501.15(B)(2) to read:

Such seals shall not be required to be explosionproof but shall be identified for the purpose of minimizing the passage of gases ~~to the rate permitted for seal fittings [200 cm3/hr (0.007 ft3/hr) of air at a pressure of 1500 pascals (6 in. of water)]~~ permitted under normal operating conditions and shall be accessible.

Informational Note: For further information, refer to ANSI/UL 514B-2012, Conduit, Tubing, and Cable Fittings.

Panel Statement: CMP-14 affirms that the requirements for these types of seals need to be identified for the user and has created an Informational Note to reference the proper ANSI standard that addresses the requirements for the intended application.

Ballot Results: Affirmative: 14

14-19 Log #374 NEC-P14 **Final Action: Accept**

(501.30)

Submitter: Robert A. Jones, Independent Electrical Contractors, Inc.

Comment on Proposal No: 14-56a

Recommendation: Revise text to read as follows:

Regardless of the voltage of the electrical system, wiring and equipment in Class I, Division 1 and 2 locations shall be grounded as specified in Article 250 and in accordance with the requirements of 501.30(A) and (B).

Substantiation: CMP 14 had a long discussion about deleting the informational note about referring to 250.100. During the discussion the phrase "regardless of the voltage of the electrical system" was considered important to minimize the possibility of an ignition; however Proposal 14-56a did not insert these words in the sections affected.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-20 Log #188 NEC-P14 **Final Action: Accept**

(501.105(B)(6))

Submitter: Technical Correlating Committee on National Electrical Code®

Comment on Proposal No: 14-61

Recommendation: It was the action of the Correlating Committee that this proposal be reconsidered and correlated with the action taken on Proposal 1-114.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Panel Statement: CMP-14 has taken the direction of the Correlating Committee and reconsidered the action taken on Proposal 14-61. CMP-14 continues to reject Proposal 14-61 because the additional text is not necessary. Since Articles 500 through 516 do not amend the requirements of 110.21, these requirements already apply.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-21 Log #373 NEC-P14 **Final Action: Accept**

(501.105(B)(6)(1))

Submitter: Robert A. Jones, IEC Texas Gulf Coast

Comment on Proposal No: 14-62

Recommendation: Revise text to read as follows:

A switch complying with 501.105(B)(1) is provided so that the attachment plug is not depended on to interrupt current.~~, unless the circuit is nonincendive field wiring, in which case the switch is not required.~~

Exception: The switch is not required if the circuit is nonincendive field wiring.

Substantiation: Action taken by CMP 14 on this proposal is not in accordance with the National Electrical Code® style manual. The added phrase is really an exception to the previous phrase.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-22 Log #189 NEC-P14 **Final Action: Accept**

(501.125(B) Informational Note 4)

TCC Action: The Correlating Committee directs that the date of the latest referenced standard in 501.125(B) Informational Note 4 will be included in the Code.

Submitter: Technical Correlating Committee on National Electrical Code®

Comment on Proposal No: 14-66

Recommendation: The Correlating Committee directs that the panel rewrite this Informational Note to eliminate the following phrase "…it is important to consider the risk of…" which is in violation of 3.1.3 of the NEC Style Manual.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Revise new Informational Note 4 to read as follows:

Informational Note No. 4: Reciprocating engine driven generators, compressors, and other equipment installed in Class I Division 2 locations, may present a risk of ignition of flammable materials associated with fuel, starting, compression, etc. due to inadvertent release or equipment malfunction by the engine ignition system and controls. For further information on the requirements for ignition systems for reciprocating engines installed in Class I Division 2 hazardous (classified) locations, see ANSI/ISA-12.20.01, *General Requirements for Electrical Ignition Systems for Internal Combustion Engines in Class I, Division 2 or Zone 2, Hazardous (Classified) Locations*.

Panel Statement: CMP-14 has made the change as directed by the Correlating Committee. Also, CMP-14 has replaced the word "loads" with "equipment".

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-23 Log #512 NEC-P14 **Final Action: Accept**

(501.130(B)(4) Exception)

Submitter: Edward M. Briesch, UL LLC

Comment on Proposal No: 14-72

Recommendation: Accept Proposal 14-72. Revise the Exception to 501.130(B)(4) as follows:

(4) Portable Lighting Equipment. Portable lighting equipment shall comply with 501.130(A)(1).

Exception: Where portable lighting equipment is mounted on movable stands and is connected by flexible cords, as covered in 501.140, it shall be permitted to comply with 501.130(B)(1), where mounted in any position, provided ~~if~~ it also complies with ~~conforms to~~ 501.130(B)(2).

Substantiation: This proposal should be accepted. It does not, as the Panel Statement indicates, reduce the level of protection from Division 1 to Division 2. This exception first appears in the 1984 NEC in 501-9(b)(1). The exception states that portable lighting equipment in Class I, Division 2 need not comply with the requirements for Class I, Division 1 if it complies with "Section 501-9(b)(2) below". Section 501-9(b)(2) of the 1984 NEC details the requirements for fixed lighting in Class I, Division 2. Those requirements now are found in 501.130(B)(1).The intent of Proposal 14-72 is to clarify that this was indeed the case.

A review of Proposal 14-62 for the 1984 NEC and the resultant action of the Panel as documented in the National Electrical Code Technical Committee Report for the 1984 NEC clearly indicates that the intent of the proposal was to permit portable lighting on moveable stands and connected by cord to comply with the Division 2 requirements instead of the Division 1 requirements. The submitter's substantiation for Proposal 14-62 also states that this was needed for temporary lighting during periods of maintenance but at that time the Panel chose not to limit the usage in this way. The final wording was modified to conform to the style manual by Comment 14-75 from the NEC Correlating Committee.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-24 Log #886 NEC-P14 **Final Action: Reject**

(501.140(B)(4))

Submitter: David Wechsler, American Chemical Council

Comment on Proposal No: 14-11b

Recommendation: Do not add a new definition to 500.2, 505.2 and 506.2 reading:

~~Cord Connector. A fitting intended to terminate a cord to a box or similar device and reduce the strain at points of termination and may include an explosionproof, a dust ignition proof, or a flameproof seal.~~

Under 501.140 (B) (4) change cord connector to cord fitting as shown below:

(4) In Division 1 locations or in Division 2 locations where the boxes, fittings, or enclosures are required to be explosionproof, the cord shall be terminated with a cord <u>fitting</u> ~~connector~~ or attachment plug listed for the location or a cord <u>fitting</u> ~~connector~~ installed with a seal listed for the location. In Division 2 locations where explosionproof equipment is not required, the cord shall be terminated with a listed cord <u>fitting</u> ~~connector~~ or listed attachment plug.

Under 502.140 (B) (4) change cord connector to fitting as shown below:

(4) In Division 1 locations, the cord shall be terminated with a cord <u>fitting</u> ~~connector~~ listed for the location or a listed cord <u>fitting</u> ~~connector~~ installed with a seal listed for the location. In Division 2 locations, the cord shall be terminated with a listed dusttight cord <u>fitting</u> ~~connector~~.

Under 503.140 (B) (4) change cord connector to fitting as shown below:

(4) Be terminated with a listed dusttight cord <u>fitting</u> ~~connector~~.

Under 505.17(5) change cord connector to fitting as shown below:

(5) Be terminated with a listed cord <u>fitting</u> ~~connector~~ that maintains the type of protection where the flexible cord enters boxes, fittings, or enclosures that are required to be explosionproof or flameproof.

Under 506.17(5) change cord connector to fitting as shown below:

(5) Be terminated with a listed cord <u>fitting</u> ~~connector~~ that maintains the protection technique of the terminal compartment.

NOTE: Separate comments were submitted for each of the respective sections shown above to comply with the Style Manual.

Substantiation: This proposal was offered to attempt to correct the incorrect use of the term 'connector'. However the action taken simply makes this problem more unclear as the term 'cord connector' is not appropriate in this case and a different term that includes the word "fitting" should be used as part of the term, not to describe something different. The action addressed in the proposed text revisions provides appropriate solutions.

ANSI/UL 514B is not limited for use in hazardous (classified) areas. The term fitting is widely used in UL product standards to refer to these and other types of products that are used to secure wiring methods and cords to equipment. The actual title of UL 514B uses the term fittings, not connectors "Conduit, Tubing, and Cable Fittings". Section 1.2 of UL 514B uses the phrase "fittings for flexible cord" Interestingly 1.4 states "These requirements do not cover FITTINGS intended for use in hazardous locations as defined in the National Electrical Code, ANSI/NFPA 70, the Canadian Electrical Code (CEC), Part I, CSA C22.1, and the Standard for Electrical Installations, NOM-001-SEDE."

The term cord connector is used in other places in the NEC as a wiring device such as in 210.50(A) where it permits a "cord connector" to be considered a receptacle outlet. Section 626.2 defines a cord connector as a device for establishing a connection. The term fitting is commonly used in the NEC and product standards related to flexible cords products that are attached to enclosures. Section 400.7(B) uses the term cord connector body as device used to energize an attachment plug.

The term "cord fitting" as indicated should be used in sections 501.140(B)(4), 502.140(4), 503.140(4), 505.17(5), 506.17(5) and anywhere else the term is used to describe the fitting.

As presently used in these articles the term cord connector is confusing whether the term is defined differently (for no good reason) or not. The term "cord connector" is commonly used in the field to describe a wiring device that is connected to a cord.

Users of Chapter 5 are not exempt from the requirements in Chapters 1 through 4, chapter 5 requirements can supplement or modify the general rules but creating using the same term to define different items should not be done and will create confusion and likely misinterpretation of the associated requirements.

The term "fitting" is used in many other NEC sections to describe the product used to secure a cord to an enclosure.

Panel Meeting Action: Reject

Panel Statement: The definition of "connector" in UL 514B includes cord and cable, but the definition of "fitting" does not include cord. For this reason, CMP-14 affirms that the definition for the term "cord connector" is appropriate and does not agree that it should be replaced by the term "fitting". The term "fitting" is defined in Article 100 and is a generic term that includes locknuts and bushings. The use of the term "connector" emphasizes the need to provide strain relief at the point of termination of the cord and the need to reduce the risk of the termination being compromised due to excess strain on the connection. The use of the term "cord connector", without the definition, does not make the strain relief requirement explicit.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 2

Explanation of Negative:

MCBRIDE, W.: IEEE statement opposing the panel action:

The term "cord connector" should not be defined as CMP14 has accepted. The term cord connector is commonly used in the field to describe a wiring device that is connected to a cord. Wiring device manufacturer's websites indicate that cord connectors are used to describe wiring devices. Other locations in the NEC use the term cord connector where referring to a wiring device and 626.2 actually defines it as such. Using the same term to define different items in the NEC should not be done, is inconsistent, will create confusion and likely misinterpretation of the associated requirements.

The term fitting as suggested by a commenter includes the concept of it primarily performing a mechanical function. If CMP14 does not like the use of the term fitting then a different term should be chosen, although Article 400 uses the term fitting when referring to products used to secure cords to enclosures.

Users of Chapter 5 are not exempt from the requirements in Chapters 1 through 4, Chapter 5 requirements can supplement or modify the general rules.

WECHSLER, D.: See my negative ballot comment related to "[1] cord connector" in Comment 14-1 and Comment 14-2 and 14-3.

If CMP14 does not like the use of the term fitting then a different term should be chosen, although Article 400 uses the term fitting when referring to products used to secure cords to enclosures.
Users of Chapter 5 are not exempt from the requirements in Chapters 1 through 4, Chapter 5 requirements can supplement or modify the general rules.
WECHSLER, D.: See Negative ballot comment related to “[1] cord connector” in Comment 14-1 and Comments 14-2, 14-3, 14-24, and Comment 14-30.

ARTICLE 504 — INTRINSICALLY SAFE SYSTEMS

14-33 Log #191 NEC-P14 **Final Action: Accept**
(504)

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 14-112
Recommendation: The Correlating Committee understands that the date references to the ISA Standards are to remain as shown in the panel action.
Furthermore, it was the action of the Correlating Committee that this proposal be reconsidered and correlated with the action taken on Proposal 14-117.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: CMP-14 accepts the action taken on Proposal 14-112 and not that of Proposal 14-117. The text agreed to by CMP-14 is accurately reflected in the draft of the proposed 2014 edition of the NEC. See also Comment 14-36.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-34 Log #490 NEC-P14 **Final Action: Accept in Principle**
(504.2.Associated Apparatus)

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 14-114
Recommendation: Revise text to read as follows:
Associated Apparatus. Apparatus in which the circuits are not necessarily intrinsically safe themselves but that affect the energy in the intrinsically safe circuits and are relied on to maintain intrinsic safety. Examples of such ~~Associated~~ apparatus are ~~may be either of~~ the following:
(1) Electrical apparatus that has an alternative-type protection for use in the appropriate hazardous (classified) location
(2) Electrical apparatus not so protected that shall not be used within a hazardous (classified) location
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains the defined term in the last sentence and the NEC manual of style does not permit the definition to contain the defined term. Definitions are not requirements. The proposed changes eliminate the defined term. Alternatively CMP 14 might want to place the examples in an alternate suitable location in Article 504 as a requirement. The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Associated Apparatus. Apparatus in which the circuits are not necessarily intrinsically safe themselves but that affect the energy in the intrinsically safe circuits and are relied on to maintain intrinsic safety. Such ~~Associated~~ apparatus are one ~~may be either~~ of the following:
(1) Electrical apparatus that has an alternative-type protection for use in the appropriate hazardous (classified) location
(2) Electrical apparatus not so protected that shall not be used within a hazardous (classified) location

Panel Statement: Associated apparatus are limited to the two cases cited. The Style Manual has been satisfied by the minor adjustment to the text. CMP-14 notes that, by the action on Comment 14-1, this definition will be relocated to Section 500.2.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-35 Log #897 NEC-P14 **Final Action: Reject**
(504.4)

Submitter: David Wechsler, American Chemical Council
Comment on Proposal No: 14-111
Recommendation: Insert the following new text in 504.4:
504.4 Equipment. All intrinsically safe apparatus and associated apparatus shall be listed.
Testing for energy for intrinsically safe circuits shall be permitted to utilize a factor of 1.5 applied to energy or, both 1.5 applied to voltage and 1.5 applied to current.
Exception: Simple apparatus, as described on the control drawing, shall not be required to be listed.
504.10 Equipment Installation.
Substantiation: In the Panel Statement the Panel states that there are at least two US documents on intrinsic safety and this suggests that either would be acceptable for use. This comment addresses currently a major issue dealing with energy and the factor being considered and merely affirms this acceptable use within the NEC.
Panel Meeting Action: Reject
Panel Statement: This comment is attempting to modify testing requirements that do not exist in the Code.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-36 Log #192 NEC-P14 **Final Action: Accept**
(504.10(B))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 14-117
Recommendation: It was the action of the Correlating Committee that this proposal be reconsidered and correlated with the action taken on Proposal 14-112.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: CMP-14 accepts the action taken on Proposal 14-112 and not that of Proposal 14-117. The text agreed to by CMP-14 is accurately reflected in the draft of the proposed 2014 edition of the NEC.
See also Comment 14-33.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 505 — ZONE 0, 1, AND 2 LOCATIONS

14-37 Log #889 NEC-P14 **Final Action: Reject**
(505.2 and 505.17(5))

Submitter: David Wechsler, American Chemical Council
Comment on Proposal No: 14-11b
Recommendation: Do not add a new definition to 500.2, 505.2 and 506.2 reading:
~~Cord Connector. A fitting intended to terminate a cord to a box or similar device and reduce the strain at points of termination and may include an explosionproof, a dust ignition proof, or a flameproof seal.~~
Under 501.140 (B) (4) change cord connector to cord fitting as shown below:
(4) In Division 1 locations or in Division 2 locations where the boxes, fittings, or enclosures are required to be explosionproof, the cord shall be terminated with a cord fitting ~~connector~~ or attachment plug listed for the location or a cord fitting ~~connector~~ installed with a seal listed for the location. In Division 2 locations where explosionproof equipment is not required, the cord shall be terminated with a listed cord fitting ~~connector~~ or listed attachment plug.
Under 502.140 (B) (4) change cord connector to fitting as shown below:
(4) In Division 1 locations, the cord shall be terminated with a cord fitting ~~connector~~ listed for the location or a listed cord fitting ~~connector~~ installed with a seal listed for the location. In Division 2 locations, the cord shall be terminated with a listed dusttight cord fitting ~~connector~~.
Under 503.140 (B) (4) change cord connector to fitting as shown below:
(4) Be terminated with a listed dusttight cord fitting ~~connector~~.
Under 505.17(5) change cord connector to fitting as shown below:
(5) Be terminated with a listed cord fitting ~~connector~~ that maintains the type of protection where the flexible cord enters boxes, fittings, or enclosures that are required to be explosionproof or flameproof.
Under 506.17(5) change cord connector to fitting as shown below:
(5) Be terminated with a listed cord fitting ~~connector~~ that maintains the protection technique of the terminal compartment.
NOTE: Separate comments were submitted for each of the respective sections shown above to comply with the Style Manual.
Substantiation: This proposal was offered to attempt to correct the incorrect use of the term ‘connector’. However the action taken simply makes this problem more unclear as the term ‘cord connector’ is not appropriate in this case and a different term that includes the word “fitting” should be used as part of the term, not to describe something different. The action addressed in the proposed text revisions provides appropriate solutions.
ANSI/UL 514B is not limited for use in hazardous (classified) areas. The term fitting is widely used in UL product standards to refer to these and other types of products that are used to secure wiring methods and cords to equipment. The actual title of UL 514B uses the term fittings, not connectors “Conduit, Tubing, and Cable Fittings”. Section 1.2 of UL 514B uses the phrase “fittings for flexible cord” Interestingly 1.4 states “These requirements do not cover FITTINGS intended for use in hazardous locations as defined in the National Electrical Code, ANSI/NFPA 70, the Canadian Electrical Code (CEC), Part I, CSA C22.1, and the Standard for Electrical Installations, NOM-001-SEDE.”
The term cord connector is used in other places in the NEC as a wiring device such as in 210.50(A) where it permits a “cord connector” to be considered a receptacle outlet. Section 626.2 defines a cord connector as a device for establishing a connection. The term fitting is commonly used in the NEC and product standards related to flexible cords products that are attached to enclosures. Section 400.7(B) uses the term cord connector body as device used to energize an attachment plug.
The term “cord fitting” as indicated should be used in sections 501.140(B)(4), 502.140(4), 503.140(4), 505.17(5), 506.17(5) and anywhere else the term is used to describe the fitting.
As presently used in these articles the term cord connector is confusing whether the term is defined differently (for no good reason) or not. The term “cord connector” is commonly used in the field to describe a wiring device that is connected to a cord.
Users of Chapter 5 are not exempt from the requirements in Chapters 1 through 4, chapter 5 requirements can supplement or modify the general rules but creating using the same term to define different items should not be done and will create confusion and likely misinterpretation of the associated requirements.
The term “fitting” is used in many other NEC sections to describe the product used to secure a cord to an enclosure.
Panel Meeting Action: Reject
Panel Statement: The definition of “connector” in UL 514B includes cord and cable, but the definition of “fitting” does not include cord. For this reason, CMP-14 affirms that the definition for the term “cord connector” is appropriate and does not agree that it should be replaced by the term “fitting”. The term “fitting” is defined in Article 100 and is a generic term that includes locknuts and bushings. The use of the term “connector” emphasizes the need to provide strain relief at the point of termination of the cord and the need to reduce the risk of the termination being compromised due to excess strain on the connection. The use of the term “cord connector”, without the definition, does not make the strain relief requirement explicit.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:
MCBRIDE, W.: IEEE statement opposing the panel action:
The term “cord connector” should not be defined as CMP14 has accepted. The term cord connector is commonly used in the field to describe a wiring device that is connected to a cord. Wiring device manufacturer’s websites indicate that cord connectors are used to describe wiring devices. Other locations in the NEC use the term cord connector where referring to a wiring device and 626.2 actually defines it as such. Using the same term to define different items in the NEC should not be done, is inconsistent, will create confusion and likely misinterpretation of the associated requirements.
The term fitting as suggested by a commenter includes the concept of it primarily performing a mechanical function. If CMP14 does not like the use of the term fitting then a different term should be chosen, although Article 400 uses the term fitting when referring to products used to secure cords to enclosures.
Users of Chapter 5 are not exempt from the requirements in Chapters 1 through 4, Chapter 5 requirements can supplement or modify the general rules.
WECHSLER, D.: See Negative ballot comment related to “[1] cord connector” in Comment 14-1 and Comments 14-2, 14-3, 14-24, 14-30, and Comment 14-32.

14-38 Log #193 NEC-P14 **Final Action: Accept**
(505.5(A))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 14-136a
Recommendation: The Correlating Committee directs that the panel clarify the action on this proposal.
The Correlating Committee notes that this proposal incorporates changes in the first sentence that were not identified in legislative format.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Replace the first paragraph of current text of 505.5(A) with the following:

(A) Classification of Locations. Locations shall be classified depending on the properties of the flammable gases, flammable liquid-produced vapors, ~~liquids, or gases~~ combustible-liquid produced vapors, combustible dusts, or fibers/flyings that may be present and the likelihood that a flammable or combustible concentration or quantity is present. Each room, section, or area shall be considered individually in determining its classification. Where pyrophoric materials are the only materials used or handled, these locations are outside the scope of this article ~~shall not be classified~~

~~Each room, section, or area shall be considered individually in determining its classification.~~"

Panel Statement: CMP-14 has restated the action of Proposal 14-136a, to indicate the amendments, as directed by the Correlating Committee.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-39 Log #194 NEC-P14 **Final Action: Accept**

(505.6, Informational Note 2)

TCC Action: The Correlating Committee directs that Information Note No. 3 be revised as follows:

Group II is currently subdivided into Groups "IIA", "IIB", and "IIC". Prior marking requirements allowed some types of protection to be marked without a subdivision, showing only Group "II". ~~Equipment so marked should be is considered to be suitable for Group IIC applications.~~

The last sentence has been deleted to bring the Informational Note into compliance with the NEC Style Manual.

Submitter: Technical Correlating Committee on National Electrical Code®

Comment on Proposal No: 14-139

Recommendation: It was the action of the Correlating Committee that the panel reconsider this proposal. The third sentence of the Informational Note contains a recommendation which does not comply with 3.1.3 of the NEC Style Manual.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Revise text to read as follows:

~~Group II shall be subdivided into IIC, IIB, and IIA, as noted in 505.6(A), (B), and (C), according to the nature of the gas or vapor, for protection techniques "d," "ia," "ib," "[ia]," and "[ib]," and, where applicable, "n" and "o.".~~

Informational Note No. 3~~2~~: ~~Verification of electrical equipment utilizing protection techniques "e," "m," "p," and "q," due to design technique, does not require tests involving MESG or MIC. Therefore, Group II is not required to be subdivided for these protection techniques.~~ Group II is currently subdivided into Groups "IIA", "IIB", and "IIC". Prior marking requirements allowed some types of protection to be marked without a subdivision, showing only Group "II". Equipment so marked ~~should be~~ is considered to be suitable for Group IIC applications.

Panel Statement: CMP-14 has amended the subject text at the direction of the Correlating Committee. CMP-14 also recognizes that this Note is to be renumbered.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-40 Log #1284 NEC-P14 **Final Action: Accept**

(505.7(F) (New))

Submitter: William G. Lawrence, Jr., S. Yarmouth, MA

Comment on Proposal No: 14-141

Recommendation: Add new text to read as follows:

Proposed as normative text based on comment:

(F) Available Short-Circuit Current for Type of Protection "e" - The available short circuit current for electrical equipment using type of protection "e" for the field wiring connections in Zone 1 locations shall be limited to 10,000 rms symmetrical amperes to reduce the likelihood of ignition of a flammable atmosphere by an arc during a short circuit event.

Informational Note 3: Limitation of the available short circuit current to this level may require the application of current-limiting fuses or current-limiting circuit breakers.

Substantiation: The short circuit current rating of terminals and terminal blocks, according to ANSI/UL 508A, is 10,000 rms symmetrical amperes unless otherwise evaluated. To align with the ratings of these components, the available short circuit current should be limited to corresponding values. This is consistent with the approach in Article 409 for industrial control panels. The addition of this requirement to 505.7 is necessary as these terminals are used in many applications other than industrial control panels.

Panel Meeting Action: Accept

Panel Statement: CMP-14 notes that the informational note does not need to be numbered.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-41 Log #195 NEC-P14 **Final Action: Accept**

(505.15)

Submitter: Technical Correlating Committee on National Electrical Code®

Comment on Proposal No: 14-160

Recommendation: The Correlating Committee directs that the panel reconsider the actions taken on this proposal.

The Correlating Committee notes that the panel omitted the last sentence of 505.15(B)(1)(b) without identifying this as a change.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Correct 505.15(B)(1)(b) as indicated:

(b) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, Type MC-HL cable listed for use in Class I, Zone 1 or Division 1 locations, with a gas/vaportight continuous corrugated metallic sheath, an overall jacket of suitable polymeric material, a separate equipment grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the application. Type MC-HL cable shall be installed in accordance with the provisions of Article 330, Part II.

Panel Statement: CMP-14 has reinserted existing text that was inadvertently deleted during transcription at the ROP stage.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-42 Log #317 NEC-P14 **Final Action: Accept**

(505.15(B)(1)(g))

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.

Comment on Proposal No: 14-163

Recommendation: Revise text to read as follows:

(e) ~~Fiber~~ Optical fiber cables ~~of the~~ types OFNP, OFCP, OFNR, OFCR, OFNG, OFCG, OFN, and OFC shall be permitted to be installed in raceways as stated in 505.15(B). These ~~Fiber Optic~~ optical fiber cables shall be sealed in accordance with 505.16.

Substantiation: This is an editorial comment. Terminology should be consistent throughout the code. Article 770 covers optical fiber cables not fiber optic cables. There are many places this change needs to be made to correlate with Article 770.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-43 Log #1267 NEC-P14 **Final Action: Accept in Principle**

(505.15(B)(1)(g) (New))

Submitter: Donald W. Ankele, UL LLC

Comment on Proposal No: 14-164

Recommendation: The Panel Action should be Accept in Principle.

CMP 14 Task Group on 14-164 proposes a new 505.15(B)(1)(g) as follows:

(g) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, and where the cable is not subject to physical damage, Type TC-ER-HL cable listed for use in Class I, Zone 1 locations with an overall jacket of suitable material and terminated with fittings listed for the location.

Informational Note: See 336.10(7) for restrictions on the installation of Type TC-ER cable.

Substantiation: The wiring methods currently permitted by 505.15(B)(1) are not always well suited for connection to electrical equipment employing many of the Zone 1 types of protection.

Because Zone 1 is not as onerous as Division 1, as Division 1 encompasses conditions that constitute both Zone 0 and Zone 1, meeting the -HL crush and impact performance requirements without requiring an armor construction requirements is acceptable because of the lower level of the risk of a flammable atmosphere being present, combined with the installation requirements in Section 336.10(7) for TC-ER cable that require continuous support and mechanical protection for Type TC-ER cable.

Proposal 14-164 to add Type TC-HL cable that is dual listed as Shipboard cable into 505.15 is not viable because no installation requirements exist in Chapter 3 for Shipboard cable, whereas Type TC-ER which is intended for installation in industrial establishments has installation requirements currently found in Article 336. Listed termination fittings currently exist for both flameproof "d" and increased safety "e" types of protection.

Type TC-ER-HL cable will be required meet the crush and impact resistance requirements for -HL cables that is already established in ANSI/UL 2225 for Type MC-HL, and Type ITC-HL; however, a metal sheath or armor will not be required for TC-ER-HL. Data show that some current Type TC-ER cables meet or exceed the UL 2225 Type MC-HL and Type TC-HL requirements.

This comment was prepared by a Task Group consisting of Don Ankele, convener, and the following members of Code Making Panel 14: Bill Fisk, Bill Lawrence, Will McBride, Richard Holub, Jack Jamison, and John Simmons.
Panel Meeting Action: Accept in Principle
Revise new 505.15(B)(1)(g) to read:
In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the installation, for applications limited to 600 volts nominal or less, for cable diameters 25 mm (1 in.) or less, and where the cable is not subject to physical damage, Type TC-ER-HL cable listed for use in Class I, Zone 1 locations, with an overall jacket and a separate equipment grounding conductor(s) in accordance with 250.122, and terminated with fittings listed for the location. Type TC-ER-HL cable shall be installed in accordance with the provisions of Article 336, including the restrictions of 336.10(7).
Panel Statement: The submitter's comment has been amended to ensure proper application and compliance with Article 336. The voltage limitation has been introduced to avoid the risks associated with unshielded high voltage conductors. The size limitation has been introduced to address problems encountered in the field with MC-HL cable with diameters less than 1 in. due to kinking of the armor.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-44 Log #1344 NEC-P14 **Final Action: Accept in Principle**
(505.15(B)(1)(g) (New))

Submitter: William E. McBride, Northern Electric Company
Comment on Proposal No: 14-164
Recommendation: Modify existing Text:
(1) General. In Class I, zone I locations, the wiring methods in 8(1)(8) through (8)(I)(g) shall be permitted.
Add new text
(g) In industrial establishments with restricted public access, where the conditions of maintenance and supervision ensure that only qualified persons service the
installation, and where the cable is not subject to physical damage listed Type TC-ER-HL Cable, up to I inch in diameter, that complies with the crush and impact
requirements of Type MC-HL cable, and is identified for such use with the marking Type TC-ER-HL shall be permitted. The cable shall contain separate equipment
bonding conductor(s) in accordance with 250.119, and terminated with fittings listed for the application. Type TC-ER·HL Cable shall be installed in accordance with
the provisions of TC·ER Cable in Article 336.
Substantiation: Existing small diameter MC·HL cables that are run between enclosures and instruments are easily kinked during initial installation and routine maintenance. The risk
of ignition is not from the middle of cables, but from the devices and reminations of cables where the conductor is exposed.
If the Code Making panel thinks it necessary they might further restrict the circuit voltage of these TG-ER-HL Cables to be restricted to less than half of the cond uctor
insulation voltage rating. The application is mostly for 24 volt instrumentation, but may also include some 120 volt utilization devices, yet the cable is rated for 600
volts.
Panel Meeting Action: Accept in Principle
See Panel Action on Comment 14-43.
Panel Statement: The action taken on Comment 14-43 address the submitter's concerns.

(505.17(B)(1))

Submitter: Edward M. Briesch, UL LLC
Comment on Proposal No: 14-180
Recommendation: In 505.17(B)(1) as documented in the Panel Meeting Action for Proposal 14-180, revise text as follows:
505.17(B) Instrumentation Connections for Zone 2. To facilitate replacements, process control instruments shall be permitted to be connected through flexible cord, attachment plug, and receptacle, provided all of the following conditions apply:
(1) A switch <u>listed</u> ~~identified~~ for Zone 2 is provided so that the attachment plug is not depended on to interrupt current, unless the circuit is type of protection "ia, ib, or ic" then the switch <u>shall</u> ~~is~~ not <u>be</u> required.
Substantiation: In 505.17(B)(1) the switch should be required to be "listed" and not "identified". Equipment in Zone 2 locations is required to be listed by 505.20(C) and there was no technical rationale provided in the Proposal or Panel Statement to take an exception to that requirement. Also, the end of the sentence was modified to conform to the Style Manual.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-47 Log #196 NEC-P14 **Final Action: Accept**
(505.22, Informational Note)

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 14-185
Recommendation: The Correlating Committee directs that the panel reconsider this Informational Note to eliminate the following phrase "…it is important to consider the risk of…" which is in violation of 3.1.3 of the NEC Style Manual.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise new Informational Note to read as follows:
Informational Note: Reciprocating engine driven generators, compressors, and other equipment installed in Class I Zone 2 locations, may present a risk of ignition of flammable materials associated with fuel, starting, compression, etc. due to inadvertent release or equipment malfunction by the engine ignition system and controls. For further information on the requirements for ignition systems for reciprocating engines installed in Class I Zone 2 hazardous (classified) locations, see ANSI/ISA-12.20.01, *General Requirements for Electrical Ignition Systems for Internal Combustion Engines in Class I, Division 2 or Zone 2, Hazardous (Classified) Locations*.
Panel Statement: CMP-14 has made the change as directed by the Correlating Committee. Also, CMP-14 has replaced the word "loads" with "equipment".
Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

ARTICLE 506 — ZONE 20, 21, AND 22 LOCATIONS FOR COMBUSTIBLE DUSTS, FIBERS, AND FLYINGS

14-49 Log #892 NEC-P14 **Final Action: Reject**
(506.1)

Submitter: David Wechsler, American Chemical Council
Comment on Proposal No: 14-190a
Recommendation: Restore the following last sentence under 506.1 Scope:
<u>Combustible metallic dusts are not covered by the requirements of this article.</u>
Substantiation: The statement in this Article is correct. The Proposal action was based upon ANSI/ISA standard 60079-0. However, the ISA Standard 60079-0 which is a draft is taking a US deviation from the IEC 60079-0 standard by replacing that term 'conductive' with metal which differs from that found in its Group IIIC definition. The IEC 60079-0 standard under 3.18.1.1

defines **conductive dust** as 'combustible dust with electrical resistivity equal to or less than 10^3 ohm m'. There also is a note: "Note: IEC 61241-2-2 contains the test method for determining the electrical resistivity of dusts." which suggests that a simple replacement of the term 'metal' for 'conductive' may not reflect the same potential hazards. The NEC rejected defining combustible dust using resistivity.

Panel Meeting Action: Reject

Panel Statement: The substantiation does not support the submitter's recommendation. CMP-14 confirms its intent to include metal dusts in Article 506.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

WECHSLER, D.: See my explanation of negative vote on Comment 14-56.

Submitter: David Wechsler, American Chemical Council

Comment on Proposal No: 14-11b

Recommendation: Do not add a new definition to 500.2, 505.2 and 506.2 reading:

~~Cord Connector. A fitting intended to terminate a cord to a box or similar device and reduce the strain at points of termination and may include an explosionproof, a dust ignition proof, or a flameproof seal.~~

Under 501.140 (B) (4) change cord connector to cord fitting as shown below:

(4) In Division 1 locations or in Division 2 locations where the boxes, fittings, or enclosures are required to be explosionproof, the cord shall be terminated with a cord fitting ~~connector~~ or attachment plug listed for the location or a cord fitting ~~connector~~ installed with a seal listed for the location. In Division 2 locations where explosionproof equipment is not required, the cord shall be terminated with a listed cord fitting ~~connector~~ or listed attachment plug.

Under 502.140 (B) (4) change cord connector to fitting as shown below:

(4) In Division 1 locations, the cord shall be terminated with a cord fitting ~~connector~~ listed for the location or a listed cord fitting ~~connector~~ installed with a seal listed for the location. In Division 2 locations, the cord shall be terminated with a listed dusttight cord fitting ~~connector~~.

Under 503.140 (B) (4) change cord connector to fitting as shown below:

(4) Be terminated with a listed dusttight cord fitting ~~connector~~.

Under 505.17(5) change cord connector to fitting as shown below:

(5) Be terminated with a listed cord fitting ~~connector~~ that maintains the type of protection where the flexible cord enters boxes, fittings, or enclosures that are required to be explosionproof or flameproof.

Under 506.17(5) change cord connector to fitting as shown below:

(5) Be terminated with a listed cord fitting ~~connector~~ that maintains the protection technique of the terminal compartment.

NOTE: Separate comments were submitted for each of the respective sections shown above to comply with the Style Manual.

Substantiation: This proposal was offered to attempt to correct the incorrect use of the term 'connector'. However the action taken simply makes this problem more unclear as the term 'cord connector' is not appropriate in this case and a different term that includes the word "fitting" should be used as part of the term, not to describe something different. The action addressed in the proposed text revisions provides appropriate solutions.

ANSI/UL 514B is not limited for use in hazardous (classified) areas. The term fitting is widely used in UL product standards to refer to these and other types of products that are used to secure wiring methods and cords to equipment. The actual title of UL 514B uses the term fittings, not connectors "Conduit, Tubing, and Cable Fittings". Section 1.2 of UL 514B uses the phrase "fittings for flexible cord" Interestingly 1.4 states "These requirements do not cover FITTINGS intended for use in hazardous locations as defined in the National Electrical Code, ANSI/NFPA 70, the Canadian Electrical Code (CEC), Part I, CSA C22.1, and the Standard for Electrical Installations, NOM-001-SEDE."

The term cord connector is used in other places in the NEC as a wiring device such as in 210.50(A) where it permits a "cord connector" to be considered a receptacle outlet. Section 626.2 defines a cord connector as a device for establishing a connection. The term fitting is commonly used in the NEC and product standards related to flexible cords products that are attached to enclosures. Section 400.7(B) uses the term cord connector body as device used to energize an attachment plug.

The term "cord fitting" as indicated should be used in sections 501.140(B)(4), 502.140(4), 503.140(4), 505.17(5), 506.17(5) and anywhere else the term is used to describe the fitting.

As presently used in these articles the term cord connector is confusing whether the term is defined differently (for no good reason) or not. The term "cord connector" is commonly used in the field to describe a wiring device that is connected to a cord.

Users of Chapter 5 are not exempt from the requirements in Chapters 1 through 4, chapter 5 requirements can supplement or modify the general rules but creating using the same term to define different items should not be done and will create confusion and likely misinterpretation of the associated requirements.

The term "fitting" is used in many other NEC sections to describe the product used to secure a cord to an enclosure.

Panel Meeting Action: Reject

Panel Statement: The definition of "connector" in UL 514B includes cord and cable, but the definition of "fitting" does not include cord. For this reason, CMP-14 affirms that the definition for the term "cord connector" is appropriate and does not agree that it should be replaced by the term "fitting". The term "fitting" is defined in Article 100 and is a generic term that includes locknuts and bushings. The use of the term "connector" emphasizes the need to provide strain relief at the point of termination of the cord and the need to reduce the risk of the termination being compromised due to excess strain on the connection. The use of the term "cord connector", without the definition, does not make the strain relief requirement explicit.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 2

Explanation of Negative:

MCBRIDE, W.: IEEE statement opposing the panel action:

The term "cord connector" should not be defined as CMP14 has accepted. The term cord connector is commonly used in the field to describe a wiring device that is connected to a cord. Wiring device manufacturer's websites indicate that cord connectors are used to describe wiring devices. Other locations in the NEC use the term cord connector where referring to a wiring device and 626.2 actually defines it as such. Using the same term to define different items in the NEC should not be done, is inconsistent, will create confusion and likely misinterpretation of the associated requirements.

The term fitting as suggested by a commenter includes the concept of it primarily performing a mechanical function. If CMP14 does not like the use of the term fitting then a different term should be chosen, although Article 400 uses the term fitting when referring to products used to secure cords to enclosures.

Users of Chapter 5 are not exempt from the requirements in Chapters 1 through 4, Chapter 5 requirements can supplement or modify the general rules.

WECHSLER, D.: See Negative ballot comment related to "[1] cord connector" in Comment 14-1 and Comments 14-2, 14-3, 14-24, 14-30, 14-32, and Comment 14-37.

14-51 Log #1179 NEC-P14 **Final Action: Accept**

(506.2)

Submitter: Eliana Brazda, ISA

Comment on Proposal No: 14-194

Recommendation: Revise text to read as follows:

ANSI/ISA-12.12.01-201~~1~~2, Nonincendive Electrical Equipment for Use in Class I and II, Division 2, and Class III, Divisions 1 and 2 Hazardous (Classified) Locations.

Substantiation: Change the ISA standards date of publication to the current publication date.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

14-52 Log #491 NEC-P14 **Final Action: Accept in Principle**

(506.2.Associated Nonincendive Field Wiring Apparatus and Informational Note)

Submitter: Marcelo M. Hirschler, GBH International

Comment on Proposal No: 14-191

Recommendation: Revise text to read as follows:

Associated Nonincendive Field Wiring Apparatus. Apparatus in which the circuits are not necessarily nonincendive themselves but that affect the energy in nonincendive field wiring circuits and are relied upon to maintain nonincendive energy levels. ~~Associated nonincendive field wiring~~ Examples of such apparatus are ~~may be either of~~ the following:

(1) Electrical apparatus that has an alternative type of protection for use in the appropriate hazardous (classified) location

(2) Electrical apparatus not so protected that shall not be used in a hazardous (classified) location

Informational Note: Associated nonincendive field wiring apparatus has designated associated nonincendive field wiring apparatus connections for nonincendive field wiring apparatus and may also have connections for other electrical apparatus.

Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains the defined term in the last sentence and the NEC manual of style does not permit the definition to contain the defined term. Definitions are not requirements. The proposed changes eliminate the defined term. Alternatively CMP 14 might want to place the examples in an alternate suitable location in Article 506 as a requirement. The NEC Manual of Style states as follows:

2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.

Panel Meeting Action: Accept in Principle

Revise text to read as follows:

Associated Nonincendive Field Wiring Apparatus. Apparatus in which the circuits are not necessarily nonincendive themselves but that affect the energy in nonincendive field wiring circuits and are relied upon to maintain nonincendive energy levels. ~~Associated nonincendive field wiring~~ Such apparatus are one ~~may be either~~ of the following:

(1) Electrical apparatus that has an alternative type of protection for use in the appropriate hazardous (classified) location

(2) Electrical apparatus not so protected that shall not be used in a hazardous (classified) location

Informational Note: Associated nonincendive field wiring apparatus has designated associated nonincendive field wiring apparatus connections for nonincendive field wiring apparatus and may also have connections for other electrical apparatus.

Panel Statement: Associated nonincendive field wiring apparatus are limited to the two cases cited. The Style Manual has been satisfied by the minor adjustment to the text. CMP-14 notes that, by the action on Comment 14-1, this definition will be relocated to Section 500.2.

Number Eligible to Vote: 14

14-53 Log #574 NEC-P14 **Final Action: Reject**

(506.2.Combustible Dust)

Note: When the ballot result does not confirm the TC action on a Proposal by a two-thirds affirmative vote, the Report on Proposals shall be published with a specific request for public comment on that Proposal. The Proposal is now being reconsidered by the TC as a public comment.

Submitter: Code-Making Panel 14,

Comment on Proposal No: 14-192a

Recommendation: In 506.2 replace the current definition of Combustible Dust with the following:

Combustible Dust. Dust particles of 500 microns or smaller (material passing a U.S. No. 35 Standard Sieve as defined in ASTM E 11, Standard Specification for Wire Cloth and Sieves for Testing Purposes) are considered to present a dust fire or dust explosion hazard unless determined otherwise. (See ASTM E 1226 or ISO 6184/1). [499:3.3.3]

Substantiation: Definition is extracted from NFPA 499 and the definition in the 2012 Edition of NFPA 499 has been revised.

Panel Meeting Action: Reject

Panel Statement: CMP-14 affirms that the definition should be revised and this has been done in Comment 14-6. However, the action on Comment 14-1 deletes the definition from this section and retains it in 500.2 with appropriate language.

Number Eligible to Vote: 14

(506.6)

Submitter: David Wechsler, American Chemical Council

Comment on Proposal No: 14-200a

Recommendation: Delete new 506.6 and renumber accordingly.

Substantiation: First the Committee under Log 14-111 stated that some language in a Product Standard belongs in a product standard and not an installation code, like the NEC. Claiming that product standards include a marking of the dust group, does not provide substantiation to reflect the basis for these specific defined terms in the NEC.

IEC and ISA use the terms "Group IIIC, IIIB and IIIA". However these terms have different definitions. For example the IEC 60079-0 standard under paragraph 4.3 defines Group IIIC as: "conductive dust" and under 3.18.1.1 defines conductive dust as 'combustible dust with electrical resistivity equal to or less than 103 ohm m.' There also is a note: "Note: IEC 61241-2-2 contains the test method for determining the electrical resistivity of dusts." which suggests that a simple replacement of the term 'metal' for 'conductive' may not reflect the same potential hazards.

The ISA 60079-0 draft standard under paragraph 4.3 contains Note 2, a US deviation from the IEC standard, which states: "The 2011 NEC does not recognize the identification of location or equipment as 'Group IIIA, IIIB, or IIIC', but identifies equipment suitable for Zone 20, 21 and 22 and no separate differentiation is made of combustible dusts or ignitable fibers."

Lastly based upon the NFPA Standards Council, Jan. 1995, 95-6 ruling, it is the responsibility for group classification of materials to the Technical Committee on Electrical Equipment in Chemical Atmospheres (EECA) and not the NEC CMP-14. NFPA 499 which is under the EECA does not include these defined terms.

Panel Meeting Action: Reject

Panel Statement: The submitter's interpretation of the NFPA Standards Council decision is not correct. It is the responsibility of CMP-14 to establish the Group classifications and it is the responsibility of the Technical Committee on Electrical Equipment in Chemical Atmospheres to populate those groups.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

WECHSLER, D.: This issue needs to be addressed by the NEC Correlating Committee and input from the NFPA EECA Committee on the meaning of these new material group terms solicited.

A directive of the NFPA Standards Council relative to this Comment issue was that CMP-14 was responsible only for creating Material Groups; another NFPA Committee, the EECA, was responsible for populating/defining the information in the Material Groups.

Here the Committee proposal action created Materials Groups. The Committee proposed action also populated these Material Groups. The Committee proposed action also generated informational notes supplementing the populated material group materials.

Clearly, the aspect involved with population/defining information within the created Material Groups exceeds the directional authority provided by the Standards Council. The Panel statement supports the knowledge of this Standard Council directive. The Panel Action should have been to accept this comment and not proceed with the publishing of this Group information.

14-61 Log #896 NEC-P14 **Final Action: Reject**
(506.20(D))

Submitter: David Wechsler, American Chemical Council
Comment on Proposal No: 14-225
Recommendation: Delete new 520.6 (D) and renumber accordingly.
Substantiation: Again if the prior action to delete the Article 506 Groups is accepted because based upon the NFPA Standards Council, Jan. 1995, 95-6 ruling, it is the responsibility for group classification of materials to the Technical Committee on Electrical Equipment in Chemical Atmospheres (EECA) and not the NEC CMP-14. NFPA 499 which is under the EECA does not include these defined terms, then this action as stated in this proposal serves no purpose.

Also it was stated in the Panel Statement, Product Standard belongs in a product standard and not an installation code, like the NEC. Claiming that product standards include a marking of the dust group, does not provide substantiation to reflect the basis for these specific defined terms in the NEC.

IEC and ISA use the terms "Group IIIC, IIIB and IIIA". However these terms have different definitions. For example the IEC 60079-0 standard under paragraph 4.3 defines Group IIIC as: "conductive dust" and under 3.18.1.1 defines conductive dust as 'combustible dust with electrical resistivity equal to or less than 103 ohm m.' There also is a note: "Note: IEC 61241-2-2 contains the test method for determining the electrical resistivity of dusts." which suggests that a simple replacement of the term 'metal' for 'conductive' may not reflect the same potential hazards.

The ISA 60079-0 draft standard under paragraph 4.3 contains Note 2, a US deviation from the IEC standard, which states: "The 2011 NEC does not recognize the identification of location or equipment as 'Group IIIA, IIIB, or IIIC', but identifies equipment suitable for Zone 20, 21 and 22 and no separate differentiation is made of combustible dusts or ignitable fibers."

Lastly based upon the NFPA Standards Council, Jan. 1995, 95-6 ruling, it is the responsibility for group classification of materials to the Technical Committee on Electrical Equipment in Chemical Atmospheres (EECA) and not the NEC CMP-14. Submitter: Donald W. Ankele, UL LLC
Comment on Proposal No: 14-244
Recommendation: The Panel Action should be Accept in Principle. CMP-14 Finishing Processes Committee Task Group on 14-244 proposes a revised Article 516 as follows:

ARTICLE 516
Spray Application, Dipping, ~~and~~ Coating, and Printing Processes Using Flammable or Combustible Materials

Informational Note: Text that is followed by a reference in brackets has been extracted from NFPA 33-2011, *Standard for Spray Application Using Flammable and Combustible Materials*, or NFPA 34-2011, *Standard for Dipping, Coating, and Printing Processes Using Flammable or Combustible Liquids*. Only editorial changes were made to the extracted text to make it consistent with this *Code*.
516.1 Scope. This article covers the regular or frequent application of flammable liquids, combustible liquids, and combustible powders by spray operations and the application of flammable liquids, or combustible liquids at temperatures above their flashpoint, by dipping, coating, printing or other means.
Informational Note: For further information regarding safeguards for these processes, such as fire protection, posting of warning signs, and maintenance, see NFPA 33-2011, *Standard for Spray Application Using Flammable and Combustible Materials*, and NFPA 34-2011, *Standard for Dipping, Coating, and Printing Processes Using Flammable or Combustible Liquids*. For additional information regarding ventilation, see NFPA 91-2010, *Standard for Exhaust Systems for Air Conveying of Vapors, Gases, Mists, and Noncombustible Particulate Solids*.
516.2 Definitions. For the purpose of this article, the following definitions shall apply.
Flash-Off Area. An open or enclosed area after a spray application process where vapors are released due to exposure to ambient air or a heated atmosphere. [33:3.3.1.1]
Limited Finishing Workstation. An apparatus that is capable of confining the vapors, mists, residues, dusts, or deposits that are generated by a spray application process and that meets the requirements of Section 14.3 of NFPA 33, *Standard for Spray Application Using Flammable or Combustible Materials*, but does not meet the requirements of a spray booth or spray room, as herein defined. [**33**:3.3.15.1]
Resin Application Area. Any area in which polyester resins or gelcoats are spray applied. [**33**:3.3.1.2]
Spray Area. Any fully enclosed, partly enclosed, or unenclosed area in which ignitable quantities of flammable or combustible vapors, mists, residues, dusts, or deposits are present due to the operation of spray processes, including (1) any area in the direct path of a spray application process; (2) the interior of a spray booth or spray room or limited finishing workstation, as herein defined; (3) the interior of any exhaust plenum, eliminator section, or scrubber section; (4) the interior of any exhaust duct or exhaust stack leading from a spray application process; (5) the interior of any air recirculation filter house or enclosure, including secondary recirculation particulate filters; (6) any solvent concentrator (pollution abatement) unit or solvent recovery (distillation) unit. The following are not considered to be a part of the spray area: (1) fresh air make-up units; (2) air supply ducts and air supply plenums; (3) recirculation air supply ducts downstream of secondary filters; (4) exhaust ducts from solvent concentrator (pollution abatement) units. [**33**: 3.3.2.3]
Informational Note: Unenclosed spray areas are ~~normally~~ locations outside of buildings or are localized operations within a larger room or space. Such are normally provided with some local vapor extraction/ventilation system. In automated operations, the area limits are ~~shall be~~ the maximum area in the direct path of spray operations. In manual operations, the area limits are the maximum area of spray when aimed at ~~180~~ 90 degrees to the application surface.
Spray Booth. A power-ventilated enclosure for a spray application operation or process that confines and limits the escape of the material being sprayed, including vapors, mists, dusts, and residues that are produced by the spraying operation and conducts or directs these materials to an exhaust system. [**33**:3.3.14]
Informational Note: A spray booth is an enclosure or insert within a larger room used for spray/coating/dipping applications. A spray booth may be fully enclosed or have open front or face and may include separate conveyor entrance and exit. The spray booth is provided with a dedicated ventilation exhaust but may draw supply air from the larger room or have a dedicated air supply.
Spray Room. A power-ventilated fully enclosed room used exclusively for open spraying of flammable or combustible materials. A spray room is a purposefully enclosed room built for spray/coating/dipping applications provided with dedicated ventilation supply and exhaust. Normally the room is configured to house the item to be painted, providing reasonable access around the item/process. Depending on the size of the item being painted, such rooms may actually be the entire building or the major portion thereof. [**33**:3.3.15]
Unenclosed Spray Area. Any spray area that is not confined by a limited finishing workstation, spray booth, or spray room, as herein defined. [**33**:3.3.2.3.2]

516.3 Classification of Locations. Classification is based on ~~dangerous~~ quantities of flammable vapors, combustible mists, residues, dusts, or deposits that are present or might be present in quantities sufficient to produce ignitable or explosive mixtures with air.

(A) Zone Classification of Locations.

(1) For the purposes of this Article, the Zone system of electrical area classification shall be applied as follows:

~~(a) The inside of open or closed containers or vessels shall be considered a Class I, Zone 0 location.~~

(a) A Class I, Division 1 location shall be permitted to be alternatively classified as a Class I, Zone 1 location.

(b) A Class I, Division 2 location shall be permitted to be alternatively classified as a Class I, Zone 2 location.

(c) A Class II, Division 1 location shall be permitted to be alternatively classified as a Zone 21 location.

(d) A Class II, Division 2 location shall be permitted to be alternatively classified as a Zone 22 location. [**33:** 6.2.2]

(2) For the purposes of electrical area classification, the Division system and the Zone system shall not be intermixed for any given source of release. [**33:**6.2.3]

(3) In instances of areas within the same facility classified separately, Class I, Zone 2 locations shall be permitted to abut, but not overlap, Class I, Division 2 locations. Class I, Zone 0 or Zone 1 locations shall not abut Class I, Division 1 or Division 2 locations. [**70:**505.7(B)] [**33:**6.2.4]

(4) Open flames, spark-producing equipment or processes, and equipment whose exposed surfaces exceed the autoignition temperature of the material being sprayed shall not be located in a spray area or in any surrounding area that is classified as Division 2, Zone 2, or Zone 22.

Exception: This requirement shall not apply to drying, curing, or fusing apparatus. [**33:**6.2.5]

(5) Any utilization equipment or apparatus that is capable of producing sparks or particles of hot metal and that is located above or adjacent to either the spray area or the surrounding Division 2, Zone 2, or Zone 22 areas shall be of the totally enclosed type or shall be constructed to prevent the escape of sparks or particles of hot metal. [**33:** 6.2.6]

(B) (A) Class I, Division 1 or Class I, Zone 0 Locations. The following spaces shall be considered Class I, Division 1, or Class I, Zone 0, as applicable:

(1) The interior of any open or closed container or vessel of a flammable liquid

(2) The interior of any dip tank or coating tank

(3) The interior of any ink fountain, ink reservoir, or ink tank

Informational Note: For additional guidance ~~and explanatory diagrams~~, see Chapter 6 ~~4.3.5~~ of NFPA 33-2011, *Standard for Spray Application Using Flammable or Combustible Materials*, and Chapter 6 ~~Sections 4.2, 4.3, and 4.4~~ of NFPA 34-2011, *Standard for Dipping, Coating, and Printing Processes Using Flammable or Combustible Liquids*.

(C) ~~(B)~~ Class I, Division 1; Class I, Zone 1; ~~or~~ Class II, Division 1; or Zone 21 Locations. The following spaces shall be considered Class I, Division 1, or Class I, Zone 1, ~~or~~ Class II, Division 1, or Zone 21 locations, as applicable:

(1) The interior of spray booths and rooms except as specifically provided in 516.3(D).

(2) The interior of exhaust ducts.

(3) Any area in the direct path of spray operations.

(4) For open dipping and coating operations, all spaces within a 1.5-m (5-ft) radial distance from the vapor sources extending from these surfaces to the floor. The vapor source shall be the liquid exposed in the process and the drainboard, and any dipped or coated object from which it is possible to measure vapor concentrations exceeding 25 percent of the lower flammable limit at a distance of 300 mm (1 ft), in any direction, from the object as in Figure 516.3(D)(6)(a).

(5) Sumps, pits, or belowgrade channels within 7.5 m (25 ft) horizontally of a vapor source. If the sump, pit, or channel extends beyond 7.5 m (25 ft) from the vapor source, it shall be provided with a vapor stop or it shall be classified as Class I, Division 1 for its entire length.

(6) All space in all directions outside of but within 900 mm (3 ft) of open containers, supply containers, spray gun cleaners, and solvent distillation units containing flammable liquids.

(7) For limited finishing workstations, the area inside the curtains or partitions. (See Figure 516.3(D)(5).)

(D) ~~(C)~~ Class I, Division 2; Class I, Zone 2; ~~or~~ Class II, Division 2; or Zone 22 Locations. The following spaces shall be considered Class I, Division 2; ~~or~~ Class I, Zone 2; ~~or~~ Class II, Division 2; or Zone 22 as applicable.

(1) Unenclosed Spray Processes ~~Open Spraying~~. For unenclosed ~~open~~ spraying, all space outside of but within 6 m (20 ft) horizontally and 3 m (10 ft) vertically of the Class I, Division 1 or Class I, Zone 1 location as defined in 516.3(A) and not separated from it by partitions. See Figure 516.3(D)~~(C)~~(1) . [**33:**6.5.1]

(2) Closed-Top, Open-Face, and Open-Front Spray~~ing~~ Booths and Spray Rooms. If spray application operations are conducted within a closed-top, open-face, or open-front booth or room, as shown in Figure 516.3(D)(2), any electrical wiring or utilization equipment located outside of the booth or room but within 915mm (3 ft) of any opening ~~the boundaries designated as Division 2 or Zone 2 in Figure 516.3(C)(2)~~ shall be suitable for Class I, Division 2; Class I, Zone 2; ~~or~~ Class II, Division 2; or Zone 22 locations, whichever is applicable. The Class I, Division 2; Class I, Zone 2; ~~or~~ Class II, Division 2; or Zone 22 locations shown in Figure 516.3(D)~~(C)~~(2) shall extend from the edges of the open face or open front of the booth or room in accordance with the following:

Informational Note: For both interlocked and non-interlocked exhaust ventilation systems, the Division 2, Zone 2 or Zone 22 location extends 915 mm (3 ft) horizontally and 915 mm (3 ft) vertically from the open face or open front of the booth or room, as shown in Figure 516.3(D)(2).

******Insert Figure 516.3(D)~~(C)~~(1)***** Electrical Area Classification for Unenclosed ~~Open~~ Spray Areas. [33:Figure 6.5.1] (not shown)**

Insert Figure 516.3(D)~~(C)~~(2)** Class I, Division 2; Class I, Zone 2; ~~or~~ Class II, Division 2; or Zone 22 Locations Adjacent to a Closed Top, Open Face, or Open Front Spray Booth or Room. [33:Figure 6.5.2] (not shown)**

Add “or Zone 21” and “or Zone 22” to respective legends

~~(a) If the exhaust ventilation system is interlocked with the spray application equipment, the Division 2 or Zone 2 location shall extend 1.5 m (5 ft) horizontally and 900 mm (3 ft) vertically from the open face or open front of the booth or room, as shown in Figure 516.3(C)(2), top.~~

~~(b) If the exhaust ventilation system is not interlocked with the spray application equipment, the Division 2 or Zone 2 location shall extend 3 m (10 ft) horizontally and 900 mm (3 ft) vertically from the open face or open front of the booth or room, as shown in Figure 516.3(C)(2), bottom.~~

~~For the purposes of this subsection, *interlocked* shall mean that the spray application equipment cannot be operated unless the exhaust ventilation system is operating and functioning properly and spray application is automatically stopped if the exhaust ventilation system fails. [**33:**6.5.2.2]~~

(3) Open-Top Spray~~ing~~ Booths. For spraying operations conducted within an open top spray booth, the space 915mm ~~900 mm~~ (3 ft) vertically above the booth and within 915mm ~~900 mm~~ (3 ft) of other booth openings shall be considered Class I, Division 2; Class I, Zone 2; ~~or~~ Class II, Division 2; or Zone 22. [**33:**6.5.3]

(4) Enclosed Spray Booths and Spray Rooms. For spraying operations confined to an enclosed spray booth or room, electrical area classification shall be as follows: ~~the space within 900 mm (3 ft) in all directions from any openings shall be considered Class I, Division 2; or Class I, Zone 2; or Class II, Division 2 as shown in Figure 516.3(C)(4)~~. [**33:**6.5.4]

(A) The area within 915 mm (3 ft) of any opening shall be classified as Class I, Division 2; Class I, Zone 2; Class II, Division 2; or Zone 22 locations, whichever is applicable, as shown in Figure 516.3(D)(4) .

(B) Where exhaust air is recirculated both of the following shall apply:

(1) The interior of any recirculation path from the secondary particulate filters up to and including the air supply plenum shall be classified as Class I, Division 2; Class I, Zone 2; Class II, Division 2; or Zone 22 locations, whichever is applicable.

(2) The interior of fresh air supply ducts shall be unclassified.

(C) Where exhaust air is not recirculated, the interior of fresh air supply ducts and fresh air supply plenums shall be unclassified.

Figure 516.3(D)(~~C~~)(4)** Class I, Division 2; Class I, Zone 2; ~~or~~ Class II, Division 2; or Zone 22 Locations Adjacent to an Enclosed Spray Booth or Spray Room. [33:Figure 6.5.4] (not shown)**

(5) Limited Finishing Workstations. For limited finishing workstations, the area inside the 915 mm (3-ft) space horizontally and vertically beyond the volume enclosed by the outside surface of the curtains or partitions shall be classified as Class I, Division 2; Class I, Zone 2; Class II, Division 2; or Zone 22, as shown in Figure 516.3(D)(5)

Figure 516.3(D)(5).** Class I, Division 2; Class I, Zone 2; Class II, Division 2; or Zone 22 Locations Adjacent to a Limited Finishing Workstation. [33:Figure 14.3.5.1] (not shown)**

(not shown)

~~**(5) Tanks and Drain Boards — Surrounding Space.** For dip tanks and drain boards, the 914-mm (3-ft) space surrounding the Class I, Division 1 or Class I, Zone 1 location shall be as defined in 516.3(A)(4) and as shown in Figure 516.3(D)(C)(5). [**34:**6.4.4]~~

~~**(6) Dip Tanks, and Drain Boards — Space Above Floor.** For dip tanks, and drain boards, the space 900 mm (3 ft) above the floor and extending 6 m (20 ft) horizontally in all directions from the Class I, Division 1 or Class I, Zone 1 location.~~

~~*Exception: This space shall not be required to be considered a hazardous (classified) location where the vapor source area is 0.46 m^2 (5 ft^2) or less and where the contents of the open tank trough or container do not exceed 19 L (5 gal). In addition, the vapor concentration during operation and shutdown periods shall not exceed 25 percent of the lower flammable limit outside the Class I location specified in 516.3(B)(4). [**34:**6.4.4 Exception]*~~

(6) Areas Adjacent to Open Dipping and Coating Processes. Electrical wiring and electrical utilization equipment located adjacent to open processes shall meet the requirements of (a) through (c) and Figures 516.3(D)(6)(a), 516.3(D)(6)(b), 516.3(D)(6)(c), 516.3(D)(6)(d), or 516.3(D)(6)(e), whichever is applicable. [34:6.4]

(a) Electrical wiring and electrical utilization equipment located in any sump, pit, or below grade channel that is within 7620 mm (25 ft) horizontally of a vapor source, as defined by this standard, shall be suitable for Class I, Division 1 or Class I, Zone 1 locations. If the sump, pit, or channel extends beyond 7620 mm (25 ft) of the vapor source, it shall be provided with a vapor stop, or it shall be classified as Class I, Division 1 or Class I, Zone 1 for its entire length. [34:6.4.1]

(b) Electrical wiring and electrical utilization equipment located within 1525 mm (5 ft) of a vapor source shall be suitable for Class I, Division 1 or Class I, Zone 1 locations. The space inside a dip tank, ink fountain, ink reservoir, or ink tank shall be classified as Class I, Division 1 or Class I, Zone 0, whichever is applicable. [34:6.4.2]

(c) Electrical wiring and electrical utilization equipment located within 915 mm (3 ft) of the Class I, Division 1 or Class I, Zone 1 location described in 6.4.2 shall be suitable for Class I, Division 2 or Class I, Zone 2 locations, whichever is applicable. [34:6.4.3]

(d) The space 915 mm (3 ft) above the floor and extending 6100 mm (20 ft) horizontally in all directions from the Class I, Division 1 or Class I, Zone 1 location described in 6.4.3 shall be classified as Class I, Division 2 or Class I, Zone 2, and electrical wiring and electrical utilization equipment located within this space shall be suitable for Class I, Division 2 or Class I, Zone 2 locations, whichever is applicable. [34:6.4.4]

Exception: This space shall be permitted to be unclassified for purposes of electrical installations if the surface area of the vapor source does not exceed 0.5 m2 (5 ft2), the contents of the dip tank, ink fountain, ink reservoir, or ink tank do not exceed 19 L (5 gal), and the vapor concentration during operating and shutdown periods does not exceed 25 percent of the lower flammable limit.

Figure 516.3(D)(6)(a)(~~C~~)(~~5~~)** Electrical Area Classification for Open Dipping and Coating Processes Without Vapor Containment or Ventilation. [34:Figure 6.4(a)] (not shown)**

Figure 516.3(D)(6)(b)(~~C~~)(~~5~~)** Electrical Area Classification for Open Dipping and Coating Processes With Peripheral Vapor Containment and Ventilation – Vapors Confined to Process Equipment. [34:Figure 6.4(b)] (not shown)**

Figure 516.3(D)(6)(c)(~~C~~)(~~5~~)** Electrical Area Classification for Open Dipping and Coating Processes With Partial Peripheral Vapor Containment and Ventilation – Vapors NOT Confined to Process Equipment. [34:Figure 6.4(c)] (not shown)**

Figure 516.3(D)(6)(d)(~~C~~)(~~5~~)** Electrical Area Classification for Open Dipping and Coating Processes With Partial Peripheral Vapor Containment and Ventilation – Vapors Confined to Process Equipment. [34:Figure 6.4(d)] (not shown)**

Figure 516.3(D)(6)(e)(~~C~~)(~~5~~)** Electrical Area Classification for a Typical Printing Process. [34:Figure 6.4(e)] (not shown)**

(7)(~~D~~) Enclosed Dipping and Coating Operations. Areas adjacent to enclosed dipping and coating processes shall be classified in accordance with 516.3(D)(1) and Figure 516.3(D)(7). The space adjacent to an enclosed dipping or coating process or apparatus shall be considered unclassified. [**34:**6.5.3]

*Exception: The space within 915 mm (3 ft) in all directions from any opening in the enclosures shall be classified as Class I, Division 2 or Class I, Zone 2, as applicable. [**34:**6.5.2]*

(1) The interior of any enclosed dipping or coating process or apparatus shall be a Class I, Division 1 or Class I, Zone 1 location, and electrical wiring and electrical utilization equipment located within this space shall be suitable for Class I, Division 1 or Class I, Zone 1 locations, whichever is applicable. The area inside the dip tank shall be classified as Class I, Division 1 or Class I, Zone 0, whichever is applicable. [34:6.5.1]

Figure 516.3(D)(7)** Electrical Area Classification Around an Enclosed Dipping or Coating Process [34:Figure 6.5] (not shown)**

(8) Open Containers. All space in all directions within 600 mm (2 ft) of the Division 1 or Zone 1 area surrounding open containers, supply containers, spray gun cleaners, and solvent distillation units containing flammable liquids, as well as the area extending 1.5 m (5 ft) beyond the Division 1 or Zone 1 area up to a height of 460 mm (18 in.) above the floor or grade level. [**33:**<u>**6.5.5**</u> ~~6.6.2~~]

(E) Adjacent Locations. Adjacent locations that are cut off from the defined Class I or Class II locations by tight partitions without communicating openings, and within which flammable vapors or combustible powders are not likely to be released, shall be unclassified.

(F) Unclassified Locations. Locations using drying, curing, or fusion apparatus and provided with positive mechanical ventilation adequate to prevent accumulation of flammable concentrations of vapors, and provided with effective interlocks to de-energize all electrical equipment (other than equipment identified for Class I locations) in case the ventilating equipment is inoperative, shall be permitted to be unclassified where the authority having jurisdiction so judges.

Informational Note: For further information regarding safeguards, see NFPA 86-2011, *Standard for Ovens and Furnaces*.

516.4 Wiring and Equipment in Class I Locations.

(A) Wiring and Equipment — Vapors. All electrical wiring and equipment within the Class I location (containing vapor only — not residues) defined in 516.3 shall comply with the applicable provisions of Article 501 or Article 505, as applicable.

(B) Wiring and Equipment — Vapors and Residues. Unless specifically listed for locations containing deposits of dangerous quantities of flammable or combustible vapors, mists, residues, dusts, or deposits (as applicable), there shall be no electrical equipment in any spray area as herein defined whereon deposits of combustible residue may readily accumulate<u>. All electrical wiring shall be per 516.4(A).</u>~~, except wiring in rigid metal conduit, intermediate metal conduit, Type MI cable, or in metal boxes or fittings containing no taps, splices, or terminal connections. [**33:**6.4.2]~~

<u>**(C) Illumination.**</u>

(1) <u>Luminaires, like that shown in Figure 516.4(C)(1), that are attached to the walls or ceiling of a spray area but that are outside any classified area and are separated from the spray area by glass panels shall be suitable for use in unclassified locations. Such fixtures shall be serviced from outside the spray area. [33:6.6.1]</u>

<u>**Figure 516.4(C)(1)**** Example of a Luminaire that is Mounted Outside of the Spray Area and is Serviced from Outside the Spray Area. [33:Figure 6.6.1]**</u> **(not shown)**

(2) <u>Luminaires, like that shown in Figure 516.4(C)(1), that are attached to the walls or ceiling of a spray area; that are separated from the spray area by glass panels and that are located within a Class I, Division 2; a Class I, Zone 2; a Class II, Division 2; or a Zone 22 location shall be suitable for such location. Such fixtures shall be serviced from outside the spray area. [33:6.6.2]</u>

<u>(3) Luminaires, like that shown in Figure 516.4(C)(3), that are an integral part of the walls or ceiling of a spray area shall be permitted to be separated from the spray area by glass panels that are an integral part of the fixture. Such fixtures shall be listed for use in Class I, Division 2; Class I, Zone 2; Class II, Division 2; or Zone 22 locations, whichever is applicable, and also shall be listed for accumulations of deposits of combustible residues. Such fixtures shall be permitted to be serviced from inside the spray area. [33:6.6.3]</u>

<u>**Figure 516.4(C)(3)**** Example of a Luminaire that is an Integral Part of the Spray Area and is Serviced from Inside the Spray Area. [33:Figure 6.6.3]**</u> **(not shown)**

<u>(4) Glass panels used to separate luminaires from the spray area or that are an integral part of the luminaire shall meet the following requirements.</u>

<u>(a) Panels for light fixtures or for observation shall be of heat-treated glass, laminated glass, wired glass, or hammered-wired glass and shall be sealed to confine vapors, mists, residues, dusts, and deposits to the spray area. [33:5.5.1]</u>

<u>Exception: Listed spray booth assemblies that have vision panels constructed of other materials shall be permitted.</u>

<u>(b) Panels for light fixtures shall be separated from the fixture to prevent the surface temperature of the panel from exceeding 93°C (200°F). [33:5.5.2]</u>

<u>(c) The panel frame and method of attachment shall be designed to not fail under fire exposure before the vision panel fails. [33:5.5.3]</u>

~~**(C) Illumination.** Illumination of readily ignitible areas through panels of glass or other transparent or translucent material shall be permitted only if it complies with the following:~~

~~(1) Fixed lighting units are used as the source of illumination.~~

~~(2) The panel effectively isolates the Class I location from the area in which the lighting unit is located.~~

~~(3) The lighting unit is identified for its specific location.~~

~~(4) The panel is of a material or is protected so that breakage is unlikely.~~

~~(5) The arrangement is such that normal accumulations of hazardous residue on the surface of the panel will not be raised to a dangerous temperature by radiation or conduction from the source of illumination.~~

(D) Portable Equipment. Portable electric luminaires or other utilization equipment shall not be used in a spray area during spray operations.

*Exception No. 1: Where portable electric luminaires are required for operations in spaces not readily illuminated by fixed lighting within the spraying area, they shall be of the type identified for Class I, Division 1 or Class 1, Zone 1 locations where readily ignitible residues may be present. [**33:**6.9 Exception]*

Exception No. 2: Where portable electric drying apparatus is used in spray booths and the following requirements are met:

(a) The apparatus and its electrical connections are not located within the spray enclosure during spray operations.

(b) Electrical equipment within 450 mm (18 in.) of the floor is identified for Class I, Division 2 or Class I, Zone 2 locations.

(c) All metallic parts of the drying apparatus are electrically bonded and grounded.

(d) Interlocks are provided to prevent the operation of spray equipment while drying apparatus is within the spray enclosure, to allow for a 3-minute purge of the enclosure before energizing the drying apparatus and to shut off drying apparatus on failure of ventilation system.

(E) Electrostatic Equipment. Electrostatic spraying or detearing equipment shall be installed and used only as provided in 516.10.

Informational Note: For further information, see NFPA 33-2011, *Standard for Spray Application Using Flammable or Combustible Materials*.

(F) Static Electric Discharges.

(1) All persons and all electrically conductive objects, including any metal parts of the process equipment or apparatus, containers of material, exhaust ducts, and piping systems that convey flammable or combustible liquids, shall be electrically grounded. [34:6.8.1]

(2) Provision shall be made to dissipate static electric charges from all nonconductive substrates in printing processes.

516.7 Wiring and Equipment Not Within Classified ~~I and II~~ Locations.

(A) Wiring. All fixed wiring above the Class I and II locations shall be in metal raceways, Type PVC conduit, Type RTRC conduit, or electrical nonmetallic tubing; where cables are used, they shall be Type MI, Type TC, or Type MC cable. Cellular metal floor raceways shall only be permitted to supply ceiling outlets or as extensions to the area below the floor of a Class I or II location. Where cellular metal raceways, are used, they shall not have connections leading into or passing through the Class I or II location unless suitable seals are provided.

(B) Equipment. Equipment that may produce arcs, sparks, or particles of hot metal, such as lamps and lampholders for fixed lighting, cutouts, switches, receptacles, motors, or other equipment having make-and-break or sliding contacts, where installed above a Classified ~~I or II~~ location or above a location where freshly finished goods are handled, shall be of the totally enclosed type or be constructed so as to prevent the escape of sparks or hot metal particles.

516.10 Special Equipment.

(A) Fixed Electrostatic Equipment. This section shall apply to any equipment using electrostatically charged elements for the atomization, charging, and/or precipitation of hazardous materials for coatings on articles or for other similar purposes in which the charging or atomizing device is attached to a mechanical support or manipulator. This shall include robotic devices. This section shall not apply to devices that are held or manipulated by hand. Where robot or programming procedures involve manual manipulation of the robot arm while spraying with the high voltage on, the provisions of 516.10(B) shall apply. The installation of electrostatic spraying equipment shall comply with 516.10(A)(1) through (A)(10). Spray equipment shall be listed except as permitted by 11.5 of NFPA 33. All automatic electrostatic equipment systems shall comply with 516.4(A)(1) through (A)(9).

(1) Power and Control Equipment. Transformers, high-voltage supplies, control apparatus, and all other electrical portions of the equipment shall be installed outside of the Class I location as defined in 516.3 or be of a type identified for the location.

Exception: High-voltage grids, electrodes, electrostatic atomizing heads, and their connections shall be permitted within the Class I location.

(2) Electrostatic Equipment. Electrodes and electrostatic atomizing heads shall be adequately supported in permanent locations and shall be effectively insulated from ground. Electrodes and electrostatic atomizing heads that are permanently attached to their bases, supports, reciprocators, or robots shall be deemed to comply with this section.

(3) High-Voltage Leads. High-voltage leads shall be properly insulated and protected from mechanical damage or exposure to destructive chemicals. Any exposed element at high voltage shall be effectively and permanently supported on suitable insulators and shall be effectively guarded against accidental contact or grounding.

(4) Support of Goods. Goods being coated using this process shall be supported on conveyors or hangers. The conveyors or hangers shall be arranged (1) to ensure that the parts being coated are electrically connected to ground with a resistance of 1 megohm or less and (2) to prevent parts from swinging.

(5) Automatic Controls. Electrostatic apparatus shall be equipped with automatic means that will rapidly de-energize the high-voltage elements under any of the following conditions:

(1) Stoppage of ventilating fans or failure of ventilating equipment from any cause

(2) Stoppage of the conveyor carrying goods through the high-voltage field unless stoppage is required by the spray process

(3) Occurrence of excessive current leakage at any point in the high-voltage system

(4) De-energizing the primary voltage input to the power supply

(6) Grounding. All electrically conductive objects in the spray area, except those objects required by the process to be at high voltage, shall be adequately grounded. This requirement shall apply to paint containers, wash cans, guards, hose connectors, brackets, and any other electrically conductive objects or devices in the area.

Informational Note: For more information on grounding and bonding for static electricity purposes, see NFPA 33-2011, *Standard for Spray Application Using Flammable or Combustible Materials*; NFPA 34-2011, *Standard for Dipping, Coating, and Printing Processes Using Flammable or Combustible Liquids*; and NFPA 77-2007, *Recommended Practice on Static Electricity*.

(7) Isolation. Safeguards such as adequate booths, fencing, railings, interlocks, or other means shall be placed about the equipment or incorporated therein so that they, either by their location, character, or both, ensure that a safe separation of the process is maintained.

(8) Signs. Signs shall be conspicuously posted to convey the following:

(1) Designate the process zone as dangerous with regard to fire and accident

(2) Identify the grounding requirements for all electrically conductive objects in the spray area

(3) Restrict access to qualified personnel only

(9) Insulators. All insulators shall be kept clean and dry.

(10) Other Than Nonincendive Equipment. Spray equipment that cannot be classified as nonincendive shall comply with (A)(10)(a) and (A)(10)(b).

(a) Conveyors, ~~or~~ hangers, and application equipment shall be arranged so ~~as to maintain a safe~~ that a minimum separation ~~distance~~ of at least twice the sparking distance is maintained between the workpiece or material being sprayed ~~between goods being painted~~ and electrodes, electrostatic atomizing heads, or charged conductors. Warnings defining this safe distance shall be posted. [**33:**11.4.1]

(b) The equipment shall provide an automatic means of rapidly de-energizing the high-voltage elements in the event the distance between the goods being painted and the electrodes or electrostatic atomizing heads falls below that specified in (a). [**33:**11.3.8]

(B) Electrostatic Hand-Spraying Equipment. This section shall apply to any equipment using electrostatically charged elements for the atomization, charging, ~~and/~~or precipitation of flammable and combustible materials for coatings on articles, or for other similar purposes in which the charging or atomizing device is hand-held and ~~or~~ manipulated during the spraying operation. Electrostatic hand-spraying equipment and devices used in connection with paint-spraying operations shall be of listed types and shall comply with 516.10(B)(1) through (B)(5).

(1) General. The high-voltage circuits shall be designed so as not to produce a spark of sufficient intensity to ignite the most readily ignitible of those vapor–air mixtures likely to be encountered, or result in appreciable shock hazard upon coming in contact with a grounded object under all normal operating conditions. The electrostatically charged exposed elements of the handgun shall be capable of being energized only by an actuator that also controls the coating material supply.

(2) Power Equipment. Transformers, power packs, control apparatus, and all other electrical portions of the equipment shall be located outside of the Class I location or be identified for the location.

Exception: The handgun itself and its connections to the power supply shall be permitted within the Class I location.

(3) Handle. The handle of the spraying gun shall be electrically connected to ground by a conductive material ~~metallic connection~~ and be constructed so that the operator in normal operating position is in direct ~~intimate~~ electrical contact with the grounded handle with a resistance of not more than 1 megohm to prevent buildup of a static charge on the operator's body. Signs indicating the necessity for grounding other persons entering the spray area shall be conspicuously posted.

(4) Electrostatic Equipment. All electrically conductive objects in the spraying area, except those objects required by the process to be at high voltage shall be electrically connected to ground with a resistance of not more than 1 megohm ~~adequately grounded~~. This requirement shall apply to paint containers, wash cans, and any other electrical conductive objects or devices in the area. The equipment shall carry a prominent, permanently installed warning regarding the necessity for this grounding feature.

Informational Note: For more information on grounding and bonding for static electricity purposes, see NFPA 33-2011, *Standard for Spray Application Using Flammable or Combustible Materials*; NFPA 34-2011, *Standard for Dipping, Coating, and Printing Processes Using Flammable or Combustible Liquids*; and NFPA 77-2007, *Recommended Practice on Static Electricity*.

(5) Support of Objects. Objects being painted shall be maintained in electrical ~~metallic~~ contact with the conveyor or other grounded support. Hooks shall be regularly cleaned to ensure adequate grounding of 1 megohm or less. Areas of contact shall be sharp points or knife edges where possible. Points of support of the object shall be concealed from random spray where feasible; and, where the objects being sprayed are supported from a conveyor, the point of attachment to the conveyor shall be located so as to not collect spray material during normal operation. [**33:** Chapter 12]

(C) Powder Coating. This section shall apply to processes in which combustible dry powders are applied. The hazards associated with combustible dusts are present in such a process to a degree, depending on the chemical composition of the material, particle size, shape, and distribution.

(1) Electrical Equipment and Sources of Ignition. Electrical equipment and other sources of ignition shall comply with the requirements of Article 502. Portable electric luminaires and other utilization equipment shall not be used within a Class II location during operation of the finishing processes. Where such luminaires or utilization equipment are used during cleaning or repairing operations, they shall be of a type identified for Class II, Division 1 locations, and all exposed metal parts shall be connected to an equipment grounding conductor.

Exception: Where portable electric luminaires are required for operations in spaces not readily illuminated by fixed lighting within the spraying area, they shall be of the type listed for Class II, Division 1 locations where readily ignitible residues may be present.

(2) Fixed Electrostatic Spraying Equipment. The provisions of 516.10(A) and 516.10(C)(1) shall apply to fixed electrostatic spraying equipment.

(3) Electrostatic Hand-Spraying Equipment. The provisions of 516.10(B) and 516.10(C)(1) shall apply to electrostatic hand-spraying equipment.

(4) Electrostatic Fluidized Beds. Electrostatic fluidized beds and associated equipment shall be of identified types. The high-voltage circuits shall be designed such that any discharge produced when the charging electrodes of the bed are approached or contacted by a grounded object shall not be of sufficient intensity to ignite any powder–air mixture likely to be encountered or to result in an appreciable shock hazard.

(a) Transformers, power packs, control apparatus, and all other electrical portions of the equipment shall be located outside the powder-coating area or shall otherwise comply with the requirements of 516.10(C)(1).

Exception: The charging electrodes and their connections to the power supply shall be permitted within the powder-coating area.

(b) All electrically conductive objects within the powder-coating area shall be adequately grounded. The powder-coating equipment shall carry a prominent, permanently installed warning regarding the necessity for grounding these objects.

Informational Note: For more information on grounding and bonding for static electricity purposes, see NFPA 33-2011, *Standard for Spray Application Using Flammable or Combustible Materials*; NFPA 34-2011, *Standard for Dipping, Coating, and Printing Processes Using Flammable or Combustible Liquids*; and NFPA 77-2007, *Recommended Practice on Static Electricity*.

(c) Objects being coated shall be maintained in electrical contact (less than 1 megohm) with the conveyor or other support in order to ensure proper grounding. Hangers shall be regularly cleaned to ensure effective electrical contact. Areas of electrical contact shall be sharp points or knife edges where possible.

(d) The electrical equipment and compressed air supplies shall be interlocked with a ventilation system so that the equipment cannot be operated unless the ventilating fans are in operation. [**33:** Chapter 15]

516.16 Grounding. All metal raceways, the metal armors or metallic sheath on cables, and all non–current-carrying metal parts of fixed or portable electrical equipment, regardless of voltage, shall be grounded and bonded. Grounding and bonding shall comply with 501.30, 502.30, or 505.25, as applicable.

Substantiation: For the 2011 NEC, the Informational Notes in Article 516 were revised to the 2011 editions of NFPA 33 and NFPA 34. The actual text in Article 516, however, remained the extracted text from 2007.
Proposal 14-244 and others proposed partial revisions to 516, but no proposal addressed all of the parts of 516 that were 2007 extracted text.
The TCC directed that a task group be formed consisting of members of CMP14 and the Committee on Finishing Processes.
This comment was prepared by a Task Group consisting of the following members:
CMP14
Don Ankele, UL, Task Group Chair
Bill Lawrence, FM Global
Jeremy Neagle, US Bureau of ATF
Ed Briesch, UL LLC
Fred Walker, US Department of the Air Force
Panel Meeting Action: Accept

Panel Statement: CMP-14 notes that this rewrite of Article 516 has the full concurrence of the Technical Committee on Finishing Processes, who is responsible for NFPA 33, *Standard for Spray Application Using Flammable or Combustible Materials*.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-68 Log #492 NEC-P14 **Final Action: Reject**
(516.2.Spray Area and 516.3 (New))

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 14-245
Recommendation: Revise text to read as follows:
Spray Area. Normally, locations outside of buildings or localized operations within a larger room or space. Such <u>locations</u> are normally provided with some local vapor extraction/ventilation system. ~~In automated operations, the area limits shall be the maximum area in the direct path of spray operations. In manual operations, the area limits shall be the maximum area of spray when aimed at 180 degrees to the application surface.~~
<u>**516.3 Maximum spray areas.**</u>
<u>**516.3.1** In automated operations, the spray area limits shall be the maximum area in the direct path of spray operations.</u>
<u>**516.3.2** In manual operations, the spray area limits shall be the maximum area of spray when aimed at 180 degrees to the application surface.</u>
This would require renumbering of sections 516.3 and 516.4.
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However, on rereading it appears that a subject is needed for the second sentence. I also feel that CMP 14 might want to consider whether to place the third and fourth sentences, which are requirements, in an alternate location within Article 516, since definitions are not allowed to contain requirements. The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Another approach would be to simply make the third and last sentences into an informational note, for example as follows:
<u>**Informational Note:** In automated operations, the spray area limits should be the maximum area in the direct path of spray operations. In manual operations, the spray area limits should be the maximum area of spray when aimed at 180 degrees to the application surface.</u>
Similar approaches to what is being suggested above for spray areas might be done also for spray booths and spray rooms but spray area is the term with the clearest problems because of the requirements and the missing subject.
Panel Meeting Action: Reject
Panel Statement: The comment in effect creates a new definition of "spray area" and a new concept of determining its extent, neither of which have been reviewed by the Technical Committee on Finishing Processes, who is responsible for NFPA 33, *Standard for Spray Application Using Flammable or Combustible Materials*. CMP-14 points out that the definition of "spray area" in Article 516 (of the 2011 edition of the Code) is being replaced with one extracted without alteration from the 2011 edition of NFPA 33, as indicated in Comment 14-67.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

14-69 Log #493 NEC-P14 **Final Action: Reject**
(516.2.Spray Area)

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 14-245
Recommendation: Revise text to read as follows:
Spray Area. Normally, locations outside of buildings or localized operations within a larger room or space. Such <u>locations</u> are normally provided with some local vapor extraction/ventilation system. In automated operations, the area limits shall be the maximum area in the direct path of spray operations. In manual operations, the area limits shall be the maximum area of spray when aimed at 180 degrees to the application surface.
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However, on rereading it appears that a subject is needed for the second sentence. I also feel that CMP 14 might want to consider whether to place the third and fourth sentences, which are requirements, in an alternate location within Article 516, since definitions are not allowed to contain requirements. This is proposed in an additional comment. The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Another approach would be to simply make the third and last sentences into an informational note, for example as follows:
<u>**Informational Note:** In automated operations, the spray area limits should be the maximum area in the direct path of spray operations. In manual operations, the spray area limits should be the maximum area of spray when aimed at 180 degrees to the application surface.</u>
Similar approaches to what is being suggested above for spray areas might be done also for spray booths and spray rooms but spray area is the term with the clearest problems because of the requirements and the missing subject.

14-70 Log #203 NEC-P14 **Final Action: Accept**
(516.10(B)(4))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 14-254
Recommendation: It was the action of the Correlating Committee that this proposal be reconsidered and correlated with the action on taken on Proposal 1-114.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: CMP-14 has taken the direction of the Correlating Committee and reconsidered the action taken on Proposal 14-254. CMP-14 affirms its decision to reject Proposal 14-254 because the additional text is not necessary. Since Articles 500 through 516 do not amend the requirements of Section 110.21, the requirements therein already apply.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 517 — HEALTH CARE FACILITIES

15-4 Log #1296 NEC-P15 **Final Action: Reject**
(517.1, Informational Note (New))

TCC Action: The Correlating Committee directs that this comment be reported as Reject. The format and language used in this Code follows guidelines established by NFPA and published in the NEC Style Manual.
Submitter: Stephen M. Lipster, The Electrical Trades Center
Comment on Proposal No: 15-46
Recommendation: Add a new informational note to 517.1:
Informational Note: NFPA 99 Health Care Facilities Code extracted material found in the design elements of this Article cannot be revised by the standard National Electrical Code making process. Revisions to these elements must be submitted to the Electrical Systems Technical Committee of the NFPA 99 Health Care Code.
Substantiation: Understandably code users believe the NEC can be revised under the normal NEC code making process. Recent Standards Council decisions have given jurisdiction to large portions of Article 517 to the NFPA 99 ELS. Code users should be made aware of this change so code users participating in the code making process can submit revisions to the proper entity.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:
ROCK, B.: Per 2.2.1 of the *2011 National Electrical Code® Style Manual*, Article Scope statements are the responsibility of the Correlating Committee. Furthermore, the content of the proposed added Informational Note is redundant to *NEC*® 90.5(C) and 90.9(C)(2) regarding content extracted from other NFPA documents, in this case *NFPA 99*.
TALKA, D.: This should be rejected for two reasons. (1) This is new material that has not had public review and comment. (2) This Informational Note is basically an instruction to the CMP on how to approach changes to Article 517. The Informational Note does nothing to assist the NEC reader to apply or interpret the code. It does not belong in the NEC.

15-4a Log #CC1500 NEC-P15 **Final Action: Accept**
(517.2)

Submitter: Code-Making Panel 15,
Comment on Proposal No: N/A
Recommendation: Add extraction reference to definition as follows:
Alternate Power Source. One or more generator sets, or battery systems where permitted, intended to provide power during the interruption of the normal electrical service; or the public utility electrical service intended to provide power during interruption of service normally provided by the generating facilities on the premises. <u>[**99:** 3.3.5]</u>
Substantiation: The Panel notes that this is extracted material from NFPA 99 and should be referenced as such. [99: 3.3.5]. The panel action adds the NFPA 99 reference.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-5 Log #435 NEC-P15 **Final Action: Accept in Principle**
(517.2.Critical Branch)

Submitter: Neil F. LaBrake, Jr., National Grid USA
Comment on Proposal No: 15-12
Recommendation: The Panel action should be "accept-in-principle" and the recommended text for "517.2 Critical Branch" should read as follows:

"**Critical Branch.** A system of feeders and branch circuits supplying power for task illumination, fixed equipment, select receptacles, and select power circuits serving areas and functions related to patient care that are automatically connected to alternate power sources by one or more transfer switches during interruption of the normal power source. [99: 3.3.30]"

Also, the NFPA 99 extract note shall be identified in the NEC for this section.
Substantiation: This comment is the work of the Task Group on 2014 NEC/2012 NFPA 99 Correlation with the following representation: Larry Todd, CMP-15; Don Talka, CMP-15; Jim Duncan, CMP-15; Sam Friedman, CMP-15; Walt Vernon, NFPA 99; Dave Dagenais, NFPA 99; James Costley, NFPA 99; Chad Beebe, NFPA 99; Jim Dollard, NEC Correlating Committee; and Neil LaBrake, Jr., NEC Correlating Committee (Chair). As directed by Mr. Michael J. Johnston, NEC Correlating Committee Chair on June 8th, 2012, the Task Group acted on correlation matters and conformance with the Standard Council direction on "Installation vs. Performance" to resolve any conflicts or inconsistencies resulting from proposed revisions in the A2013NEC Report on Proposals (ROP) related to the 2012 NFPA 99.

This definition is under the jurisdiction of the NFPA 99 Technical Committee. This action results in correlation of NFPA 99-2012 Section 3.3.30 with A2013NEC ROP.
Panel Meeting Action: Accept in Principle
Revise the following definition in 517.2 to agree with NFPA 99:
Critical Branch. A system of feeders and branch circuits supplying power for task illumination, fixed equipment, select receptacles, and select power circuits serving areas and functions related to patient care that are is automatically connected to alternate power sources by one or more transfer switches during interruption of the normal power source. [99: 3.3.30]
Panel Statement: The word "are" should be changed to "is" because it is grammatically matching and does not change the intent. It is consistent with NEC Style Manual 4.3.2.2. The definition is an extraction from NFPA 99, *Health Care Facilities Code,* 3.3.30. This information should be forwarded to NFPA 99 ELS Committee.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-6 Log #1187 NEC-P15 **Final Action: Accept in Principle**
(517.2, Critical Branch)

Submitter: Technical Committee on Electrical Systems,
Comment on Proposal No: 15-12
Recommendation: Revise text to read as follows:

Critical Branch. A system of feeders and branch circuits supplying power for task illumination, fixed equipment, select receptacles, and power circuits serving areas and functions related to patient care ~~and~~ that are automatically connected to alternate power sources by one or more transfer switches during interruption of normal power source. [**99:** 3.3.30]
Substantiation: The ELS committee requests this revision to what was accepted at the ROP stage to completely correlate with Section 3.3.30 of NFPA 99-2012.

This comment was balloted through the Technical Committee on Electrical Systems with the following results:

25 Members Eligible to Vote

Ballot Results: Affirmative: 14

15-7 Log #1484 NEC-P15 **Final Action: Reject**
(517.2.Critical Branch)

Submitter: Randy Hunter, Las Vegas, NV
Comment on Proposal No: 15-12
Recommendation: Reject the proposal.
Substantiation: The text for 517.2 for the definition of a "critical branch" should not be revised as indicated in Proposal 15-12, just as the text in 517.26 should revert to the 2011 NEC and previous editions of the NEC involved the requirement of the essential electrical system, such as the life safety and the critical branch, to use Article 700, except as amended by Article 517. For the 2014 NEC, Proposal 15-48 was submitted by the NFPA 99 Technical Committee on Electrical Systems to revise 517.26 as follows: "Application of Other Articles. The life safety branch of the essential electrical system shall meet the requirements of Article 700, except as amended by Article 517." What the NFPA 99 Electrical Committee did not take into consideration is the existing text in 517.30(D) stating the following: "The sizing requirements in 700.4 and 701.4 shall not apply to hospital generator set(s)." Both the NFPA 99 Electrical Committee and CMP-15 may have overlooked NEC 517.30(D) as a solution to their concerns and negating any reason for deleting the critical branch from 517.26. Deleting the critical branch from compliance with Article 700 will also delete safety features covered by Article 700, such as 700.5 for transfer switches where the transfer switches are required to be electrically-operated and mechanically-held. Similar action should be made for Proposal 15-12 making changes to the definition of a "critical branch." Making the necessary changes in Article 517 for critical branch circuits at this point in the process would constitute new material and would not be permitted at the comment stage, however, rejecting the proposal would leave Article 700 as a requirement with a rewrite possible for the 2017 NEC.
Panel Meeting Action: Reject
Panel Statement: Panel 15 has been directed by the correlating committee to achieve correlation with NFPA 99, *Health Care Facilities Code*. The panel actions on Comments 15-5 and 15-6 achieves this. The arrangement of the various systems and branches is a performance concern under the purview of the NFPA 99 Electrical Systems committee. Requests for changes to performance requirements should be processed through that committee.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-8 Log #918 NEC-P15 **Final Action: Reject**
(517.2.Equipment Branch)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 15-14
Recommendation: Revise text to read as follows:
517.2 Definitions.
Equipment Branch. A system of feeders and branch circuits arranged for delayed, automatic, or manual connection to the alternate power source ~~and that serves primarily 3-phase power equipment~~. [**99:**3.3.46].
Substantiation: Three branches are defined in 517: Critical, Equipment, and Life Safety. These branches are defined by what they serve. Only e*quipment* is identified by the type of electrical circuit. This unnecessary and perhaps misleading.
The definition is copied from NFPA 99, but the NEC should be as precise as possible when it comes to electrical descriptions.
Panel Meeting Action: Reject
Panel Statement: This is extracted material and Panel 15 has been directed by the correlating committee to maintain correlation with NFPA 99, *Health Care Facilities Code*. The arrangement of the various systems and branches is a performance concern under the purview of the NFPA 99 ELS Committee. Requests for changes to performance requirements should be processed through that committee.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-9 Log #494 NEC-P15 **Final Action: Reject**
(517.2.Health Care Facilities and Informational Note (New))

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 15-15
Recommendation: Revise text to read as follows:
Health Care Facilities. Buildings or portions of buildings in which medical, dental, psychiatric, nursing, obstetrical, or surgical care are provided. ~~Health care facilities include, but are not limited to, hospitals, nursing homes, limited care facilities, clinics, medical and dental offices, and ambulatory care centers, whether permanent or movable.~~
Informational Note: Health care facilities include, but are not limited to, hospitals, nursing homes, limited care facilities, clinics, medical and dental offices, and ambulatory care centers, whether permanent or movable.
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains a list of examples and such examples are not usually contained in definitions but as information. If, on the other hand, the CMP believes that this list is a requirement it should place it somewhere else in Article 517, for example as a section 517.3 or a similar new location, since NEC definitions shall not contain requirements. Moreover, the NEC manual of style does not permit the definition to contain the defined term and the second sentence contains the defined term "health care facilities".
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Panel Meeting Action: Reject
Panel Statement: The glossary of terms gives the definition for "Health Care Facilities" to NFPA 5000. The panel suggests that the submitter make the proposal to the appropriate document.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-10 Log #436 NEC-P15 **Final Action: Accept in Principle**
(517.2.Life Safety Branch)

Submitter: Neil F. LaBrake, Jr., National Grid USA
Comment on Proposal No: 15-16
Recommendation: The Panel action should be "accept-in-principle" and the recommended text for "517.2 Life Safety Branch" should read as follows:
Life Safety Branch. A system of feeders and branch circuits supplying power for lighting, receptacles, and equipment essential for life safety that are automatically connected to alternate power sources by one or more transfer switches during interruption of the normal power source. [99: 3.3.94]
Also, the NFPA 99 extract note shall be identified in the NEC for this section.
Substantiation: This comment is the work of the Task Group on 2014 NEC/2012 NFPA 99 Correlation with the following representation: Larry Todd, CMP-15; Don Talka, CMP-15; Jim Duncan, CMP-15; Sam Friedman, CMP-15; Walt Vernon, NFPA 99; Dave Dagenais, NFPA 99; James Costley, NFPA 99; Chad Beebe, NFPA 99; Jim Dollard, NEC Correlating Committee; and Neil LaBrake, Jr., NEC Correlating Committee (Chair). As directed by Mr. Michael J. Johnston, NEC Correlating Committee Chair on June 8th, 2012, the Task Group acted on correlation matters and conformance with the Standard Council direction on "Installation vs. Performance" to resolve any conflicts or inconsistencies resulting from proposed revisions in the A2013NEC Report on Proposals (ROP) related to the 2012 NFPA 99.
This definition is under the jurisdiction of the NFPA 99 Technical Committee. This action results in correlation of NFPA 99-2012 Section 3.3.94 with A2013NEC ROP.
Panel Meeting Action: Accept in Principle
Revise the following definition in 517.2 to agree with NFPA 99:
Life Safety Branch. A system of feeders and branch circuits supplying power for lighting, receptacles, and equipment essential for life safety that is ~~are~~ automatically connected to alternate power sources by one or more transfer switches during interruption of the normal power source. [99: 3.3.94]
Panel Statement: The word "are" should be changed to "is" because it is grammatically matching and does not change the intent. It is consistent with NEC Style Manual 4.3.2.2. The definition is an extraction from NFPA 99, *Health Care Facilities Code*, 3.3.94. This information should be forwarded to NFPA 99 ELS Committee.

(517.2.Patient Care Area)

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 15-19
Recommendation: The Correlating Committee directs the panel to reconsider this proposal with respect to the accuracy of the extracted material and the use of permissive language in the Informational Notes. Defined terms in this proposal shall be extracted from NFPA 99.
The Correlating Committee further directs that the panel ensure that where text is extracted from NFPA 99 it meets the requirements of 4.3.2.2 of the NEC Style Manual.
In addition, it was the action of the Correlating Committee that further consideration be given to the comments expressed in the voting.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Change the following as shown in the 2014 NEC ROP Version:
Patient Care Space. Space within a health care facility wherein patients are intended to be examined or treated.
Basic Care Space. Space in which failure of equipment or a system is not likely to cause injury to the patients or caregivers but may cause patient discomfort.
Critical Care Space. Space in which failure of equipment or a system is likely to cause major injury or death to patients or caregivers.
General Care Space. Space in which failure of equipment or a system is likely to cause minor injury to patients or caregivers.
Support Space. Space in which failure of equipment or a system is not likely to have a physical impact on patients or caregivers.
Informational Note No. 1: The governing body of the facility designates patient care space in accordance with the type of patient care anticipated and with the definitions of the area classification. Business offices, corridors, lounges, day rooms, dining rooms, or similar areas typically are not classified as patient care ~~rooms~~ space.
Informational Note No. 2: Basic Care SpaceRoom. This spacerooms is typically where basic medical or dental care, treatment, or examinations are performed. Examples include but are not limited to, examination or treatment rooms in clinics, medical and dental offices, nursing homes and limited care facilities.
Informational Note No. ~~2~~ 3: General care space ~~may~~ includes areas such as patient bedrooms, examining rooms, treatment rooms, clinics, and similar areas ~~in~~ where the patient may come in contact with electromedical devices or ordinary appliances such as a nurse call system, electric beds, examining lamps, telephones, and entertainment devices.
Informational Note No. ~~3~~ 4: Critical care space ~~rooms may~~ includes special care units, intensive care units, coronary care units, angiography laboratories, cardiac catheterization laboratories, delivery rooms, operating rooms, and similar areas in which patients are intended to be subjected to invasive procedures and connected to line-operated, electromedical devices.
Informational Note No. ~~4~~ 5: Space~~Rooms within a patient care room~~ where a procedure is performed that subjects patients or staff to wet conditions ~~may be~~ are considered as wet procedure areas. This includes standing fluids on the floor or drenching of the work area. Procedures and incidental spillage of liquids do not define wet procedure areas. It is the responsibility of the governing body of the health care facility to designate the wet procedure areas.
Panel Statement: The panel reconsiders its action and agrees with action taken on Proposal 15-19 and Proposal 15-20 to change to the word "space" instead of "room" or "area". As directed, the panel has corrected the permissive language in the informational notes and made other grammatical and editorial corrections. The panel recognizes the following statement from the NEC Correlating Committee Task Group on 2014 NEC/2012 NFPA 99 Correlation: "The TG recognizes in Proposals 15-20, 15-26, 15-33, 15-42, and 15-62 that these definitions as revised with the term change from "areas" to "spaces" do not correlate with NFPA 99, *Health Care Facilities Code*, 2012. However, NFPA 99 members of this Task Group are submitting a TIA to NFPA 99-2012 to have correlation when the 2014 NEC is issued based on the A2014 NFPA 99 ROP meeting. The 2015 revision of NFPA 99 can then process the change during its comment stage to ensure its correlation with the 2014 NEC."
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-13 Log #495 NEC-P15 **Final Action: Reject**
(517.2.Patient Care Area)

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 15-19
Recommendation: Please accept the proposal as submitted and do not modify it.
Substantiation: The NFPA Standards Council has set up an Advisory Committee on the Glossary on Terminology to obtain consistency in definitions with the NFPA set of documents. The NFPA 99 set of definitions are reasonable and the small differences between what was proposed and what was accepted will simply lead to new confusion when users of both codes find similar terms and similar definitions but a lack of consistency. Accepting extracted definitions will create consistency.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 15-12.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-14 Log #205 NEC-P15 **Final Action: Accept**
(517.2.Patient Care Areas)

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 15-20
Recommendation: The Correlating Committee directs the panel to reconsider this proposal with respect to the accuracy of the extracted material. Defined terms in this proposal shall be extracted from NFPA 99.
The Correlating Committee further directs that the panel ensure that where text is extracted from NFPA 99 it meets the requirements of 4.3.2.2 of the NEC Style Manual.

In addition, it was the action of the Correlating Committee that further consideration be given to the comments expressed in the voting.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: See the panel action and statement on Comment 15-12.

15-16 Log #1400 NEC-P15 **Final Action: Reject**
(517.2.Patient Care Room)

Submitter: Timothy Crnko, St. Louis, MO
Comment on Proposal No: 15-19
Recommendation: Revise text to read as follows:
Patient Care ~~Area~~ Room. Any ~~portion~~ room ~~space~~ of a health care facility wherein patients are intended to be examined or treated. [99:3.3.138]
Basic Care Room ~~Space~~: Room ~~Space~~ in which failure of equipment or a system is not likely to cause injury to the patients or caregivers but may cause patient discomfort, Category 3. [99:3.3.138.1]
Critical Care Room ~~Space~~. ~~Space~~ Room in which failure of equipment or a system is likely to cause major injury or death to patients or caregivers. Category 1.
[99:3.3.138.2]
General Care Room ~~Space~~. ~~Space~~ Room in which failure of equipment or a system is likely to cause minor injury to patients or caregivers. Category 2
[99:3.3.138.3]
Support ~~Space~~ Room: ~~Space~~ Room in which failure of equipment or a system is not likely to have a physical impact on patients or caregivers. Category 4
[99:3.3.138.4]
Informational Note No. I: This Article reflects the NFPA 99 requirements where the risk to the patient is defined by categories of risk in a specific location or space and the various systems to support. It is important to note these requirements are no longer occupancy-based. The risk to the patient does not change for a given procedure. If the procedure is performed in a doctor's office versus a hospital the risk remains the same. The different essentially electrical systems Type 1, 2, and 3 are designed to meet the designated Category for the specific room usage, intended use of receptacles, etc.
Four levels of systems categories are defined in NFPA 99, based on the risks to patients and caregivers in the facilities. See NFPA 99:4.1. The categories are as follows:
(1) Category 1: Systems are expected to work or be available at all times to support patient needs. [99:A.4.1.1]
(2) Category 2: Systems are expected to provide a high level of reliability; however limited short durations of equipment downtime can be tolerated without significant impact on patient care. Category 2 systems support patient needs but are not critical for life support. [99:A.4.1.2]
(3) Category 3: Normal building system reliabilities are expected. Such systems support patient needs. but failure of such equipment would not immediately affect patient care. Such equipment is not critical for life support. [99:A.4.1.3]
(4) Category 4: Such systems have no impact on patient care and would not be noticeable to patients in the event of failure. [99:A.4.1.4]
Informational Note No. ~~1~~2: The governing body of the facility designates patient care ~~spaces~~ rooms in accordance with the type of patient care anticipated and with the definitions of the area classification. Business offices, corridors, lounges, day rooms, dining rooms, or similar areas typically are not classified as patient care rooms. [99:1.3.4.1]
lnformational Note No. 3: Patient Care Room, business offices, corridors, lounges, day rooms. dining rooms or similar areas typically are not classified as patient care rooms. [99:A.3.3.l38]
Basic Care Room. These rooms are typically where basic medical or dental care. treatment. or examinations are performed.
Examples include but are not limited to, examination or treatment rooms in clinics, medical and dental offices, nursing homes and limited care facilities. [99:A.3.3.138.1]
Critical Care Room. These rooms are typically where patients are intended to be subjected to invasive procedures and connected to line-operated patient care-related appliances. Examples include but are not limited to special care patient rooms used for critical care, intensive care, and special care treatment rooms such as angiography laboratories,cardiac catheterization laboratories, delivery rooms, operating rooms, post-anesthesia care units, trauma rooms and other similar rooms. [99: A.3.3.138.2]
General Care Room. Examples include but are not limited to, inpatient bedrooms dialysis rooms in vitro fertilization rooms procedural rooms and similar rooms. [99:A.3.3.138.3]
Support Room. Examples of support rooms include. but are not limited to anesthesia work rooms, sterile supply, laboratories, morgues, waiting rooms, utility rooms and lounges. [99:A.3.3.138.4]
Informational Note No. 4. Spaces within a patient care room where a procedure is performed that subjects patients or staff to wet conditions may be considered as wet procedure areas. These include standing fluids on the floor or drenching of the work area. Routine housekeeping procedures and incidental spillage of liquids do not define wet procedure areas. It is the responsibility of the governing body of the health care facility to designate the wet procedure areas. [99:1.3.4.3]
~~Informational Note No. 2: General care spacesrooms may include areas such as patient bedrooms, examining rooms, treatment rooms, clinics, and similar areas in where the patient may come in contact with electromedical devices or ordinary appliances such as a nurse call system, electric beds, examining lamps, telephones, and entertainment devices.~~
~~Informational Note 3: Critical care spacerooms may include special care units, intensive care units, coronary care units, angiography laboratories, cardiac catheterization laboratories, delivery rooms, operating rooms, and similar areas in which patients are intended to be subjected to invasive procedures and connected to line operated, electromedical devices.~~
Substantiation: Use "room" rather than "space" as used in NFPA 99. Include NFPA 99 designated Category for each room since this is the guide post as to designated risk and this then makes an extract reference possible which is more transparent. Informational Note No. 1 is needed to inform reader of the major change from occupancy-based to risk-based. The last two paragraphs from 2012 NFPA 99 Origins and Development of NFPA 99 on page 99-3 in part:
"The 2012 edition went through a major overhaul, The premise of an occupancy-based document was modified to become a risk-based document.... The
administration of health care continues to change. NFPA 99 has changed to reflect how health care is delivered.
The risk to the patient does not change for a given procedure. If the procedure is performed in a doctor's office versus a hospital, the risk remains the same.
Therefore, NFPA 99 eliminated the occupancy chapters and has gone to a risk-based approach. New Chapter 4 outlines the parameters for this approach The Code now reflects the risk to the patient in defined categories of risk."
The 2012 NFPA 99 Chapter 4 is the foundation for the change to a risked-based approach rather than an occupancy-based:
"**4.1*** ***Building System Categories***. *Building systems in health care facilities shall be designed to meet system Category 1 through Category 4 requirements as detailed in this code.*"
4.1.1 to 4,1.3 details four different categories of facility systems that should be applied to Chapter 6 Electrical Systems, For instance, Category 1 systems are intended to supply loads where failure could result in "major injury or death of patients or caregivers".
The 2012 NFPA 99 in Chapter 3 section 3.3.138 ties the patient care rooms to categories. Examples: critical care room would be Category 1, general care room would be Category 2, and basic care room would be Category 3.
The 2012 NFPA 99 has three types of essential electrical systems: Type 1, Type 2, and Type 3. NFPA 99:6.3.2.2.10 specifies which type of essential electrical system is required to serve various categories of rooms, Examples: "critical care rooms (Category 1 Room) shall be served only by a Type 1 essential electrical system and "general care rooms (Category 2 Room) shall be served only by a Type l or Type II "essential electrical system. (Note the 2012 NFPA is inconsistent in its nomenclature in denoting Types: such as sometime it denotes Type 2 and sometime it denotes Type II.)
Other examples of where the type of essential electrical system is designated is NFPA 99 6.3.2.2.6.2: "Receptacles for Patient Bed Locations in Critical Care Areas (Category 1)" means these receptacles need to be served by an essential electrical system Type 1 and "Receptacles for Patient Bed Locations in General Care Areas (Category 2)" means these receptacles need to be served by an essential electrical system Type 2.
Informational Note No. 3 is extracted material from NFPA 99 Annex to help readers understand the information.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 15-12. NFPA 99, *Health Care Facilities Code*, ELS has jurisdiction over the design criteria for health care facilities. The submitter is advised to send his comment to NFPA 99 Electrical Systems committee for correlation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-17 Log #497 NEC-P15 **Final Action: Reject**
(517.2.Wet Procedure Area (New))

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 15-24
Recommendation: Please accept the proposal as submitted and do not modify it.
Substantiation: The NFPA Standards Council has set up an Advisory Committee on the Glossary on Terminology to obtain consistency in definitions with the NFPA set of documents. The NFPA 99 definition is reasonable. Accepting extracted definitions will create consistency.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its intention to use the word "space" as evidenced by the panel action and statement on Comment 15-12. The panel also reaffirms its intention to use the word "location" instead of the word "area" in the definition title. The panel believes that the informational note provides clarity.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-18 Log #498 NEC-P15 **Final Action: Reject**
(517.2.Wet Procedure Locations, Wet Procedure Area (New) and Informational Note (New))

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 15-25
Recommendation: Revise text to read as follows:
~~**Wet Procedure Locations.** Those spaces within patient care areas where a procedure is performed and that are normally subject to wet conditions while patients are present. These include standing fluids on the floor or drenching of the work area, either of which condition is intimate to the patient or staff. Routine housekeeping procedures and incidental spillage of liquids do not define a wet procedure location.~~
Wet Procedure Area. The area in a patient care room where a procedure is performed that is normally subject to wet conditions while patients are present, including standing fluids on the floor or drenching of the work area, either of which condition is intimate to the patient or staff. [**99:**3.3.184]
Informational Note: Routine housekeeping procedures and incidental spillage of liquid do not define a wet procedure area or location.
Substantiation: The action by CMP 15 is unclear. No proposal was accepted to delete the definition of "wet procedure locations" in spite of the acceptance in 15-24 of a definition for "wet procedure location area". In order to clarify the action of CMP 15 this comment asks that the existing definition of "wet procedure locations" be deleted and the definition of "wet procedure area" be extracted from NFPA 99.
This comment also recommends that the informational note proposed by CMP 15 in 15-24 be added to the extracted definition because it definitely gives useful information to the user of the NEC.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 15-17.

Ballot Results: Affirmative: 14

15-19 Log #206 NEC-P15 **Final Action: Accept**
(517.10)

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 15-26
Recommendation: The Correlating Committee directs that the panel reconsider this proposal with respect to the Correlating Committee Action on Proposals 15-19 and 15-20.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Change the following as shown in the 2014 NEC ROP Version to read as follows:
(A) Applicability. Part II shall apply to patient care space~~s~~ of all health care facilities.
Panel Statement: See panel action and statement on Comment 15-12. The panel made an editorial change.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-20 Log #387 NEC-P15 **Final Action: Reject**
(517.15)

Submitter: Dan Ordahl, Apple Valley, MN
Comment on Proposal No: 15-28
Recommendation: Add new text to read as follows:
517.15 All 125 volt, single-phase 15 and 20 amp receptacles that are installed in patient care areas, shall be listed hospital grade type.
Substantiation: With increasing complex procedures being performed in the clinic exam room and dentist office. The equipment being utilized for those procedures is listed for use only with a hospital grade receptacle. But that equipment will still fit directly into a nonhospital grade receptacle.
It would only seem prudent that hospital grade receptacles be installed in those areas requiring the special wiring methods in 517.13(A). The special wiring methods in 517.13(A) shall be provided for branch circuits for All patient care areas. This requirement of the wiring method is not limited to patient bed locations.
A hospital grade receptacle is designed to a higher standard than a standard receptacle for use and grounding. This would work in harmony with the higher standard for wiring methods serving all patient care areas required in 517.13(A). Use of standard receptacle is a weak-link between the 517.13(A) wiring method and the hospital grade equipment to patient safety.
Panel Meeting Action: Reject
Panel Statement: This change would eliminate the use of existing locking type receptacles and receptacles listed for "Hospital Use Only".
Patient bed locations in patient care space require hospital grade receptacles as addressed in 517.18(B) and 517.19(C)(2). This section addresses grounding of receptacles and fixed equipment in Patient Care Space.
Equipment in dental offices often uses Midget Locking receptacles "NEMA configuration ML-2".
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
SAMPSON, M.: The panel should take another closer look at this proposal. If patient care areas are required to be supplied by a robust wiring method listed as an equipment grounding conductor as well as an insulated equipment grounding conductor, and then - in other than inpatient sleeping rooms - why is it terminated at a general purpose receptacle, not a hospital grade device. Listed medical equipment such as dental chairs and exam tables often have this marking "Grounding reliability can only be achieved with the use of a hospital grade receptacle" and have hospital grade supply cords. By not requiring all receptacles in patient care areas, a weak link is created in the equipment grounding chain.

15-21 Log #367 NEC-P15 **Final Action: Accept**
(517.16)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 15-31
Recommendation: Revise text and add the 2012 *NFPA 99* references to read as follows:
517.16 **Use of Isolated Ground Receptacles** ~~**with Insulated Grounding Terminals.**~~ ~~Receptacles with insulated grounding terminals, as permitted in 250.146(D), shall not be permitted.~~ An isolated ground receptacle shall not be installed within a patient care vicinity. [**99:**6.3.2.2.7.1(B)]
Substantiation: The Panel Action on this proposal should have been Accept In Part.
The first part of Proposal 15-31 that would not permit isolated ground receptacles in patient care vicinity should have been accepted. The panel's concern is that redundant grounding is needed for the patient's safety. However, if isolated ground receptacles are not permitted in the patient care vicinity, this concern would be addressed. Away from this space the use of isolated ground receptacles would mitigate against equipment interference due to electrical noise without affecting patient safety. Furthermore, acceptance of the proposal's first part would correlate *NEC*® 517.16 with the requirements of *NFPA99* 6.3.2.2.7.1. Therefore, a Panel Action of Accept In Part would have been more appropriate.

(517.17(A))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 15-33
Recommendation: The Correlating Committee directs that the panel reconsider this proposal with respect to the Correlating Committee Action on Proposals 15-19 and 15-20.
The Correlating Committee notes that the term "space" is not used in NFPA 99.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Change the following as shown in the 2014 NEC ROP Version as follows:
517.17 Ground-Fault Protection.
(A) Applicability. The requirements of 517.17 shall apply to hospitals and other buildings (including multiple occupancy buildings) with critical care space~~s~~ or utilizing electrical life support equipment, and buildings that provide the required essential utilities or services for the operation of critical care space~~s~~ or electrical-life support equipment.
Panel Statement: See panel action and statement on Comment 15-12. The panel made editorial changes.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-24 Log #445 NEC-P15 **Final Action: Reject**
(517.18(B))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 15-35
Recommendation: 517.18 General Care Areas.
(B) Patient Bed Location Receptacles. Each patient bed location shall be provided with a minimum of eight receptacles ~~They shall be permitted to be of the single, duplex, or quadruplex type, or any combination of the three.~~ All receptacles shall be listed "hospital grade" and shall be so identified. The grounding terminal of each receptacle shall be connected to an insulated copper equipment grounding conductor sized in accordance with Table 250.122. **[ROP 15–35, ROP 15–36]**
Substantiation: Why chase the additional receptacle configurations? The important part is "Hospital Grade".
Panel Meeting Action: Reject
Panel Statement: The text in question aids the NEC user and correlates with NFPA 99, *Health Care Facilities Code*.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-25 Log #1407 NEC-P15 **Final Action: Reject**
(517.18(B))

Submitter: Timothy Crnko, St. Louis, MO
Comment on Proposal No: 15-36
Recommendation: Revise text to read as follows:
(B) Patient Bed Location Receptacles. Each patient bed location shall be provided with a minimum of eight receptacles. <u>Category 2. [99:6.3.2.2.6.2(A)]</u>
Substantiation: Include the NFPA 99 designated Category since this is the guide post as to designated risk and this then makes an extract reference possible which is more transparent.
99:6.3.2.2.6.2 provides the *Minimum Number of Receptacles* for various locations and each is designated Category where appropriate. This then ties to 99: 6.3.2.2.10 *Essential Electrical Systems* which provides the requirements for the Type essential electrical system (Type I, 2, or 3) that must serve various types of patient care rooms which are designated with a Category where appropriate.
The last two paragraphs from 2012 NFPA 99 *Origins and Development of NFPA 99* on page 99-3 in part:
"The 2012 edition went through a major overhaul. The premise of an occupancy-based document was modified to become a risk-based document... The administration of health care continues to change. NFPA 99 has changed to reflect how health care is delivered.
The risk to the patient does not change for a given procedure. The procedure is performed in a doctor's office versus a hospital, the risk remains the same.
Therefore, NFPA 99 eliminated the occupancy chapters and has gone to a risk-based approach. New Chapter 4 outlines the parameters or this approach. The Code now reflects the risk to the patient in defined categories at risk." The 2012 NFPA 99 Chapter 4 is the foundation for the change to a risked-based approach rather than an occupancy-based:
*"**4.1* Building System Categories**. Building systems in health care facilities shall be designed to meet system Category I through Category 4 requirements as detailed in this code."*
4.1.1 to 4.1.3 details four different categories of facility systems that should be applied to Chapter 6 *Electrical Systems*. For instance, Category I systems are intended to supply loads where failure could result in *"major injury or death of patients or caregivers"*.
The 2012 NFPA 99 in Chapter 399:3.3.138 ties the patient care rooms to categories, Examples: critical care room would be Category 1, general care room would be Category 2, and basic care room would be Category 3.
The 2012 NFPA 99 has three types of essential electrical systems: Type 1, Type 2, and Type 3. NFPA 99 6.3.2.2.10 specifies which type of essential electrical system is required to serve various categories of rooms. Examples: *"critical care rooms (Category I Room) shall be served only by a Type 1"* essential electrical system and *"general care rooms (Category 2 Room) shall be served only by a Type I or Type II"* essential electrical system. (Note the 2012 NFPA is inconsistent in its nomenclature in denoting Types: such as sometime it denotes Type 2 and sometime it denotes Type II.)
Other examples of where the type of essential electrical system is designated is 99:6.3.2.2.6.2: *"Receptacles for Patient Bed Locations in Critical Care Areas (Category I)"* means these receptacles need to be served by an essential electrical system Type 1 and *"Receptacles/or Patient Bed Locations in General Care Areas (Category 2)"* means these receptacles need to be served by an essential electrical system Type 2.
Panel Meeting Action: Reject
Panel Statement: The use of the term "Category 2" as described in NFPA 99, *Health Care Facilities Code,* is not necessary in the NEC and would be confusing to NEC users.

Ballot Results: Affirmative: 14

15-26 Log #437 NEC-P15 **Final Action: Accept**
(517.18(C))

Submitter: Neil F. LaBrake, Jr., National Grid USA
Comment on Proposal No: 15-37
Recommendation: The Panel action should be "accept-in-principle" and the recommended text for 517.18(C) should read as follows:
"<u>**Designated General Care Pediatric Locations.** Receptacles that are located within the patient rooms, bathrooms, playrooms, and activity rooms of pediatric units, other than nurseries, shall be listed tamper-resistant or shall employ a listed tamper-resistant cover. [99: 6.3.2.2.6.2(F)]</u>"
Also, the NFPA 99 extract note shall be identified in the NEC for this section.
Substantiation: This comment is the work of the Task Group on 2014 NEC/2012 NFPA 99 Correlation with the following representation: Larry Todd, CMP-15; Don Talka, CMP-15; Jim Duncan, CMP-15; Sam Friedman, CMP-15; Walt Vernon, NFPA 99; Dave Dagenais, NFPA 99; James Costley, NFPA 99; Chad Beebe, NFPA 99; Jim Dollard, NEC Correlating Committee; and Neil LaBrake, Jr., NEC Correlating Committee (Chair). As directed by Mr. Michael J. Johnston, NEC Correlating Committee Chair on June 8th, 2012, the Task Group acted on correlation matters and conformance with the Standard Council direction on "Installation vs. Performance" to resolve any conflicts or inconsistencies resulting from proposed revisions in the A2013NEC Report on Proposals (ROP) related to the 2012 NFPA 99.
Pediatric locations are under the jurisdiction of the NFPA 99 Technical Committee. This action results in correlation of NFPA 99-2012 Section 6.3.2.2.6.2(F) with A2013NEC ROP.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:
LIPSTER, S.: Mr. Rock's comments are well taken, especially the concerns raised regarding siblings and the "…curiosity factor of a healthcare environment…". This panel and the NFPA 99 Electrical Systems Technical Committee should follow the lead provided by Article 406 and consider expanding the use of tamper-resistant receptacles in appropriate healthcare facilities.
ROCK, B.: The purpose of tamper-resistant receptacles is to reduce injuries to mobile toddlers and young children. This Comment's revision from "rooms … of pediatric units" to "<u>patient</u> rooms … of pediatric units" effectively removes the requirement for tamper-resistant receptacles in public-accessible waiting rooms, hallways and lobbies of pediatric units. Often, visitors to maternity areas are accompanied by toddlers and young children. During such visits, the focus is on the mother and newborn infant, and less so on those accompanying youngster under the presumption that visitor-accessible spaces of healthcare facilities are inherently free from hazards. The curiosity factor of a healthcare environment and of novel medical equipment is in fact quite the opposite.
Furthermore, the new exclusion of UNQUALIFIED "nurseries" from requiring installation of tamper-resistant receptacles aggravates this risk to toddlers and youngsters. Neither the *National Electrical Code®* nor *NFPA 99* defines the term "nursery". Per 3.2.1.2 of the *Manual of Style for NFPA Technical Committee Documents*, definitions of general terms shall follow *Webster's Collegiate Dictionary*. There, "nursery" is broadly defined as "a place where <u>children</u> are temporarily cared for in their parents' absence", NOT as a space for the care of newborn patients. NEMA finds unacceptable both the specific omission of "neonatal" qualification before "nurseries" and the general sophistry of editorially supplanting substantive, <u>un</u>extracted requirements with requirements that reduce broader, essential safety under the pretext of conveniently using a quoted extraction from another NFPA document narrower in scope and purpose.

15-27 Log #1189 NEC-P15 **Final Action: Reject**
(517.18(C))

Submitter: Technical Committee on Electrical Systems,
Comment on Proposal No: 15-37
Recommendation: Revise text to read as follows:
(C) Designated Pediatric Locations. Receptacles that are located within the patient rooms, bathrooms, playrooms, and activity rooms of pediatric units, or spaces with similar risk as determined by the governing body, other than nurseries, ~~and patient care areas of designated pediatric locations~~ shall be listed tamper resistant or shall employ a listed tamper-resistant cover.
Substantiation: This comment is being proposed to change this section to match an accepted proposal at the NFPA 99 ELS committee meeting. The proposed change now references spaces with similar risks to address the concern of limiting this to only patient rooms noted in the reason for the "reject" at the ROP stage. This is a performance requirement which the ELS committee has reviewed the technical nature of.

(517.19(A))

Submitter: Technical Committee on Electrical Systems,
Comment on Proposal No: 15-38
Recommendation: Revise text to read as follows:
(A) Patient Bed Location Branch Circuits. Each patient bed location ~~room~~ shall be supplied by at least two branch circuits, one or more from the critical branch and one or more circuits from the normal system. At least one branch circuit from the critical branch shall supply an outlet(s) only at that bed location. All branch circuits from the normal system shall be from a single panelboard. Critical branch receptacles shall be identified and shall also indicate the panelboard and circuit number supplying them. The branch circuit serving patient bed locations shall not be part of a multi-wire branch circuit.
Exception No. 1: Branch circuits serving only special-purpose receptacles or equipment in critical care spaces shall be permitted to be served by other panelboards.
Exception No. 2: Critical care spaces served from two separate critical branch transfer switches ~~on the emergency system~~ shall not be required to have circuits from the normal system.
Substantiation: The NFPA 99 ELS TC is proposing these changes to be consistent with NFPA 99. The term "emergency system" is no longer used in NFPA 99.

(517.19(B))

Submitter: Timothy Crnko, St. Louis, MO
Comment on Proposal No: 15-39
Recommendation: Revise text to read as follows:
(B) Patient Bed Location Receptacles.
(1) Minimum Number and Supply. Each patient bed location shall be provided with a minimum of fourteen receptacles. Category 1. [99;6.3.2.2.6.2(B)] At least one ~~of which~~ receptacle shall be connected to either of the following:
(1)The normal system branch circuit required in 517.19(A)
(2) A critical branch circuit supplied by a different transfer switch than the other receptacles at the same patient bed location.
(2) Receptacle Requirements. The receptacles required in 517.19(B)(I) shall be permitted to be single, duplex, or quadruplex type or any combination thereof. AIl receptacles shall be listed "hospital grade" and shall be so identified. The grounding terminal of each receptacle shall be connected to the reference grounding point by means of an insulated copper equipment grounding conductor.
Substantiation: Include NFPA 99 designated Category since this is the guide post as to designated "risk" and this then makes an extract reference possible which is more transparent, 99:6.3.2.2.6.2 provides the *Minimum Number of Receptacles* for various locations and each is designated Category where appropriate. This then ties to 99: 6.3.2.2.10
Essential Electrical Systems which provides the requirements for the Type essential electrical system (Type 1, 2, or 3) that must serve various types of patient care
rooms which are designated with a Category where appropriate.
The last two paragraphs from 2012 NFPA 99 *Origins and Development of NFPA 99* on page 99-3 in part:
"The 2012 edition went through a major overhaul. The premise of an occupancy-based document was modified to become a risk-based document.... The administration of health care continues to change. NFPA 99 has changed to reflect how health care is delivered.
The risk to the patient does not change/or a given procedure. If the procedure is performed in a doctor's office versus a hospital, the risk remains the same. Therefore, NFPA 99 eliminated the occupancy chapters and has gone to a risk-based approach. New Chapter 4 outlines the parameters for this approach. The Code now reflects the risk to the patient in defined categories of risk."
The 2012 NFPA 99 Chapter 4 is the foundation for the change to a risked-based approach rather than an occupancy-based:
"4.1 * *Building System Categories.* *Building systems in health care facilities shall be designed to meet system Category 1 through Category 4 requirements as detailed in this code."*
4.1.1 to 4.1.3 details four different categories of facility systems that should be applied to Chapter 6 *Electrical Systems*. For instance, Category 1 systems are intended to supply loads where failure could result in *"major injury or death a/patients or caregivers."*
The 2012 NFPA 99 in Chapter 3 [99:3.3.138] ties the patient care rooms to categories. Examples: critical care room would be Category 1, general care room would be Category 2, and basic care room would be Category 3.
The 2012 NFPA 99 has three types of essential electrical systems: Type 1, Type 2, and Type 3. NFPA 99 6.3.2.2.10 specifies which type of essential electrical system is required to serve various categories of rooms. Examples: *"critical care rooms (Category 1 Room) shall be served only by a Type I"* essential electrical system and *"general care rooms (Category 2 Room) shall be served only by a Type 1 or Type II"* essential electrical system. (Note the 2012 NFPA is inconsistent in its nomenclature in denoting Types: such as sometime it denotes Type 2 and sometime it denotes Type II.)
Other examples of where the type of essential electrical system is designated is 99:6.3.2.2.6.2: *"Receptacles for Patient Bed Locations in Critical Care Areas (Category 1)"* means these receptacles need to be served by an essential electrical system Type 1 and *"Receptacles/or Patient Bed Locations in General*

Care Areas (Category 2)" means these receptacles need to be served by an essential electrical system Type 2.
Panel Meeting Action: Reject
Panel Statement: The use of the term "Category 1" as described in NFPA 99, *Health Care Facilities Code,* is not necessary in the NEC and would be confusing to NEC users. In addition the removal of the words "of which" reduces clarity as to the receptacles referenced.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-31 Log #446 NEC-P15 **Final Action: Reject**
(517.19(B)(2))

Comment on Proposal No: 15-39
Recommendation: Revise text to read as follows:
517.19 Critical Care Areas.
(B) Patient Bed Location Receptacles.
(2) Receptacle Requirements. The receptacles required in 517.19(B)(1) shall ~~be permitted to be single, duplex, or quadruplex type or any combination thereof. All receptacles shall~~ be listed "hospital grade" and shall be so identified. The grounding terminal of each receptacle shall be connected to the reference grounding point by means of an insulated copper equipment grounding conductor.
Substantiation: Why chase the additional receptacle configurations? The important part is "Hospital Grade".
Panel Meeting Action: Reject
Panel Statement: The text in question aids the NEC user and correlates with NFPA 99, *Health Care Facilities Code*.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-32 Log #1405 NEC-P15 **Final Action: Reject**
(517.19(C))

Submitter: Timothy Crnko, St. Louis, MO
Comment on Proposal No: 15-41
Recommendation: Revise text to read as follows:
(C) Operating Room Receptacles.
(1) Minimum Number and Supply. ~~Each o~~Operating room shall be provided with a minimum of thirty six receptacles. Category 1, [99:6.3.2.2.6.2(C)] At least twelve ~~of which~~ receptacles shall be connected to either of the following:
(1) The normal system branch circuit required in 517.19(A).
(2) A critical branch circuit supplied by a different transfer switch than the other receptacles at the same location.
(2) Receptacle Requirements. The receptacles required in 517.19(C)(1) shall be permitted to be of the single or duplex types or a combination of both. All receptacles, whether thirty six or more, shall be listed "hospital grade" and so identified. The grounding terminal of each receptacle shall be connected to the reference grounding point by means of an insulated copper equipment grounding conductor.
Substantiation: Include NFPA 99 designated Category since this is the guide post as to designated risk and this then makes an extract reference possible which is more transparent.

99:6.3.2.2.62 provides the *Minimum Number of Receptacles* for various locations and each is designated with a Category where appropriate. This then ties to 99:

6.3.22.10 *Essential Electrical Systems* which provides the requirements for the Type essential electrical system (Type I, 2, or 3) that must serve various types of patient care rooms which are designated with a Category where appropriate.

The last two paragraphs from 2012 NFPA 99 *Origins and Development of NFPA 99* on page 99-3 in part:

"The 2012 edition went through a major overhaul, The premise of an occupancy-based document was modified to become a risk-based document.... The administration of health care continues to change. NFPA 99 has changed to reflect how health care is delivered.

The risk to the patient does not change for a given procedure. If the procedure is performed in a doctor 's office versus a hospital, the risk remains the same.

Therefore, NFPA 99 eliminated the occupancy chapters and has gone to a risk-based approach. New Chapter 4 outlines the parameters for this approach. The Code now reflects the risk to the patient in defined categories of risk." The 2012 NFPA 99 Chapter 4 is the foundation for the change to a risked-based approach rather than an occupancy-based:

*"**4.1 * Building System Categories.** Building systems in health care facilities shall be designed to meet system Category I through Category 4 requirements as detailed in this code."*

4.1.1 to 4.1.3 details four different categories of facility systems that should be applied to Chapter 6 *Electrical Systems*. For instance, Category I systems are intended to supply loads where failure could result in "major injury or death a/patients or caregivers".

The 2012 NFPA 99 in Chapter 3 99:3.3.138 ties the patient care rooms to categories. Examples: critical care room would be Category 1, general care room would be Category 2, and basic care room would be Category 3.

The 2012 NFPA 99 has three types of essential electrical systems: Type I, Type 2, and Type 3. NFPA 99 6.3.2.2.10 specifies which type of essential electrical system is required to serve various categories of rooms. Examples: *"critical care rooms (Category 1 Room) shall be served only by a Type 1"* essential electrical system and *"general care rooms (Category 2 Room) shall be served only by a Type I or Type II"* essential electrical system. (Note the 2012 NFPA is inconsistent in its nomenclature in denoting Types: such as sometime it denotes Type 2 and sometime it denotes Type II.)

Other examples of where the type of essential electrical system is designated is 99:6.3.22.6.2: *"Receptacles for Patient Bed Locations in Critical Care Areas (Category 1)"* means these receptacles need to be served by an essential electrical system Type I and *"Receptacles for Patient Bed Locations in General Care Areas (Category 2)"* means these receptacles need to be served by an essential electrical system Type 2.
Panel Meeting Action: Reject
Panel Statement: The use of the term "Category 1" as described in NFPA 99, *Health Care Facilities Code,* is not necessary in the NEC and would be confusing to NEC users. In addition the removal of the words "of which" reduces clarity as to the receptacles referenced.

Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-35 Log #385 NEC-P15 **Final Action: Reject**
(517.26)

Submitter: Rocco DeLuca, Jr., City of Phoenix Arizona
Comment on Proposal No: 15-48
Recommendation: Continue to reject this proposal. Text in the 2014 NEC should read as follows:
517.26 Application of Other Articles. The essential electrical system shall meet the requirements of Article 700, except as amended by Article 700.

lnformational Note: The provisions of NFPA 110-2010, Standard for Emergency and Standby Power Systems, should be considered when designing and installing essential electrical power supply systems.
Substantiation: This proposal is unsubstantiated and removes necessary correlation between Article 517 and Article 700. The critical branch of health care facilities is part of the essential electrical system, no matter what you call it. Even though there was an effort to remove the word "emergency" from Article 517, it does not change how the essential (emergency) electrical system must perform to protect occupants and patients. There are essential rules in Article 700 that are necessary for inspectors to apply to the critical branch in addition to the life safety branch and equipment branch (in some instances) of electrical systems. This proposal (15-48) seeks to only correlate the requirements of Article 700 just to the life safety branch, without any technical or practical substantiation. This is an injustice to the inspection community not to mention a disservice to the heath and welfare of patients. Here is one

example of some of what is lost by such a revision.

Transfer switches used on emergency systems are required to be listed and identified as Suitable for use on Emergency Systems (See the UL White Book for information on transfer equipment for emergency use). This requirement is provided in 700.5(A) and found nowhere in Article 517. Transfer equipment is required to be used in the critical branch, equipment branch and life safety branch of health care facilities. If this proposal is accepted, standard transfer equipment would be permitted in the critical branch of a health care facility. This is a serious error and results in inferior installations and designs that will impact a system essential for the health and welfare of patients. The critical branch of a health care facility is part of the "emergency' system, no matter what it is called. Other requirements that are necessary in 700 to apply to the critical branch are 700.10 dealing power source wiring and separation requirements [700.10(B)], and fire ratings for emergency (critical branch) feeders in health care facilities taller than 75 feet [700.10(D)].

Other requirements applicable to emergency system power sources are contained in 700.12. Section 700.26 relaxes the requirements for GFPE on the alternate power source, which is not addressed in Article 517. This would result in GFPE being required for the alternate source in health care facilities.

Panel Meeting Action: Reject

(517.26)

Note: When the ballot result does not confirm the TC action on a Proposal by a two-thirds affirmative vote, the Report on Proposals shall be published with a specific request for public comment on that Proposal. The Proposal is now being reconsidered by the TC as a public comment.

Submitter: Technical Committee on Electrical Systems,

Comment on Proposal No: 15-48

Recommendation: Revise text to read as follows:

517.26 Application of Other Articles. The <u>life safety branch of the</u> essential electrical system shall meet the requirements of Article 700, except as amended by Article 517.

Informational Note: The provisions of NFPA 110-2010, *Standard for Emergency and Standby Power Systems*, should be considered when designing and installing essential electrical power supply systems.

Substantiation: To Coordinate with NFPA 99. Article 700 is not written to include the critical branch of the essential electrical system. If the critical branch of the emergency power supply system must comply with Article 700 newly installed generators in health care facilities will be required to be substantially oversized. Article 700.5 (A) states:

700.5 Capacity.

(A) Capacity and Rating. An emergency system shall have adequate capacity and rating for all loads to be operated simultaneously.

The emergency system equipment shall be suitable for the maximum available fault current at its terminals.

Whereas,

NFPA 99, Section 6.4.1.1.9* Capacity and Rating. The generator set(s) shall have sufficient capacity and proper rating to meet the maximum actual demand likely to be produced by the connected load of the essential electrical system(s) at any one time.

The critical branch is made up of many patient and equipment related loads. These loads, unlike those for illumination, panic control, life safety, etc. are not intended to all function at the same time. The list is long and has been provided so the Standards Council members can see why requiring all loads to be operated simultaneously would cause the generator to be substantially oversized for the application.

NFPA 99 6.4.2.2.2.3* Critical Branch. The critical branch shall be permitted to be subdivided into two or more branches. The critical branch of the emergency system shall supply power for task illumination, fixed equipment, selected receptacles, and selected power circuits serving the following areas and functions related to patient care:

(1) Critical care areas that utilize anesthetizing gases, task illumination, selected receptacles, and fixed equipment

(2) The isolated power systems in special environments

(3) Task illumination and selected receptacles in the following:(a) Patient care areas, including infant nurseries, selected acute nursing areas, psychiatric bed areas (omit receptacles),and ward treatment rooms

(b) Medication preparation areas

(c) Pharmacy dispensing areas

(d) Nurses' stations (unless adequately lighted by corridor luminaires)

(4) Additional specialized patient care task illumination and receptacles, where needed

(5) Nurse call systems

(6) Blood, bone, and tissue banks

(7)*Telephone equipment rooms and closets

(8) Task illumination, selected receptacles, and selected power circuits for the following area

(a) General care beds with at least one duplex receptacle per patient bedroom, and task illumination as required by the governing body of the health care facility

(b) Angiographic labs

(c) Cardiac catheterization labs

(d) Coronary care units

(e) Hemodialysis rooms or areas

(f) Emergency room treatment areas (selected)

(g) Human physiology labs

(h) Intensive care units

(i) Postoperative recovery rooms (selected)

(9) Additional task illumination, receptacles, and selected power circuits needed for effective facility operation. Single-phase fractional horsepower motors shall be permitted to be connected to the critical branch.

As a result of the August 10, 2011 Standards Council Decision (Final), D#11-7, regarding the scoping issues of electrical requirements in NFPA 99, Health Care Facilities Code, coordination of the electrical requirements is needed between the NEC and NFPA 99.

An excerpt from D#11-7 states: "The Council believes that the distinction between performance requirements and installation requirements is reasonably clear and the Council reiterates that "without deciding in advance what the Council would do regarding specific jurisdictional issues relating to this topic, the Council considers the guidance [from the previous task group] to be Useful". (See Standards Council Minute Item 10-3-21, March 2010). In this Decision, the Council has concluded that selective coordination (cascading outages) properly falls within the jurisdiction of NFPA 99. The NEC project should proceed, as part of its standards development activities, to harmonize the NEC with the relevant provisions of NFPA 99."

This proposal was balloted through the Technical Committee on Electrical Systems with the following results:

Submitter: Technical Committee on Electrical Systems,
Comment on Proposal No: 15-48
Recommendation: Revise text to read as follows:
517.26 Application of Other Articles. The life safety branch of the essential electrical system shall meet the requirements of Article 700, except as amended by Article 517, and NFPA 99 Chapter 6.
Informational Note No. 1: For additional information see ~~The provisions of~~ NFPA 110-2010, *Standard for Emergency and Standby Power Systems*~~, should be considered when designing and installing essential electrical power supply systems.~~
Informational Note No. 2: For additional information see 517.30 and NFPA 99, Chapter 6.
Substantiation: The action on proposal 15-48 should be accepted as it was prior to the ballot of the Panel. This a performance requirement, the technical merit of which has been reviewed by the ELS committee.
The additional change is intended to correlate with NFPA 99. NFPA 99 has accepted Article 700 by reference as a standard for installation. There will be specific amendments to Article 700 in chapter 6 of NFPA 99 that amend performance requirements. This change is necessary to provide consistency for the user between the documents and Articles.
This comment was balloted through the Technical Committee on Electrical Systems with the following results:

15-40 Log #1219 NEC-P15 **Final Action: Reject**
(517.26)

Submitter: Sheldon Monson, Wadena, MN
Comment on Proposal No: 15-48
Recommendation: The panel should continue to reject this proposal.
Substantiation: Everyone knows that the critical branch of the essential electrical system is the "life safety" branch for those patients and staff that cannot exit the building and take advantage of the life safety branch. Removing the critical branch from meeting the requirements of Article 700 would be a life-threatening mistake.
To do so would remove power for patient care - power for lighting for essential tasks, power to fixed equipment, selected receptacles, and special power circuits. These circuits and systems - essential circuits and systems for those who must stay in the building in the event of an emergency situation - would no longer be afforded the same protection as the circuits and systems relied on to get ambulatory patients and staff out of the building.
Separating the critical branch from the requirements of 700 would leave emergency rooms, intensive care, hemodialysis and coronary care units, postoperative recover rooms as well as angiographic, cardiac catheterization and human physiology labs without task illumination, selected receptacles and special power circuits.
Lost too would be the lighting, receptacles and fixed equipment in critical care areas that utilize anesthetizing gases, special environments with isolated power systems; lighting and selected receptacles in infant nurseries, nurses stations not afforded light by corridor luminaires, the nurse call systems, the blood, bone, and tissue banks. Also, not afforded protection would be the telephone and data (computer system) equipment rooms containing essential patient care records.
The submitter has not provided any evidence supporting for such a major change, especially since the generator sizing issue referred to in the substantiaion is not an issue at all, per the changes made to Section 517.30(D) in the 2011 NEC.

15-41 Log #1340 NEC-P15 **Final Action: Accept in Principle**
(517.26)

Submitter: James E. Degnan, Sparling
Comment on Proposal No: 15-48
Recommendation: I support the proposed change to the text.
Substantiation: I support the action of the majority of the panel members in requiring only the life safety branch to be associated with article 700. The goals of Article 700 and the critical branch in Article 517 are different. Article 700 is primarily focused on systems that create an environment for occupants to exit a building; the critical branch is focused on sustaining life within a hospital. Examples where Article 700 has language that adversely affects the Critical Branch include:
700.10 (B)(5)(a) which requires separate vertical sections for wiring from an emergency source(many hospitals have multiple critical branch feeders, switchboard lengths would be unruly)
700.15 only allows appliances and lamps required for emergency use on emergency circuits. The critical branch of a healthcare system includes receptacles. How can the code be complied with when anything can be plugged into a receptacle? (Note: many AHJs use this code provision to prevent the general connection of receptacles on the emergency system in buildings that are not healthcare facilities, the code can't have it both ways.)
700.16 The provision has a requirement for no single lamp failure to leave a space in total darkness. The critical branch serves numerous light circuits in patient rooms, corridors, and nurse stations. How would this apply to a patient bed when the patient is sleeping?
700.20 and 700.21 restricts lighting circuit switching to authorized personnel. If this applies to critical systems, every hospital in the country is in violation, as all patient rooms have lighting that can be switched by anyone.
700.27 Selective coordination can increase arc flash hazards which makes working on live critical branch systems more dangerous.
CMP 15 is urged to make this change.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on Comment 15-39, which addresses the submitter's concern.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
SAMPSON, M.: The design of an essential electrical system for a hospital has been significantly altered by the ELS committee of NFPA 99, and the panel was directed to incorporate the revisions.

15-42 Log #1404 NEC-P15 **Final Action: Reject**
(517.26)

Submitter: Timothy Crnko, St. Louis, MO
Comment on Proposal No: 15-48
Recommendation: Continue to reject Proposal 15-48.
Substantiation: Continue to reject this proposal and retain 2011 NEC 517.26 text.
The substantiation is inaccurate. NFPA 99 permits traditional loads supplied by NEC Article 700 to be supplied by the critical branch, too. 2012 NFPA 99:6.4.2.2.3.3 permits life safety alarm and alerting systems to be connected to either the life safety branch or the critical branch. In addition, 99:6.5.2.2.2.1 pertaining to Type 2 essential electrical systems permits numerous traditional "emergency" loads to be connected to the critical branch. The equipment branch can supply loads that may be vital for life safety, see 99:6.4.2.2.5.3.
"**6.4.2.2.3.3** Alarm and alerting systems (other than fire alarm systems) shall be connected to the life safety branch or critical branch."
NFPA 99 6.5.2.2.2.1 has the critical branch for an Essential Electrical System Type 2 permitted to serve same the loads as the life safety branch:
"**6.5.2.2.2.1** The life safety and **critical branches** shall supply power for lighting, receptacles, and equipment as follows:
(1) lllumination of means of egress in accordance with NFPA 101 A, *Guide on Alternative Approaches to Life Safety*
(2) Exit signs and exit directional signs in accordance with NFPA *101, Life Safety Code*
(3) Alarm and alerting systems, including the following:
(a) Fire alarms
(b) Alarms required for systems used for the piping of nonflammable medical gases as specified in Chapter 5
(4)* Communications systems, where used for issuing instructions during emergency conditions

(5) Sufficient lighting in dining and recreation areas to provide illumination to exit ways of a minimum of 5 ft-candles
(6) Task illumination and select receptacles at the generator set location
(7) Elevator cab lighting, control, communications, and signal systems"
The equipment branch supplies loads that may be vital for life safety, such as:
99: 6.4.2.2.5.3 (Type 1 essential electrical systems equipment branch requirement) "(4) Smoke control and stair pressurization systems" and "(6) Supply, return, and exhaust ventilating systems for the following: (a) Airborne infectious/isolation rooms, (b) Protective environment rooms, (c) Exhaust fans for laboratory fume hoods, (d) Nuclear medicine areas where radioactive material is used, (e) Ethylene oxide evacuation, (f) Anesthetic evacuation"
Panel Meeting Action: Reject

15-44 Log #1485 NEC-P15 **Final Action: Reject**
(517.26)

Submitter: Randy Hunter, Las Vegas, NV
Comment on Proposal No: 15-48
Recommendation: Reject the proposal.
Substantiation: The text for 517.26 in the 2011 and previous editions of the NEC involved the requirement of the essential electrical system, such as the life safety and the critical branch, to use Article 700, except as amended by Article 517. For the 2014 NEC, Proposal 15-48 was submitted by the NFPA 99 Technical Committee on Electrical Systems to revise 517.26 as follows: "Application of Other Articles. The life safety branch of the essential electrical system shall meet the requirements of Article 700, except as amended by Article 517." What the NFPA 99 Electrical Committee did not take into consideration is the existing text in 517.30(D) stating the following: "The sizing requirements in 700.4 and 701.4 shall not apply to hospital generator set(s)." Both the NFPA 99 Electrical Committee and CMP-15 may have overlooked NEC 517.30(D) as a solution to their concerns and negating any reason for deleting the critical branch from 517.26. Deleting the critical branch from compliance with Article 700 will also delete safety features covered by Article 700, such as 700.5 for transfer switches where the transfer switches are required to be electrically-operated and mechanically-held. Similar action should be made for Proposal 15-12 making changes to the definition of a "critical branch." Making the necessary changes in Article 517 for critical branch circuits at this point in the process would constitute new material and would not be permitted at the comment stage, however, rejecting the proposal would leave Article 700 as a requirement with a rewrite possible for the 2017 NEC.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comments 15-4 and 15-39.

(517.30 Figures 1 and 2)

Submitter: Ed Larsen, Schneider Electric USA
Comment on Proposal No: 15-51
Recommendation: Accept the proposal.
Substantiation: The Panel revised the figures to conform to the revised wording in the Code and NFPA 99, Health Care Facilities Code and deleted the brackets that have been in these figures for many editions. The Panel rejected the proposal to include dashed or similar lines for clarity.
Using these figures as a model, proposals were submitted to add similar figures in Articles 700, 701, 702 and 708 (ROP 13-91, 13-130, 13-141 and 13-156 respectively). These proposals, accepted in principle by CMP13, include brackets (see 13-91 example attached). Removing the brackets in Article 517 means that the goal of having like figures in five articles will not be achieved.
The whole idea of the proposal was to add the dashed lines to add clarity. The panel should have accepted the proposal. Partially adding dashed lines like CMP13 did would be acceptable.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The figures were changed in the ROP to conform to the revised wording in the Code and NFPA 99, *Health Care Facilities Code*. The panel reaffirms its position not to include dashed or similar lines as they do not add clarity.
Number Eligible to Vote: 14

Comment on Proposal No: 15-52
Recommendation: The Correlating Committee directs the panel to reconsider this proposal and determine whether the three Informational Notes following (4) are to remain or be removed.
The panel statement did not indicate this action.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Change the following text as shown in the 2014 NEC ROP Version:
(B) General.
(1) Separate Branches. Essential electrical systems for hospitals shall be comprised of three separate branches capable of supplying a limited amount of lighting and power service that is considered essential for life safety and effective hospital operation during the time the normal electrical service is interrupted for any reason. The branches are: life safety, critical, and equipment.
(2) Transfer Switches. The number of transfer switches to be used shall be based on reliability, design, and load considerations. Each branch of the essential electrical system shall have one or more transfer switches. One transfer switch and downstream distribution system shall be permitted to serve one or more branches in a facility with a maximum demand on the essential electrical system of 150 kVA.
Informational Note No. 1: See NFPA ~~99-2005, *Standard for Health Care Facilities:* 4.4.3.2~~ 99: 2012 Heath Care Facilities Code, 6.4.3.2 Transfer Switches; 6.4.2.1.5 ~~Transfer Switch Operation Type I~~ Automatic Transfer Switch Features; ~~4.4.2.1.4,~~ 6.4.2.1.5.15 Nonautomatic ~~Automatic~~ Transfer Switch Features; and ~~4.4.2.1.6,~~ 6.4.2.1.7 Nonautomatic Transfer Device Features.
Informational Note No. 2: See Informational Note Figure 517.30, No. 1.
Informational Note No. 3: See Informational Note Figure 517.30, No. 2.
(Informational Note Figure 517.30, No. 1 and Informational Note Figure 517.30, No. 2 are addressed in Comment 15-45.)
~~(5)~~ **(3) Optional Loads.** Loads served by the generating equipment not specifically named in Article 517 shall be served by their own transfer switches such that the following conditions apply:

(1) These loads shall not be transferred if the transfer will overload the generating equipment.
(2) These loads shall be automatically shed upon generating equipment overloading.
~~(6)~~ **(4) Contiguous Facilities.** Hospital power sources and alternate power sources shall be permitted to serve the essential electrical systems of contiguous or same site facilities. ~~[**99:**13.3.4.3]~~
Panel Statement: The panel accepted the Correlating Committee direction to reconsider the proposal. The panel made editorial corrections to correlate the text to NFPA 99, *Health Care Facilities Code*. Informational Note No. 1 was corrected to show the current referenced information in NFPA 99 and Informational Notes No 1, 2, and 3 are contextually accurate and are included to provide additional clarity and information for code users.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-47 Log #1406 NEC-P15 **Final Action: Reject**
(517.30(B)(1) and (4))

Submitter: Timothy Crnko, St. Louis, MO
Comment on Proposal No: 15-52
Recommendation: Revise text to read as follows:
(1) Separate Branches. Type 1 ~~E~~essential electrical systems ~~for hospitals~~ shall be comprised of three separate branches capable of supplying a limited amount of lighting and power service that is considered essential for life safety and effective ~~hospital~~ operation during the time the normal electrical service is interrupted for any reason. The branches are: life safety, critical, and equipment.
(4) Transfer Switches. The number of transfer switches to be used shall be based on reliability, design, and load considerations. Each branch of the Type 1 essential electrical system shall have one or more transfer switches. One transfer switch and downstream distribution system shall be permitted to serve one or more branches in a facility with a maximum demand on the essential electrical system of 150 kVA.
Modify the diagrams in 517.30 FPN No. 1 and 517.30 FPN No. 2 to correspond with this change.
Substantiation: The 2012 NFPA 99 no longer has occupancy-based essential electrical systems such as "hospital essential electrical system." The "essential electrical system" for a hospital could include the use of a Type 1, Type 2 and Type 3 essential electrical systems on the hospital premise. Therefore, the proposal is not appropriate. In different locations of a hospital a Type 1 essential electrical system could supply some loads and in another location a Type 2 essential electrical system could supply some loads. In addition, a doctor's office in an office complex could be required to have a Type 1 essential electrical system.
The 2012 NFPA 99 in 6.3.2.2.10 *Essential Electrical Systems* provides the requirements for the Type essential electrical system (Type 1,2, or 3) that must serve various types of patient care rooms which arc designated with a Category where appropriate.
The last two paragraphs from 2012 NFPA 99 Origins and Development of NFPA 99 on page 99-3 in part:
"The 201 2 edition went through a major overhaul. The premise of an occupancy-based document was modified to become a risk-based document.... The administration of health care continues to change. NFPA 99 has changed to reflect how health care is delivered.
The risk to the patient does not change for a given procedure. If the procedure is performed in a doctor's office versus a hospital, the risk remains the same.
Therefore, NFPA 99 eliminated the occupancy chapters and has gone to a risk-based approach. New Chapter 4 outlines the parameters for this approach. The Code now reflects the risk to the patient in defined categories of risk." The 2012 NFPA 99 Chapter 4 is the foundation for the change to a risked-based approach rather than an occupancy-based:
*"**4.1 * Building System Categories.** Building systems in health care facilities shall be designed to meet system Category 1 through Category 4 requirements as detailed in this code."*
4.1.1 to 4.1.3 details four different categories of facility systems that should be applied to Chapter 6 *Electrical Systems*. For instance, Category 1 systems are intended to supply loads where failure could result in *"major injury or death of patients or caregivers"*.
The 2012 NFPA 99 in Chapter 3 99:3.3.138 ties the patient care rooms to categories. Examples: critical care room would be Category 1, general care room would be Category 2, and basic care room would be Category 3.
The 2012 NFPA 99 has three types of essential electrical systems: Type 1, Type 2, and Type 3. NFPA 99 6.3.2.2.10 specifies which type of essential electrical system is required to serve various categories of rooms. Examples: *"critical care rooms (Category 1 Room) shall be served only by a Type 1 essential electrical system and "general care rooms (Category 2 Room) shall be served only by a Type for Type II"* essential electrical system. (Note the 2012 NFPA is inconsistent in its nomenclature in denoting Types: such as sometime it denotes Type 2 and sometime it denotes Type II.)
Other examples of where the type of essential electrical system is designated is 99:6.3.2.2.6.2: *"Receptacles for Patient Bed Locations in Critical Care Areas (Category I)"* means these receptacles need to be served by an essential electrical system Type 1 and *"Receptacles for Patient Bed Locations in General Care Areas (Category 2)"* means these receptacles need to be served by an, essential electrical system Type 2.
Panel Meeting Action: Reject
Panel Statement: The use of the term "Type 1" as described in NFPA 99, *Health Care Facilities Code*, is not necessary in the NEC and would be confusing to NEC users.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
KRUPA, G.: I disagree with the panel statement in that adding "Type 1" or at least cross-referencing such terms does not confuse readers, but improves our understanding. As a user of the NEC, one of my biggest complaints/concerns is the lack of coordination and consistency of terms between various codes.

15-48 Log #951 NEC-P15 **Final Action: Hold**
(517.30(C))

TCC Action: The Correlating Committee notes that Panel 15 has held Comment 15-48 and related Proposal 15-61 along with Comments 15-52, 15-53, 15-54, and related Proposal 15-62.
The Correlating Committee will appoint a task group as requested by Panel 15.
Submitter: Richard E. Loyd, Sun Lakes, AZ
Comment on Proposal No: 15-61
Recommendation: Reject the Proposal for insufficient substantiation.
Substantiation: The fact finding report file #E96627 dated January 10, 2012 presented to the committee at the Proposal meeting in Hilton Head, SC is incomplete and should not be considered as adequate substantiation to permit a new wiring method.
The sample testing was inconsistent:
The mechanical testing was only done on steel sheath and the fault current tests were only done on Aluminum sheath.
UL 1569 does not specify the thickness of the metal tape sheath presumably because Article 330 does not permit Type MC cable to be used for physical protection. However, this proposal asks for this new type MC cable product to provide mechanical protection equal to EMT. Therefore, the type material (Steel or Aluminum) and the thickness of the metal tape sheath tested must be known to evaluate its suitability for the purpose.
The fault current testing was only performed on Aluminum sheath. These tests should have been performed on both steel and aluminum and the thickness of the armor tape specified.
This proposed wiring method seems to be much heavier than standard Type MC Cable. Why were tension and pullout tests not included? Is additional securing and support needed in this application? It seems this should have been part of the evaluation when comparing it to EMT since circuits covered by 517.30(C) are often long vertical runs where this would be a factor. Article 330.30(D) allows supports to be omitted in some cases. Article 358 for EMT would require both the conductors and the tubing to be supported in a vertical runs per 358.30 and 300.19. This must be a part of the evaluation for physical damage suitability equality.
This proposed Type MC cable has not been considered by CMP-7 as appropriate to be included under Article 330 or if a new Article number should be assigned to by CMP-7 if it is accepted. CMP-7 is the committee responsible for cable wiring systems and provides expertise in cable wiring methods. This proposal should be submitted to that committee before being considered as an approved wiring method in Article 517.
Panel Meeting Action: Hold
Panel Statement: In accordance with 4.4.6.2.2(c) of the Regulations Governing Committee Projects, the panel holds Proposal 15-61 and Comment 15-48 as the subject has a great level of complexity and cannot be properly dealt with in the time frame required for processing the report. This proposal should be reassigned to CMP 7. CMP 15 suggests that a task group be created between CMP 7 and CMP 15 to adequately deal with this subject matter.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
TALKA, D.: This comment should have been acted on. The proposed wiring method has been under consideration for over 10 years. The comment adds no new information that wasn't considered in the past. Either the panel must either accept or reject the wiring method.

15-49 Log #211 NEC-P15 **Final Action: Accept**
(517.30(C)(3))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 15-62
Recommendation: The Correlating Committee directs that the panel reconsider this proposal with respect to the Correlating Committee Action on Proposals 15-19 and 15-20.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept
Revise text to read as follows:
(3) Mechanical protection of the ~~Emergency~~ Essential Electrical System. The wiring of the ~~emergency~~ life safety and critical branches shall be mechanically protected. Where installed as branch circuits in patient care ~~rooms~~ spaces ~~areas~~, the installation shall comply with the requirements ~~of~~ 517.13(A) and (B). The following wiring methods shall be permitted:
Panel Statement: The panel reconsiders its action and agrees with action taken on Proposal 15-19 and Proposal 15-20 to change to the word "space" instead of "room" or "area". An editorial change was made to correct the word "spaces" to "space".
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-50 Log #409 NEC-P15 **Final Action: Reject**
(517.30(C)(3))

Submitter: Russel LeBlanc, The Peterson School of Engineering
Comment on Proposal No: 15-55
Recommendation: This proposal should have been accepted.
Substantiation: The CMP was incorrect with the statement "The submitter's proposal does not add clarity or additional restrictions to the section". The addition of the word "only" places restrictions on which wiring methods are permitted. The present wording "permits" certain wiring methods but does not tell us which wiring methods we CAN'T use. I believe the INTENT of the present wording is to use "only" the wiring methods in 517.30(C)(3), but without the word "only", there are LITERALLY no restrictions on what OTHER wiring methods could be used too. The addition of the word "only" will help clarify the intent.
Panel Meeting Action: Reject
Panel Statement: The current text is intended to be permissive. The submitter's comment does not add clarity and would exclude acceptable wiring methods.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Abstain: 1
Explanation of Abstention:
KRUPA, G.: I disagreed with the panel statement, believing that the addition of "only" increases clarity of the statement. Moreover, not having "only" in the sentence made our discussions on 15-48 a moot point...there was no way to exclude the use of MC cable which we had just put on "Hold."

15-51 Log #1165 NEC-P15 **Final Action: Reject**
(517.30(C)(3))

Submitter: Michael J. Farrell III, IBEW LU #8, Toledo, OH
Comment on Proposal No: 15-57
Recommendation: Reconsider Panel Action of Reject of Proposal 15-57(log #1291).
Substantiation: Panel statement only addressed a part of the proposal as submitted. The panel statement uses the term "mechanical protection" that the NEC Style Manual discourages. The proposal as submitted uses terms and language recognized and encouraged by the NEC Style Manual. (See inserts included with Proposal 15-57 of NEC Style Manual 3.1.2 Permissive Rules and 3.2.5.5 Provisions on Protection Against Physical Damage)
The Panel statement is contrary to the NFPA's clear direction and guidance on language and terms to be used for formulating NEC text.
The first part of the proposal was that the proper term be used for the title by eliminating the improper text (legislative text strikeout) and using the recommended terms as recognized by the Style Manual in its place.
The second part of the proposal, not addressed in the panel statement is to eliminate the confusion created in the text by the use of language that is 'permissive' rather than mandatory in regards to the types of wiring methods allowed for the use of Protection Against Physical Damage for Emergency Systems.' (Mechanical Protection of Emergency Systems)
Another Proposal 15-55 (log114) recognized the same problem with another recommended solution.
The user in the installation world and designers are left to fight out what this requirement really says. The use of the permissive adds to the conflict and confusion. As both a AHJ and a installer I can speak on many problems created in the field by the use of language that does not convey the intent of any code requirement. Making the proposed change would go along way to providing a clearer text that complies with the NEC Style Manual and makes it clear that the list of wiring methods allowed to be used are limited.
Please reconsider the panel action taken and fully review the proposal as submitted with the NEC Style Manual in mind
Panel Meeting Action: Reject
Panel Statement: This comment points to a section of the Code that is a design element that is under the purview of NFPA 99 Electrical Systems committee. The panel suggests that proposals be sent to the NFPA 99 Electrical Systems committee. The current text in 517.30(C)(3) is intended to be permissive. The submitter's comment does not add clarity and would exclude acceptable wiring methods.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-52 Log #1271 NEC-P15 **Final Action: Hold**
(517.30(C)(3)(3))

Submitter: William A. Wolfe, Steel Tube Institute
Comment on Proposal No: 15-61
Recommendation: Delete the proposed new text
(3) Listed MC cable identified as providing crush, impact, and penetration circuit protection performance comparable to electrical metallic tubing.
Substantiation: This proposal should be rejected.
• The fact finding report file #E96627 dated January 10, 2012 presented to Code Panel 15 at the Proposal meeting in Hilton Head, SC is incomplete.
• The proposal 15-61 to add a new 517.30(C)(3)(3)and the fact finding report on Metal Clad Cable objectives page G1 clearly state and request the code be changed by adding "Listed MC cable identified as providing crush, impact, and penetration circuit protection performance equivalent to Electrical Metallic Tubing". Although a crush test and impact test specifically for cable is provided, there is nothing in the report that assesses penetration. The forces applied in the crush and impact tests for cable use flat plates with rounded edges.
Even if the proposed metal clad cable in this proposal might possibly have higher physical performance properties compared to currently listed Steel MC Cable, how can the report and more importantly the product be considered equivalent to Steel EMT in a critical care application, when no such evaluation was performed or presented in the supporting documentation.
• In addition, this report should not be considered as adequate substantiation to permit a new undeveloped wiring method as follows:
1. The report is insufficient to determine equal comparison of EMT sizes commonly used in the application of 517.30(C).
2. Only two samples of the smallest size EMT were inconsistently compared to two samples of the MC Cable.
a. Samples 1 steel interlocked armor containing 4 conductor XHHW TC cable with a 12 AWG bare aluminum conductor wrapped around the TC cable inside the steel armor.
b. Samples 1A aluminum interlocked armor containing 3 conductor XHHW TC cable with a 12 AWG bare aluminum conductor wrapped around the TC cable inside the aluminum armor.
c. Sample 2 trade size ½ EMT contained 12 THHN 14 AWG
d. Sample 3 trade size ½ EMT contained 4 THHN 14 AWG.
3. All tests were only performed on the steel interlocked armor except the vibration test where only the aluminum interlocked armor was tested. Why?
4. This proposed wiring method seems to be heavier than standard Type MC Cable. Why were tension and pullout tests in the cable standard not included? It seems this should have been part of the evaluation when comparing it to EMT since circuits covered by 517.30(C) are often long vertical runs where this would be a factor. Article 330.30(D) allows supports to be omitted in some cases. EMT would require both the conductors and the tubing to be supported in a vertical runs per 358.30 and 300.19. This must be a part of the evaluation for physical damage suitability equality..
• This proposed product has not been considered by CMP-7 as appropriate to be included under Article 330 or if a new Article number should be assigned to it when it has been accepted. CMP-7 is the committee responsible for cable wiring systems and provides expertise in these products. This product should be submitted to that committee before being considered as an approved wiring method in Article 517.
• In conclusion, the testing did not cover the full spectrum of the protective characteristics provided by EMT; the testing was limited to too small of sampling of products; and what testing was done either omitted some of the products or did not report the results for them. The Fact Finding report falls far short of the minimum expectations of a compelling rationale. There would be adequate time prior to the next cycle to correct the omissions, and expand the testing and number of products evaluated. As an example of what one might consider adequate testing is the voluminous data and testing performed on IMC (Intermediate Metal Conduit) before code panel 8 accepted it as an equivalent to rigid steel conduit and added a new article covering IMC.
Panel Meeting Action: Hold

15-53 Log #1353 NEC-P15 **Final Action: Hold**
(517.30(C)(3))

Submitter: Gary A. Beckstrand, Salt Lake City, UT
Comment on Proposal No: 15-62
Recommendation: Revise text to read as follows:
(3) Mechanical Protection of the Essential Electrical System. The wiring of the life safety and critical branches shall be mechanically protected by raceways. Where installed as branch circuits in patient care spaces the installation shall comply with requirements of

517.13(A) and (B). The following wiring methods shall be permitted: **[ROP 15–62]** <u>**[99:** 6.4.2.2.6.4]</u>

Substantiation: The panel should have taken action to Accept in Principle on ROP 15-62 and add text to coordinate NEC 517.30(C) with 2012 NFPA 99 Health Care Facilities Code section 6.4.2.2.6.4. If allowed to remain as shown in the *Draft of Proposed NFPA 70 2014 Edition of the National Electrical Code,* this action will create questions and confusion for code users due to omission of a vital installation directive in NFPA 99, that life safety and critical branch circuits shall be mechanically protected by raceways.

As submitted by the Technical Committee on Electrical Systems, shown as ROP 15-62 requiring mechanical protection of these circuits, the TC stated: "**Substantiation:** To Coordinate with NFPA 99. As a result of the August 10, 2011 Standards Council Decision (Final), D#11-7, regarding the scoping issues of electrical requirements in NFPA 99, Health Care Facilities Code, coordination of the electrical requirements is needed between the NEC and NFPA 99." This statement indicates it is the direction of the NFPA 99 TC that they wish to coordinate NFPA 99 and NFPA 70, Article 517. Acceptance of this proposal is in direct conflict with this directive.

The panel needs to provide coordination between the National Electrical Code 517.30(C)(3) and 2012 NFPA 99 Health Care Facilities Code, 6.4.2.2.6.4 which states, "Mechanical Protection of the Life Safety and Critical Branches. The wiring of the life safety and critical branches shall be mechanically protected by *raceways*, as defined in *NFPA 70*, *National Electrical Code*."

On ROP 15-62, Mr. Stephen Lipster's comment for a negative vote accurately describes the failure of the committee to respond to this issue. Mr. Lipster stated, "The NFPA 99 Electrical Systems Technical Committee did not follow the requirement of providing the exact extracted material from 2012 NPPA 99 6.4.2.2.6.4. As per the Standards Council decision, the coordination of the electrical requirements, material such as this are to be direct extractions from NFPA's health care documents. The 2012 NFPA 99 Health Care Standard 6.4.2.2.6.4. "Mechanical Protection of the Life Safety and Critical Branches. The wiring of the life safety and critical branches shall be mechanically protected by raceways..." The language of the proposal should clearly coordinate with NFPA 99 with extracted material as directed in the NEC Style Manual, 4.3.1 through 4.3.3.

Panel Meeting Action: Hold

Panel Statement: This is new material and should be held to allow for public input.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

TALKA, D.: See explanation of vote for Comment 15-48.

15-54 Log #1354 NEC-P15 **Final Action: Hold**
(517.30(C)(3)(3))

Submitter: Gary A. Beckstrand, Salt Lake City, UT

Comment on Proposal No: 15-61

Recommendation: Reject proposal and return to the 2011 NEC language. Also see related comment on 15-62.

~~(3) Listed MC cable identified as providing crush, impact and penetration circuit protection performance comparable to electrical metallic tubing.~~ **[ROP 15–61]**

<u>(3) Listed flexible metal raceways and listed metal sheathed cable assemblies in any of the following:</u>

<u>a. Where used in listed prefabricated medical headwalls</u>

<u>b. In listed office furnishings</u>

<u>c. Where fished into existing walls or ceilings, not otherwise accessible and not subject to physical damage</u>

<u>d. Where necessary for flexible connection to equipment</u>

Substantiation: The panel should reject this proposal. If allowed to remain as shown in the *Draft of Proposed NFPA 70 2014 Edition of the National Electrical Code* this action will create a direct conflict between the National Electrical Code 517.30(C)(3)(3) and 2012 NFPA 99 Health Care Facilities Code, 6.4.2.2.6.4 which states, "Mechanical Protection of the Life Safety and Critical Branches. The wiring of the life safety and critical branches shall be mechanically protected by *raceways*, as defined in *NFPA 70*, *National Electrical Code*."

A similar proposal by the Technical Committee on Electrical systems, ROP 15-62 requiring mechanical protection of these circuits, the TC stated "**Substantiation:** To Coordinate with NFPA 99. As a result of the August 10, 2011 Standards Council Decision (Final), D#11-7, regarding the scoping issues of electrical requirements in NFPA 99, Health Care Facilities Code, coordination of the electrical requirements is needed between the NEC and NFPA 99." This statement indicates it is the direction of the NFPA 99 TC that they wish to coordinate NFPA 99 and NFPA 70, Article 517. Acceptance of this proposal is in direct conflict with this directive.

On ROP 15-62, Mr. Stephen Lipster's comment for a negative vote accurately describes the failure of the committee to respond to this issue. Mr. Lipster stated, "The NFPA 99 Electrical Systems Technical Committee did not follow the requirement of providing the exact extracted material from 2012 NPPA 99 6.4.2.2.6.4. As per the Standards Council decision, the coordination of the electrical requirements, material such as this are to be direct extractions from NFPA's health care documents. The 2012 NFPA 99 Health Care Standard 6.4.2.2.6.4. "Mechanical Protection of the Life Safety and Critical Branches. The wiring of the life safety and critical branches shall be mechanically protected by raceways..." The language of the proposal should clearly coordinate with NFPA 99.

Also it should be noted that the MC mentioned in the proposal is not available and its practical use cannot be ascertained though a fact finding report. It should be noted that the introduction of this report at the ROP meeting violated the regulations governing committee projects by not being submitted in a timely manner with the proposal.

The panel should reverse its action on this proposal and return to the 2011 NEC language to avoid conflicts between the Codes and confusion for code users.

Panel Meeting Action: Hold

Panel Statement: See the panel action and statement on Comment 15-48. For correlation of all comments and associated proposals concerning this issue the correlating committee should monitor the actions on Comment 15-48.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

15-55 Log #1402 NEC-P15 **Final Action: Reject**
(517.30(C)(3))

Submitter: Timothy Crnko, St. Louis, MO

Comment on Proposal No: 15-62

Recommendation: Revise text to read as follows:

(3) Mechanical Protection of the <u>Type 1</u> Essential Electrical System.

The wiring of the life safety and critical branches shall be mechanically protected. Where installed as branch circuits in patient care spaces, the installation shall comply with the requirements of 517.13(A) and (B). The following wiring methods shall be permitted:

Substantiation: The 2012 NFPA 99 requires the life safety and critical branches to be separate from other wiring for only Type 1 essential electrical systems in 99:6.4.2.2.6.1. Type 2 essential electrical systems are required in 99:6.5.2.2.4.1 to have the life safety and equipment branches independent of all other wiring. If one were to conclude that 517.40 should be titled Type 2 Essential Electrical System, then 517.40(B) is no longer valid to require complying with 517.30(C)(3). The 2012 NFPA 99 has no requirement for the life safety branch to be separate from other wiring for Type 3 essential electrical systems; refer to 99:6.5. If one were to conclude that 517.45, should be titled Type 2 Essential Electrical Systems, then 517.45 (B) is no longer valid to require complying with 517.30(C)(3).

It is important to point out that the 2012 NFPA 99 no longer has occupancy-based essential electrical systems such as "Essential Electrical System for Hospitals": title for 517.30. The "essential electrical system" for a hospital could include the use of a Type I, Type 2 and Type 3 essential electrical systems on the hospital premise.

Therefore, proposal p15-62 is not appropriate without the Type of essential electrical system. In different locations of a hospital a Type I essential electrical system could supply some loads and in another location a Type 2 essential electrical system could supply some loads. In addition, a doctor's office in an office complex could be required to have a Type 1 essential electrical system.

The 2012 NFPA 99 in 6.3.2.2.10 *Essential Electrical Systems* provides the requirements for the Type essential electrical system (Type 1,2, or 3) that must serve various types of patient care rooms which are designated with a Category where appropriate.

The last two paragraphs from 2012 NFPA 99 *Origins and Development of NFPA 99* on page 99-3 in part:

"The 2012 edition went through a major overhaul. The premise of an occupancy-based document was modified to become a risk-based document... The administration of health care continues to change. NFPA 99 has changed to reflect how health care is delivered.

The risk to the patient does not change for a given procedure. If the procedure is performed in a doctor's office versus a hospital, the risk remains the same.

Therefore, NFPA 99 eliminated the occupancy chapters and has gone to a risk-based approach. New Chapter 4 outlines the parameters for this approach. The Code now reflects the risk to the patient in defined categories of risk." The 20 12 NFPA 99 Chapter 4 is the foundation for the change to a risked-based approach rather than an occupancy-based:

"**4.1*** ***Building System Categories.*** *Building systems in health care facilities shall be designed to meet system Category I through Category 4 requirements as detailed in this code."*

4.1.1 to 4.1.3 details four different categories of facility systems that should be applied to Chapter 6 *Electrical Systems*. For instance, Category 1 systems are intended to supply loads where failure could result in *"major injury or death of patients or caregivers"*.

The 2012 NFPA 99 in Chapter 3 99:3.3.138 ties the patient care rooms to categories. Examples: critical care room would be Category I, general care room would be Category 2, and basic care room would be Category 3.

The 2012 NFPA 99 has three types of essential electrical systems: Type 1, Type 2, and Type 3. NFPA 99 6.3.2.2.10 specifies which type of essential electrical system is required to serve various categories of rooms. Examples: *"critical care rooms (Category I Room) shall be served only by a Type 1"* essential electrical system and *"general care rooms (Category 2 Room) shall be served only by a Type for Type II"* essential electrical system. (Note the

2012 NFPA is inconsistent in its nomenclature in denoting Types: such as sometime it denotes Type 2 and sometime it denotes Type II.)

Other examples of where the type of essential electrical system is designated is 99:6.3.2.2.6.2: *"Receptacles for Patient Bed Locations in Critical Care Areas (Category I)"* means these receptacles need to be served by an essential electrical system Type 1 and *"Receptacles for Patient Bed Locations in General Care Areas (Category 2)"* means these receptacles need to be served by an essential electrical system Type 2.

Panel Meeting Action: Reject

Panel Statement: The use of the term "Type 1" as described in NFPA 99, *Health Care Facilities Code*, is not necessary in the NEC and would be confusing to NEC users.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

15-55a Log #1610 NEC-P15 **Final Action: Hold**
(517.30(C)(3).3)

Submitter: Phil Simmons, National Armored Cable Manufacturers Assoc.

Comment on Proposal No: 15-59

Recommendation: Accept the proposal to add a new 517.30(c)(3)(3):
(3) Listed metal sheathed cable assemblies installed where not subject to physical damage or protected in accordance with 300.4.

Substantiation: The panel statement expresses a preference for a new construction of Type MC cable that meets selected performance requirements of EMT. In doing so the panel is not stating a preference for a wiring method that cannot be damaged. All wiring methods can be damaged if installed in inappropriate locations. Type MC cable offers a comparable level of protection to that provided by EMT in ordinary locations and the environment of hospital construction and operation.

There is no need for a special construction of MC where used in normal construction as indicated in the original substantiation for the proposal. A higher level of performance for the cable where exposed to severe physical damage may be appropriate but is not necessary where installed in ordinary locations such as in floors, walls, and ceilings. The requirements in 300.4 provide protection against normal physical damage during construction and operation in general locations.

Panel Meeting Action: Hold

Panel Statement: In accordance with 4.4.6.2.2(c) of the Regulations Governing Committee Projects, the panel holds Comment 15-55a as the subject has a great level of complexity and cannot be properly dealt with in the time frame required for processing the report. This proposal should be reassigned to CMP 7. CMP 15 suggests that a task group be created between CMP 7 and CMP 15 to adequately deal with this subject matter.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 1

Ballot Not Returned: 1 Shelly, B.

Explanation of Negative:

Talka, D.: This comment should have been acted on. The proposed wiring method has been under consideration for over 10 years. The comment adds no new information that wasn't considered in the past. The panel must either accept or reject the wiring method.

15-56 Log #1585 NEC-P15 **Final Action: Accept**
(517.30(D))

Submitter: James F. Williams, Fairmont, WV

Comment on Proposal No: 15-63

Recommendation: Revise text to read as follows:

517.30 Essential Electrical Systems for Hospitals.

(D) Capacity of Systems. The essential electrical system shall have the capacity and rating to meet the maximum actual demand likely to be produced by the connected load ~~of the essential electrical system~~.

Feeders shall be sized in accordance with 215.2 and Part III of Article 220. The generator set(s) shall have the capacity and rating to meet the demand produced by the load ~~of the essential electrical system~~ at any given time.

Substantiation: Repeating essential electrical system adds nothing to the understanding of this section.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

15-57 Log #368 NEC-P15 **Final Action: Accept**
(517.30(E))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Comment on Proposal No: 15-64

Recommendation: NEMA supports CMP15's Panel Action to Accept Proposal 15-64 adding the proposed new text.

Substantiation: Electrical contractors involved in hospital renovations have reported to NEMA members that prior maintenance replacements of cover plates and receptacles on circuits intended for nonessential electrical loads have used red cover plates or receptacles, the "distinctive color" intended in those health care facilities for essential electrical system circuits.

Under the very conditions that warrant the existence of essential electrical systems, however, there is no definitive confirmation as to which receptacles are in fact successfully being supplied power. An illuminated outlet face or a lighted indicator on the receptacle outlet inherently provides the most apparent visual indication and requires no training of visiting medical personnel working under those conditions activating the essential electrical system as to what is "readily identifiable", particularly where the cited inconsistent maintenance replacements have occurred.

Furthermore, as expressed in Mr. Friedman's affirmative ballot comment on Proposal 15-64, the Panel Actions for Proposals 15-35, 15-36, 15-39 and 15-41 increase the minimum numbers of receptacle outlets required. Rapid visual confirmation of which receptacle outlets are still energized when normal electrical service is interrupted may be essential to avoid incorrect connection into unpowered receptacle outlets of portable cord-and-plug-connected medical equipment and instrumentation during emergency conditions.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 11 Negative: 3

Explanation of Negative:

DUNCAN, J.: The Panel should have rejected this proposal and referred the submitter to NFPA 99 as this is a performance issue.

ERICKSON, D.: With the reliability, frequent testing, and regulatory oversight of emergency systems in healthcare facilities there is no need to require an indicator light on every receptacle. Alarms or battery backup or both are provided to indicate/accommodate a loss of power on vital life support equipment. There was no technical data provided to indicate that there is a widespread problem with poor patient outcomes that could have been averted with the presence of an indicator light. This change would not improve current conditions. If anything, this change could add additional risk to the patient. If the indicator light is faulty, staff may unnecessarily disconnect vital equipment from the emergency system and connect it to non-emergency system receptacles, posing additional risks.

NASH, JR., H.: With the reliability, frequent testing, and regulatory oversight of emergency systems in healthcare facilities there is no need to require an indicator light on every receptacle. Alarms or battery backup or both are provided to indicate/accommodate a loss of power on vital life support equipment. There was substantiation provided to indicate that there is a problem with poor patient outcomes that could have been averted with the presence of an indicator light. This change would not reduce risk and would cause hospital to incur unnecessary cost. Additionally, this is performance issue which should be addressed by NFPA 99.

15-58 Log #438 NEC-P15 **Final Action: Accept in Principle**
(517.30(F))

Submitter: Neil F. LaBrake, Jr., National Grid USA

Comment on Proposal No: 15-66

Recommendation: Accept in principle in part to eliminate Exception 2 and delete the term "selective" from "selective coordination" in the title and delete the word "selectively" from "selectively coordinated" in the first sentence of the proposed new section. This proposal should read in legislative text as:

(F) ~~Selective~~ Coordination. Overcurrent protective devices serving the essential electrical system shall be selectively coordinated for the period of time that a fault's duration extends beyond 0.1 second.

Exception No. 1: Between transformer primary and secondary overcurrent protective devices, where only one overcurrent protective device or set of overcurrent protective devices exists on the transformer secondary.

~~*Exception No. 2: Isolated power systems inherently comply with this selective coordination requirement.*~~

Exception No. 2~~3~~: Between overcurrent protective devices of the same size (ampere rating) in series.

Substantiation: This comment is the work of the Task Group on 2014 NEC/2012 NFPA 99 Correlation with the following representation: Larry Todd, CMP-15; Don Talka, CMP-15; Jim Duncan, CMP-15; Sam Friedman, CMP-15; Walt Vernon, NFPA 99; Dave Dagenais, NFPA 99; James Costley, NFPA 99; Chad Beebe, NFPA 99; Jim Dollard, NEC Correlating Committee; and Neil LaBrake, Jr., NEC Correlating Committee (Chair). As directed by Mr. Michael J. Johnston, NEC Correlating Committee Chair on June 8th, 2012, the Task Group acted on correlation matters and conformance with the Standard Council direction on "Installation vs. Performance" to resolve any conflicts or inconsistencies resulting from proposed revisions in the A2013NEC Report on Proposals (ROP) related to the 2012 NFPA 99. However, this Task Group did not make a determination on any proposal with respect to "installation vs. performance" except on Proposal 15-66 regarding the Standards Council direction on the term "selective coordination".

Exception 2 does not appear in NFPA 99-2012. The term "selective coordination" is a defined term in Article 100 and used in several articles in the NEC. This term is under the NEC Committee's purview. Also, the term "selectively coordinated" needs to be changed under this same concern. The NFPA 99 term used in performance requirements of protective coordination needs to be changed to remove any conflict with the NEC defined term "Coordination (Selective)".

Panel Meeting Action: Accept in Principle

Revise the text to read as follows:

(F) ~~Selective~~ Coordination. Overcurrent protective devices serving the essential electrical system shall be ~~selectively~~ coordinated for the period of time that a fault's duration extends beyond 0.1 second.

Exception No. 1: Between transformer primary and secondary overcurrent protective devices, where only one overcurrent protective device or set of overcurrent protective devices exists on the transformer secondary.

~~*Exception No. 2: Isolated power systems inherently comply with this selective coordination requirement.*~~

Exception No. 2~~3~~: Between overcurrent protective devices of the same size (ampere rating) in series.

Informational Note: The terms "Coordination" and "Coordinated" as used in this section do not cover the full range of overcurrent conditions.

Panel Statement: The word "selectively" is removed in the first sentence to make the wording of the section consistent with the removal of the word "selective". An informational note was added to clarify the meaning of the terms "Coordination" and "Coordinated".

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

KRUPA, G.: While I agree-in-principle, I have serious reservations about the changed definition of "Selective Coordination" made by a different committee; this change has serious implications, especially for design engineers trying to balance competing requirements of Art 517 with NFPA 99.

Comment on Affirmative:

SAMPSON, M.: Claiming jurisdiction of overcurrent coordination as a design issue, the ELS committee of NFPA 99 is systematically diminishing the effectiveness of the essential electrical system by limiting the coordination to overload conditions only.

The ELS committee would have us believe that fully coordinated distribution systems - where continuity of power is critical - are effective for elevators, fire pumps and critical operation power systems, but oddly, will not work in a hospital.

A properly designed selectively coordinated overcurrent protection arrangement that localizes any overcurrent condition - short circuits and overloads - to the conductors or equipment in which the overload or fault condition occurs is a critical safety element that will be lost by this provision.

15-59 Log #572 NEC-P15 **Final Action: Reject**
(517.30(F) (New))

Note: When the ballot result does not confirm the TC action on a Proposal by a two-thirds affirmative vote, the Report on Proposals shall be published with a specific request for public comment on that Proposal. The Proposal is now being reconsidered by the TC as a public comment.

Submitter: Technical Committee on Electrical Systems,

Comment on Proposal No: 15-66

Recommendation: Add new text to read as follows:

(F) Selective Coordination. Overcurrent protective devices serving the essential electrical system shall be selectively coordinated for the period of time that a fault's duration extends beyond 0.1 second.

Exception No. 1: Between transformer primary and secondary overcurrent protective devices, where only one overcurrent protective device or set of overcurrent protective devices exists on the transformer secondary.

Exception No. 2: Isolated power systems inherently comply with this selective coordination requirement.

Exception No. 3: Between overcurrent protective devices of the same size (ampere rating) in series.

Substantiation: To Coordinate with NFPA 99, 6.4.2.1.2. As a result of the August 10, 2011 Standards Council Decision (Final), D#11-7, regarding the scoping issues of electrical requirements in NFPA 99, Health Care Facilities Code, coordination of the electrical requirements is needed between the NEC and NFPA 99.

An excerpt from D#11-7 states: "The Council believes that the distinction between performance requirements and installation requirements is reasonably clear and the Council reiterates that "without deciding in advance what the Council would do regarding specific jurisdictional issues relating to this topic, the Council considers the guidance [from the previous task group] to be Useful". (See Standards Council Minute Item 10-3-21, March 2010). In this Decision, the Council has concluded that selective coordination (cascading outages) properly falls within the jurisdiction of NFPA 99. The NEC project should proceed, as part of its standards development activities, to harmonize the NEC with the relevant provisions of NFPA 99."

This proposal was balloted through the Technical Committee on Electrical Systems with the following results:

15-60 Log #1002 NEC-P15 **Final Action: Reject**
(517.30(F) (New))

Submitter: David Clements, International Association of Electrical Inspectors

Comment on Proposal No: 15-66

Recommendation: Continue to reject this proposal.

Substantiation: Proposal 15-66 was shown as a reject because it received less than a $^2/_3$ affirmative vote. The panel should continue to reject this proposal because it would create a very significant conflict with the definition of "coordination, selective" in Article 100. As written in Article 100 "Coordination, Selective" is a black or white definition. An electrical system is either selectively coordinated or it is not. There is no "in between". The proposal would add confusion to the NEC because selective coordination, as defined in Article 100 is for the full range of overcurrent conditions, not just for overloads that would take 0.1 seconds or longer to open overcurrent protective devices, as the proposal would allow.

Panel Meeting Action: Reject

Recommendation: Revise text to read as follows:
(F) ~~Selective Coordination~~ <u>Cascading of Overcurrent Protective Devices.</u>
Overcurrent protective devices serving the essential electrical system shall <u>not cascade</u> ~~be selectively coordinated~~ for the period of time that a fault's duration extends beyond 0.1 second.
Exception No. 1: (no change)
~~*Exception No. 2: Isolated power systems inherently comply with this selective coordination requirement.*~~
Exception No. ~~3~~<u>2</u>*:* (no change)
Substantiation: As proposed, there would be a conflict with the definition of "coordination, selective" in Article 100. By changing to "cascading" rather than "selective coordination", the conflict can be avoided. Exception No.2 is deleted because it does not appear in the latest edition of NFPA 99. In addition, the statement that "Isolated power systems inherently comply with this selective coordination requirement" is not technically correct and has no technical substantiation.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on Comment 15-58.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
KRUPA, G.: While I agree-in-principle, I have serious reservations about the changed definition of "Selective Coordination" made by a different committee; this change has serious implications, especially for design engineers trying to balance competing requirements of Art 517 with NFPA 99. The term "Cascading" would further confuse a situation that needs to be coordinated and corrected between competing codes.

15-66 Log #1401 NEC-P15 **Final Action: Reject**
(517.31)

Submitter: Timothy Crnko, St. Louis, MO
Comment on Proposal No: 15-68
Recommendation: Original Proposal 15-68 must be rejected. NFPA 99 has three different essential electrical systems (Type 1, Type 2, and Type 3) that are applied based on the risk to patients and caregivers at specific "locations" within a healthcare facility (risk-based). Article 517 through the proposal stage has three essential electrical systems that are applied based on occupancy type (occupancy-based). There is no suitable correlation between these two different approaches.
The proposed text of Proposal 15-68 conflicts with NFPA 99:6.4.3.1 which applies to Type I essential electrical systems, correlates to the second paragraph of Proposal 15-68.
However, 99:6.5.3.1 which applies to Type 2 essential electrical systems does not correlate to the second paragraph of Proposal 15-68 and does not correlate with 517.42.
99:6.5.3.1 "*Source.* *The life safety and* ***equipment branches*** *shall be installed and connected to the alternate source of power specified in 6.4.1.1.4 and 6.4.1.1.5 so that all functions specified herein for the life safety and equipment branches are automatically restored to operation* ***within 10 seconds*** *after interruption of the normal source."* (Applies to Type 2 essential electrical systems) Note 99:6.5.3.1 applies to the equipment branch where Proposal 15-68 does not include this branch.
In addition 99:6.6.3.1.2, which applies to Type 3 essential electrical systems, does not correlate to the second paragraph of P15-68.
99:6.6.3.1.2 *"The life safety branch shall be so arranged that, in the event of failure of the normal power source, the alternate source of power shall be automatically connected to the load within 10 seconds."* (Applies to Type 3 essential electrical systems) (A TIA removed critical branch from this requirement.)
Substantiation: It is important to point out that the 2012 NFPA 99 no longer has occupancy-based essential electrical systems such as "hospital essential electrical system." In NFPA 99 the "essential electrical system" for a hospital could include the use of a Type I, Type 2 and Type 3 essential electrical systems on the hospital premise, Therefore, the proposal is not appropriate. In different locations of a hospital a Type I essential electrical system could supply some loads and in another location a Type 2 essential electrical system could supply some loads, In addition, a doctor's office in an office complex could be required to have a Type 1 essential electrical system.
The 2012 NFPA 99 in 6.3.2.2.10 *Essential Electrical Systems* provides the requirements for the Type essential electrical system (Type 1,2, or 3) that must serve various types of patient care rooms which are designated with a Category where appropriate.
The last two paragraphs from 2012 NFPA 99 *Origins and Development of NFPA 99* on page 99-3 in part:
"The 2012 edition went through a major overhaul. The premise of an occupancy-based document was modified to become a risk-based document... The administration of health care continues to change. NFPA 99 has changed to reflect how health care is delivered. The risk to the patient does not change for a given procedure. If the procedure is performed in a doctor's office versus a hospital, the risk remains the same.
Therefore, NFPA 99 eliminated the occupancy chapters and has gone to a risk-based approach. New Chapter 4 outlines the parameters/or this approach. The Code now reflects the risk to the patient in defined categories of risk." The 2012 NFPA 99 Chapter 4 is the foundation for the change to a risk-based approach rather than an occupancy-based:
"4.1 **** Building System Categories****. Building systems in health care facilities shall be designed to meet system Category I through Category 4 requirements as detailed in this code."*
4.1.1 to 4.1.3 details four different categories of facility systems that should be applied to Chapter 6 *Electrical Systems*, For instance, Category 1 systems are intended to supply loads where failure could result in *"major injury or death o/patients or caregivers"*.
The 2012 NFPA 99 in Chapter 3 99:3.3.138 tics the patient care rooms to categories. Examples: critical care room would be Category I, general care room would be Category 2, and basic care room would be Category 3.
The 2012 NFPA 99 has three types of essential electrical systems: Type 1, Type 2, and Type 3. NFPA 99 6.3.2.2.10 specifies which type of essential electrical system is required to serve various categories of rooms. Examples: *"critical care rooms (Category I Room) shall be served only by a Type I'* essential electrical system and *"general care rooms (Category 2 Room) shall be served only by a Type 1 or Type II"* essential electrical system. (Note the 2012 NFPA is inconsistent in its nomenclature in denoting Types: such as sometime it denotes Type 2 and sometime it denotes Type II.)
Other examples of where the type of essential electrical system is designated is 99:6.3.2.2.6.2: *"Receptacles for Patient Bed Locations in Critical Care Areas (Category 1)"* means these receptacles need to be served by an essential electrical system Type 1 and *"Receptacles for Patient Bed Locations in General Care Areas (Category 2)"* means these receptacles need to be served by an essential electrical system Type 2.
Panel Meeting Action: Reject

Panel Statement: This comment points to a section of the Code that is a design element that is under the purview of NFPA 99 Electrical Systems committee. The panel suggests that proposals be sent to the NFPA 99 Electrical Systems committee.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-67 Log #919 NEC-P15 **Final Action: Reject**
(517.32(F))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 15-70
Recommendation: Revise text to read as follows:
517.32 Life Safety Branch.
(F) Generator Set Accessories. Generator set accessories as required for generator performance. Loads dedicated to a specific generator, including the fuel transfer pump(s), ventilation fans, electrically operated louvers, controls, cooling system, and other generator accessories essential for generator operation, shall be connected to the life safety branch or to the output terminals of the generator with over-current protective devices <u>directly or through a transformer</u>.
Substantiation: In the case where the generator output voltage is not compatible with the listed loads is it acceptable for the load to be supplied from a transformer fed from the generator output leads?
Panel Meeting Action: Reject
Panel Statement: The suggested wording does not add clarity.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-68 Log #1341 NEC-P15 **Final Action: Reject**
(517.33)

Submitter: James E. Degnan, Sparling
Comment on Proposal No: 15-71
Recommendation: None given.
Substantiation: Assuming that proposal 15-52 (517.30) and 15-48(517.26) are accepted, the panel should reject this proposal and refer the submitter to the panel action on the previous referenced proposals, which meet the submitters intent. By removing the critical branch from what was the “emergency system” this language is no longer necessary.
Panel Meeting Action: Reject
Panel Statement: The submitter failed to make a recommendation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-68a Log #CC1501 NEC-P15 **Final Action: Accept**
(517.33(B))

Submitter: Code-Making Panel 15,
Comment on Proposal No: 15-71
Recommendation: Reject Proposal 15-71.
Substantiation: Based on the action taken on Proposals 15-52 and 15-48, the added language in 517.33(B) is no longer required because Article 700 no longer applies to the Critical Branch. Therefore, switching of task illumination is permitted.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-69 Log #1143 NEC-P15 **Final Action: Reject**
(517.34(C))

Submitter: Stephen McCluer, Schneider Electric
Comment on Proposal No: 15-76
Recommendation: Add new text to read as follows:
Delete all text revisions from proposal 15-76 that were in paragraph 517.34 and put the following text in a new 517.33(C)
517.33 Critical Branch
(A) (no change)
(B) (no change)
<u>**(C) 517.33(C) Bridging system.** A bridging system shall be provided where uninterrupted power is necessary for patient care on the critical power branch per 517.33(A).</u>
<u>*Informational Note 1: A bridging system is intended to temporarily support the critical load with stored energy until an alternate energy source can assume the load. Uninterrupted power for the ride-through tolerance of the power supplies used in most electronic equipment is less than two cycles. Reboot of critical equipment can take minutes or even hours to recover. Equipment with built-in reserve power, such as battery backup, would satisfy this requirement.*</u>
<u>*Informational Note 2: NFPA 111-2010, Standard on Stored Electrical Energy Emergency and Standby Power Systems, defines “bridging system”, provides guidance for use of bridging systems, and provides figures for placement of a bridging system in an emergency power system architecture when energy storage is not already built into the critical equipment.*</u>
Substantiation: This comment would have the effect of “accept Proposal15-76 in principle”; it relocates the concept from under 517.34(C) (Equipment System Connection to Alternate Power Source / AC Equipment for Nondelayed Automatic Connection) to a new subparagraph (C) under 517.33 for “critical branches.”
The Panel rejected the original proposal on the basis that energy storage is always an option and can generally be provided as onboard backup systems by the critical load equipment manufacturers. While “generally” this is true, it is not mandatory. Proposal 15-76 and this comment would make it mandatory for equipment that is defined as “critical”. Such equipment is enumerated in 517.33(A), which states,
“The critical branch of an emergency system shall supply power for... fixed equipment... and special power circuits serving the following <nine> areas and functions related to patient care.”
The types of circuits and equipment that could be designated as “critical” to patient care are identified by reference to 517.33(A), so Informational Note #2 in the original proposal 15-76 is no longer needed.
New Informational Note #1 is added to briefly explain the function of a “bridging system.” It also points out that the stored energy in most equipment power supplies is only sufficient for a few milliseconds of interruption; restarting of equipment following an interruption can take time measured in minutes or hours compared to the 8 seconds it takes for a generator to start. The informational note addresses the panel’s observation that some equipment might have built-in backup. When that is provided it would meet the intent of this section.
New Informational Note #2 is added to address those applications where onboard power backup is not available. Informational Note #2 is mostly carried over from the original proposal. It points the reader to NFPA 111 where the necessity for stored electrical energy in emergency systems is delineated and where solutions external to the critical care equipment can be provided.
With the increasing use of electronics and electronic controls found connected to patient care areas, and in particular on the critical branch, a 10 second interruption can be completely unacceptable for patient care. Technology exists to “bridge” the concern on this momentary power loss risk by requiring the system to be evaluated and a “bridge” provided where it is deemed necessary to mitigate such risk.
Panel Meeting Action: Reject
Panel Statement: The NEC does not currently prohibit these installations. The equipment found in these areas generally have onboard power backup systems, rendering the recommendation in this proposal redundant.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-70 Log #369 NEC-P15 **Final Action: Accept**
(517.41(E))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 15-80
Recommendation: NEMA supports CMP15’s Panel Action to Accept Proposal 15-80 adding the proposed new text.
Substantiation: Electrical contractors involved in hospital renovations have reported to NEMA members that prior maintenance replacements of cover plates and receptacles on circuits intended for <u>non</u>essential electrical loads have used red cover plates or receptacles, the “distinctive color” intended in those health care facilities for essential electrical system circuits.
Under the very conditions that warrant the existence of essential electrical systems, however, there is no definitive confirmation as to which receptacles are in fact successfully being supplied power. An illuminated outlet face or a lighted indicator on the receptacle outlet inherently provides the most apparent visual indication and requires no training of visiting medical personnel working under those conditions activating the essential electrical system as to what is “readily identifiable”, particularly where the cited inconsistent maintenance replacements have occurred.
Furthermore, as expressed in Mr. Friedman’s affirmative ballot comment on Proposal 15-80, the Panel Actions for Proposals 15-35, 15-36, and 15-39 increase the minimum numbers of receptacle outlets required. Rapid visual confirmation of which receptacle outlets are still energized when normal electrical service is interrupted may be essential to avoid incorrect connection into unpowered receptacle outlets of portable cord-and-plug-connected medical equipment and instrumentation during emergency conditions.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 3
Explanation of Negative:
DUNCAN, J.: The Panel should have rejected this proposal and referred the submitter to NFPA 99 as this is a performance issue.
ERICKSON, D.: With the reliability, frequent testing, and regulatory oversight of
emergency systems in healthcare facilities there is no need to require an indicator light on every receptacle. Alarms or battery backup or both are provided to indicate / accommodate a loss of power on vital life support equipment. There was no technical data provided to indicate that there is a widespread problem with poor patient outcomes that could have been averted with the presence of an indicator light. This change would not improve current conditions. If anything, this change could add additional risk to the patient. If

the indicator light is faulty, staff may unnecessarily disconnect vital equipment from the emergency system and connect it to non-emergency system receptacles, posing additional risks.

NASH, JR., H.: With the reliability, frequent testing, and regulatory oversight of emergency systems in healthcare facilities there is no need to require an indicator light on every receptacle. Alarms or battery backup or both ar provided to indicate / accommodate a loss of power on vital life support equipment. There was substantiation provided to indicate that there is a problem with poor patient outcomes that could have been averted with the presence of an indicator light. This change would not reduce risk and would cause hospital to incur unnecessary cost. Additionally, this is performance issue which should be addressed by NFPA 99.

Comment on Affirmative:

KRUPA, G.: I agree with vote. As an editorial comment, the word “nonessential” in the second line of the substantiation probably should read “essential.”

SAMPSON, M.: The panel is right to insist on an indicator that permits staff to readily identify powered receptacles and insure that equipment and instrumentation continue to operate during a power interruption.

15-71 Log #1260 NEC-P15 **Final Action: Reject**
(517.71)

Submitter: John Masarick, Independent Electrical Contractors, Inc.
Comment on Proposal No: 15-90
Recommendation: I ask the panel to reject this proposal. The proposal would change 600 volts to 1000 volts.
Substantiation: Replacing 600 volts with 1000 volts will have a major impact on installers, component manufacturers, and industry standards. Increased spacing must be considered when going from 600 volts to 1000 volts. Personal safety must also be considered.
Because the proposer has not provided enough information to the public to justify and understand all the ramifications of the proposal, the committee should reject the submitter’s proposal.
Panel Meeting Action: Reject
Panel Statement: Proposal 15-90 does not require or prohibit equipment rated over 600V. Electrical system including alternate energy systems use voltages over 600V and can reach up to 1000V. Equipment must first be evaluated and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

15-72 Log #757 NEC-P15 **Final Action: Accept**
(517.71(C))

TCC Action: The Correlating Committee directs that the unnumbered text following Article 517, Part V, be identified as “517.70” with the title “Applicability.” This is an editorial correction only.
Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 15-90
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. Section 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 and 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity.
The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 520 — THEATRES, AUDIENCE AREAS OF MOTION PICTURE AND TELEVISION STUDIOS, PERFORMANCE AREAS AND SIMILAR LOCATIONS

15-73 Log #1195 NEC-P15 **Final Action: Reject**
(520.2 (New))

Submitter: Daniel J. Culhane, SECOA
Comment on Proposal No: 15-99
Recommendation: Revise text to read as follows:

Stage Lighting “Packaged” Hoist. A serially manufactured motorized lifting device that contains a moveable mounting position for one or more Iumninaires, a connector strip with wiring devices for connection of Iumninaires to branch circuits, and integral flexible cables to allow the luminaires and connector strip to travel over the lifting range of the hoist while energized~~.~~
Substantiation: Mr. Terry proposed a new class of “packaged” hoists. Add the words “packaged” and “serially manufactured” to the definition to differentiate this new class of “packaged” hoist from the majority of single purpose built hoist for one location type of hoist that is prevalent in the market place.
Panel Meeting Action: Reject
Panel Statement: This section is a definition of a stage lighting hoist and may not include requirements such as “packaged” or “serially manufactured”. The definition is the same whether or not the hoist is “packaged” or “serially manufactured”.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

15-74 Log #1193 NEC-P15 **Final Action: Reject**
(520.2.Switchboard, Stage Lighting (New))

Submitter: Daniel J. Culhane, SECOA
Comment on Proposal No: 15-98
Recommendation: Revise text to read as follows:

Stage lighting and audio equipment. Equipment at any location on the premises integral to the stage production, including but not limited to equipment for lighting, audio, ~~special effects, rigging, motion control,~~ projection or video.

Stage Lighting Switchboard. A switchboard, panelboard, or rack containing dimmers or relays with associated overcurrent protective devices, or overcurrent
protective devices alone, used primarily. to feed stage lighting equipment.
Substantiation: While stage lighting is evolving with the inclusion of circuit breakers and relay cabinets, Section 520 does not have enough safety features in place to replace NFPA 79 and UL 508A for controlling hoists that are holding and moving thousands of pounds of scenery and lighting equipment above people’s heads. I do not see within this section the safety related requirements outlined in both NFPA 70 and UL 508A. Until appropriate safety measures are in place for hoist control it is best to leave NFP A 79 and UL 508A as the standard for machine control design. Delete all references to “special effects”, “rigging”, and “motion control” out of this section of the code and add “lighting” and “audio” to the definition to clarify what is being referenced.

Panel Meeting Action: Reject
Panel Statement: Stage switchboards are no longer limited to feeding only lighting and audio equipment. They feed a wide variety of stage equipment as outlined in the original Proposal 15-98. The submitter suggests that lack of specific safety requirements in Article 520 for switchboards feeding different types of devices provides a reason for eliminating those types of devices from the definition of stage equipment, and limiting the definition of a stage equipment switchboard to cover only audio and lighting. Since the NEC is an installation code, specific requirements for various types of switchboards and control equipment do not belong in article 520. Rather, they are contained in applicable product standards, two of which are mentioned by the submitter. Inclusion of all stage equipment in the proposed definitions does not obviate the need for application of appropriate product safety standards.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 18

15-75 Log #1194 NEC-P15 **Final Action: Reject**
(520.40 (New))

Submitter: Daniel J. Culhane, SECOA
Comment on Proposal No: 15-111
Recommendation: Delete text as follows:
~~**520.40 Stage Lighting Hoists.** Stage lighting hoists shall be listed. Where a listed state lighting hoist contains an integral cable handling system and cable to connect a moving connector strip wiring device to a fixed junction box for connection to permanent wiring, the extra hard usage requirement of section 520.44(C)(1) shall not apply.~~
Substantiation: The substantiation for acceptance of this language is based upon a new class of devices listed as "packaged" stage lighting hoist but the proposed language will apply not only to the "packaged" stage lighting hoists but to all stage lighting hoists. Most stage lighting hoists manufactured today are a custom hoist design manufactured to meet a specific situation and location. They are not serially produced as the "packaged" stage lighting hoists are manufactured. Hoist controls are already listed under NFPA 79 and UL508A. As written, the definition of a stage lighting hoist is so broad as to include a regular stage hoist that happens to have a wired junction box attached to it. Adopting this language would inadvertently include all stage hoists as well as the single one-off designs that dominate the marketplace. Delete the proposed language.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 15-77.
Number Eligible to Vote: 18

522.2 Definitions.
~~**Control Circuit.** For the purposes of this article, the circuit of a control system that carries the electrical signals directing the performance of the controller but does not carry the main power current.~~
Substantiation: Article 100 Definitions now contains essentially the same text for Control Circuit.
Panel Meeting Action: Accept
Panel Statement: This action is contingent upon final acceptance of the definition of "control circuit" being included in Article 100 by CMP 11.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 525 — CARNIVALS, CIRCUSES, FAIRS, AND SIMILAR EVENTS

15-80 Log #1218 NEC-P15 **Final Action: Accept**
(525.23)

Submitter: Sheldon Monson, Wadena, MN
Comment on Proposal No: 5-122
Recommendation: The panel should reject this proposal.
Substantiation: The panel should reject this proposal for several reasons. First the submitter has not provided any evidence that open-neutral issues exist at carnival, festival and fair sites. Next, he alleges that "there is a comparable restriction" for temporary wiring at construction sites, which is not true (Section 590.6(A)(2) permits, but does not require GFCI listed for portable use. Third, at a carnival, festival or fair setting all the receptacles except those connected to permanent distribution are - at some point - supplied by cord-and-plug to the branch circuit. So, it appears to require all portable receptacles to have GFCI listed for portable use. And lastly, a code section requiring the use of portable cordsets is unenforceable as these rather expensive units will no doubt move around the fesitval grounds ahead of the inspector and then disappear when he does.
While the intent to provide a higher level of protection is understandable,

there is no substantiation, there is no precedent, the rule has larger than intended conseq1uences and is unenforceable.

Panel Meeting Action: Accept

Panel Statement: This is actually a comment on Proposal 15-122. This action rejects Proposal 15-122.

Number Eligible to Vote: 19

Ballot Results: Affirmative: 17 Negative: 2

Explanation of Negative:

ROCK, B.: NEMA supports the ballot comments expressed by Mr. Talka of UL. Portable GFCIs provide open neutral detection to assure delivery of ground-fault circuit-interrupter protection for personnel. In relation to GFCIs "identified for portable use", "portable" does not relate to the GFCI itself but rather to the nature of the supply connections powering the GFCI function. Where such supply connections are relocatable, the integrity of neutral connection essential for GFCI functionality has a higher risk of being diminished than those where the supply connections are permanent.

TALKA, D.: Open neutral protection is an important GFCI feature, especially in applications dealing with abuse and wear. Sam Sampson, in his IAEI Article entitled "Electrical Inspections for Carnivals, Fairs and Traveling Shows", points out that plug and socket connections in those venues are subject to damage and wear. Quoting from this article, "Cords are often damaged by exposure to oils, gasoline, direct sunlight, foot and vehicular traffic arriving on site worse for the wear. Distribution boxes and cords are unloaded at each stop in various stages of disrepair." The article goes on to state,"With the safety of the carnival workers and the public at stake, it is important to check the entire distribution system for properly sized over-current devices, grounding and bonding continuity and GFCI functionality." Portable GFCIs with open neutral protection provides the protection needed to deal with worn cord and plug connections.

Comment on Affirmative:

SAMPSON, M.: I urge the panel to continue to reject the original proposal by accepting this comment.

The submitter failed to provide any evidence that the existing GFCI requirements at carnivals, festivals and other outdoor events have a need for this level of protection. The fact that GFCI products "listed for portable use" come in styles designed for easy transport and are intended for temporary use makes this requirement impossible to enforce. "Regular" GFCI devices have been saving lives for over 20-years. If there was reason to believe that GFCI devices with the "no-load" release feature (found only in "GFCI listed for portable use" products) was necessary for these venues, then it stands to reason that all GFCI devices -in all locations - need to have this feature, as well. But, since there is no substantiation for this change, the proposal appears to be an attempt to mandate the use of a solution that has no problem.

15-81 Log #1026 NEC-P15 **Final Action: Hold**
(525.32)

Submitter: Mike Holt, Mike Holt Enterprises

Comment on Proposal No: 15-126

Recommendation: Accept the proposal in principle with the following changes:

525.32 Equipment Grounding Conductor Continuity Assurance. The continuity of the equipment grounding conductor<u>s</u> ~~system used to reduce electrical shock hazards as required by 250.114, 250.138, 406.4(C), and 590.4(D)~~ shall be verified each time that portable electrical equipment is connected.

Substantiation: The Code references stated do not add any value to this section. Referring to the Code sections that required the EGC doesn't change the fact (or help me understand) that I have to verify its continuity.

Panel Meeting Action: Hold

Panel Statement: The removal of these references was not introduced by the original proposal or panel action.

Number Eligible to Vote: 19

Ballot Results: Affirmative: 19

(530.22(A)(3)c.)

Submitter: Technical Correlating Committee on National Electrical Code®

Comment on Proposal No: 15-128

Recommendation: It was the action of the Correlating Committee that this proposal be reconsidered and correlated with the action taken on Proposal 1-114.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Accept Proposal 15-128, thereby adding a new last sentence after 530.22(A)(3) c as follows:

<u>The warning sign(s) or label(s) shall comply with 110.21(B).</u>

Number Eligible to Vote: 18

Ballot Results: Affirmative: 18

15-83 Log #758 NEC-P15 **Final Action: Accept**
(530.61)

Submitter: James T. Dollard, Jr., IBEW Local 98

Comment on Proposal No: 15-129

Recommendation: Continue to Accept.

Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. Section 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 and 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity.

The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

Panel Meeting Action: Accept

19-5 Log #1357 NEC-P19 **Final Action: Accept in Principle**
(547.2.Equipotential Planes)

Submitter: Barry S. Bauman, Alliante Energy / Rep. American Society of Agricultural and Biological Engineers
Comment on Proposal No: 19-11a
Recommendation: Revise text to read as follows:
Equipotential Plane. An area where wire mesh or other conductive elements are embedded in or placed under concrete, bonded to all metal structures and fixed nonelectrical equipment that may become energized, and connected to the electrical grounding system to minimize voltage potentials within the plane and between the plane and grounded electrical equipment.
Substantiation: At the CMP 19 ROP meeting it was understood that this definition needed rewording for clarity at the ROC meeting. The proposed wording provides this clarification.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Equipotential Plane. An area where wire mesh or other conductive elements are embedded in or placed under concrete, bonded to all metal structures and fixed nonelectrical equipment that may become energized, and connected to the electrical grounding system to minimize voltage potentials within the plane and between the plane, grounded equipment, and the earth.
Panel Statement: CMP-19 has revised the suggested language to more clearly describe the concept of an equipotential plane.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
ZIPSE, D.: "An area where wire mesh or other conductive elements are embedded in or placed under concrete, bonded to all metal structures and fixed nonelectrical equipment that may become energized, and connected to the electrical grounding system to minimize voltage potentials within the plane and between the plane, grounded equipment, and the earth."
The change from, "to prevent a difference in voltage from developing within the plane" to "minimize voltage potentials within the plane and between the plane, grounded equipment, and the earth" ignores the fact that the equipotential plane is connected to the equipment grounding conductor, which is connected to the neutral at the service entrance equipment, which in turn is connected to the utility companies transformer, where the primary neutral is connected to the secondary neutral.
The panel is oblivious to the fact that the neutral is an energized conductor that carries current. It is current and not voltage that is the electrical parameter that harms dairy cows.
It is evident the panel is conceding that equipotential planes do not prevent but only minimize. The panel needs to recognize and take the next step to delete this erroneous, unscientific requirement.

19-6 Log #1230 NEC-P19 **Final Action: Reject**
(547.5(A))

Submitter: Christel K. Hunter, Alcan Cable, a General Cable Company
Comment on Proposal No: 19-14
Recommendation: Revise text to read as follows:
547.5 Wiring Methods.
(A) Wiring Systems. Types UF, NMC, ~~copper~~ SE cables, jacketed Type MC cable, rigid nonmetallic conduit, liquidtight flexible nonmetallic conduit, or other cables or raceways suitable for the location, with approved termination fittings, shall be the wiring methods employed.
Substantiation: The submitter's proposal should have been accepted. The panel's statement that "Aluminum wire is more susceptible to corrosion in agricultural environments." is incorrect. In order to provide technical substantiation for the proposed change, several resources were consulted. As stated in the negative responses by NEMA and the Aluminum Association, common corrosive gases found in agricultural applications are methane, ammonia, carbon dioxide and hydrogen sulfide.
Let's analyze each of these gases in turn in relation to their corrosive effect on copper and aluminum:
Methane (natural gas): Copper has good corrosion resistance, but may be more severely affected if there are contaminants like water, sulfides, acids and various organic compounds, which can increase corrosion significantly. Methane has no corrosive effect on aluminum.
Ammonia: In absolutely dry ammonia environments, copper has excellent corrosion resistance. However, in moist ammonia environments, copper has poor resistance to corrosion. Aluminum has excellent corrosion resistance in ammonia environments, with no effect in a 10% ammonia environment up to 120 degrees F.
Carbon dioxide: In dry environments, copper has excellent resistance to corrosion by carbon dioxide. However, in moist environments, it only has good resistance. In both dry and moist environments, carbon dioxide may have a mild corrosive effect on aluminum.
Hydrogen sulfide: In dry environments, copper has excellent resistance to corrosion by hydrogen sulfide. However, in moist environments, it has poor resistance.
Aluminum in a moist, hydrogen sulfide environment will experience mild attack from the gas.
Nitrogen dioxide: Although this was not mentioned originally, it is a common agricultural gas. Copper is not recommended for use due to the corrosive effects of the nitrogen dioxide gas. Aluminum is satisfactory, but can experience corrosion in the presence of moisture.
Bleach: Although this was not mentioned originally, bleach is a common cleaning material. While concentrated chlorine water can have a corrosive effect on submerged aluminum, at the concentrations used for bleach, it has no effect on aluminum. Bleach is corrosive to copper.
As this comparison shows, aluminum is arguably a far better metal to use for electrical connections when installed in the often harsh agricultural environments. In fact, many connectors are made of aluminum, and are only corroded by contact with the copper conductors used for wiring when used in a damp environment. This type of galvanic corrosion could be avoided by using both aluminum conductors and connectors, resulting in a more stable electrical system.

Guidelines for the use of Aluminum with Food and Chemicals, published April 1994.
Corrosionsource.com,
http://encyclopedia.airliquide.com/Encyclopedia.asp?GasID=25
Panel Meeting Action: Reject
Panel Statement: Several panel members have observed rapid deterioration of aluminum grounding conductors in type SE cable where contaminants have entered under the cable jacket. The gases weren't the only consideration in the original requirement for copper. The contaminants present in livestock confinement areas are numerous and varied and are most detrimental when residue builds on the bare aluminum conductor. The substantiation addresses bare conductors only and there is not compelling substantiation for aluminum Type SE cable.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 8 Negative: 2
Explanation of Negative:
EDWARDS, T.: Several panel members expressed concern about Type SE cable construction in agricultural environments because of the bare ground under the outer jacket. Excluding aluminum will not resolve the issues observed with this construction.
MCNEIVE, T.: Sufficient evidence was submitted to the Panel to prove that aluminum SE cable is equal to or better than copper SE cable in agricultural installations.
Comment on Affirmative:
BAUMAN, B.: Other reasons that were identified at the ROC for rejecting this comment are: there has been no documentation presented on aluminum subjected to the various mixtures of contaminants found in agricultural environments, because the wrapped ground wire is not individually covered corrosion inhibitor can not be effective applied and when the outer jacket is scored for removal the aluminium is typically nicked enhancing a location for deterioration.
MICHAELIS, R.: There are two main reasons why aluminum conductors fail, these being improper installations and coefficient of expansion. Improper installation can cause aluminum oxidation which is not a conductor. The studies presented did not take into account actual field conditions or the chemicals in compound forms. The problem with aluminum wiring does not lie in the wiring itself, it lies in the connection. When aluminum heats up it expands more than copper and when it cools down it contracts more than copper. Over time this can cause a loose connection. Additionally, it is harder to make a tight connection with aluminum wire in the first place because aluminum wire has to be a thicker gauge wire than copper to carry the same electrical current. All metals also oxidize over time but there is a primary difference in how copper oxidizes compared to aluminum. When copper oxidizes it forms a conductor which creates no threat. When aluminum oxidizes it develops as a resistor which causes a major threat. Resistance causes heat which could lead heating up and possibly catching on fire or the insulation melting around the wire causing additional fire risk. The common use of razor knifes to strip the outer jacket nicks the thin strands of the conductors and causes future fatigue.

19-7 Log #1231 NEC-P19 **Final Action: Reject**
(547.5(C)(3), Informational Note 2)

Submitter: Christel K. Hunter, Alcan Cable, a General Cable Company
Comment on Proposal No: 19-16
Recommendation: Revise text to read as follows:
Informational Note No. 2: ~~Aluminum and m~~Magnetic ferrous materials may corrode in agricultural environments.
Substantiation: The submitter's proposal should have been accepted. In order to provide technical substantiation for the proposed change, several resources were consulted. As stated in the negative responses by NEMA and the Aluminum Association to Proposal 19-14, common corrosive gases found in agricultural applications are methane, ammonia, carbon dioxide and hydrogen sulfide. Let's analyze each of these gases in turn in relation to their corrosive effect on aluminum:
Methane (natural gas): Methane has no corrosive effect on aluminum.
Ammonia: Aluminum has excellent corrosion resistance in ammonia environments, with no effect in a 10% ammonia environment up to 120 degrees F.
Carbon dioxide: In both dry and moist environments, carbon dioxide may have a mild corrosive effect on aluminum.
Hydrogen sulfide: Aluminum in a moist, hydrogen sulfide environment will experience mild attack from the gas.
Nitrogen dioxide: Although this was not mentioned originally, it is a common agricultural gas. Aluminum is satisfactory, but can experience corrosion in the presence of moisture.
Bleach: Bleach is a common cleaning material. While concentrated chlorine water can have a corrosive effect on submerged aluminum, at the concentrations used for bleach, it has no effect on aluminum.
Aluminum is an excellent metal to use for electrical applications when installed in the often harsh agricultural environments. While aluminum (like all metals) may corrode in agricultural applications, it is no more likely and often less likely to corrode than other metals used in the same way.
Resources:
Guidelines for the use of Aluminum with Food and Chemicals, published April 1994.
Corrosionsource.com
http://encyclopedia.airliquide.com/Encyclopedia.asp?GasID=25
Panel Meeting Action: Reject
Panel Statement: The informational note in question is an accurate statement.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
EDWARDS, T.: The Informational Note provides misleading and biased information in that it singles out aluminum as the only non-ferrous metal that may corrode in agricultural environments whereas copper is also non-ferrous and is known to corrode in some agricultural environments.
Comment on Affirmative:
BAUMAN, B.: A reason that was identified at the ROC for rejecting this comment is: there has been no documentation presented on aluminum subjected to the various mixtures of contaminants found in agricultural environments.

19-8 Log #1232 NEC-P19 **Final Action: Accept**
(547.5(F))

19-9 Log #928 NEC-P19 **Final Action: Hold**
(547.9)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 19-21
Recommendation: Revise text to read as follows:
547.9(A)
(5) Grounding. At the site-isolating device, the system grounded conductor shall be connected to a grounding electrode system via a grounding electrode conductor. <u>The equipment grounding conductor is connected to the grounded circuit conductor and the site-isolating device enclosure at the distribution point.</u>
547.9(B)(3)
(2) The equipment grounding conductor is connected to the grounded circuit conductor ~~and the site-isolating device enclosure at the distribution point~~<u>at the disconnecting means</u>.

Substantiation: 1) 547.9 Electrical Supply to Building(s) or Structure(s) from a Distributing Point. It does not reference a site-isolating device.
2) 547.9(A) references a site-isolating device. It is required to be pole-mounted.
3) 547.9(A) (4) and (5) discuss Bonding and Grounding.
4) 547.9(B) does not reference a site-isolating device. It references disconnects at buildings or structures. Although a pole might be considered a structure, I believe (A) and (B) are designed to separate pole-mounted from non-pole-mounted.
5) Now in 547.9(B)(3) (1) and (2) we are talking about Grounding and Bonding.
6) in 547.9(B)(3)(2) we are back to talking about site-isolating device, even though it appears we don't have one in (B).
It appears to me that 547.9(B)(3)(2) properly belongs in 547.9(A)(5)
It appears to me that most of 547.9(B)(3)(2) should be retained.
Panel Meeting Action: Hold
Panel Statement: This amendment is new material that has not had public review.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

19-10 Log #1445 NEC-P19 **Final Action: Reject**
(547.10)

Submitter: Donald W. Zipse, Electrical Forensics, LLC
Comment on Proposal No: 19-25
Recommendation: Please delete Section 547.10 in its entirety.
Substantiation: Please delete Section 547.10 in its entirety for the following reasons:

The testing justifying the selection of the grid spacing was based on voltage alone. Voltage is only the pressure that pushes the current. Voltage does not burn the body. It is the current that burns the body, sets the heart into fibrillation, halting the pumping action of the heart, resulting in death of both.

It is clear that it is the current that causes a reaction in animals, which include both humans and dairy cows, not the voltage.

Professor Dalziel in 1946 states, "Perhaps the most serious misconception concerns the effect of voltage versus the effects of current. Current and not voltage is the proper criterion of shock intensity."

There is no difference between the fundamentals in low voltage and high voltage as Ohms Law, Kirchhoff's Laws, etc. apply equally to each.

Measurement of voltage alone without measuring resistance invalidates the tests to determine harm to animals, which includes humans and dairy cows. See attached peer reviewed technical paper, "THE MISUSE OF VOLTAGE AS A PARAMETER OF CONCERN FOR ELECTRICAL HAZARD".

The fallacy of the tests conducted on the spacing of the so called equipotential plane was the measurement of voltage when voltage alone does harm. Ohms Law states that current equals resistance divided by voltage and since it is current that harms the measurement of voltage alone without resistance invalidates the testing.

In 1985, the proposers of 547.10 lacked sufficient knowledge of the Institute of Electrical and Electronic Engineers' (IEEE) Standard 80, IEEE Guide for Safety in AC Substation Grounding. They based their proposals on substation protection for step and touch potentials from fault current. It is opined that they failed to understand the difference between hundreds of amperes flowing for only a very short time, until the protective device opens stopping the flow of fault current in a substation and the condition existing with stray current in dairies where the current is very low and flows continuously.

An equipotential plane 1) prevented the cows from entering the milking parlor because the cows received an electric shock when stepping onto the equipotential plane, 2) reduced the milk production because the dairy cows were getting an electric shock when being milked while standing on an equipotential plane and/or bumped into the stations, 3) injured the cows and resulted in deteriorated health of the herd, reduced milk production and ultimate death of the dairy cows.

One of the dairies that we tested had three dairy areas. Two areas did not have Equipotential Planes and there were no problems with stray current. The newest dairy had an Equipotential Plane installed and problems with stray current existed resulting in reduced milk production, sick dairy cows and difficulty with breeding. In my opinion, this unnecessary requirement is driving the dairy industry to extinction, especially the small dairies. Equipotential Planes do not protect dairy cows against stray voltage or stray current and are a figment of the imagination.

This section needs to be eliminated so that the dairy industry can survived. From the years of testing, it is opined that the equipotential plane is no more than an excellent earth electrode, which lacks any ability to maintain or to have zero voltage gradient across it when any amount of electrical current flows over, across or through the equipotential plane. As an excellent electrode-earthing element, the equipotential plane has the potential for attracting uncontrolled stray current from the multigrounded neutral electrical distribution system allowing dangerous and hazardous stray current to flow across the equipotential plane permitting the stray current to shock humans, cows and pigs.

When a dairy cow is in the milking parlor and bumps against the stanchions, she receives an electrical shock and will not let down her milk. If the dairy cow is not milked out completely she gets mastitis, inflammation of the udder, which ultimately usually leads to being turned into ground beef. In addition, dairy cows standing 24 hours per day 7 days per week on Equipotential Planes in dairy barns have continuous stray current flowing in their legs. Their joints have sufficient resistance that heating occurs and the joint becomes inflamed and swollen to the point where the dairy cow cannot walk. She is rendered into ground beef.

As should be evident from the above information Section 547.10 should be eliminated in its entirety in order to improve the health of dairy cows, improve milk production and breeding and sanity of the dairyman and his family. The original proposal was based on lack of understanding of electrical principles. The panel needs to rectify this problem by eliminating Section 547.10, as there is no redeeming justification for Section 547.10.

Please delete Section 547.10 as the deletion will restore the dairy farmer to sanity, improve the dairy's milk production, and save the dairy farm from extinction.

This substantiation also applies to the deletion of 547.2 Definition of Equipotential Plane.

Attached peer reviewed IEEE Technical paper titled: "THE MISUSE OF VOLTAGE AS A PARAMETER OF CONCERN FOR ELECTRICAL HAZARD".

(Staff Note: IEEE paper was not provided.)

Panel Meeting Action: Reject
Panel Statement: The submitter has provided no new substantiation to reverse the code-making panel's decision on the original proposal.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:

ZIPSE, D.: Equipotential planes do not protect livestock against stray current. Equipotential planes do not prevent a difference in voltage from developing within the plane (reference IEEE I&CPS technical paper titled Equipotential Planes: A Figment of the Imagination dated May 2006). This paper asserts that since 1994 it has been shown through testing that dairy cows can be and are electrically shocked while standing on so-called equipotential planes.

ARTICLE 550 — MOBILE HOMES, MANUFACTURED HOMES, AND MOBILE HOME PARKS

19-11 Log #504 NEC-P19 **Final Action: Reject**
(550.2.Manufactured Home and 550.5.1 through 550.4.4 (New))

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 19-30
Recommendation: Revise text to read as follows:

Manufactured Home. A structure, transportable in one or more sections, that~~, in the traveling mode, is 2.4 m (8 body-ft) or more in width or 12.2 m (40 body-ft) or more in length, or, when erected on site, is 29.7 m2 (320 ft2) or more and that~~ is built on a permanent chassis and designed to be used as a dwelling, with or without a permanent foundation, when connected therein. ~~The term *manufactured home* includes any structure that meets all the provisions of this paragraph except the size requirements and with respect to which the manufacturer voluntarily files a certification required by the regulatory agency, and except that such term does not include any self-propelled recreational vehicle. Calculations used to determine the number of square meters (square feet) in a structure are based on the structure's exterior dimensions, measured at the largest horizontal projections when erected on site. These dimensions include all expandable rooms, cabinets, and other projections containing interior space but do not include bay windows. For the purpose of this *Code* and unless otherwise indicated, the term *mobile home* includes manufactured homes.~~**Informational Note No. 1:** See the applicable building code for definition of the term *permanent foundation*.**Informational Note No. 2:** See Part 3280, *Manufactured Home Construction and Safety Standards, of the Federal Department of Housing and Urban Development*, for additional information on the definition.

550.4 General Requirements

550.4.1 The size of a manufactured home shall be 2.4 m (8 body-ft) or more in width or 12.2 m (40 body-ft) or more in length (in the traveling mode) or 29.7 m2 (320 ft2) or more (when erected on site).

550.4.2 The term *manufactured home* (see 550.2) includes any structure that meets all the provisions of the definition except the size requirements and with respect to which the manufacturer voluntarily files a certification required by the regulatory agency, and except that such term does not include any self-propelled recreational vehicle.

550.4.3 Calculations used to determine the number of square meters (square feet) in a structure are based on the structure's exterior dimensions, measured at the largest horizontal projections when erected on site. These dimensions include all expandable rooms, cabinets, and other projections containing interior space but do not include bay windows.

550.4.4 For the purpose of this *Code* and unless otherwise indicated, the term *mobile home* includes manufactured homes.

Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains a list of examples and such examples are not usually contained in definitions. Moreover, the information included should really be considered a requirement. If the CMP agrees that this is a requirement it should be placed somewhere else in Article

550, and section 550.4, on general requirements, is the perfect location, since NEC definitions shall not contain requirements. Moreover, the NEC manual of style does not permit the definition to contain the defined term and the second sentence contains the defined term "manufactured home". This is a more generic approach than the alternate comment because it eliminates all the requirements from the definition.
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Panel Meeting Action: Reject
Panel Statement: For enforcement purposes, the examples and descriptive details contained in the present definition provide clarity for distinguishing a manufactured home from other structures.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

19-12 Log #505 NEC-P19 **Final Action: Reject**

(550.17(C)(1))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 19-27
Recommendation: Revise text to read as follows:
550.17(C)
(1) Exposed Non–Current-Carrying Metal Parts. All exposed non–current-carrying metal parts that are likely to become energized shall be effectively bonded to the grounding terminal or enclosure of the panelboard. A bonding conductor shall be connected between the panelboard and <u>an</u> accessible terminal on the chassis.
Substantiation: Grammar, easier to read.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
550.<u>16</u>~~17~~(C)(1) Exposed Non–Current-Carrying Metal Parts. All exposed non–current-carrying metal parts that are likely to become energized shall be effectively bonded to the grounding terminal or enclosure of the panelboard. A bonding conductor shall be connected between the panelboard and <u>an</u> accessible terminal on the chassis.
Panel Statement: CMP-19 agrees that this amendment is strictly an editorial improvement, but has amended the section number to the correct reference to 550.16(C).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

19-15 Log #930 NEC-P19 **Final Action: Reject**
(550.30)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 19-27
Recommendation: Revise text to read as follows:
550.30 Distribution System. The mobile home park secondary electrical distribution system to mobile home lots shall be single-phase, 120/240 <u>or 120/208</u> volts, nominal. For the purpose of Part III, where the park service exceeds 240 volts, nominal, transformers and secondary panelboards shall be treated as services.
Substantiation: Is a three-wire 120/208 service forbidden for mobile homes?
Panel Meeting Action: Reject
Panel Statement: The submitter is introducing a new concept during the comment period without any technical substantiation. CMP-19 suggests the submitter resubmit this item as a proposal for the next Code revision cycle with technical justification for the amendment.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

19-16 Log #931 NEC-P19 **Final Action: Reject**
(550.32(C))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 19-43a
Recommendation: Revise text to read as follows:
C.32 Service Equipment.
(C) Rating. Mobile home service equipment shall be rated at not less than 100 amperes at 120/240 volts, and provisions shall be made for connecting a mobile home feeder assembly by a permanent wiring method. Power outlets used as mobile home service equipment shall also be permitted to contain receptacles rated up to 50 amperes with appropriate overcurrent protection. Fifty-ampere receptacles shall conform to the configuration ~~shown~~ in ~~Figure~~ 550.10(C).
~~Informational Note: Complete details of the 50-ampere plug and receptacle configuration can be found in ANSI/NEMA WD 6-2002 (R2008), National Electrical Manufacturers Association,~~ ~~*Standard for Wiring Devices — Dimensional Requirements*~~, ~~Figure 14-50.~~ ~~**[ROP 19–43a]**~~
Substantiation: The complete description of the receptacle is found in 550.10(C). The informational note is not necessary.
Panel Meeting Action: Reject
Panel Statement: The submitter is introducing a new concept during the comment period. Also, the comment does not at all address the amendment made via Proposal 19-43a. CMP-19 suggests the submitter resubmit this item as a proposal for the next Code revision cycle.
Number Eligible to Vote: 14

ARTICLE 551 — RECREATIONAL VEHICLES AND RECREATIONAL VEHICLE PARKS

19-17 Log #934 NEC-P19 **Final Action: Reject**
(551)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 19-45
Recommendation: Revise text to read as follows:
IV. Nominal 120-Volt<u>, 208Y/120-Volt,</u> or 120/240-Volt Systems
551.40 120-Volt<u>, 208Y/120-Volt,</u> or 120/240-Volt, Nominal, Systems.
(A) General Requirements. The electrical equipment and material of recreational vehicles indicated for connection to a wiring system rated 120 volts, nominal, 2-wire with equipment grounding conductor, or a wiring system rated 120/240 volts <u>or 208Y/120 volt</u> nominal, 3-wire with equipment grounding conductor, shall be listed and installed in accordance with the requirements of Parts I, II, III, IV, and V of this article. Electrical equipment connected line-to-line shall have a voltage rating of 208–230 volts.
C.42 Branch Circuits Required.
(C) Two to Five 15- or 20-Ampere Circuits. A maximum of five 15- or 20-ampere circuits to supply lights, receptacle outlets, and fixed appliances shall be permitted. Such recreational vehicles shall be permitted to be equipped with panelboards rated 120 volts maximum<u>, 208Y/120 volt,</u> or 120/240 volts maximum and listed for 30-ampere application supplied by the appropriate power-supply assemblies. Not more than two 120-volt thermostatically controlled appliances (e.g., air conditioner and water heater) shall be installed in such systems unless appliance isolation switching, energy management systems, or similar methods are used. **[ROP 19–45]**
551.60 Factory Tests (Electrical). Each recreational vehicle designed with a 120-volt<u>, 208Y/120 volt,</u> or a 120/240-volt electrical system shall withstand the applied potential without electrical breakdown of a 1-minute, 900-volt ac or 1280-volt dc dielectric strength test, or a 1-second, 1080-volt ac or 1530-volt dc dielectric strength test, with all switches closed, between ungrounded and grounded conductors and the recreational vehicle ground.
551.72 Distribution System. Receptacles rated at 50 amperes shall be supplied from a branch circuit of the voltage class and rating of the receptacle. Other recreational vehicle sites with 125-volt, 20- and 30-ampere receptacles shall be permitted to be derived from any grounded distribution system that supplies 120-volt single-phase power. The neutral conductors shall not be reduced in size below the size of the ungrounded conductors for the site distribution. The neutral conductors shall be permitted to be reduced in size below the minimum required size of the ungrounded conductors for<u> 208-volt or </u>240-volt, line-to-line, permanently connected loads only.
Substantiation: Make voltage consistent in Article.
551.4(A) General Requirements.
(A) Not Covered. A recreational vehicle not used for the purposes as defined in 551.2 shall not be required to meet the provisions of Part IV pertaining to the number or capacity of circuits required. It shall, however, meet all other applicable requirements of this article if the recreational vehicle is provided with an electrical installation intended to be energized from a 120-volt, *208Y/120-volt*, or 120/240-volt, nominal, ac power-supply system.
(B) Systems. This article covers combination electrical systems, generator installations, and 120-volt, *208Y/120- volt*, or 120/240-volt, nominal, systems.
Panel Meeting Action: Reject
Panel Statement: The commenter is introducing a new concept during the comment period. The comment does not address either the original Proposals 19-45 and 19-77 or the CMP-19's actions on those proposals.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

19-18 Log #933 NEC-P19 **Final Action: Reject**
(551.2.Dead Front, Disconnecting Means)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 19-45
Recommendation: Delete the following text:
551.2 Definitions.
~~**Dead Front (as applied to switches, circuit breakers, switchboards, and panelboards).**~~ ~~Designed, constructed, and installed so that no current-carrying parts are normally exposed on the front.~~ ~~**[ROP 19–45]**~~
~~**Disconnecting Means.**~~ ~~The necessary equipment usually consisting of a circuit breaker or switch and fuses, and their accessories, located near the point of entrance of supply conductors in a recreational vehicle and intended to constitute the means of cutoff for the supply to that recreational vehicle.~~ ~~**[ROP 19–45]**~~
Substantiation: The article 100 definitions of *Dead Front* and *Disconnecting Means* serve as the definitions for these terms through the entire rest of the NEC. They appear to be sufficient for Article 551 as well.
Panel Meeting Action: Reject
Panel Statement: See panel statement on Comment 19-19.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

19-19 Log #1529 NEC-P19 **Final Action: Reject**
(551.2.Dead Front)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 19-47
Recommendation: Delete the following text:
551.2 Definitions. (See Article 100 for additional definitions.)
~~**Dead Front (as applied to switches, circuit breakers, switchboards, and panelboards).**~~ ~~Designed, constructed, and installed so that no current-carrying parts are normally exposed on the front.~~
Substantiation: If the definition of "Dead Front" is essentially the same as the 100 I definition of "Dead Front" why redefine it here?
"Panel Statement: Article 551 was originally created from a previous chapter in NFPA 501C (now NFPA 1192, *Standard on Recreational Vehicles*), to provide the RV industry with consolidated and concise electrical requirements. The panel continues to recognize the need to retain the definitions in Article 551."
551.2 states "See Article 100 for additional definitions." So Article 551 itself indicates that it depends on definitions in Article 100. I fail to see how the definition in Article 100 for Dead Front can not also serve Article 551.
Panel Meeting Action: Reject
Panel Statement: CMP-19 has been consistent over the years in consolidating requirements for the RV industry, despite some redundancy, as clearly communicated in the panel's statement on Proposal 19-47.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

19-20 Log #507 NEC-P19 **Final Action: Reject**
(551.2.Recreational Vehicle, 551.4.1 and 551.4.2 (New))

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 19-48
Recommendation: Revise text to read as follows:
Recreational Vehicle. A vehicular-type unit primarily designed as temporary living quarters for recreational, camping, or travel use, which either has its own motive power or is mounted on or drawn by another vehicle. ~~The basic entities are travel trailer, camping trailer, truck camper, and motor home.~~
551.4 General Requirements
<u>**551.4.1** The basic types of recreational vehicle are travel trailer, camping trailer, truck camper, and motor home.</u>
<u>**551.4.2** Plots within in a recreational vehicle park can be used as a recreational vehicle site or as camping unit sites.</u>
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains a list of examples and such examples are not usually contained in definitions. Moreover, the information included should really be considered a requirement. If the CMP agrees that this is a requirement it should be places somewhere else in Article 551, and section 551.4, on general requirements, is the perfect location, since NEC definitions shall not contain requirements. Moreover, the NEC manual of style does not permit the definition to contain the defined term. The new section 551.4.2 is associated with the comment to proposal 19-49.
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Panel Meeting Action: Reject

Panel Statement: For enforcement purposes, the "basic entities" included in the definition provide additional clarity and are not seen as suitable text for a requirement. See panel action on Comment 19-21.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

19-21 Log #508 NEC-P19 **Final Action: Accept in Principle in Part**
(551.2.Recreational Vehicle, 551.4.1 and 551.4.2 (New))

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 19-49
Recommendation: Revise text to read as follows:
Recreational Vehicle Site. A plot of ground within a recreational vehicle park set aside for the accommodation of a recreational vehicle on a temporary basis. ~~It can be used as either a recreational vehicle site or as a camping unit site.~~
551.4 General Requirements
551.4.1 The basic types of recreational vehicle are travel trailer, camping trailer, truck camper, and motor home.
551.4.2 Plots within in a recreational vehicle park can be used as a recreational vehicle site or as camping unit sites.
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains a list of examples and such examples are not usually contained in definitions. Moreover, the information included should really be considered a requirement. If the CMP agrees that this is a requirement it should be places somewhere else in Article 551, and section 551.4, on general requirements, is the perfect location, since NEC definitions shall not contain requirements. Moreover, the NEC manual of style does not permit the definition to contain the defined term and the second sentence of the definition contains the term "recreational vehicle site". The new section 551.4.1 is associated with the comment to proposal 19-48.
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Panel Meeting Action: Accept in Principle in Part
Revise text to read as follows:
Recreational Vehicle Site. A plot of ground within a recreational vehicle park set aside for the accommodation of a recreational vehicle on a temporary basis or used as a camping unit site. ~~It can be used as either a recreational vehicle site or as a camping unit site.~~
Panel Statement: CMP-19 does not accept the creation of 551.4.1 and 551.4.2. The revision of the text in the definition addresses the submitter's style concern about using the defined term within the definition. See Comment 19-20.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

19-22 Log #932 NEC-P19 **Final Action: Reject**
(551.4(C))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 19-44
Recommendation: Add text to read as follows:
551.4 (D) Motors and Actuators. Electric motors and actuators that have manual controls shall meet the requirements of 110.25.
Substantiation: From ROP:
"Substantiation:
A disconnect for these motors within sight of the motor or a lockable disconnect is just as important for an RV tip out motor as for any other motor. If a person is underneath an RV working on these tip outs a person inside could engage the tip out and cause a severe injury from the screw jacks. The gear reduction ratio makes these jacks extremely powerful."
"Panel Statement:
Regarding the protection of individuals working on slideouts that could be operated while one is underneath, a provision is provided within NFPA 1192 that the activation mechanism be a non-latching switch; only a momentary switch so the slideout cannot be activated, should the operator walk away while the system was in the functioning mode."
I'm astonished at the suggestion underlined above. The argument immediately falls apart as soon as you realize that it is possible for 2 persons to be present at the same time. That scenerio is the whole reason behind *disconnects within sight* and *lockable disconnects* that permeate the *NEC*.
Panel Meeting Action: Reject
Panel Statement: This comment represents new material and does not reference at all the subject matter of Proposal 19-44.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

19-23 Log #1447 NEC-P19 **Final Action: Accept in Principle**
(551.4(C))

TCC Action: The Correlating Committee directs that the date of the latest referenced standard in 551.4(C) Information Note be included in the Code.
Submitter: Bruce A. Hopkins, Recreation Vehicle Industry Association
Comment on Proposal No: 19-50
Recommendation: Revise the Panel Meeting Action by adding the following text to the first part of the sentence:
551.4(C) Labels. Labels required by Article 551 shall comply with *ANSI Z535 Product Safety Signs and Labels* and shall be made of etched...".
Substantiation: NFPA has approved 2014 code changes proposals for NFPA 1192 Standard for Recreational Vehicles that require all signs and labels to comply with the requirements of ANSI Z535 and therefore to remain consistent the labels as identified in Article 551 for RVs should follow suit. This will enable the RV industry to provide a set of RV labels that will be uniform and better recognizable labels for the RV consumer.
Panel Meeting Action: Accept in Principle
Add a new informational note to 551.4(C) to read:
Informational Note. For guidance on other label criteria used in the recreational vehicle industry, refer to *ANSI Z535, Product Safety Signs and Labels*.
Panel Statement: The informational note provides the desired reference on additional label criteria without the use of unenforceable language.

(551.42(C))

Submitter: Bruce A. Hopkins, Recreation Vehicle Industry Association
Comment on Proposal No: 19-59
Recommendation: Recommendation: revise the proposal to read as follows:
Exception No. 2: Six 15- or 20-ampere circuits shall be permitted without employing an energy management system, provided the ~~combined load of two circuits does not exceed the allowable load of a single circuit~~. added sixth circuit serves only the power converter; and the combined load of all six (6) circuits does not exceed the allowable load that was designed for use by the original five (5) circuits.
Substantiation: The proposed revision adds clarity to this requirement by indicating that the sixth circuit can only serve a converter and that the total combined load when employing six circuits cannot be more than what five circuits could handle.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

19-25 Log #285 NEC-P19 **Final Action: Accept**
(551.45(B))

Submitter: Jerome A. Hoover, Monaco RV, LLC
Comment on Proposal No: 19-61
Recommendation: Revise Panel Meeting action, and change the word "and" back to the original proposal "or" so that the exception reads:
Exception No. 1: Where the panelboard cover is exposed to the inside aisle space, one of the working clearance dimensions shall be permitted to be reduced to a minimum of 550 mm (22 in.). A panelboard is considered exposed where the panelboard cover is within 50 mm (2 in.) of the aisle's finished surface, ~~and~~ or no more than 25 mm (1 in.) from the backside of doors that enclose the space.
Substantiation: Changing "or" to "and" requires both conditions be met simultaneously which, as illustrated below, cannot be achieved in all installations. Some doors mounted flush to the aisles finished surface require installation of the panel board cover more than 50 mm (2 in.) of the aisle's finished surface. This proposal permits an alternate installation when the door installation prohibits meeting the specified 50 mm (2 in.) setback limit but provides for a alternative setback reference point which is 25 mm (1 in.) behind the door inner surface. This proposal prevents storage of material in front of the panelboard without sacrificing circuit breaker accessibility.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

19-26 Log #1449 NEC-P19 **Final Action: Accept**
(551.45(B))

Submitter: Bruce A. Hopkins, Recreation Vehicle Industry Association
Comment on Proposal No: 19-60
Recommendation: Reject Proposal 19-60, Log #2592.
Substantiation: The proposal was originally submitted for the purpose of harmonizing the NEC requirements governing installation locations for panel boards inside RVs with the parallel Canadian requirements.
The term "condensation" was used in the proposal and the panel determined in its discussions that this is a difficult and subjective word to add to the NEC. To approve the proposal, the panel added language that would prohibit panelboards from being installed under sinks or in areas occupied by toilets, showers or tubs. This added language, however, eliminates locations that have been safely used for years without issue. Further, the proposed change as it now reads will not achieve the intended NEC/Canadian harmonization, as some of these now prohibited stated locations are still permitted in Canada.
Due to these considerations, we are now commenting that the entire proposal should be deleted until more clarification can be obtained from Canada. To

date, no issues have been brought to the panel's attention suggesting that the existing requirement does not provide adequate safety. Therefore, rejecting this proposal and retaining the existing text of the 2011 NEC will not lessen safety.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

19-27 Log #1587 NEC-P19 **Final Action: Accept**
(551.47(S)(3))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 19-75
Recommendation: Revise text to read as follows:
551.47 Wiring Methods.
(S) Prewiring for Other Circuits.
(3) A safety label with the signal word "WARNING" with minimum 1/4 in. (6 mm) high letters minimum and body text with minimum 1/8 in. (3 mm) high letters on a contrasting background, shall be affixed on or adjacent to the junction box or device listed for the purpose and shall read as follows:
WARNING THIS CONNECTION IS FOR _____ RATED _____ VOLT AC, 60 HZ, _____ AMPERES MAXIMUM. DO NOT EXCEED CIRCUIT RATING.
~~AN AMPERE RATING NOT TO EXCEED 80 PERCENT OF THE CIRCUIT RATING SHALL BE LEGIBLY MARKED IN THE BLANK SPACE.~~
EXCEEDING THE CIRCUIT RATING MAY CAUSE A FIRE AND RESULT IN DEATH OR SERIOUS INJURY.
An ampere rating not to exceed 80 percent of the circuit rating shall be legibly marked in the blank space.
Substantiation: The deleted sentence does not appear in the ROP. 19-50 has similar text to the corrected text.
Panel Meeting Action: Accept
Panel Statement: CMP-19 notes that this sentence was inadvertently omitted during the ROP stage, which was not the panel's intent.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

19-28 Log #1220 NEC-P19 **Final Action: Reject**
(551.75)

TCC Action: The Correlating Committee directs that Proposal 19-79 and Comment 19-28 be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative. The concept proposed in Proposal 19-79 no longer has consensus.
Submitter: Sheldon Monson, Wadena, MN
Comment on Proposal No: 19-79
Recommendation: The panel should reject this proposal.
Substantiation: These pedestals are the outdoor interface" from the distribution to the portable equipment (RV) with equipment grounding (bonding) conductors back to the service/source of supply. The grounded and grounding conductors within the equipment are isolated and nothing is gained by establishing yet another grounding electrode system adjacent to the RV equipment.

250.4(A)(1) states that these systems are to limit the voltage imposed by lightning, line surges, or unintentional contact with higher-voltage lines and that will stabilize the voltage to earth during normal operation. Requiring 2-ground rods (or possibly another electrode system) at multiple locations accomplishes none of the above, and conflicts with the panel's goad of reducing unintentional circulating currents in premises distribution.

Not only is there no substantiating evidence for this proposal, this requirement is just not a good idea.
Panel Meeting Action: Reject
Panel Statement: CMP-19 accepted Proposal 19-79 to clarify that an RV pedestal is a separate structure and the provisions of Article 250 apply.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 6 Negative: 8
Explanation of Negative:

BAUMAN, B.: I agree with the comments submitted by B. Hopkins.

ELLIOTT, W.: 1. No documentation of any accidents, incidents, injuries or deaths due to lack of grounding electrodes at the RV Site equipment, have been documented and these installations have been being installed for more than 30 years.
2. There has been NO testing to prove that electrodes are needed or if present would prevent injury or death beyond the presence of the equipment ground.
3. RV Site equipment is a distribution point, not a separate structure. It is NEMA 3R equipment that meets NEC and UL listing requirements and is for exterior distribution and not housed in any further enclosures or buildings.
4. RV Site equipment is UL listed for a specific purpose, and all major manufactures have their equipment listed as RV Site equipment. Only Milbank and Jamestown also list their RV Site equipment as listed for temporary power.
5. Equipment not listed as suitable for use as RV Site equipment (for example an 816 box installed for a site) is not allowed by the NEC and should not be an excuse for demanding that each site is a separate structure. In practice, the use of non-listed equipment is so minimal as to be considered nonexistent.
6. All RV Site equipment have provisions for equipment grounding back to the service entrance equipment and are grounded back to the service entrance in practice. In fact a case can be made for a common ground for safety reasons because of the close proximity of neighboring RV Sites.
7. If RV Site equipment is considered a separate structure and requires local grounding electrodes, why would marina site equipment be different? The case could be made that NEITHER are separate structures and should not be considered such.
8. Finally, the cost of adding individual grounding electrodes in today's average size RV Park is economically disastrous as costs of $75 to $100 per site will be required without improvement in safety.

HOPKINS, B.: 1. No documentation of any accidents, incidents, injuries or deaths due to lack of grounding electrodes at the RV Site equipment, have been documented and these installations have been being installed for more than 30 years.
2. There has been NO testing to prove that electrodes are needed or if present would prevent injury or death beyond the presence of the equipment ground.
3. RV Site equipment is a distribution point, not a separate structure. It is NEMA 3R equipment that meets NEC and UL listing requirements and is for exterior distribution and not housed in any further enclosures or buildings.
4. RV Site equipment is UL listed for a specific purpose, and all major manufactures have their equipment listed as RV Site equipment. Only Milbank and Jamestown also list their RV Site equipment as listed for temporary power.
5. Equipment not listed as suitable for use as RV Site equipment (for example an 816 box installed for a site) is not allowed by the NEC and should not be an excuse for demanding that each site is a separate structure. In practice, the use of non-listed equipment is so minimal as to be considered nonexistent.
6. All RV Site equipment have provisions for equipment grounding back to the service entrance equipment and are grounded back to the service entrance in practice. In fact a case can be made for a common ground for safety reasons because of the close proximity of neighboring RV Sites.
7. If RV Site equipment is considered a separate structure and requires local grounding electrodes, why would marina site equipment be different? The case could be made that NEITHER are separate structures and should not be considered such.
Finally, the cost of adding individual grounding electrodes in today's average size RV Park is economically disastrous as costs of $75 to $100 per site will be required without improvement in safety.

MULVANEY, D.: Reasons for Negative vote:
1. No documentation of any accidents, incidents, injuries or deaths due to lack of grounding electrodes at the RV Site equipment.
2. There has been NO testing to prove that electrodes are needed or if present would prevent injury or death beyond the presence of the equipment ground.
3. RV Site equipment is a distribution point, not a separate structure. It is NEMA 3R equipment that meets NEC and UL listing requirements and is for exterior distribution and not housed in any further enclosures or buildings.
4. RV Site equipment is UL listed for a specific purpose, and all major manufactures have their equipment listed as RV Site equipment. Only Milbank and Jamestown also list their RV Site equipment as listed for temporary power.
5. Equipment not listed as suitable for use as RV Site equipment (for example an 816 box installed for a site) is not allowed by the NEC and should not be an excuse for demanding that each site is a separate structure. In practice, the use of non-listed equipment is so minimal as to be considered nonexistent.
6. All RV Site equipment have provisions for equipment grounding back to the service entrance equipment and are grounded back to the service entrance in practice. In fact a case can be made for a common ground for safety reasons because of the close proximity of neighboring RV Sites.
7. If RV Site equipment is considered a separate structure and requires local grounding electrodes, why would marina site equipment be different? I would make the case that NEITHER are separate structures and should not be considered such.
8. Finally, the cost of adding individual grounding electrodes in today's average size RV Park is economically disastrous.

SABIN-MERCADO, L.: I agree with the submitter of Comment 19-28 that the panel should have rejected Proposal 19-79.

A factory-built RV pedestal should not be considered a structure. RV pedestals are "equipment". The requirements of Article 250.32 should not apply. The action taken by CMP-19 to accept Proposal 19-79 and define the RV pedestal as a separate structure, requiring the provisions of 250.32 to be met, was not justified by any technical substantiation. There has been a lot of discussion over the years about whether a grounding electrode (system) is required at each RV pedestal providing site power. No justification has been submitted to CMP-19 that the level of safety provided by the existing requirements in 551.74 and 551.75 are not sufficient. A grounding electrode system at each pedestal or site power supply is not necessary since an equipment grounding conductor is routed with the feeder to each site. A grounding electrode at each RV pedestal may be "nice" to have, but should not be a "requirement".

THIERHEIMER, T.: I agree with the voting comments submitted by L. Sabin-Mercado.

ZIEMAN, M.: I believe the original proposal (19-79) should be rejected and thus comment 19-28 asking that proposal 19-79 be rejected should have been accepted by the committee.

My reasons include:

1. I concur with some of the reasons stated by those who voted negative on the committee action on 19-28.

2. I believe the committee's actions have unintended consequences such as unjustified increased cost which need to be reviewed.
3. I believe the actions of the committee may not provide added or needed safety.
4. I would like to see this matter revisited in the next code cycle.

ZIPSE, D.: A grounding electrode system at each pedestal or site power supply is not necessary since an equipment grounding conductor (EGC) is routed with the feeder to each site. A grounding electrode at each RV pedestal may be "nice" to have, but should not be a "requirement". Back before the requirement for EGC a ground rod at each pedestal was needed, but not today.

19-29 Log #404 NEC-P19 **Final Action: Reject**
(551.79)

Submitter: Thomas L. Adams, Macomb, IL
Comment on Proposal No: 19-81
Recommendation: This Proposal should be rejected.
Substantiation: The present text of OSHA 1926.403(i) limits the requirements in that paragraph to applications up to 600 Volts. Changing the application of the text in 551.79 will create a conflict between the two documents causing voltages from 601 to 1000 Volts to be in violation of OSHA requirements. In addition, a Note within the OSHA document states that "If the electrical installation is made in accordance with the National Electrical Code ANSI/NFPA 70-1984, exclusive of Formal Interpretations and Tentative Interim Amendments, it will be deemed to be in compliance with 1926.403 through 1926.408, except for 1926.404(b)(1) and 1926.405(a)(2)(ii)(E), (F), (G), and (J)." This would further conflict with the proposed text without significant amendment.
Panel Meeting Action: Reject
Panel Statement: Section 551.79 addresses "Clearances for overhead conductors" in recreational vehicle parks. CMP-19 questions the relevance of the requirements in OSHA 1926.403, Safety and Health Regulations for Construction, Sub Part K, Electrical. Further, CMP-19 noted that the proposals to change 600 V to 1000 V in Sections 225.18 and 225.19 were accepted in principle by CMP-4.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

19-30 Log #760 NEC-P19 **Final Action: Accept**
(551.79)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 19-81
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. Section 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 and 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

19-31 Log #1261 NEC-P19 **Final Action: Reject**
(551.79)

Submitter: John Masarick, Independent Electrical Contractors, Inc.
Comment on Proposal No: 19-81
Recommendation: I ask the panel to reject this proposal. The proposal would change 600 volts to 1000 volts.
Substantiation: Replacing 600 volts with 1000 volts will have a major impact on installers, component manufacturers, and industry standards. Increased spacing must be considered when going from 600 volts to 1000 volts. Personal safety must also be considered.
Because the proposer has not provided enough information to the public to justify and understand all the ramifications of the proposal, the committee should reject the submitter's proposal.
Panel Meeting Action: Reject
Panel Statement: Section 551.79 addresses "Clearances for overhead conductors" in recreational vehicle parks. The concerns expressed in the submitter's substantiation do not seem relevant to the application of the change in Section 551.79. CMP-19 noted that the proposals to change 600 V to 1000 V in Sections 225.18 and 225.19 were accepted in principle by CMP-4.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

ARTICLE 553 — FLOATING BUILDINGS

19-32 Log #1568 NEC-P19 **Final Action: Reject**
(553.4)

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 19-96
Recommendation: Accept the proposal.
Substantiation: The comments in the voting are exactly on point. The notion that one device could address the plethora of instances of floating buildings, from little houseboats to major maritime floating aquariums and other large commercial applications is preposterous. In addition, the differences cited in the substantiation between fresh and salt water further compound the problem.
Panel Meeting Action: Reject
Panel Statement: Since the adoption of the "not to exceed 100 mA" leakage limit for residual current devices at marinas and boatyards in the 2011 Code, it is the understanding of CMP-19 that 30 mA ground-fault protection of equipment (GFPE) industrial circuit breakers have been employed. While it is recognized that the optimal level of protection for personnel is 5 mA, CMP-19 recognizes that only part of the solution to electrocutions at these locations can be solved on the docks and marinas. A large contributor to the safety issue comes from the watercraft and any measures taken at the services at the marinas cannot solve the problem. Constant nuisance tripping caused by expected wide disparities between the levels of the stray currents and optimal personnel protection can be expected to meet with strong resistance by the marina and boatyard owner/operators.

The panel has proposed an NFPA Research Foundation Code Fund Project to review the American Boat and Yacht Council (ABYC) study on the subject, titled "Research on the Mitigation of Residual Current/Voltage Detection in Marinas, Boatyards to a Level Below Muscular Tentanization Level". CMP-19 hopes that results from such a study will provide necessary stimulus for development of life saving technologies. In the meantime, CMP-19 has concluded that elimination of the present requirement would be regressive at this time and lead to no required protection at all.

CMP-19 recognizes the critical nature and immediacy of the safety issue and, if this above-mentioned code fund project is approved, intends to address the findings of the project when any recommendations become available.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 8 Negative: 2
Explanation of Negative:

CHILTON, R.: Although information was submitted during the Proposal meeting that reflected a need for better protection at marinas, the Action is based on a study that contains obvious flaws. The 100 MA setting claimed by some to eliminate this hazard far exceeds the 4-6 MA Standard set for GFCI, the limit considered maximum to protect personnel. With electrocutions growing in number each summer, and the recent July 2012 tragic events providing an emotional reaction to public demands for more regulations this simply does not help. The known responses to current imposed on the human body just will not stop with the 100 MA level and the public is being convinced this will. As experienced laymen of the Electrical Industry, with all facets represented on this Code Making Panel, we have become part of the charade that we're protecting the Public by this requirement. The real protection would incorporate GFCI protection on each feeder and branch circuit.

LICHTENSTEIN, T.: The panel should have accepted the comment and proposal 19-103. The 100mA recommendation by the Coast Guard research far exceeds the level of 5mA which is the level that should not be exceeded to prevent muscle tetanization of children in water. See definition of "Ground-Fault Circuit Interrupter" in Article 100. Muscle tetanization is a state of muscle contraction that results in the inability of a person to control their muscles. When the muscles tetanize the ability to control breathing and to swim or climb out of the water is lost which results in swimmers sinking to the bottom of the water and drowning. Ground fault protection of equipment (GFPE) circuit breakers that trip at the 30mA level will not provide ground fault protection for personnel and will only serve to provide a false sense of protection.

The intent of the Coast Guard research to address a known problem has merit, however, implementing the 100mA limit alone may not have an impact on solving this problem, and may even increase the hazard by giving those in or near the water a false sense of protection. As the panel statement indicated "A large contributor to the safety issue comes from the watercraft and any measures taken at the services at the marinas cannot solve the problem." A comprehensive solution including ground fault protection, wiring methods, wiring devices, grounding, system design and enforcement must be developed to alleviate this hazard.

19-35 Log #761 NEC-P19 **Final Action: Accept**
(555.4)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 19-104
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. Section 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 and 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:

MICHAELIS, R.: There are two main reasons why aluminum conductors fail, these being improper installations and coefficient of expansion. Improper installation can cause aluminum oxidation which is not a conductor. The studies presented did not take into account actual field conditions or the chemicals in compound forms. The problem with aluminum wiring does not lie in the wiring itself, it lies in the connection. When aluminum heats up it expands more than copper and when it cools down it contracts more than copper. Over time this can cause a loose connection. Additionally, it is harder to make a tight connection with aluminum wire in the first place because aluminum wire has to be a thicker gauge wire than copper to carry the same electrical current. All metals also oxidize over time but there is a primary difference in how copper oxidizes compared to aluminum. When copper oxidizes it forms a conductor which creates no threat. When aluminum oxidizes it develops as a resistor which causes a major threat. Resistance causes heat which could lead heating up and possibly catching on fire or the insulation melting around the wire causing additional fire risk.

19-36 Log #1233 NEC-P19 **Final Action: Accept**

(555.15(B) and (C))

Submitter: Christel K. Hunter, Alcan Cable, a General Cable Company

Comment on Proposal No: 19-106

Recommendation: Revise text to read as follows:

555.15(B) Type of Equipment Grounding Conductor. The equipment grounding conductor shall be an insulated ~~copper~~ conductor with a continuous outer finish that is either green or green with one or more yellow stripes. The equipment grounding conductor of Type MI cable shall be permitted to be identified at terminations. For conductors larger than 6 AWG, or where multiconductor cables are used, re-identification of conductors as allowed in 250.119(A)(2)(b) and (A)(2)(c) or 250.119(B)(2) and (B)(3) shall be permitted.

(C) Size of Equipment Grounding Conductor. The insulated ~~copper~~ equipment grounding conductor shall be sized in accordance with 250.122 but not smaller than 12 AWG.

Substantiation: The submitter's proposal should have been accepted. In order to provide technical substantiation for the proposed change, several resources were consulted.

According to corrosionsource.com, the effects of both seawater and fresh water on aluminum will be minor. According to aluminum.org, "Used in the marine industry for more than 100 years, aluminum combines light weight and ease of fabrication with corrosion and fatigue resistance." According to copper.org, copper also has excellent resistance to a marine atmosphere, forming a protective green basic copper chloride or carbonate patina.

In the Aluminum Electrical Conductor Handbook (1989), corrosion resistance is addressed with the following statement: "The inherent corrosion resistance of aluminum is due to the thin, tough, oxide coating that forms directly after a fresh surface of metallic aluminum is exposed to air. Another reason for the excellent corrosion resistance of aluminum conductors in ordinary atmospheres is that the alloy components are selected so as to minimize corrosion. Thus, suitable alloys of the 6000-series, though not listed as "marine" alloys, are well suited for oceanshore applications, as well as for the usual industrial and chemical atmospheres, as are the aluminum 1350 conductors. Instances where corrosion has appeared are usually traceable to connections between dissimilar metal subjected to moisture conditions. Protective means should be employed to prevent this. Present-day compression connectors act to break the oxide layer on the wires of stranded cable connections. Where unplated flat surfaces are joined, as with bus conductors or terminal pads, scratch brushing and the addition of oxide-inhibiting joint compound remove the oxide and prevent its further formation because the compound excludes oxygen."

ASTM performed a 10-year study to determine the corrosion rates of four metals exposed to desert, rural, coastal and industrial atmospheric conditions. In the coastal test environments (Key West, FL and La Jolla, CA), aluminum outperformed copper, zinc and lead. While both copper and aluminum held up very well in coastal testing, aluminum lost only 0.004 mils/year in Key West and 0.028 mils/year in La Jolla, compared with a copper loss of 0.020 mpy in Key West and 0.052 mpy in La Jolla.

Note that aluminum conductors are usually made of AA-1350 or AA-8000 series aluminum. Both of these types are highly corrosion resistant. Aluminum connectors are made of highly corrosion resistant materials as well, usually AA-6061 or AA-1000 series, depending on the connector type.

Aluminum Electrical Conductor Handbook, published 1989.

Panel Meeting Action: Accept

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:

CHILTON, R.: Stranded conductors should be addressed in this environment separately from solid conductors, no considerations were given in the Comment. Oxidation occurs more rapidly when salt water and air contaminates and settles within the strands of exposed aluminum.

19-37 Log #1177 NEC-P19 **Final Action: Reject**

(555.16)

Submitter: Donald W. Zipse, Zipse Electrical Forensics, LLC

Comment on Proposal No: 19-107

Recommendation: Add new text to read as follows:

555.16 Mitigation of Neutral Related Stray Voltages and Stray Currents. To provide protection for neutral related stray voltages and stray currents, when 5 ma or more exists, a suitably rated transformer that isolates the service neutral conductor from the load neutral conductor at the branch circuit service panel supplying the shore power shall be installed. The following shall be required for a transformer that isolates system neutral conductors:

(1) The transformer that isolates shall be rated to carry full through-fault current.

(2) The transformer that isolates shall have over current protection on the supply side as required in Section 450.3.

(3) The metal enclosure of the transformer shall be connected to the supply side grounded conductor as required by Section 250.4(A).

(4) The load side grounded conductor and equipment grounding conductors shall be connected together and bonded at the transformer as required by Section 250.20(B). To provide adequate isolation, the installed grounding electrode shall be located at least 6m (20 ft) from the nearest grounding electrode on the supply side of the transformer and shall be connected to the transformer by an insulated grounding conductor.

(5) There shall be three conductors attached to the secondary side of the transformer XO terminal:

(1) The identified conductor (the neutral).

(2) The equipment grounding conductor (the green conductor).

(3) The insulated grounding electrode conductor.

(6) The location of the transformer that isolates shall be on the load side of the service disconnecting means and shall not be below the electrical datum plane.

Note: Supporting Material is available for review at NFPA headquarters.

Substantiation: THIS IS NOT NEW MATERIAL AS A VERSION APPEARED IN THE ROP.

The only change is the addition of "when 5 ma or more exists."

This revised text meets Article 250, Separately Derived Systems. Transformers that isolate have been used successfully since 1994 in isolating the distribution system neutral return current from the user's property. This method of using a transformer to isolate the dangerous and hazardous stray current emanating from the distribution system neutral return current will save lives and reduce electrical shock hazards.

This neutral isolating transformer has been installed in dairies and residential homes since 1994. The author has a neutral isolation transformer installation which has been approved by the local inspection agency.

This installation is required only if the stray current exceeds 5 mA which is the same as a GFCI trip setting. The stray current is on the identified conductor, neutral (white conductor) and the equipment grounding conductor (Bare or Green color). The equipment grounding conductor does not have any protection such as a GFCI in the equipment grounding conductor circuit. There is no other protection from stray current except by interrupting the current flow from the primary neutral of the supply transformer by the installation of a neutral isolation transformer.

Panel Meeting Action: Reject

Panel Statement: The comment intends to reverse CMP-19's action on the original proposal. It, however, also introduces new concepts during the comment period. The original proposal only asked for an isolation transformer to be "permitted". The comment introduces a new requirement for the transformer when 5 mA leakage current is detected.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 10 Negative: 1

Explanation of Negative:

ZIPSE, D.: The use of transformers that isolate the primary neutral from the secondary neutral, preventing stray current from entering premises, such as a marina, will eliminate a source of potential harmful current. Such transformers have been used for approximately 20 years to prevent stray current from shocking and the potential of electrocution of humans. The panel is remiss in failing to take this opportunity to protect the public - one of the objects of the National Electrical Code.

19-38 Log #1224 NEC-P19 **Final Action: Reject**

(555.16)

Submitter: Carson Day, Georgia Institute of Technology - NEETRAC

Comment on Proposal No: 19-107

Recommendation: The following text would be a new paragraph under section 555. Below are the changes recommended to the original change proposal submitted in November 2011.

555.16 Mitigation of Neutral Related Stray Voltages and Currents
To provide protection for neutral related stray voltages and currents, a suitably rated isolation transformer (a separately derived system) at the branch circuit service panel supplying the shore power shall be permitted.
The following ~~shall be required~~ configuration is recommended for the isolated system:
~~(1) The isolation transformer should be double insulated or its equivalent and shall have an internal shield between t he windings that is rated to carry full fault current.~~
(1)The isolation transformer shall have overcurrent protection on the supply side as required in 450.3.
(2) The isolation transformer shall be provided with a ground fault protection device on the load side ~~not exceeding 30mA (UL943C Class B Ground Fault Circuit Interrupter)~~
(3) Metal enclosure ~~and internal shield conductor~~ of the transformer shall be connected to the supply side neutral and grounding system as required by 250.4 (A).
(4) The load side neutral and equipment grounding conductors shall be connected together and grounded on the secondary side of the transformer as required by 250.20(8). To provide adequate isolation, the installed grounding electrode shall ~~should~~ be located atleast 6' from the nearest grounding electrode of the supply side and shall ~~should be~~ connected to the transformer by an insulated grounding conductor.
(5) The location of the isolation transformer shall be on the load side of the service disconnecting means ~~panel containing breaker and/or disconnecting means~~ and shall not be below the electrical datum plane.
Substantiation: Last summer, four children and one adult died in a two week period around July 4 due to electrocution while swimming around boat docks. These occurred in Missouri and Tennessee. The source of the electricity, whether contact voltage or stray voltage, was not detailed in the reports. During testing at similar boat docks, in North Carolina and Georgia, the stray voltage was great enough to pose a similar risk. Application of the isolation transformer, as described in the change proposal, effectively mitigates the risk to people swimming near docks. In the case of single branch circuit, the isolation transformer can also serve as a back up to GFCI outlets and provide effective protection against contact voltages.
The changes presented here address some of the committee member comments to the original change proposal. This includes, changing the verbiage which makes this application mandatory and removing references to obsolete GrCl equipment.
A more detailed description of the isolation transformer application and the test results for contact voltage and stray voltage scenarios is presented in the report, "Summary of NEC Change Proposal for Mitigation of Neutral Related Exposure Voltages at Marinas and Boat Docks."
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: As previously written in CMP-19's action and statement on Proposal 19-107, the installation of a transformer intended to isolate stray voltage (current) is not presently prohibited. The NEC is not intended as a design guide.
CMP-19 is very sympathetic to the evident safety concerns surrounding electrocution hazards at marinas and boatyards. See Comment 19-32.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

19-39 Log #1356 NEC-P19 **Final Action: Reject**
(555.16)

Submitter: Robert Metz, Duke Energy
Comment on Proposal No: 19-107
Recommendation: The following text would be a new paragraph under section 555. Below are the changes recommended to the original change proposal submitted in November 2011.
555.16 Mitigation of Neutral related Stray Voltages
To provide protection for neutral related stray voltages, a suitably rated isolation transformer at the branch circuit service panel supplying the shore power may be permitted.
The following configuration is recommended for the isolated system:
(1) The isolation transformer should be double insulated or its equivalent and shall should have an internal shield between the windings that is rated to carry full fault current.
(2) The isolation transformer should have overcurrent protection on the supply side as required in 450.3.
(3) The isolation transformer should be provided with a ground fault protection device on the load side.
(4) Metal enclosure and internal shield conductor of the transformer should be connected to the supply side neutral and grounding system as required by 250.4(A).
(5) The load sisde neutral and equipment gronding conductors should be connected together and grounded at the tramsformer as required by 250.20(B). to provide adequate isolation, the installed grounding electrode should be located at least 6 ft from the nearest grounding electrode and shouold be connected to the transformer by an insulated grounding conductor.
(6) The location of the isolation transformer should be on the load side of the service panel containing breaker and/or disconnecting means and should not be below the electrical datum plane.
Substantiation: This change proposal was submitted by Carson Day from Georgia Tech NEETRAC. Duke Energy supports this change to provide a method for boat dock owners to mitigate both stray voltage and contact voltage problems. As a registered professional engineer in North and South Carolina and as a Power Quality Specialist with duke Energy, I have worked to address numerous contact and stray voltage issues at docks on Lakes Jocassee, Keowee and Hartwell in South Carolina. Years of monitoring shows that dock safety is a serious issue that is not adequately addressed in the NEC.
The five deaths due to electrocution around boat docks show the importance of this change proposal. contact voltage problems are possible at any boat dock that has electric service. Stray voltage is a problem that can occur even when the dock is wired correctly due to current NEC requirements.
During their testing, NEETRAC has shown that both contact voltage and stray voltage can be fatal. The testing also showed that the use of an isolation transformer can successfully mitigate these dangers.
Panel Meeting Action: Reject

(590.4(J))

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 3-105
Recommendation: Adjust the proposed new third sentence as follows:
Cable assemblies and flexible cords installed for temporary branch circuit or feeder wiring shall not be permitted to be laid on the floor or the ground.
Substantiation: The submitter has identified a significant physical damage concern that should be addressed. This comment provides a slight adjustment to the proposed third sentence in an effort to address the comments and concerns in the negative ballot statements and the panel statement related to the proposal being to broad and overly restrictive. As adjusted, the proposed sentence now clarifies that where cable assemblies and flexible cords are installed as branch circuits or feeders (not connected by cord-and-plug connections) they are not permitted to be laid on the floor or ground. As adjusted this section would not impact the normal construction site use of extension cords that are normally connected and disconnected to a branch circuit. Extension cord use would still be subject to protection from physical damage during such transient use.
Panel Meeting Action: Accept in Principle
Panel Statement: Refer to the panel action and statement on Comment 3-35 that addresses the same issue.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
WALSH, R.: This revised text is an effort to coordinate with OSHA regulations and will not to include extension cords. However, this new text is not enforceable in a practical sense because the the question of what is considered an extension cords is not easily interpreted by the installers. Most often, electrical inspectors are dispatched to approve temporary electrical installations on job sites for supply from the serving utility. Once the utility supply has been approved, the contractors can avoid code compliance of supporting the branch circuits and feeders above the ground or floors by requesting an inspection before installing the cords and cables or after the temporary cords and cables have been removed. Presently, many contractors are reminded by the AHJ to provide GFCI protection for existing outlets during the course of construction. All contractors that are cited agree to comply, however, the next dispatch request is usually for a final inspection when all of the power tools and cords have been removed.
Comment on Affirmative:
CASPARRO, P.: See my comment on Comment 3-35.

3-35 Log #1538 NEC-P03 **Final Action: Accept in Principle**
(590.4(J))

TCC Action: The Correlating Committee directs that the text in the new third sentence in this comment be modified by deleting the comma after "Cable assemblies" as follows: "Cable assemblies and flexible cords and cables installed as branch circuits or feeders shall not be installed on the floor or on the ground."
Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 3-105
Recommendation: This proposal should be Accepted in Principal as follows:
(J) Support of Branch Circuits and Feeders. Cable assemblies and flexible cords and cables shall be supported in place at intervals that ensure that they will be protected from physical damage. Support shall be in the form of staples, cable ties, straps, or similar type fittings installed so as not to cause damage. Cable assemblies and flexible cords and cables shall not be laid in the floor or the ground.
Substantiation: As explained in the substantiation provided in proposal 3-105, this proposed revision seeks to align the NEC requirements with existing OSHA requirements and address a serious safety issue. As the submitter of this proposal, I understand the confusion and rejection by CMP-3. The proposed revision did not seek to prohibit extension cords from being laid on the ground. That would be impossible. It is important to note that the term "extension cord" literally means an extension of the branch circuit. We permit these extensions of branch circuits on the ground in tough/wet construction environments because we need to power hand tools and because we have rules in place that mandate GFCI or an AEGCP for these extensions. There is no such GFCI or AEGCP requirement for branch circuits and feeders, which is why they must be prohibited from being laid on the floor or ground. This is practical, feasible, safety driven and required by OSHA.
The revision to the title of first level subdivision (J), now clarifies that the requirement applies only to branch circuits and feeders. Extension cords are not impacted in any manner.
The proposed text in this comment does not represent new material; it is included in the negative vote of Mr. Casparro and has had public review in the ROP. The negative statement of Mr. Clary says it all.
Panel Meeting Action: Accept in Principle
Revise the comment recommendation to read as follows:
(J) Support. Cable assemblies and flexible cords and cables shall be supported in place at intervals that ensure that they will be protected from physical damage. Support shall be in the form of staples, cable ties, straps, or similar type fittings installed so as not to cause damage. Cable assemblies, and flexible cords and cables installed as branch circuits or feeders shall not be installed on the floor or on the ground. Extension cords shall not be required to comply with 590.4(J). Vegetation shall not be used for support of overhead spans of branch circuits or feeders. (Exception unchanged.)
Panel Statement: The panel recognizes the OSHA regulations in CFR 1926.405(a)(2)(ii)(B). The revised text meets the intent of the submitter. The existing title has been retained because some of the requirements apply more generally.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 12 Negative: 1
Explanation of Negative:
WALSH, R.: This revised text is an effort to coordinate with OSHA regulations and will not to include extension cords. However, this new text is not enforceable in a practical sense because the the question of what is considered an extension cords is not easily interpreted by the installers. Most often, electrical inspectors are dispatched to approve temporary electrical installations on job sites for supply from the serving utility. Once the utility supply has been approved, the contractors can avoid code compliance of supporting the branch circuits and feeders above the ground or floors by requesting an inspection before installing the cords and cables or after the temporary cords and cables have been removed. Presently, many contractors are reminded by the AHJ to provide GFCI protection for existing outlets during the course of construction. All contractors that are cited agree to comply, however, the next dispatch request is usually for a final inspection when all of the power tools and cords have been removed..
Comment on Affirmative:
CASPARRO, P.: OSHA requirements address a serious safety issue of laying cable assemblies, flexible cords and cables installed as branch circuits or feeders on the floor or the ground.

STENE, S.: The text in the new third sentence in this comment should be further modified by deleting the comma after "Cable assemblies" as follows: "Cable assemblies and flexible cords and cables installed as branch circuits or feeders shall not be installed on the floor or on the ground." This new sentence should have the same punctuation marks as the first sentence in this section, otherwise, the comma separates the title from the remainder of the sentence and makes it an incomplete sentence. Without the change in punctuation, "installed as branch circuits or feeders shall not be installed on the floor or on the ground" only applies to "flexible cords and cables", not to "cable assemblies."

3-36 Log #1463 NEC-P03 **Final Action: Reject**
(590.6(A))

Submitter: Michael O. Flegel, Reliance Controls Corporation
Comment on Proposal No: 3-106
Recommendation: Accept the proposal.
Substantiation: Either using GFCI protection or an assured equipment conductor program in the harsh environments covered by this article is a must. But using GFCI protection with a portable generator in ungrounded systems must be understood and is dangerous if not done properly. The changes proposed show how to do it properly as stated in the proposal justification and the study done by Construction Safety Association of Ontario (provided).

The panel continues not to understand the problem. Someone on the panel said that not having a ground wire connected to a GFCI receptacle will not prevent its operation. This is true but is not the point. The point is that GFCI's work only in bonded and grounded systems because those are the systems that can have ground faults back to the source. When I talked to the panel during the last comment cycle, it was clear that the panel didn't understand the benefits of a floating system and the need to have the GFCI protection as close to the tool as possible. At that time and when I realized you were going to require GFCI protection on all portable generators, I asked the panel to at least require the system to be grounded even though this creates an unnecessary environment that more readily creates a ground fault. If you are going to use GFCI protection in portable generator applications, it has to be installed correctly. Please take time to read and understand the material in the proposal and the attached study. If you don't,
you will make a bad decision that will demonstrate that this process is not working and people will get hurt. There is a good reason that the personnel GFCI protection worked prior to the changes in the 2011 NEC. You must give workers the correct information on GFCI use with portable generators so they have the best opportunity to survive ground faults.

The panel statement is incorrect about my proposal. Grounding of the generator with built in GFCI protection would be an alternative to using downstream GFCI protection. If such a generator is not grounded, it would require downstream GFCI protection. It doesn't remove the requirement for integral GFCI protection. It says if it is present, you need to ground the generators to make it work. It does allow generators without integral GFCI protection but they must not be grounded and people must use downstream GFCI protection. This is safer than grounding a generator with the integral protection.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: There has been no additional technical information provided in the comment stage to warrant accepting this comment or the referenced proposal. The conclusions on page 14 and 15 of the GFCI generator study that was done in Canada accurately reflect the safety provided by generators with GFCIs provided. Compliance with 250.34(A) permits the grounding electrode to be eliminated where the neutral is connected to the frame of the portable or vehicle-mounted generator before supplying the line side of the GFCI and providing an equipment grounding conductor with the output of the GFCI to the load downstream.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-37 Log #1162 NEC-P03 **Final Action: Reject**
(590.6(A), Informational Note (New))

Submitter: Thomas A. Domitrovich, Eaton Corporation
Comment on Proposal No: 3-107
Recommendation: This proposal should have been accepted.
Substantiation: The Code panel rejected this proposal stating "All components of an electrical system must comply with 110.10, therefore, if the information is available from the manufacturer, inserting it into an Informational Note is unnecessary. This same information could be inserted throughout the NEC on many different products and would just load the NEC with data when the installer can receive the same information from the manufacturer or on-line... "

However, the case of a GFCI receptacle is much different than most products in that many people are not even aware that these devices have a short circuit rating.

The UL 943 Standard requires a 2000A test for the typical device, and permits an Optional 10kA Short Circuit Current Test, but does NOT permit it to be marked 10kA. UL 943 states the following:

"SA3.1 A ground-fault circuit-interrupter that complies with SA2.1 and SA2.2 shall not be marked to indicate the ability to withstand a 10kA short circuit current as a result of these tests."

The rating information for these products, especially for the inspector reviewing the installation after these products have been installed, is often unchecked. This enables the misapplication of these life saving devices beyond their ratings. There are many areas where these devices are applied, especially in commercial and industrial environments, where the available fault currents may exceed the rating of the device.

This informational note is important for safety as it raises the awareness to installers and inspectors alike who are not aware of the short circuit capabilities of these devices. This will go a long way for ensuring these devices are applied within their rating.
Panel Meeting Action: Reject
Panel Statement: As stated in the panel statement for Proposal 3-107, all components of an electrical system must comply with 110.10. Therefore, if the information is available from the manufacturer, inserting it into an Informational Note is unnecessary.

This same information could be inserted throughout the NEC on many different products and would just load the NEC with data when the installer can receive the same information from the manufacturer or on-line.

The panel recognizes the proposal is dealing with 2000 ampere short circuit current rating. The submitter has not provided any additional technical substantiation for inserting this informational note into 590.6(A).

Comment on Proposal No: 3-107a
Recommendation: Revise text to read as follows:
(1) Receptacle Outlets Not Part of Permanent Wiring. All 125-volt, single-phase,15-, 20-, and 30-ampere receptacle outlets that are not a part of the permanent wiring of the building or structure and that are in use by personnel shall have ground-fault circuit-interrupter protection for personnel. Listed cord sets or devices incorporating listed ground-fault circuit-interrupter protection for personnel identified for portable use shall be permitted.
Substantiation: The permissible use of "listed cord sets or devices incorporating listed ground-fault circuit-interrupter protection for personnel identified for portable use" is not explicitly stated in the existing Article 590.6(A)(1) language, as is done in Article 590.6(A)(2) and Article 590.6(A)(3). The proposed language is to add this text which makes it explicitly clear that these cord sets or devices are permitted in addition to the ground-fault circuit-interrupter (GFCI) protected wiring.
In addition, the proposed language requires that listed cord sets or devices incorporate GFCI protection for personnel, resulting in all of the outlets of these cord sets providing GFCI protection.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13
Comment on Affirmative:

STENE, S.: This comment should have been an accept in principle with the following underlined text as follows: Listed cord sets or devices incorporating listed ground-fault circuit-interrupter protection for personnel identified for portable use shall be permitted, where already protected by a GFCI device as required by the first sentence in (A)(1) above."
The added phrase "where already protected by a GFCI device as required by the first sentence in (A)(1) above" ensures that the portable GFCI device is located downstream from a GFCI device already protecting the circuit conductors out to the location of the portable device.

3-39 Log #1488 NEC-P03 **Final Action: Reject**
(590.6(A)(3))

Submitter: Richard E. Loyd, Sun Lakes, AZ
Comment on Proposal No: 3-106
Recommendation: Revise text to read as follows:
(3) Receptacles on ~~15- kW or less~~ Portable Generators. 125-volt and 125/250-volt, single-phase, 15-, 20-, and 30-ampere receptacle outlets that are a part of a ~~15 -kw or smaller~~ portable generator shall be ~~have~~ listed ground-fault circuit-interrupter protection for personnel type. All 15- and 20- ampere, 125- and 250-volt receptacles, including those that are part of a portable generator, used in a damp or wet location shall comply with 406.9(A) and a. Listed cord sets or devices incorporating listed ground-fault circuit interrupter protection for personnel identified for portable use shall be permitted ~~for use with 15-kW or less portable generators manufactured or remanufactured prior to January 1, 2011~~.
Substantiation: There has been no substantiation for limiting this rule to 15 kW or smaller generators.

The submitter as well as many comments in CMP-3, 13 and 5 related to this subject has substantiated that in some cases the safety intended may not protect those using the portable generator regardless of the installation of GFCI receptacles on the equipment. This fact should cause concern to the committee, 90.1(A) states the purpose of the code is "safeguarding persons and property" It is an established fact that placing the GFCI protection as close to the tool as possible or using double insulated tools is desirable to achieved this safeguarding.

There has been no substantiation of a safety problem even though both the floating neutral and the bonded types of generators are being used every day in many applications. Based on the ECOA/IBEW study both types can be safe or not so safe based on the conditions of use.

Placing the GFCI nearest to likely fault (tool or personnel) and using double insulated tools provides the greatest safety. Nothing in the study indicates the bonded type is safer.

In 1997 the construction safety association of Ontario (ECAO) in conjunction with the IBEW, with the assistance of Kubota Canada completed a in-depth study on the use of GFCIs on portable generators. They tested both types the following are the analysis and conclusions of that study:

Analysis: It is clear that when generators of the floating-neutral or bonded-neutral type sit on dry surfaces in dry environments, they behave similarly In both cases, the GFCIs failed to trip In addition, the reading of little or no current on the multimeter indicated that there was not enough electricity leaking to ground to constitute a hazard In both cases, the GFCI did not trip when there was only one ground fault in the system. When effective grounding was established, GFCIs performed as expected Testing also proved that wet surfaces can create grounding for bonded-neutral generators When a bonded-neutral generator was placed on wet ground, the GFCI tripped under the prescribed current leakage.

However, testing also showed that grounding can vary from one place to another, even when both are relatively close In one test, a variation in ground elevation yielded different results When the screwdriver was inserted in wet ground, the GFCI tripped When the screwdriver was moved 100 feet to a slope that had better drainage, the GFCI did not trip.

The second series of tests showed that the placement of the GFCI in the circuit is critical to a floating-neutral system.

When the GFCI was plugged directly to the generator, the GFCI failed to detect any imbalance in the current As a result, it did not trip even when the current leak reached a higher than acceptable level When the GFCI was placed at the tool, however, it tripped at the prescribed level.

Conclusions: Since the GFCI test button functioned regardless of the generator's grounding property, GFCI test buttons cannot and should not be used to test the effectiveness of GFCIs as personnel protection or the grounding of portable generators The test button should only be used to test GFCIs after grounding has been established. Portable generators *with established ground* must be treated the same way as any grounded utility system Workers must be protected by GFCIs to prevent electrocution by ground fault Ground should be established and verified only by competent workers trained to do so and using specialized instruments.

Generators with established ground allow a GFCI mounted at the generator outlet to work effectively. When there is a current leak, the current goes to ground to complete the circuit. This creates an imbalance, causing the GFCI to trip When generators with established ground are being used, GFCIs should be located *closest to the generator,* protecting all workers from ground faults, not just the generator user.

Construction people complain that GFCIs trip unnecessarily, especially with extension cords As a result, personnel often consider GFCIs a nuisance and don't use them But GFCIs trip for a reason These trips should be treated as a warning that there is a ground fault in the system When a GFCI trips, tools, cords, and plugs should be inspected for defects and, where necessary, replaced before work continues.

When the electrical system does not have reference to ground, GFCIs mounted on the generator do not work With one fault, not enough current leaks to ground to be considered a hazard.

Thus, in a floating-neutral circuit, workers are not endangered by electrocution from current going to ground *as long as there is only ONE fault in the system.*

However, with two faults in the system, one on the neutral and one on the hot side, it is possible that the floating-neutral system can become grounded In that case, workers without properly located GFCIs can be electrocuted Two faults can be produced by a defective generator, poorly insulated or defective extension cord, defective tool, or defective plug, to name just a few causes Other conditions such as wet ground, rain, or high humidity can increase the risk that the electrical system will become grounded.

Testing showed that in a two-fault system, the placement of the GFCI is critical The GFCI must be placed between the two faults in order to function Since the likely locations for faults are tool cord, tool plug, and extension cord, the GFCI should be placed *closest to the tool.*

Last but not least, the hazards of electrocution can be minimized by using only double-insulated tools in good working order and well-insulated cords.

Panel Meeting Action: Reject

Panel Statement: There has been no additional technical information provided in the comment stage to warrant accepting this comment or the referenced proposal. The conclusions on page 14 and 15 of the GFCI generator study that was done in Canada accurately reflect the safety provided by generators with GFCIs provided. Compliance with 250.34(A) permits the grounding electrode to be eliminated where the neutral is connected to the frame of the generator before supplying the line side of the GFCI and providing an equipment grounding conductor with the output of the GFCI to the load downstream. Requiring GFCI protection on the generator provides a safer installation as indicated in the conclusion of the Construction Safety Association of Ontario study as noted above. Using an additional portable GFCI protection device is permissible but leaving the conductors unprotected between the source of supply (the generator) and the portable GFCI leaves these conductors and personnel totally unprotected against a ground fault.

(600.4(E))

Submitter: Mike Holt, Mike Holt Enterprises

Comment on Proposal No: 18-93

Recommendation: Reject this proposal.

Substantiation: While doing an inspection, the installer hands me the instructions for the sign. I am then supposed to fail him or her because the sign isn't marked to state that instructions are required, despite the fact that I have the instructions in my hand? That is indefensible.

Panel Meeting Action: Reject

Panel Statement: Marking is a reminder to the inspector. Actions taken by installers does not circumvent the code requirements.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 9 Negative: 2

Explanation of Negative:

CARPENTER, F.: While we acknowledge that UL 48 requires all signs to be supplied with installation instructions, there is no justification to require marking all signs with a statement indicating that installation instructions have been provided. The current edition of UL 48 requires Section Signs to be marked "Installation and assembly required, see installation instructions" since Section Signs frequently require significant field wiring. Many complete signs are considerably simpler in construction and requiring a similar marking for all signs has not been substantiated.

TODD, S.: The requirement for installation instructions is a part of the product standard as stated in Mr. F. Carpenter's negative ballot on Proposal 18-93 and does not add to the safety of the installation.

18-46 Log #924 NEC-P18 **Final Action: Accept in Principle**
(600.6(A)(1))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 18-99
Recommendation: Revise text to read as follows:
600.6 Disconnects.
(A) Location.
1. At Point of Entry to a Sign Enclosure. The ~~disconnect shall be located at the point the~~ feeder circuit or branch circuit(s) supplying a sign or outline lighting system shall enter the disconnect and shall not enter~~s~~ a sign enclosure. ~~and shall disconnect all wiring where it~~ The disconnect shall open all ungrounded conductors before they enter~~s~~ the enclosure of the sign. **[ROP 18–99]**
Substantiation: The above text is clearer and, I believe, matches the admirable intent of the original proposal. Note that the exception allows the feed before the disconnect to pass through the sign ONLY if it is completely enclosed in a raceway.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 18-47 which meets the intent of the submitter.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11

18-47 Log #1451 NEC-P18 **Final Action: Accept in Principle in Part**
(600.6(A)(1))

Submitter: William S. Dundas, International Sign Association
Comment on Proposal No: 18-99
Recommendation: Revise text to read as follows:
(1) At Point of ~~Entry~~ Connection to a Sign ~~Enclosure~~. The disconnect shall be located at the point the feeder circuit or branch circuit(s) supplying a sign or outline lighting system ~~enters~~ connects to a sign enclosure or a metal or nonmetallic pole in accordance with 600.5(C)(3) and shall disconnect all wiring ~~where~~ at the point it enters ~~the enclosure of~~ the sign enclosure or metal or nonmetallic pole.
~~Exception: A disconnect is not required for branch or feeder circuits passing through the sign where enclosed in a Chapter 3 listed raceway.~~
Substantiation: The phraseology for this new rule must be changed to include the connection point for feeders and branch circuits on freestanding signs which typically are located at the base of the sign structure and not at or on the sign enclosure itself. Poles are an integral part of a freestanding sign and are permitted as enclosures for supply conductors in signs and luminaires. (410.30(B) A disconnecting means, either snap switch or circuit breaker in a panelboard supplying the sign meets the intent of the original proposal. [ROP 18-99] The use of the term "connection" is appropriate and harmonizes with 90.2(3). Electric signs are utilization equipment that is connected to the electrical supply. A Connection Point is analogous to the Code term "Service Point" and clearly describes the intent to disconnect conductors before they enter a sign enclosure.
Exception. Agree with dissenting vote by B. Gray. The proposed rule applies only to conductors that supply a sign or flood lights that are part of the sign system. A raceway for conductors that does not terminate in the sign is an integral part of the sign construction and covered under UL 48. Article 300 is not intended to apply to conductors that are integral part of listed utilization equipment. (300.1)(B).
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Principle in Part
Revise text to read as follows:
(1) At Point of Entry to a Sign Enclosure. The disconnect shall be located at the point the feeder circuit or branch circuit(s) supplying a sign or outline lighting system enters a sign enclosure or a pole in accordance with 600.5(C)(3) and shall disconnect all wiring where it enters the enclosure of the sign or pole.
Exception: A disconnect shall not be required for branch or feeder circuits passing through the sign where enclosed in a Chapter 3 listed raceway.
Panel Statement: The panel accepts adding poles to the rule, but did not se the need to reference both metallic and non-metallic types." And delete all other proposed changes. The existing language adequately describes the intent of the panel. In addition, the Panel added the words "or pole" to the base paragraph and " shall" and "be" to the exception for better clarity. The panel concluded that the exception should be retained as Chapter 3 wiring methods are suitable to pass conductors through a sign enclosure.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 11
Comment on Affirmative:
KOCHAN, M.: I agree with the addition of the words "sign body" to clarify where the disconnect can be safely placed in most general duty signs. My concern is when I build an extremely large sign with a super structure and provided with multiple feeders, branch circuits with multiple 200 amp panels provided at each level of the structure that will qualify as the disconnect. These panel are delivered and comply with Chapter Three wiring methods. The circuit breaker in these panel will act as the disconnect before the circuits enter the sign section or enclosure.
WRIGHT, R.: I accept the action of the panel to correct and clarify our intention. My concern is we have omitted the words "Body" after sign and before enclosure. Also we did not change the word wiring to "ungrounded conductors" and could have the impression the neutrals need opened as well. The wiring is not as critical as the exclusion of the sign body. The intention of this section is to protect the service personnel from contacting live conductors when they believe they have disconnected the sign. Electric signs have either a sign body or sign enclosure or both. My concern is with the revised text we could allow a conductor to be live in the sign body and then disconnected when it enters the sign enclosure. Corrective text could be:
(1) At Point of Entry to a Sign Body or Enclosure. The disconnect shall be located at the point the feeder circuit or branch circuit(s) supplying a sign or outline lighting system enters a sign body, enclosure or a pole in accordance with 600.5 (C) (3) and shall disconnect all wiring ungrounded conductors where it enters the enclosure or body of the sign or pole.

18-48 Log #925 NEC-P18 **Final Action: Hold**
(600.6(B))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 18-102a
Recommendation: Revise text to read as follows:
600.6 Disconnects.
(B) Control Switch Rating. Switches, flashers, and similar devices controlling transformers and electronic power supplies shall be rated for controlling inductive loads or have a current rating not less than twice the current rating of the transformer or the electronic power supply. **[ROP 18–102a]**
Substantiation: Transformerless electronic power supplies typically have high inrush currents.
Panel Meeting Action: Hold
Panel Statement: The panel finds that this is not a comment related to Proposal 102a and is therefore new material and needs to be held as a proposal for the next cycle.
Number Eligible to Vote: 11

18-49 Log #1450 NEC-P18 **Final Action: Accept**
(600.12(A))

Submitter: William S. Dundas, International Sign Association
Comment on Proposal No: 18-110
Recommendation: Revise text to read as follows:
(A) 1000 Volts or Less. Neon and ~~S~~secondary circuit wiring of 1000 volts or less shall comply with 600.31.
Substantiation: To harmonize 600.12(B) with 600.32, CMP 18 agreed that scope of 600.32 was specific to neon secondary wiring over 1000 volts but at the same time rejected harmonizing 600.12(A) with the scope of 600.31, Neon Secondary-Circuit Wiring, 1000 volts or Less.
The Panel's premise is that this applies to secondary wiring for fluorescent, HID and other. This overlooks the fact that there are neon cold cathode systems used for sign illumination which employ transformers rated 1000 volts or less. Secondly, 600.31 was inserted into Article 600 during the 1996 Code Cycle. The Panel's substantiation at that time was that 600.31 applied to a secondary circuit of a transformer and ballast; presumably neon and fluorescent electric discharge tubing. Including neon along
with secondary wiring in the reference to 600.31 will avoid confusion and will harmonize 600.12(A) with the title and scope of 600.31.
"Sections 600.31 (b) and 600-32(b) apply to the secondary circuit of a transformer or ballast." [1996 ROP 18-91(a)]

ARTICLE 604 — MANUFACTURED WIRING SYSTEMS

19-41 Log #1297 NEC-P19 **Final Action: Reject**
(604.4 Exception No. 3 (New))

Submitter: Fred Carpenter, Acuity Brands Lighting Inc.
Comment on Proposal No: 19-110
Recommendation: The Panel should accept the recommended text for new Exception No. 3 from Proposal 19-110.
Substantiation: The Panel indicated that they had two problems with the proposal. The first problem indicated was that, "Some manufactured wiring systems, listed or not, are comprised of wiring methods themselves which are not suitable for concealed spaces according to Chapter 3 of the Code". The proposed wording for new Exception No. 3 does not negate Section 604.5, so this stated concern is already addressed by the Code. The second reason stated for rejecting the proposal was, "Presently, neither Article 604 or UL 183 have provisions for manufactured wiring systems listed for use in concealed spaces". I concur with the Panel, neither Article 604 nor UL 183 have provisions for MWS in concealed spaces; that's why I proposed the revision. UL has a policy that prohibits their standards from conflicting with the Code. When a panel accepts a revision to the Code that would subsequently require UL to address the Code revisions in one or more of their standards, UL is obligated to undertake the necessary standards revisions. Since listing requirements for Manufactured Wiring Systems designed for use in concealed spaces do not currently exist, accepting Proposal 19-110 would clearly prompt a revision to UL 183 to develop appropriate listing requirements. Historically, Code revisions have prompted revisions to UL standards, so the current lack of provisions in UL 183 should not be used as a restriction to this proposed revision. If desired the Panel could add a future effective date to allow ample time for the needed standard revision.
Panel Meeting Action: Reject
Panel Statement: The proposed language is a paradox. The definition of "Concealed" in Article 100 starts with "Rendered inaccessible…". The panel cannot understand how a "listed enclosure that provides access for inspection" can be located in concealed spaces. Limitations on placement of electrical connections and certain wiring systems in concealed spaces does not only address inspection, say at rough in, it also addresses accessibility for maintenance without the destruction of fixed structures.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10
Comment on Affirmative:
LICHTENSTEIN, T.: The addition of new Exception No. 3 to 604.4 is unnecessary. Proposal 19-110 supporting documentation included an illustration of what the submitter was trying to revise the Code to permit. The illustration showed a MWS power distribution assembly that was accessible above a ceiling with a cable/flexible conduit whip tap that extended down into a concealed framed wall and terminated in a device box for connection to a switch or receptacle. This construction is already permitted by 604.4 Exception No. 1.

ARTICLE 605 — OFFICE FURNISHINGS

18-52 Log #343 NEC-P18 **Final Action: Accept**
(605.3)

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 18-127
Recommendation: Revise text to read as follows:
A wiring channel that is separate from the channel containing the branch circuits for light and power may be provided within the system components for the routing of communications, signaling, and ~~fiber~~ optical fiber cables.
Substantiation: This is an editorial comment. Terminology should be consistent throughout the code. Article 770 covers optical fiber cables not fiber optic cables. There are many places this change needs to be made to correlate with Article 770.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

18-53 Log #1085 NEC-P18 **Final Action: Reject**
(605.3)

Submitter: Michael Everhart, Steelcase Inc.
Comment on Proposal No: 18-125a
Recommendation: Revise text to read as follows:
~~A wired partition shall not extend from floor to ceiling.~~ A wired partition shall not penetrate the ceiling.
~~Exception: Where permitted by the Authority Having Jurisdiction, these relocatable wired partitions shall be permitted to extend to, but shall not penetrate, the ceiling.~~
Substantiation: NEC clean up. Proposed wording provides the same requirements as previous, with less words.
Panel Meeting Action: Reject
Panel Statement: The submitter's recommended revision completely changes the intent of the article. The proposed text deletes the rule that prohibits wired partitions from extending from floor to the ceiling and would only require wired partitions from penetrating the ceiling. In addition, removing the exception an AHJ would not be able to grant a modification to the rule.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

18-54 Log #1084 NEC-P18 **Final Action: Accept**
(605.6(6))

Submitter: Michael Everhart, Steelcase Inc.
Comment on Proposal No: 18-125a
Recommendation: Revise text to read as follows:
A cord provided ~~on the load side of a~~ on a listed Class 2 power source shall be of the type provided with the listed luminaire assembly or of the type specified in Sections 725.130 and 725.127.
Substantiation: Existing wording would require that a listed Class 2 power supply have a supply cord of "hard usage type" per Section 605.6(5). Hard usage type cord on a Class 2 power supply is not an industry standard and extremely limits the power supplies that are available for this application. Other Class 2 power supplies that are utilized in the office environment (computers, desk lamps, radios etc.) are not required to be supplied with "hard usage cords".
Adding the requirements from NEC Section 725.127 will ensure that the supply side as well as the load side of a Class 2 power supply is adequately constructed.
Panel Meeting Action: Accept
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

Ballot Results: Affirmative: 11

12-5 Log #748 NEC-P12 **Final Action: Accept**
(620.3(A) and (C))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 12-17
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. Section 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 and 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

Comment on Proposal No: 12-19a
Recommendation: Revise text to read as follows:

620.13 Feeder and Branch-Circuit Conductors. Conductors shall have an ampacity in accordance with 620.13(A) through (D). With generator field control, the conductor ampacity shall be based on the nameplate current rating of the driving motor of the motor-generator set that supplies power to the elevator motor.
Informational Note No. 1: The heating of conductors depends on ~~root-mean-square~~ current values, which, with generator field control, are reflected by the nameplate current rating of the motor-generator driving motor rather than by the rating of the elevator motor, which represents actual but short-time and intermittent full-load current values.
(A) Conductors Supplying Single Motor. Conductors supplying a single motor shall have an ampacity not less than the percentage of motor nameplate current determined from 430.22(A) and (E).
Informational Note: Some elevator motor currents, or those of similar functions, exceed the nameplate value, but because they are inherently intermittent duty ~~and the heating of the motor and conductors is dependent on the root-mean-square (rms) current value~~, conductors are sized for duty cycle service as shown in Table 430.22(E). **[ROP 12–19a]**
(B) Conductors Supplying a Single Motor Controller. Conductors supplying a single motor controller shall have an ampacity not less than the motor controller nameplate current rating, plus all other connected loads. Motor controller nameplate current rating shall be permitted to be derived based on ~~the rms value of the~~ motor current using an intermittent duty cycle and other control system loads, if present. **[ROP 12–19a]**
__OR__
620.13 Feeder and Branch-Circuit Conductors. Conductors shall have an ampacity in accordance with 620.13(A) through (D). With generator field control, the conductor ampacity shall be based on the nameplate current rating of the driving motor of the motor-generator set that supplies power to the elevator motor.
Informational Note No. 1: The heating of conductors depends on ~~root-mean-square~~ rms current values, which, with generator field control, are reflected by the nameplate current rating of the motor-generator driving motor rather than by the rating of the elevator motor, which represents actual but short-time and intermittent full-load current values.
(A) Conductors Supplying Single Motor. Conductors supplying a single motor shall have an ampacity not less than the percentage of motor nameplate current determined from 430.22(A) and (E).
Informational Note: Some elevator motor currents, or those of similar functions, exceed the nameplate value, but because they are inherently

intermittent duty ~~and the heating of the motor and conductors is dependent on the root-mean-square (rms) current value~~, conductors are sized for duty cycle service as shown in Table 430.22(E). **[ROP 12–19a]**

(B) Conductors Supplying a Single Motor Controller. Conductors supplying a single motor controller shall have an ampacity not less than the motor controller nameplate current rating, plus all other connected loads. Motor controller nameplate current rating shall be permitted to be derived based on the rms value of the motor current using an intermittent duty cycle and other control system loads, if present**. [ROP 12–19a]**

Substantiation: ‘rms’ is never referenced in the rest of the text in connection with current, only with voltage. ‘rms’ is not really related to duty cycle as suggested in (A).

__OR__

The dominate form of reference to root-mean-square is rms in the rest of the text.

Panel Meeting Action: Accept in Principle

Revise the informational note to read as follows:

Informational Note: Some elevator motor currents, or those motor currents of similar function, exceed the motor nameplate value. Heating of the motor and conductors is dependent of the root-mean square (rms) current value and the length of operation time. Because this motor application is inherently intermittent duty, conductors are sized for duty cycle service as shown in Table 430.22(E).

Panel Statement: CMP-12 understands the issue of the submitter with regard to the informational note after 620.13(A). CMP-12 revises the text of the informational note.

Comment on Proposal No: 12-32

Recommendation: Continue to Accept.

Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. Section 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 and 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

ARTICLE 625 — ELECTRIC VEHICLE CHARGING SYSTEM

12-19 Log #796 NEC-P12 **Final Action: Accept in Principle**
(625.1, Informational Note 2)

Submitter: Joseph M. Bablo, UL LLC
Comment on Proposal No: 12-52
Recommendation: Revise text to read as follows:
Informational Note No. 2: UL 2594-~~2011~~2012, *Standard for Electric Vehicle Supply Equipment*, is a safety standard for Electric Vehicle Supply Equipment. UL 2202-2009, *Standard for Electric Vehicle Charging System Equipment*, is a safety standard for Electric Vehicle Charging Equipment.
Substantiation: The referenced date in the proposal would not be correct. The actual date for the standard would be 2012.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Informational Note No. 2: UL 2594-~~2011~~2013, *Standard for Electric Vehicle Supply Equipment*, is a safety standard for Electric Vehicle Supply Equipment. UL 2202-2009, *Standard for Electric Vehicle Charging System Equipment*, is a safety standard for electric vehicle charging equipment.
Panel Statement: CMP-12 requests that the Correlating Committee verify that the standard has been published. As information, UL 2594-2012 is not yet published and is proposed to have a date of 2013.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Ward, R.
Comment on Affirmative:
CROUSHORE, T.: This comment should be accepted provided the particular UL standard is published. CMP-12 members stated that they reviewed the draft of the standard but not the published one because it was not available at the time of the meeting. Reference NFPA Regulations Governing Committee Projects, Section 3.3.7. Should this standard not be published at the time of the Correlating Committee meeting, this comment should be rejected.

12-20 Log #776 NEC-P12 **Final Action: Accept in Principle**
(625.2.Cable Management System)

Submitter: Gregory C. Nieminski, Gregory C. Nieminski, LLC
Comment on Proposal No: 12-52
Recommendation: Revise text to read as follows:
Cable Management System. An apparatus designed to control and organize unused lengths of cable or cord at electric vehicle charging sites.
Substantiation: The term "cable management system" has been used in the new Article 62.5.17(C) but is not defined. The term is presently used and defined in Article 626. It is proposed that the same definition be added to 625.2 or, alternatively, that the term be defined commonly in Article 100.
This comment is submitted on behalf of the EPRI Electric Transportation Infrastructure Working Council's NEC Task Force.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Cable Management System (Electric Vehicle Supply Equipment). An apparatus designed to control and organize unused lengths of output cable to the electric vehicle.
Panel Statement: CMP-12 edits the submitter's definition to add clarity.
As information to the Correlating Committee, CMP-12 considered and dismissed a single definition in Article 100. A similar, but not identical, definition is placed in Article 626 for that equipment.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Ward, R.

12-21 Log #480 NEC-P12 **Final Action: Reject**
(625.2.Electric Vehicle and 625.3 (New))

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 12-54
Recommendation: Revise text to read as follows:
Electric Vehicle. An automotive-type vehicle for on-road use, such as passenger automobiles, buses, trucks, vans, neighborhood electric vehicles, electric motorcycles, and the like, primarily powered by an electric motor that draws current from a rechargeable storage battery, fuel cell, photovoltaic array, or other source of electric current. ~~Plug-in hybrid electric vehicles (PHEV) are considered electric vehicles. For the purpose of this article, off-road, self-propelled electric vehicles, such as industrial trucks, hoists, lifts, transports, golf carts, airline ground support equipment, tractors, boats, and the like, are not included.~~
625.3 General Requirements
625.3.1 Plug-in hybrid electric vehicles (PHEV) shall be considered electric vehicles.
625.3.2 For the purpose of this article, off-road, self-propelled electric vehicles, such as industrial trucks, hoists, lifts, transports, golf carts, airline ground support equipment, tractors, boats, and the like, are not included.
625.3.3 Both the electric vehicle connector and the electric vehicle inlet shall be considered a part of the electric vehicle coupler.
625.3.4 For the purposes of this Code, the electric vehicle inlet shall be considered to be part of the of the electric vehicle and not part of the electric vehicle supply equipment.
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains a list of examples and such examples are not usually contained in definitions. Moreover, the information included should really be considered a requirement. If the CMP agrees that this is a requirement it should be placed somewhere else in Article 625, and a new section 625.3, on general requirements, is the perfect location, since NEC definitions shall not contain requirements. Moreover, the NEC manual of style does not permit the definition to contain the defined term and the second sentence of the definition contains the term "electric vehicle". The sections in 625.3.3 and 625.3.4 are associated with the comments to proposals 12-55 and 12.56.
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Panel Meeting Action: Reject
Panel Statement: CMP-12 rejects changing the definition. The current definition does comply with the NEC Style Manual because it just states what an electrical vehicle is and what it is not. In addition, the submitter's text does not add clarity to the article.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Ward, R.

12-22 Log #481 NEC-P12 **Final Action: Reject**
(625.2.Electric Vehicle Connector and 625.3 (New))

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 12-55
Recommendation: Revise text to read as follows:
Electric Vehicle Connector. A device that, by insertion into an electric vehicle inlet, establishes an electrical connection to the electric vehicle for the purpose of power transfer and information exchange. ~~This device is part of the electric vehicle coupler~~.
625.3 General Requirements
625.3.1 Plug-in hybrid electric vehicles (PHEV) shall be considered electric vehicles.
625.3.2 For the purpose of this article, off-road, self-propelled electric vehicles, such as industrial trucks, hoists, lifts, transports, golf carts, airline ground support equipment, tractors, boats, and the like, are not included.
625.3.3 Both the electric vehicle connector and the electric vehicle inlet shall be considered a part of the electric vehicle coupler.
625.3.4 For the purposes of this Code, the electric vehicle inlet shall be considered to be part of the of the electric vehicle and not part of the electric vehicle supply equipment.
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains a requirement. If the CMP agrees that this is a requirement it should be placed somewhere else in Article 625, and a new section 625.3, on general requirements, is the perfect location, since NEC definitions shall not contain requirements. Moreover, the NEC manual of style does not permit the definition to contain the defined term. The sections in 625.3.1 through 625.3.4 are associated with the comments to proposals 12-54 and 12.56 also.
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Panel Meeting Action: Reject
Panel Statement: CMP-12 rejects changing the definition. The current definition does comply with the NEC Style Manual because it just states what an electrical vehicle connector is and what it is not. In addition, the submitter's text does not add clarity to the article.
Number Eligible to Vote: 12

Ballot Not Returned: 1 Ward, R.

12-23 Log #774 NEC-P12 **Final Action: Accept**
(625.2.Electric Vehicle Connector)

Submitter: Gregory C. Nieminski, Gregory C. Nieminski, LLC
Comment on Proposal No: 12-52
Recommendation: Revise text to read as follows:
~~Electric Vehicle Connector~~ Electric Vehicle Connector
Substantiation: It appears that the term was crossed out inadvertently in the NEC Committee Report on Proposals, A2013 (page 70-658,printed version), and should remain.
This comment is submitted on behalf of the EPRI Electric Transportation Infrastructure Working Council's NEC Task Force.
Panel Meeting Action: Accept
Panel Statement: The submitter's text clarifies that the text of the ROP Draft

is correct. However, the text of the Proposal 12-52 has electric vehicle connector struckthrough. CMP-12 accepts that electric vehicle connector is the intended title for this definition.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Ward, R.

12-24 Log #482 NEC-P12 **Final Action: Reject**
(625.2.Electric Vehicle Inlet and 625.3 (New))

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 12-56
Recommendation: Revise text to read as follows:
Electric Vehicle Inlet. The device on the electric vehicle into which the electric vehicle connector is inserted for power transfer and information exchange. ~~This device is part of the electric vehicle coupler. For the purposes of this *Code,* the electric vehicle inlet is considered to be part of the electric vehicle and not part of the electric vehicle supply equipment.~~
625.3 General Requirements
625.3.1 Plug-in hybrid electric vehicles (PHEV) shall be considered electric vehicles.
625.3.2 For the purpose of this article, off-road, self-propelled electric vehicles, such as industrial trucks, hoists, lifts, transports, golf carts, airline ground support equipment, tractors, boats, and the like, are not included.
625.3.3 Both the electric vehicle connector and the electric vehicle inlet shall be considered a part of the electric vehicle coupler.
625.3.4 For the purposes of this Code, the electric vehicle inlet shall be considered to be part of the of the electric vehicle and not part of the electric vehicle supply equipment.
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains a set of requirements. If the CMP agrees that this is a requirement it should be placed somewhere else in Article 625, and a new section 625.3, on general requirements, is the perfect location, since NEC definitions shall not contain requirements. Moreover, the NEC manual of style does not permit the definition to contain the defined term and the second sentence of the definition contains the term "electric vehicle inlet". The sections in 625.3.1 through 625.3.4 are associated with the comments to proposals 12-54 and 12.55 also.
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Panel Meeting Action: Reject
Panel Statement: CMP-12 rejects changing the definition. The current definition does comply with the NEC Style Manual because it just states what an electrical vehicle Inlet is and what it is not. In addition, the submitter's text does not add clarity to the article.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Ward, R.

12-25 Log #1375 NEC-P12 **Final Action: Hold**
(625.2.Fastened in Place (New))

TCC Action: The Correlating Committee directs that the panel action be reported as "Hold" as this definition introduces a new concept that has not had public review.
Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 12-52
Recommendation: Add new definition:
Fastened In Place: equipment attached to a structure but removable without the use of tools, where the fastening means are specifically designed to facilitate the following:
a. Ready removal for interchange
b. Facilitate maintenance and repair
c. Repositioning to another location
Substantiation: The term or phrase "fastened in place" is not defined and subject to misinterpretation. The definition is needed for consistency throughout article 625.
Panel Meeting Action: Accept in Principle
Add new definition to 625.2 that reads as follows:
Fastened In Place. Equipment attached to a structure either permanently or where the fastening means is specifically designed to facilitate removal for interchange, maintenance and repair, and repositioning to another location.
Panel Statement: CMP-12 agrees with the need to add a definition for "fastened in place" and has revised the submitter's text to comply with the NEC Style Manual. Tools are not requisite for equipment to be fastened in place.
Since "fastened in place" is used several times in Article 625, CMP-12 defines the term to clarify for the users of the code the specific criteria to allow cord and plug connected equipment above 125 volts and 20 amps without permitting portable equipment above 125 volts and 20 amps.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Ward, R.

12-26 Log #775 NEC-P12 **Final Action: Accept in Principle**
(625.2.Power Supply Cord)

Submitter: Gregory C. Nieminski, Gregory C. Nieminski, LLC
Comment on Proposal No: 12-52
Recommendation: Revise text to read as follows:
Power Supply Cord. An assembly consisting of an attachment plug cap and length of flexible cord that connects the equipment (E SE) to a receptacle.
Substantiation: The term "attachment plug cap" appears only once in Article 625 in this definition. The primary term "attachment plug" is used everywhere else in Article 625 and should be used here for consistency. It is also the predominant term used in the NEC and defined in Article 100:
Attachment Plug (Plug Cap) (Plug). A device that, by insertion in a receptacle, establishes a connection between the conductors of the attached flexible cord and the conductors connected permanently to the receptacle.
Attachment plug cap is a term referring to an older design of an attachment plug that permitted the flexible cord to be knotted for strain relief purposes and covered by a "cap" that was part of the attachment plug assembly. The term is not used in LZ 191. Standard for Attachment Plugs and Receptacles, nor is the method of using a knot for strain relief purposes included in the Standard.
This comment is submitted on behalf of the EPRI Electric Transportation Infrastructure Working Council's NEC Task Force.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
Power Supply Cord. An assembly consisting of an attachment plug and length of flexible cord that connects the electric vehicle supply equipment (EVSE) to a receptacle.
Panel Statement: CMP-12 revises the submitter's text to remove "cap," adds "electric vehicle supply" and editorially correct EVSE.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Ward, R.

12-27 Log #797 NEC-P12 **Final Action: Accept in Principle**
(625.10(A) and Exception (New))

Submitter: Joseph M. Bablo, UL LLC
Comment on Proposal No: 12-52
Recommendation: Revise text to read as follows:
625.10 Electric Vehicle Coupler.
The electric vehicle coupler shall comply with 625.10(A) through (F).
(A) Polarization. The electric vehicle coupler shall be polarized ~~unless part of a listed electric vehicle charging system or an electric vehicle supply equipment system~~.
Exception: A coupler that is listed as part of the electric vehicle supply equipment.
Substantiation: The intent of this clause would be that the coupler shall be polarized, but a non-polarized version is acceptable if part of a system that is listed. The word "unless" as indicated in the original proposal would infer that the coupler shall be polarized if part of a system that is not listed and non-polarized if part of a listed system. That is not the intent of the requirement. The proposed wording eliminates this possible interpretation of the clause by adding an exception that is identical to the format used in other parts of the article (see 625.17(A)(1) for example).
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
(A) Polarization. The electric vehicle coupler shall be polarized.
Exception: A coupler that is part of a listed electric vehicle supply equipment.
Panel Statement: CMP-12 accepts the change to (A).
CMP-12 revises the exception for clarity.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Ward, R.

12-27a Log #CC1202 NEC-P12 **Final Action: Accept**
(625.14)

TCC Action: The Correlating Committee directs that the reference to 625.14 be changed to 625.41 in Table 220.3.
Submitter: Code-Making Panel 12,
Comment on Proposal No: 12-52
Recommendation: Renumber existing 625.14 to 625.41(New).
In Table 220.3 Additional Load Calculation References, change 625.14 to 625.41 in the column titled Section (or Part).
Substantiation: CMP-12 appropriately relocates text from 625.14 to 625.41 (New). 625.14 Rating correctly applies to Part III Installation rather than Part II Equipment Construction.
CMP-12 requests the CC review the correlation of 625.14 to 625.41 with CMP-2.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Ward, R.

12-28 Log #515 NEC-P12 **Final Action: Reject**
(625.14)

Submitter: Ken Jensen, Portland, OR
Comment on Proposal No: 12-52
Recommendation: Revise 625.14 as follows:
"625.14 Rating. Electrical vehicle supply equipment shall have sufficient rating to supply the load served. Electric vehicle charging loads shall be considered to be continuous loads for the purposes of this article. Where an automatic load management system is used, the maximum electric vehicle supply equipment load on a service or feeder or branch circuit shall be the ~~maximum load permitted~~ setting in use or communicated by the automatic load management system.
Substantiation: The original TIA sentence in question is copied below:
"Where an automatic load management system is used, the maximum electric vehicle supply equipment load on a service or feeder shall be the maximum load permitted by the automatic load management system."
The first use of the word "maximum" is clear but, the second use of the word "maximum" is confusing when applied to Electric Vehicle Supply Equipment. Replacing the words "maximum load permitted" with "setting in use or communicated" clarify the intent of the NEC.
I found there are two (2) ways of understanding or interpreting this "maximum load permitted" wording within TIA 1038 for NEC 625.14.
Today many EVSEs on-board chargers are built to use the standard called "Society of Automotive Engineers J1772". This standard addresses the problem that different premises EVSEs will have different rated ampacities and different electric vehicles will have different loads. SAE J1772 allows many combinations to interconnect with each other by having the premises EVSE communicate or provide to the electric vehicle on-board charger how much ampacity is available from that premises EVSE. Then the electric vehicle on-board charger must adjust or regulate the load so that is less than or equal to the available premises EVSE ampacity.
The following text is copied from two (2) revisions of that standard.
SAE J1772 2001
"5.3.5 EVSE Current Capacity - The EVSE provides the maximum available continuous current capacity, and by inference the rating of the protective circuit breaker, to the EV by modulating the pulse width..."
SAE J1772 2010
"5.3.5 EVSE Current capacity - The EVSE communicates the maximum available continuous current capacity to the EV/HEV by modulating the pilot duty cycle..."
Some EVSEs are built to offer a single fixed large communicated available current. However many EVSEs offer multiple or adjustable settings of communicated available current. One common EVSE I know of offers 15amp or 8amp settings. A second common EVSE I know of offers 12 amp, 16 amp, 24 amp, or 30 amp settings.
Every single one of these different values is a maximum current value. So an EVSE with multiple settings has a group of maximum current values. The group also has a maximum of all the maximum current values.
Which meaning does TIA 1038 NEC 625.14 maximum mean? Is the maximum electric vehicle supply equipment load the real setting of the EVSE?
Is the maximum electric vehicle supply equipment load the largest possible, worst case setting of the EVSE?
Replacing "maximum load permitted" with "setting or communicated" means the NEC 625.14 will allow a versatile installation of low demand low ampacity or medium demand medium ampacity, or high demand high ampacity.
Adding the wording "or branch circuit" to NEC 625.14 text simply reflect a common practice. EVSEs are often installed on a branch circuit.
Panel Meeting Action: Reject
Panel Statement: CMP-12 does not agree that the proposed wording will provide clarity. The use of the term "maximum load" is commonly understood in the NEC and is used in several sections. CMP-12 does not agree with the addition of branch circuit because the automatic load management system pertains only to the sizing of a service or feeder. Sizing of branch circuits are required to be sized for continuous loads.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Ward, R.

12-29 Log #798 NEC-P12 **Final Action: Accept**
(625.15(B))

Submitter: Joseph M. Bablo, UL LLC
Comment on Proposal No: 12-52
Recommendation: Revise text to read as follows:
625.15 Markings. The electric vehicle supply equipment shall comply with 625.15(A) through (C).
(B) Ventilation Not Required. Where marking is required by ~~625.29(C)~~ 625.52(A), the electric vehicle supply equipment shall be clearly marked by the manufacturer as follows:
VENTILATION NOT REQUIRED
The marking shall be located so as to be clearly visible after installation.
Substantiation: The reference given is part of the old text and was not updated to the new renumbering structure of the rewritten article. The proposed reference would point to the correct clause.
Panel Meeting Action: Accept

Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Ward, R.

12-31a Log #CC1201 NEC-P12 **Final Action: Reject**
(625.17(B)(2))

TCC Action: The Correlating Committee directs that this Comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Code-Making Panel 12,
Comment on Proposal No: 12-52
Recommendation: Revise 625.17(B)(2) to read as follows:
(2) Ampacities as specified in Table 400.5(A)(1) for 14 AWG and smaller, and in the 60 C column of Table 400.5(A)(2) for 12 AWG and larger.
Substantiation: CMP-12 revises 625.17(B)(2) because no rationale has been identified for the current ampacity breakpoint for 8 AWG conductor.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 5 Negative: 6
Ballot Not Returned: 1 Ward, R.
Explanation of Negative:
BROWN, T.: It is my opinion that increasing the ampacities permitted by the present code presents a hazard because this would permit lighter duty cable to be used for the cable which is most exposed and most handled by users.
CLARK, P.: This comment should be rejected. Changing the breakpoint from 8 AWG to 12 AWG will result in a reduction of safety. Type EV cables are specified in Article 400 and Table 400.4. As specified in Table 400.4, EV cord constructions for sizes 12 and 10 AWG are the same as cords in table 400.5(A)(1) and not the heavier duty cords in table 400.5(A)(2). If this revision is implemented it will allow 12 and 10 AWG cords to be utilized at ampacities beyond what they are rated to safely handle.
HOLMES, J.: This comment should be rejected. The insulation types Table 400.5(A)(1) have substantially lower nominal insulation thickness (as much as 15 mils) than the insulations used in Table 400.5(A)(2). Using the lower insulation values at the higher ampacities will create more heat with in the cord and lead to cord insulation breakdown.
KOVACIK, J.: The Panel Action on comment 12-31a should have been Reject. The original text included an exception to using the tables. That

exception allowed the certifying body to evaluate the particular cable as part of a specific system, including all protective measures that are intended to protect that cable and are provided as part of the equipment. Revising the text as shown in the comment would remove the exception and modify the use of the tables such that the 10 AWG and 12 AWG EV cables could be used based on ampacity values in Table 400.5(A)(2). This would not be correct based on information provided by NEMA's 5EVSE section. Rejecting the comment would return the text to the original form where the exception would allow the output cable of a Listed device to be evaluated as part of that Listed device.

LOTTMANN, T.: This comment should be rejected. Changing the breakpoint from 8 AWG to 12 AWG will result in a reduction of safety. Type EV cables are specified in Article 400 and Table 400.4. As specified in Table 400.4, EV cord constructions for sizes 12 and 10 AWG are the same as cords in table 400.5(A)(1) and not the heavier duty cords in table 400.5(A)(2). If this revision is implemented it will allow #12 and #10 AWG cords to be utilized at ampacities beyond what they are rated to safely handle.

WHITE, K.: This comment should be rejected. Changing the breakpoint from 8 AWG to 12 AWG will result in a reduction of safety. Type EV cables are specified in Article 400 and Table 400.4. As specified in Table 400.4, EV cord constructions for sizes 12 and 10 AWG are the same as cords in table 400.5(A)(1) and not the heavier duty cords in table 400.5(A)(2). If this revision is implemented it will allow 12 and 10 AWG cords to be utilized at ampacities beyond what they are rated to safely handle.

Comment on Affirmative:

CROUSHORE, T.: This revision applies to the text in Proposal 12-52 and is shown in the ROP Draft for 625.17(B)(2).

12-32 Log #360 NEC-P12 **Final Action: Accept**

12-33 Log #361 NEC-P12 **Final Action: Accept in Principle**
(625.17(C)(2))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 12-52
Recommendation: Revise text to read as follows:
625.17(C)(2) Where the electric vehicle supply equipment or charging system is fixed in place, the useable length of the output cable shall be measured from the cable exit of the electric vehicle supply equipment or charging system to the face of the electric vehicle connector. The term fixed in place shall include devices that are permanently wired as well as devices that are cord and plug connected and fastened in place where the fastening means are specifically designed to facilitate any of the following

a. Ready removal for interchange
b. Facilitate maintenance and repair
c. Repositioning to another location

Substantiation: The existing language could cause confusion. Adding this wording will clarify that the term "fixed in place" can include cord and plug connected devices and that they are not necessarily restricted by 625.17(C)(1).
Panel Meeting Action: Accept in Principle
Panel Statement: CMP-12 accepts the submitter's concept but not the submitter's text. See panel action on Comment 12-43a (Log CC1200).

CMP-12 also refers the submitter to Comment 12-25 for the definition of "fastened in place."

Number Eligible to Vote: 12

Ballot Not Returned: 1 Ward, R.

12-34 Log #170 NEC-P12 **Final Action: Accept**
(625.18)

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 12-66
Recommendation: The Correlating Committee directs that the panel clarify the panel statement on this proposal with respect to revised definitions for "Electric Vehicle Coupler" and "Electric Vehicle Interlock."
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: CMP-12 accepts the direction of the correlating committee with regard to the panel statement to revise the definitions of electric vehicle coupler and electric vehicle interlock.

The panel statement on Proposal 12-66 should have read as follows: "The panel agrees with the submitter's intent and has revised the definitions of electric vehicle connector and electric vehicle inlet."

Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Ward, R.

12-35 Log #516 NEC-P12 **Final Action: Reject**
(625.21)

Submitter: Ken Jensen, Portland, OR
Comment on Proposal No: 12-52
Recommendation: A revised 625.21 as follows:
"625.21 Overcurrent Protection. Overcurrent protection for feeders and branch circuits supplying electric vehicle supply equipment shall be sized for continuous duty and shall have a rating of not less than 125 percent of the maximum load of the electric vehicle supply equipment. Where noncontinous loads are supplied from the same feeder or branch circuit, the overcurrent device shall have a rating of not less than the sum of the noncontinous loads plus 125 percent of the continuous loads.
Where an automatic load management system is used to time shift multiple loads into sequential loads, the maximum load of the electric vehicle supply equipment shall be the maximum sequential load, for the purposes of this article.
Substantiation: NEC article 100 defines "Continuous Load" to be 3 hours or more. Real world examples of electric vehicle charge times are more than 3 hours, but less than 24 hours.
NEC 625 should clarify these questions.
May an automatic load management system apply and use time of day control, to prevent multiple simultaneous continuous loads and instead create a single sequential non over lapping (time shipping) continuous load? Should all EVSE loads plan to be simultaneous loads?
Here is an example of these two (2) questions
Assume the following:
A) Two electric vehicles in one garage
B) Two EVSEs with automatic load management
C) Both EVSEs are rated 30 amps available
D) Both EVSEs are on the same circuit
E) Both EVSE have time of day controls
F) One EVSE is adjusted or set to only provide current from 10 PM to 2 AM (4 hours only)
G) One EVSE is adjusted or set to only provide current from 2 AM to 6 AM (4 hours only)
The time of day controls are set to never over lap, so the maximum load permitted by the automatic load management will be a single sequential 30 amp continuous load.
So plan for a 30 amp continuous load.
The real measured load is 30 amps for 8 hours.
The time of day controls may be reset to enable two simultaneous 30 amp continuous loads.
So plan for a 60 amp continuous load.
Which of these is the intent of NEC 625.21?
Panel Meeting Action: Reject
Panel Statement: CMP-12 does not agree with the addition of the proposed wording. The existing wording is well established and applied in several articles throughout the code. The overcurrent protection shall be at least 125% of all continuous loads on a feeder or branch circuit plus 100% of all non-continuous loads. A continuous load is defined as maximum load lasting 3 hours or longer. All loads lasting 3 hours or longer need to be added together and the 125% factor applied to that sum.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Ward, R.

12-36 Log #783 NEC-P12 **Final Action: Reject**
(625.22)

Submitter: Gregory C. Nieminski, Gregory C. Nieminski, LLC
Comment on Proposal No: 12-71
Recommendation: Revise text to read as follows:

625.22 Personnel Protection System. The electric vehicle supply equipment shall have a listed system of protection against electric shock of personnel. ~~The personnel protection system shall be composed of listed personnel protection devices and constructional features. Where cord-and-plug-connected electric vehicle supply equipment is used, the interrupting device of a listed personnel protection system shall be provided and shall be an integral part of the attachment plug or shall be located in the power supply cable not more than 300 mm (12 in.) from the attachment plug.~~

(A) Where cord-and-plug-connected electric vehicle supply equipment, that is intended to be carried from charging location to charging location, is used, the interrupting device of a listed personnel protection system shall be provided and shall be an integral part of the attachment plug or shall be located in the power supply cable cord not more than 300 mm (12 in.) from the attachment plug.

(B) Where cord-and-plug-connected electric vehicle supply equipment is intended to be installed in a dedicated location for the purpose of charging a vehicle, has a means for temporary mounting and can be dismounted without the use of a tool, the interrupting device of a listed personnel protection system shall be provided and shall be an integral part of the attachment plug or shall be located in the power supply cable cord not more than 1.2 m (4 ft) from the attachment plug.

Substantiation: The panel statement recognizes there are conditions where a longer cord can be used safely.

EVSEs other than portable units are generally intended to be installed in a dedicated location in order to charge a vehicle. Some may be moved or relocated after installation without the use of tools (cf. UL 2594), using a mounting means similar to that used for relocatable power taps described in UL 1363, Standard for Relocatable Power Taps. Since these units would typically be mounted 0.6-0.9 m (2-3 feet) from the floor when in use, this would allow the safe use of a longer than 1 foot unprotected power supply cord yet provide adequate physical protection for the power supply cord against damage.

The term “power supply cable” should be changed to “power supply cord” to align with the new definitions.

This comment is submitted on behalf of the EPRI Electric Transportation Infrastructure Working Council’s NEC Task Force.

Panel Meeting Action: Reject

Panel Statement: There is insufficient technical substantiation to relax the current safety requirements for personnel protection. CMP-12 reaffirms its position that the personnel protection shall be an integral part of the attachment plug or shall be located in the power supply cord not more than 300 mm (12 in.) from the attachment plug. Significant technical substantiation, such as a fact finding report, would be required to justify a change to this established requirement.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 10 Negative: 1

Ballot Not Returned: 1 Ward, R.

Explanation of Negative:

MENIG, J.: I disagree with the panel’s statement that there is insufficient technical substantiation to relax the current safety requirements for personal protection as there is no quantifiable substantiation for the current requirement. I recommend that a study be performed by the Fire Research Foundation. The current requirement regarding portable or 120V cord and plug connected devices, is associated with large, heavy and moveable equipment (vending machines, portable air conditioners) that can be moved frequently resulting in possible hidden damage to the power supply cord. The equipment in this recommendation is substantially dissimilar in its construction and use.

Comment on Affirmative:

HOLMES, J.: CMP-12 should continue to support limiting the amount of unprotected cord on the supply-side of the EVSE.

12-37 Log #799 NEC-P12 **Final Action: Reject**
(625.22)

Submitter: Joseph M. Bablo, UL LLC

Comment on Proposal No: 12-52

Recommendation: Revise text to read as follows:

625.22 Personnel Protection System. The electric vehicle supply equipment shall have a listed system of protection against electric shock of personnel. Where cord-and-plug connected electric vehicle supply equipment is used, the interrupting device of a listed personnel protection system shall be provided and shall be an integral part of the attachment plug or shall be located in the power supply cord not more than 300 mm (12 in.) from the attachment plug, unless the EVSE complies with 625.44(B), in which case the interrupting device may be located within the overall device enclosure.

Substantiation: There is a disconnect between three clauses in the article, and this disconnect causes a problem in the interpretation of the wording in 625.44(B)(4). In order to clarify this intent, the wording is proposed to be added to 625.22. Rationale is as follows:

The intent of 625.44(B)(4) was to allow constructions where the interrupting device of the personnel protection system required by 625.22 was located within the device enclosure, but the power cord was allowed to be longer than the 12 inches required by 625.17(A)(3)(a), due to the other requirements within 625.44(B).

625.17(A)(3)(a) limits the cord length to 12 inches because the interrupting device of the personnel protection system required by 625.22 is located within the device enclosure.

625.17(A)(3)(b) allows the cord length to be 6 feet minimum, 15 feet maximum, provided the interrupting device of the personnel protection system required by 625.22 is located at the attachment plug or within 12 inches of the attachment plug.

The current wording in 625.22 supports this.

625.44(B) states that a product can be cord connected provided it meets all the subclauses (1) through (5). Subclause 4 states that the power cord shall be maximum 6 feet. All this does is limit the overall length of the power cord to 6 feet. However, the intent of this proposal was to allow for a 6 foot cord length when the interrupting device of the personnel protection system required by 625.22 was located within the enclosure. This would be a direct violation to 625.17(A)(3)(a) based on the current wording. The rationale for the wording in 625.44(B)(4) was that a device fixed in place, as required by 625.44(B)(3), would protect the cord by limiting the cord to 6 feet thereby keeping it off the floor and protected from abuse. In so doing, the need to protect the cord by limiting it to 12 inches is no longer required. Therefore, 625.44(B)(4) was proposed to allow a 6 foot cord length on products where the interrupting device of the personnel protection system was located within the device enclosure, but the device was wall mounted and fixed in place.

In order to clarify this intent and allow constructions that were intended to be acceptable, the wording in 625.22 is needed.

Panel Meeting Action: Reject

Panel Statement: CMP-12 does not agree that the intent of 625.44(B) is to allow the length of unprotected supply cord to be longer than 300 mm (12 in.). Significant technical substantiation, such as a fact finding report, would be required to justify a change to this established requirement.

Number Eligible to Vote: 12

Ballot Results: Affirmative: 8 Negative: 3

Ballot Not Returned: 1 Ward, R.

Explanation of Negative:

CROUSHORE, T.: This comment should be accepted. This section provides two options for the location of the listed system of protection against shock of personnel for cord-and-plug connected electric vehicle supply equipment. Option 1 has the protection contained within the plug of a cord-and-plug connected electric vehicle supply equipment. Option 2 has the protection within 300 mm (12 in) from the attachment plug. Accepting this comment would allow Option 2 to allow the protection within 1.8 M (6 feet) from the attachment plug which could place the protection as part of the Electric Vehicle Supply Equipment itself without being a separate device. I believe this is a reasonable optioin to allow the cord to be a maximum of 6 feet rather than 1 foot because there is no technical substantiation to limit the length of the cord to 1 foot. During the task group meetings, there were issues discussed where the safety device that was place at in the cord within 1 foot from the plug caused additional strain on the receptacle due to the weight of the safety device. CMP-12 remains divided on this issue and additional research or additional technical substantiation such as a fact finding report would be needed to document and provide a recommendation for an appropriate solution to this issue.

KOVACIK, J.: The Panel Action on Comment 12-37 should have been Accept. The comment would help resolve a technical inconsistency in requirements between products rated 125V and 250V, and clarify the intent of the action taken by the Panel in the 2011 NEC in TIA 11-2. In 625.44(B), the cord length for 250 V rated products is limited to 6 feet. 625.44(A) does not specify a cord length limit for 125 V rated products; 625.17(A)(3)(b) limits cord length to 6 to 15 feet for products where the interrupting device of the personnel protection system, required by 625.22, is located in the attachment plug or within the first 12 inches of the supply cord.

The current text of the draft 2014 NEC would allow for a 125 V, 16 A, AC Level 1 EV cord set, to be provided with a 15 foot power cord if the interrupting device was located in the attachment plug or within the first 12 inches of the power cord. However, a 250V product in accordance with 625.44(B) would only be allowed to have a 6 foot cord length under the same circumstances; the cord length would be protected in the same manner as the 125 V rated product, but there is no technical reason to only allow a 6 foot cord in this case. The intent of the 6 foot cord length was to protect the cord from physical abuse by not allowing it to touch the floor, based on its location and the fact that the EVSE is fastened in place. The reason the cord would be protected in this manner is that the intent of the change to 625.44(B) was to allow the interrupting device to be located within the EVSE enclosure. Comment 12-37 would clarify that for 250V products complying with 625.44(B) the interrupting device may be located in the device enclosure.

MENIG, J.: I disagree with the panel’s statement that there is insufficient technical substantiation to relax the current safety requirements for personal protection as there is no quantifiable substantiation for the current requirement. I recommend that a study be performed by the Fire Research Foundation. The current requirement regarding “fixed in place” 220V cord and plug connected EVSE, is associated with large, heavy and moveable equipment (vending machines, portable air conditioners) that can be moved frequently resulting in possible hidden damage to the power supply cord. The equipment in this recommendation is substantially dissimilar in its construction and use.

Comment on Affirmative:

HOLMES, J.: CMP-12 should continue to support limiting the amount of unprotected cord on the supply-side of the EVSE.

12-38 Log #1087 NEC-P12 **Final Action: Reject**
(625.22)

Submitter: Joseph C. Engel, Monroeville, PA

Comment on Proposal No: 12-69

Recommendation: Revise text to read as follows:

625.22 Personnel Protection System. The electric vehicle supply equipment shall have a listed system of protection against electric shock for personnel. The personnel protection system shall be composed of listed CLASS A

personnel protection devices and constructional features. Where cord-and-plug connected electric vehicle supply equipment is used, the interrupting device shall be an integral part of the attachment plug or shall be located in the power supply cable not more than 300 mm (12 in.) from the plug.
Informational Note: The INDEX under Ground-fault protection (Personnel) states "*see* Ground-fault circuit interrupters".
ARTICLE 100 defines a Ground-Fault Circuit Interrupter (GFCI) as being a CLASS A device. A CLASS A must trip at 6mA or below.
Substantiation: The Panel's Statement in support of rejecting the addition of the words "CLASS A" has missed the point. While a device can be UL Listed as being either a 6 mA or 30 mA device, NEC allows only a 6 mA "Personnel Protection System". Adding the words "CLASS A" doesn't change the requirement, only further clarifies it. The need for such clarification is obvious when one considers that more than half of the EVSEs installed today are in violation of NEC 2001 and thus could be considered unsafe.
Panel Meeting Action: Reject
Panel Statement: CMP-12 rejects specifying the type of personal protection required. In addition, current product safety requirements specify a CCID, not a GFCI, for use in EVSE. GFCIs are vulnerable to high frequency noise and DC currents that may be present during vehicle charging that may prevent or delay tripping during a fault.

Ballot Not Returned: 1 Ward, R.

12-40 Log #823 NEC-P12 **Final Action: Reject**
(625.44)

Submitter: Jeffrey L. Holmes, IBEW Local Union 1 JATC
Comment on Proposal No: 12-52
Recommendation: Delete all of part (B) and reword as follows:
(B) All other electric vehicle supply equipment shall be permanently connected and fastened in place.
Substantiation: There was no substantiation for allowing cord and plug connected EVSE up to 50 ampere rating. Most of the larger branch circuits are protected by the equipment (range & dryer), so that the possibility of unplugging the equipment under load is minimized. This would not be the case with this proposal. The supply side of the EVSE could be unplugged, under load, in a constant current status of up to 50 amperes without any safe guards. Treating EVSE as a portable appliance is a safety concern. The TIA and the proposal do not satisfy the intent of Article 625.13. The proposed 625.44 needs to be evaluated for all safety concerns in both commercial and residential applications.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided data to suggest there is an overall safety concern. Appliances such as stoves, cook tops, clothes dryers are cord and plug connected. In addition to these appliances, campers and RVs are cord and plug connected at these currents.
Users of EVs are very familiar with the process of charging by plugging and unplugging at the vehicle. The vehicle coupler is substantially more convenient (force to plug and unplug) to use than the power cord.
CMP-12 selected a 50 amp maximum rating because of the wide consumer availability of 50 amp NEMA plugs and outlets.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 10 Negative: 1
Ballot Not Returned: 1 Ward, R.
Explanation of Negative:
HOLMES, J.: Data is not available at this point in time, because cord and plug connections were limited to Level 1(125 volt, 12-16 ampere) EVSE. Allowing cord and plug connections at the voltages and ampere ratings is simply dangerous.

(625.48)

Submitter: Gregory C. Nieminski, Gregory C. Nieminski, LLC
Comment on Proposal No: 12-52
Recommendation: Revise text to read as follows:
Electric vehicle supply equipment and other parts of a system, either on-board or off-board the vehicle, that are ~~identified for and~~ intended to be interconnected to a vehicle and also serve as an optional standby system or an electric power production source or provide for bi-directional power feed shall be listed and marked ~~as~~ "Suitable for Bidirectional Power Feed" ~~suitable for that purpose.~~
When used as an optional standby system, the requirements of Article 702 shall apply, and when used as an electric power production source, the requirements of Article 705 shall apply.
Substantiation: The proposal in 12-52 contained the phrase "as suitable for that purpose", which is vague and unenforceable. Electric vehicle supply equipment intended for bidirectional power feed should be listed and identified by a specific marking to distinguish it from other EVSE that is not suitable for bidirectional power feed.
This comment is submitted on behalf of the EPRI Electric Transportation Infrastructure Working Council's NEC Task Force.
Panel Meeting Action: Reject
Panel Statement: The intent of 625.48 is to permit the bi-directional power flow from the premises wiring to the vehicle and from the vehicle to the premises wiring provided it is done safely.
There are two methods where this can be done safely. It can be done safely as an interconnected electric power production source as discussed in Article 705. It can also be done safely as an optional standby system as discussed in Article 702. Any bi-directional system would need to comply with one or the other or both sets of requirements to be permitted by 625.48. The text of existing 625.48 requires listing for the capabilities of optional standby, or interconnected power production, or both.

Comment on Proposal No: 12-52
Recommendation: Revise text to read as follows:
(4) Power supply cord length for electric vehicle supply equipment fastened in place is limited to ~~6 ft (1.8 m)~~ 1.8 m (6 ft).
Substantiation: Metric units should be the primary dimension with the English units in parentheses per the style manual.
This comment is submitted on behalf of the EPRI Electric Transportation Infrastructure Working Council's NEC Task Force.
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Ward, R.

12-47 Log #781 NEC-P12 **Final Action: Accept in Principle**
(625.52)

Submitter: Gregory C. Nieminski, Gregory C. Nieminski, LLC
Comment on Proposal No: 12-52
Recommendation: Add missing Tables 625.52(B)(1) and 625.52(B)(2) after 625.52(B)(4) Supply Circuits:

See Tables 625.52(B)(1) and 625.52(B)(2) on Page 314

Substantiation: It appears that the Tables 625.2952(DB)(1) and 625.2952(DB)(2) were not included in the printed version of NEC Committee Report on Proposals, A2013, and should be added. This may be a printing error and should be corrected to include these two Tables in the recommended text provided by CMP 12, following 625.52(B)(4).
This comment is submitted on behalf of the EPRI Electric Transportation Infrastructure Working Council's NEC Task Force.
Panel Meeting Action: Accept in Principle
Tables 625.52(B)(1) and (B)(2), in the ROP Draft, are printed out of order. Relocate Table 625.52(B)(1) before Table 625.52(B)(2).
Revise the column heading from "DC Less Than 50V" to read "DC Greater Than or Equal to 50V" in both tables.
Panel Statement: The tables are on page 70-578 of the A2013 ROP Draft. In the ROP Draft, the two tables, 625.52(B)(1) and (B)(2), are printed out of order.
CMP-12 edits the column headings.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Ward, R.

12-48 Log #782 NEC-P12 **Final Action: Accept in Principle**
(625.52)

Submitter: Gregory C. Nieminski, Gregory C. Nieminski, LLC
Comment on Proposal No: 12-52
Recommendation: Revise Table Heads as follows:

Table 625.52(B)(1) and 625.52(B)(2) Change Table headings to include references for DC voltages:

Branch-Circuit Ampere Rating	Branch-Circuit Voltage		
	DC Less Than 50 V	**Single Phase Alternating Current Or Direct Current**	**3 Phase Alternating Current**
	(17)		

(The remainder of the table and values would be unchanged)

Substantiation: Although the two tables have been expanded to include a column for up to 50 volts DC, the proposed Article 625-4 acknowledges DC voltages up to 600 volts. The remaining Single Phase columns in both Tables 625.52(B)(1) and 625.52(B)(2) should be revised to include references for DC voltages above 50 volts DC. This can be done by changing the headings to add Alternating Current or Direct Current in the Single Phase column heading and Alternating Current in the 3-Phase column heading, as was proposed in Proposal Number 12-76 that was "Accepted in Principal". The additional DC voltage values proposed in Proposal Number 12-76 could be added as well at the Panel's discretion.

This comment is submitted on behalf of the EPRI Electric Transportation Infrastructure Working Council's NEC Task Force.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 12-47 which meets the intent of the submitter.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 11
Ballot Not Returned: 1 Ward, R.

ARTICLE 626 — ELECTRIFIED TRUCK PARKING SPACES

12-48a Log #CC1203 NEC-P12 **Final Action: Accept**
(626.2)

Submitter: Code-Making Panel 12,
Comment on Proposal No: 12-52
Recommendation: Revise the definition in 626.2 to read as follows:
Cable Management System (Electrified Truck Parking Spaces). An apparatus designed to control and organize unused lengths of cable or cord at electrified truck parking spaces.
Substantiation: CMP-12 revises the definition to properly define the difference between a Cable Management System for Electrified Truck Parking Spaces and for Electric Vehicle Output Cable.

As information to the Correlating Committee, CMP-12 considered and dismissed a single definition in Article 100. A similar, but not identical, definition is placed in Article 625 for that equipment.

This definition is revised to correlate with the revised definition of Comment 12-20.
Panel Meeting Action: Accept
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Ward, R.

12-49 Log #483 NEC-P12 **Final Action: Reject**
(626.2.Cord Connector and 626.4 (New))

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 12-81
Recommendation: Revise text to read as follows:
Cord Connector. A device that, by inserting it into a truck flanged surface inlet, establishes an electrical connection to the truck for the purpose of providing power for the on-board electric loads and may provide a means for information exchange. ~~This device is part of the truck coupler.~~
626.4 General Requirements
626.4.1 Cord connectors shall be considered a part of the truck coupler.
626.4.2 Truck flanged surface inlets shall be considered a part of the truck coupler.
626.4.3 For the purposes of this article, the truck flanged surface inlet is considered to be part of the truck and not part of the electrified truck parking space supply equipment.

Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains a requirement. If the CMP agrees that this is a requirement it should be placed somewhere else in Article 626, and a new section under 625.4, on general requirements, is the perfect location, since NEC definitions shall not contain requirements. Moreover, the NEC manual of style does not permit the definition to contain the defined term. The sections 626.4.2 and 626.4.3 are associated with the comment to proposal 12-82.
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Panel Meeting Action: Reject
Panel Statement: CMP-12 rejects changing the definition. The current definition does comply with the NEC Style Manual because it just states what a cord connector is. In addition, the submitter's text does not add clarity to the article.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Ward, R.

12-50 Log #484 NEC-P12 **Final Action: Reject**
(626.2.Truck Flanged Surface Inlet)

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 12-82
Recommendation: Revise text to read as follows:
Truck Flanged Surface Inlet. The device(s) on the truck into which the cord connector(s) is inserted to provide electric energy and other services. ~~This device is part of the truck coupler. For the purposes of this article, the truck flanged surface inlet is considered to be part of the truck and not part of the electrified truck parking space supply equipment.~~
626.4 General Requirements
626.4.1 Cord connectors shall be considered a part of the truck coupler.
626.4.2 Truck flanged surface inlets shall be considered a part of the truck coupler.
626.4.3 For the purposes of this article, the truck flanged surface inlet is considered to be part of the truck and not part of the electrified truck parking space supply equipment.
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains a requirement. If the CMP agrees that this is a requirement it should be placed somewhere else in Article 626, and a new section under 625.4, on general requirements, is the perfect location, since NEC definitions shall not contain requirements. Moreover, the NEC manual of style does not permit the definition to contain the defined term. The section 626.4.1 is associated with the comment to proposal 12-81.
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Panel Meeting Action: Reject
Panel Statement: CMP-12 rejects changing the definition. The current definition does comply with the NEC Style Manual because it just states what a truck flanged surface Inlet is and is not. In addition, the submitter's text does not add clarity to the article.

12-51 Log #1376 NEC-P12 **Final Action: Accept**
(626.5)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 12-79
Recommendation: Delete the following text:
626.5 ~~The equipment located in the electrified truck parking spaces shall be permitted to be used for charging electric vehicles. Additional electric vehicle supply equipment (EVSE) shall be permitted to be located in these spaces~~.
Substantiation: NEMA opposes the panel action on proposal 12-79 (626.1) that creates a new 626.5 Electric Vehicle Charging article.
This proposal could create a safety issue as the wording of the proposed article 626.5 allow EV charging equipment in electrified truck parking spaces without demanding that it satisfies all the relevant requirements of article 625.
Panel Meeting Action: Accept
Panel Statement: CMP-12 accepts the recommendation of the submitter which deletes 626.5 in its entirety. CMP-12 recognizes the potential confusion of requirements as discussed by the submitter with regard to placing this text in 626.5. However, CMP-12 notes that electric vehicle supply equipment (EVSE) is not restricted to be located in electrified truck parking spaces. Rather, EVSE is permitted to be located within electrified truck parking spaces as long as the requirements in Article 625 for the installation of the EVSE are met.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Ward, R.

12-52 Log #784 NEC-P12 **Final Action: Accept**
(626.24(B)(1))

Submitter: Gregory C. Nieminski, Gregory C. Nieminski, LLC
Comment on Proposal No: 12-86
Recommendation: We support the panel action to reject Proposal 12-86.
Substantiation: We agree with the panel's comment reaffirming its intent to have a maximum of 3 receptacles on two different branch circuits. The original intent of the original article requiring two single receptacles was to minimize the number of connections from the truck parking space supply equipment to the truck or trucks in adjacent parking spaces. Each receptacle was intended to be connected to its own individual branch circuit.
Serious injury can occur to the operator or repairman if one of the multiple supply sources is not disconnected or its branch circuit is not opened during repair or maintenance. Minimizing the number of circuits connected to the truck will reduce the risk of such hazard.
This comment is submitted on behalf of the EPRI Electric Transportation Infrastructure Working Council's NEC Task Force.
Panel Meeting Action: Accept
Panel Statement: Accepting this comment continues to reject Proposal 12-86. There is no change to the current 626.24(B)(1) of the 2011 edition of the NEC.
Number Eligible to Vote: 11
Ballot Results: Affirmative: 10
Ballot Not Returned: 1 Ward, R.

ARTICLE 630 — ELECTRIC WELDERS

12-53 Log #614 NEC-P12 **Final Action: Accept in Principle**
(630.13)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 12-93
Recommendation: Revise text to read as follows:
630.13 Disconnecting Means. A disconnecting means shall be provided in the supply circuit for each arc welder that is not equipped with ~~a~~ an integral disconnect ~~mounted as an integral part of the welder~~ ~~and~~. Each external disconnect shall be marked to identify what arc welder it disconnects.
Substantiation: Text is extremely awkward.
Panel Meeting Action: Accept in Principle
Revise text of 630.13 to read as follows:
630.13 Disconnecting Means. A disconnecting means shall be provided in the supply circuit for each arc welder that is not equipped with a disconnect mounted as an integral part of the welder. The disconnecting means identity shall be marked in accordance with 110.22(A).
Panel Statement: CMP-12 agrees with the submitter that the text of the revised 630.13 is awkward. CMP-12 also agrees with the intent of the submitter of the proposal to identify the disconnecting means for each arc welder.
CMP-12 revises the first sentence of existing (NEC 2011) 630.13 and adds one additional sentence at the end of 630.13.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 640 — AUDIO SIGNAL PROCESSING, AMPLIFICATION, AND REPRODUCTION EQUIPMENT

12-54 Log #575 NEC-P12 **Final Action: Accept**
(640.9, Informational Note 2)

Submitter: Thomas M. Burke, UL LLC
Comment on Proposal No: 12-19
Recommendation: Revise the Information Note 2 associated with requirements for listing of amplifiers to add a reference to the new standard, UL 62368-1.
Informational Note No. 2: Examples of requirements for listing amplifiers used in residential, commercial, and professional use are found in ANSI/UL 813-1996, *Commercial Audio Equipment*; ANSI/UL 1419-2011, *Professional Video and Audio Equipment*; ANSI/UL 1492-2010, *Audio-Video Products and Accessories*; and ANSI/UL 6500-2006, *Audio/Video and Musical Instrument Apparatus for Household,*
Commercial, and Similar Use; and UL 62368-1-2012, *Audio/Video, Information and Communication Technology Equipment – Part 1: Safety Requirements.*
Substantiation: This is one in a series of proposals to update NFPA 70 to add a reference to UL 62368-1.
ANSI/UL 62368-1, Audio/video, information and communication technology equipment – Part 1: Safety requirements, was published on February 17, 2012. This new standard will eventually replace (later this decade) both, UL 60065, Audio, Video, and Similar Electronic Apparatus-Safety Requirements, and UL 60950-1, Information Technology Equipment Safety - Part 1: General Requirements. In the meantime, multiple references to UL 6500 and UL 60950-1 in the body of the Code should be supplemented by a reference to UL 62368-1 since similar equipment complying with, and Listed to both standards will be installed per the Code. In fact, equipment already is being Listed to UL 62368-1.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 645 — INFORMATION TECHNOLOGY EQUIPMENT

12-55 Log #171 NEC-P12 **Final Action: Accept**
(645)

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 12-109
Recommendation: The Correlating Committee directs that this proposal be reconsidered and reviewed in its entirety for compliance with the NEC Style Manual.
Numbering between Parts should start, at minimum, with the next decade in accordance with the NEC Style Manual.
The Correlating Committee directs the panel to reconsider the titles for both Parts II and Parts III to improve clarity.
The term "power grounding" should also be reconsidered since it is not defined in the NEC.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: CMP-12 accepts the direction of the Correlating Committee to reconsider and review the proposal in its entirety.
See panel action and statement on Comment 12-56.

Submitter: Stanley Kaufman, CableSafe, Inc.
Comment on Proposal No: 12-109
Recommendation: Continue CMP 12 action to Accept In Principle and modify the text as shown:
ARTICLE 645
Information Technology Equipment
Informational Note: Text that is followed by a reference in brackets has been extracted from NFPA 75-2009, *Standard for the Protection of Information Technology Equipment*. Only editorial changes were made to the extracted text to make it consistent with this *Code*.
I. General
645.1 Scope. This article covers equipment, power-supply wiring, equipment interconnecting wiring, and grounding of information technology equipment and systems in an information technology equipment room.
Informational Note: For further information, see NFPA 75-2009, *Standard for the Protection of Information Technology Equipment*, which covers the requirements for the protection of information technology equipment and information technology equipment areas.

645.2 Definitions.

Abandoned Supply Circuits and Interconnecting Cables. Installed supply circuits and interconnecting cables that are not terminated at equipment and not identified for future use with a tag.

Critical Operations Data System. An information technology equipment system that requires continuous operation for reasons of public safety, emergency management, national security, or business continuity.

Information Technology Equipment (ITE). Equipment and systems rated 600 volts or less, normally found in offices or other business establishments and similar environments classified as ordinary locations, that are used for creation and manipulation of data, voice, video, and similar signals that are not communications equipment as defined in Part I of Article 100 and do not process communications circuits as defined in 800.2.

Informational Note: For information on listing requirements for both information technology equipment and communications equipment, see UL 60950-1-2011, *Information Technology Equipment - Safety - Part 1: General Requirements*.

Information Technology Equipment Room. A room within the information technology equipment area that contains the information technology equipment. [**75:**3.3.9]

Remote Disconnect Control. An electric device and circuit that controls a disconnecting means through a relay or equivalent device.

Zone. A physically identifiable area (such as barriers or separation by distance) within an information technology equipment room, with dedicated power and cooling systems for the information technology equipment or systems.

645.3 Other Articles. Circuits and equipment shall comply with 645.3(A) through (H), as applicable.

(A) Spread of Fire or Products of Combustion. The provisions of 300.21, 770.26, 800.26, and 820.26 shall apply to penetrations of the fire-resistant room boundary.

(B) Other Spaces Used for Environmental Air (Plenums). The provisions of 300.22(C)(1), 725.154(A), 760.53(B)(2), 760.154(A), 770.113(C), 800.113(C), and 820.113(C) and Tables 770.154(A), 800.154(A) and 820.154(A) shall apply to the space over a suspended ceiling used for environmental air handling purposes in ~~wiring and cabling in a plenum (other space used for environmental air) above~~ an information technology equipment room.

(C) Grounding. The non–current-carrying conductive members of optical fiber cables in an information technology equipment room shall be grounded in accordance with the provisions of 770.114.

(D) Electrical Classification of Data Circuits. The provisions of 725.121(A)(4) shall apply to the electrical classification of listed information technology equipment signaling circuits. The provisions of 725.139(D)(1) and 800.133(A)(1)(b) shall apply to the electrical classification of Class 2 and Class 3 circuits in the same cable with communications circuits.

(E) Fire Alarm Equipment. The provisions of Parts I, II, and III of Article 760 shall apply to fire alarm systems equipment installed in an information technology equipment room.

(F) Communications Equipment. The provisions of Parts I, II, III, IV, and V of Article 800 shall apply to communications equipment installed in an information technology equipment room. Article 645 shall apply to the powering of communications equipment in an information technology equipment room.

Informational Note: See Part I of Article 100, Definitions, for a definition of communications equipment.

(G) Community Antenna Television and Radio Distribution Systems Equipment. The provisions of Parts I, II, III, IV, and V of Article 820 shall apply to community antenna television and radio distribution systems equipment installed in an information technology equipment room. Article 645 shall apply to the powering of community antenna television and radio distribution systems equipment installed in an information technology equipment room.

(H) Cables Not in Information Technology Equipment Room. Cables extending beyond the information technology equipment room shall be subject to the applicable requirements of this *Code*.

645.4 Special Requirements for Information Technology Equipment Room. This article shall be permitted to provide alternate wiring methods within the information technology room and under the raised floor to the provisions of Chapter 3 ~~Chapters 1 through 4~~ for power wiring, Parts I and III of Article 725 for signaling wiring and Parts I and V of Article 770 for optical fiber cabling when all of the following conditions are met:

(1) Disconnecting means complying with 645.32 ~~645.30~~ are provided.

(2) A heating/ventilating/air-conditioning (HVAC) system is provided in one of the methods identified in 645.4(2)(a) or (b).

(a) a separate HVAC system that is dedicated for information technology equipment use and is separated from other
areas of occupancy

(b) an HVAC system that serves other occupancies and:

(1) also serves the information technology equipment room; and

(2) provides fire/smoke dampers at the point of penetration of the room boundary; and

(3) activates the damper operation upon initiation by smoke detector alarms, by operation of the disconnecting means required by 645.32 ~~645.30~~, or both.

Exception: Where information technology equipment is installed in a critical operations data system in compliance with 645.32(B) ~~645.10(B)~~, a procedure shall be permitted that controls the cessation of the air circulation within the room or zone.

Informational Note: For further information, see NFPA 75-2009, *Standard for the Protection of Information Technology Equipment*, Chapter 10, 10.1, 10.1.1, 10.1.2, and 10.1.3.

(3) All information technology and communications equipment installed in the room is listed.

(4) The room is occupied by, and accessible to, only those personnel needed for the maintenance and functional operation of the installed information technology equipment.

(5) The room is separated from other occupancies by fire-resistant-rated walls, floors, and ceilings with protected openings.

Informational Note: For further information on room construction requirements, see NFPA 75-2009, *Standard for the Protection of Information Technology Equipment*, Chapter 5.

(6) Only electrical equipment and wiring associated with the operation of the information technology room is installed in the room.

Informational Note: HVAC systems, communications systems, and monitoring systems such as telephone, fire alarm systems, security systems, water detection systems, and other related protective equipment are examples of equipment associated with the operation of the information technology room.

~~(7) If a raised floor is present, the raised floor is of approved construction, and the area under the floor is accessible.~~

~~(8) If a raised floor in present, ventilation in the underfloor area is used for the information technology equipment room only, except as provided in 645.4(2). The ventilation system shall also be so arranged, with approved smoke detection devices, that upon the detection of fire or products of combustion in the underfloor space, the circulation of air will cease.~~

~~(9) If a raised floor is present, openings for cords and cables protect cords and cables against abrasion and minimize the entrance of debris beneath the floor.~~

II Wiring Methods

645.20 Equipment Grounding and Bonding. All exposed non–current-carrying metal parts of an information technology system shall be bonded to the equipment grounding conductor in accordance with the provisions of Parts V, VI and VII of Article 250 or shall be double insulated. Where signal reference structures are installed, they shall be bonded to the equipment grounding conductor provided for the information technology equipment. Any auxiliary grounding electrode(s) installed for information technology equipment shall be installed in accordance with the provisions of 250.54.

Informational Note No. 1: The bonding requirements in the product standards governing this listed equipment ensure that it complies with Article 250.

Informational Note No. 2: Where isolated grounding-type receptacles are used, see 250.146(D) and 406.3(D).

645.21 System Grounding. Separately derived power systems shall be installed in accordance with the provisions of Part II or Article 250. Power systems derived within listed information technology equipment that supply information technology systems through receptacles or cable assemblies supplied as part of this equipment shall not be considered separately derived for the purpose of applying 250.30.

~~**645.15 Grounding.** All exposed non–current-carrying metal parts of an information technology system shall be bonded to the equipment grounding conductor or shall be double insulated. Where signal reference structures are installed, they shall be bonded to the equipment grounding conductor provided for the information technology equipment. Any auxiliary grounding electrode(s) installed for information technology equipment shall be installed in accordance with Section 250.54.~~

~~Informational Note: The bonding requirements in the product standards governing this listed equipment ensure that it complies with Article 250.~~

~~**645.25**~~ **645.22 Engineering Supervision.** As an alternative to the feeder and service load calculations required by Parts III and IV of Article 220, feeder and service load calculations for new or existing loads shall be permitted to be used if provided by qualified persons under engineering supervision.

~~**645.26**~~ **645.23 Ampacity of Branch-Circuit Conductors.** The branch-circuit conductors supplying one or more units of information technology equipment shall have an ampacity not less than 125 percent of the total connected load.

~~645.16~~ **645.24 Equipment Marking.** Each unit of an information technology system supplied by a branch circuit shall be provided with a manufacturer's nameplate, which shall also include the input power requirements for voltage, frequency, and maximum rated load in amperes.

~~**645.18**~~ **645.25 Abandoned Supply Circuits and Interconnecting Cables.** The accessible portion of abandoned supply circuits and interconnecting cables shall be removed unless contained in a raceway.

~~**645.19**~~ **645.26 Installed Supply Circuits and Interconnecting Cables Identified for Future Use.**

(1) Supply circuits and interconnecting cables identified for future use shall be marked with a tag of sufficient durability to withstand the environment involved.

(2) Supply circuit tags and interconnecting cable tags shall have the following information:

(1) ~~a.~~ Date identified for future use

(2) ~~b.~~ Date of intended use

(3) ~~c.~~ Information relating to the intended future use

~~**645.13**~~ **645.27 Physical Protection of Supply circuits and Interconnecting Cables.** Where exposed to physical damage, supply circuits and interconnecting cables shall be protected.

~~645.14~~ 645.28 Securing in Place. Power cables; communications cables; connecting cables; interconnecting cables; and associated boxes, connectors, plugs, and receptacles that are listed as part of, or for, information technology equipment shall not be required to be secured in place.

~~II. Power Circuits~~

~~645.20~~ 645.30 Uninterruptible Power Supplies (UPSs). Except for installations and constructions covered in 645.30(1) ~~645.20(1)~~ or (2), UPS systems installed within the information technology equipment room, and their supply and output circuits, shall comply with 645.32 ~~645.30~~. The disconnecting means shall also disconnect the battery from its load.

(1) Installations qualifying under the provisions of Article 685

(2) Power sources limited to 750 volt-amperes or less derived either from UPS equipment or from battery circuits integral to electronic equipment

~~645.21~~ 645.31 Power Distribution Units. Power distribution units that are used for information technology equipment shall be permitted to have multiple panelboards within a single cabinet, if the power distribution unit is utilization equipment listed for information technology application.

~~**645.22 Power Systems Grounding.** Power systems derived within listed information technology equipment that supply information technology systems through receptacles or cable assemblies supplied as part of this equipment shall not be considered separately derived for the purpose of applying 250.30~~

~~Informational Note: Where isolated grounding-type receptacles are used, see 250.146(D) and 406.3(D).~~

~~645.30~~ 645.32 Disconnecting Means. An approved means shall be provided to disconnect power to all electronic equipment in the information technology equipment room or in designated zones within the room. There shall also be a similar approved means to disconnect the power to all dedicated HVAC systems serving the room or designated zones and shall cause all required fire/smoke dampers to close. The installation of remote disconnect controls shall be in accordance with (A) through (B).

Exception No. 1: Installations qualifying under the provisions of Article 685.

(A) Remote Disconnect Controls.

(1) Remote disconnect means shall be located at approved locations readily accessible in case of fire to authorized personnel and emergency responders.

(2) The remote disconnect controls for the control of electronic equipment power and HVAC systems shall be grouped and identified. A single means to control both systems shall be permitted.

(3) Where multiple zones are created, each zone shall have an approved means to confine fire or products of combustion to within the zone.

(4) Additional means to prevent unintentional operation of remote disconnect controls shall be permitted.

Informational Note: For further information, see NFPA 75-2009, *Standard for the Protection of Information Technology Equipment.*

(B) Critical Operations Data Systems. Remote disconnecting controls shall not be required for critical operations data systems when all of the following conditions are met:

(1) An approved procedure has been established and maintained for removing power and air movement within the room or zone.

(2) Qualified personnel are continuously available to meet emergency responders and to advise them of disconnecting methods.

(3) A smoke-sensing fire detection system is in place.

Informational Note: For further information, see *NFPA 72*-2010, *National Fire Alarm and Signaling Code*.

(4) An approved fire suppression system suitable for the application is in place.

(5) ~~Signal wiring under a raised floor is in compliance with~~ 645.32. Cables installed under a raised floor, other than branch-circuit wiring and power cords are installed in compliance with 645.36(A) and 645.36(A), (B) or (C), or in compliance with 300.22(C), 725.154 (A), 770.113(C) and Table 770.154(a), 800.113(C) and Table 800.154(a), or 820.113(C) and Table 820.154(a).

~~645.23~~ 645.33 Selective Coordination. Critical Operations Data System(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices.

~~645.27~~ 645.34 Power-Supply Cords. Information technology equipment shall be permitted to be connected to a branch circuit by a power-supply cord.

(1) Power-supply cords shall not exceed 4.5 m (15 ft).

(2) Power cords shall be listed and a type permitted for use on listed information technology equipment or shall be constructed of listed flexible cord and listed attachment plugs and cord connectors of a type permitted for information technology equipment.

Informational Note: One method of determining if cords are of a type permitted for the purpose is found in UL 60950-1-2011 ~~2007~~, *Safety of Information Technology Equipment - Safety - Part 1: General Requirements.*

~~645.28~~ 645.35 Interconnecting Cables. Separate information technology equipment units shall be permitted to be interconnected by means of listed cables and cable assemblies. The 4.5 m (15 ft) limitation in 645.34(1) ~~645.27(1)~~ shall not apply to interconnecting cables.

~~645.29~~ 645.36 Under Raised Floors. Power cables, connecting cables, interconnecting cables, cord-and-plug connections, and receptacles associated with the information technology equipment shall be permitted to be installed under a raised floor ~~shall comply with (1) through (4):~~ provided the conditions of 645.36(A)are met. The installation of branch circuit conductors shall be in accordance with the provisions of 645.36(B). The installation of electrical supply cords, data cables, interconnecting cables and grounding conductors shall be in accordance with the provisions of 645.36(C). The installation of optical fiber cables shall be in accordance with the provisions of 645. 36(D):

(A) Conditions

(1) The raised floor is of approved construction, and the area under the floor is accessible.

(2) Ventilation in the underfloor area is used for the information technology equipment room only, except as provided in 645.4(2). The ventilation system is arranged, with approved smoke detection devices, that upon the detection of fire or products of combustion in the underfloor space, the circulation of air will cease.

(3) Openings in raised floors for cords and cables protect cords and cables against abrasion and minimize the entrance of debris beneath the floor.

(B) Installation Requirements for Branch Circuit Supply Conductors Under a Raised Floor.

(1) The provisions of 300.11 shall apply

(2) The provisions of 300.22(C) shall apply.

Exception No. 1 Rigid metal conduit with an overall nonmetallic covering, rigid nonmetallic conduit, electrical nonmetallic tubing, metal wireway without metal covers, nonmetallic wireway, surface nonmetallic raceway, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit and associated nonmetallic boxes or enclosures shall be permitted to be installed under a raised floor.

Exception No. 2: Type MI cable with an overall nonmetallic covering and Type MC cable with an overall nonmetallic covering shall be permitted to be installed under a raised floor.

~~(1) The branch-circuit supply conductors to receptacles or field-wired equipment are in rigid metal conduit, rigid nonmetallic conduit, intermediate metal conduit, electrical metallic tubing electrical nonmetallic tubing, metal wireway, nonmetallic wireway, surface metal raceway with metal cover, surface nonmetallic raceway, flexible metal conduit, liquidtight flexible metal conduit, or liquidtight flexible nonmetallic conduit, Type MI cable, Type MC cable, or Type AC or Type TC cable and associated metallic and nonmetallic boxes or enclosures. These supply conductors shall be installed in accordance with the requirements of 300.11.~~

(C) Installation Requirements for Electrical Supply Cords, Data Cables, Interconnecting Cables and Grounding Conductors Under a Raised Floor. The following cords, cables and conductors shall be permitted to be installed under a raised floor.

(1~~2~~) Supply cords of listed information technology equipment in accordance with 645.34 ~~645.27~~ ~~shall be permitted.~~

(2~~3~~) Interconnecting cables ~~shall be~~ enclosed in a raceway

(3~~4~~) Equipment grounding conductors

~~III. Signaling Circuits~~

~~**645.31 Under Raised Floors- General.** The following wiring cables shall be permitted:~~

~~(1) Cable type designations shown in Table 645.31~~

(2~~4~~)Listed Type DP cable having adequate fire-resistant characteristics suitable for use under raised floors of an information technology equipment room

Informational Note No. 1: One method of defining fire resistance is by establishing that the cables do not spread fire to the top of the tray in the "UL Flame Exposure, Vertical Tray Flame Test" in UL 1685-2011 ~~2000~~, Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable.

Another method of defining fire resistance is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA "Vertical Flame Test — Cables in Cable Trays," as described in CSA C22.2 No. 0.3-M- 2001, Test Methods for Electrical Wires and Cables.

Informational Note No. 2: Informational Note: For information on listing requirements for communications raceways and cable routing assemblies, see UL 2024-2011, Signaling, Optical Fiber and Communications Raceways and Cable Routing Assemblies.

~~(2) Listed interconnecting cables, enclosed in a raceway, that interconnect separate information technology equipment units.~~

~~Renumber Table 645.5 to 645.31~~

(5) Cable type designations shown in Table 645.36

Table ~~645.5~~ 645.36 Cable Types Permitted Under Raised Floors

Article	Plenum	Riser	General Purpose
336			TC
725	CL2P & CL3P	CL2R & CL3R	CL2, CL3 & PLTC
727			ITC
760	NPLFP & FPLP	NPLFR & FPLR	NPLF & FPL

645.32 Under Raised Floors in a Critical Operations Data System. Signal wiring under a raised floor in a critical operations data system shall be in compliance with 300.22(C), 725.154(A), 770.113(C) and Table 770.154(a), 800.113(C) and Table 800.154(a), or 820.113(C) and Table 820.154(a).
(A) Installation Requirements for Optical Fiber Cables Under a Raised Floor. Optical fiber cables under a raised floor shall be installed in accordance with the provisions of 770.113(C) and Table 770.154(a).
Exception: Types ORNR, OFCR, OFN and OFC shall be permitted to be installed under a raised floor.

Substantiation: This is one of several Comments prepared by the CMP 12 Article 645 Task Group consisting of CMP 12 members Tom Brown, Tim Croushore, Tom Hedges, Bob Johnson, Stan Kaufman, John Kovacik, Todd Lottmann and Jose Salazar.

The Task Group was appointed by CMP 12 Chairman Croushore to review the reorganization. In addition, the task group took on the assignment of making recommendations to implement the Correlating Committee directives:

Reconsider and review the proposal in its entirety for compliance with the NEC Style Manual.

Renumber so that numbering between Parts should start, at minimum, with the next decade in accordance with the NEC Style Manual.

Reconsider the titles for both Parts II and Parts III to improve clarity.

Reconsidered the term "power grounding" since it is not defined in the NEC.

The Task Group's recommended text improves clarity by reorganizing Article 645 into two parts, Part I, General and Part II, Wiring Methods. The text as proposed and accepted in principle had three parts, Part I, General, Part II, Power Circuits and Part III, Signaling Circuits. Clarity is improved by having Part II, Wiring Methods cover both power and signaling because some of the wring methods, DP Cable, for example, can be used for powering or signaling. Doing so also complies with the Correlating Committee directive to reconsider the titles for Parts II and III.

The recommended text for 645.2, Definitions, restores the informational note associated with Information Technology Equipment. It had been inadvertently omitted from the proposal. With the restoration of the informational note, the recommended text for 645.2 is identical to the text in the 2011 NEC except that the reference to UL 60950 has been updated from 2007 to 2011.

The recommended text for 645.3 revises the panel action by adding "the provisions of" in several more places. See panel action on proposals 12-110a and 12-111. The recommended text for 645.3 is in compliance with the NEC Style Manual. 645.3(B) was revised to improve clarity.

The recommended revision to the introductory paragraph of 645.4, which replaces "Chapters 1 through 4" with "Chapter 3" clarifies the intent of 645.4 and reflects the titles of the Articles. The title of Chapter 1 is "General"; Chapter 2, "Wiring and Protection"; Chapter 3, "Wiring Methods; and Chapter 4 "Equipment for General Use".

The intent of Article 645 is to provide "alternate wiring methods" that are commonly found in Chapter 3 of the National Electrical Code. Article 645 provides an option to Chapter 3 wiring methods when the facility and installation meets the qualification requirements contained within Article 645 to allow such an option. The non-wiring method requirements contained in Article 645 do supplement or modify the requirements contained within Chapters 1, 2, and 4 of the NEC as per 90.3.

The recommended text for 645.4 deletes 645.4(7), (8) and (9) since it recommends moving these required conditions back to the section on wiring under raised floors (645.36(A)).

The recommended text for 645.4 revises several cross-references to coordinate with the renumbering of the referenced sections.

New Part II, Wiring Methods begins with 645.20 in compliance with the Correlating Committee directive on numbering. Part II begins with grounding and bonding and divides the grounding requirements into two logical sections, one for equipment grounding and bonding and one for systems grounding, and adds requirements for separately derived power systems. The recommended text for 645.20, Equipment Grounding and Bonding and 645.21 System Grounding replaces 645.15 Grounding and 645.22 Power Systems Grounding in the text accepted at the ROP meeting and thereby complies with the Correlating committee directive to reconsider the term "power grounding".

The recommended text for 645.20 complies with the NEC Style Manual prohibition of references to entire Articles by specifying the relevant parts of Article 250 that should apply. The accepted text from the Panel action on Proposal 12-139 continues to be included in the recommended text.

The renumbering includes reordering the sections so that the planning sections on engineering calculations (645.22 Engineering supervision) and sizing of conductors (645.23 Ampacity of Branch-Circuit Conductors) are encountered before the installation sections. Note that the title of 645.23 is expanded from Branch-Circuit Conductors to Ampacity of Branch-Circuit Conductors to have the title of the section better describe the contents of the section.

Likewise, the title of the next section (645.24 Equipment Marking) has been expanded from "Marking" to reflect that what this section is about, equipment marking and not circuit or cable marking.

The numbering within 645.26, Installed Supply Circuits and Interconnecting Cables Identified for Future Use, has been revised to comply with the NEC Style Manual. See 645.19 in the NEC ROP Preprint, where the editor made this change.

The title of the Physical Protection section (645.27), has been expanded to Physical Protection of Supply circuits and Interconnecting Cables to accurately reflect the actual content of the section.

Other than renumbering to comply with the Correlating Committee directive, the sections on securing in place, UPSs and PDUs are unchanged. The cross-references to other sections are changed wherever necessary.

Within the renumbered section on disconnecting means (645.32), section 645.32(B)(5) on signal wiring has been restored to the text in 645.10(B)(5) in the 2011 NEC (with cross-references renumbered as necessary).

Section 645.33 Selective Coordination has been placed immediately after the section on disconnecting means because relates to critical operations data systems, which is directly above it in the recommended text.

In 645.34 Power-Supply Cords, the reference to UL 60950 in the informational note, has been updated from 2007 to 2011.

The section on Interconnecting Cables is unchanged except for the renumbering of the section and renumbering of the cross-reference to the length limitation on power-supply cords.

The text for the section on wiring under raised floors has been revised to clearly state the conditions that must be satisfied before wiring is permitted under a raised floor (645.36(A)) and installation requirements are clearly labeled as installation requirements.

The recommended text for 645.4 is clear that the provisions of Chapter 3 apply to power wiring and Article 645 is permitted to provide alternate wiring methods to Chapter 3. The recommended text for the installation requirements for branch circuit conductors under a raised floor states the two sections of Chapter 3 that apply (300.11 and 300.22(C)) and then introduces the alternate wiring methods as exceptions.

The first exception covers permitted raceways and second exception covers permitted cables. Exception No. 1 includes all the raceways permitted in 645.5(E)(2) but not permitted by 300.22(C)(1) in the 2011 NEC.

The text of the Exception No. 2 correlates with CMP 3 action on proposal 3-84 which added additional prohibitions on the use of plastic jacked metal-sheathed cables in air plenums (other spaces used for environmental air). Specifically, the revision to 300.22(C)(1) permits Type MI cable without an overall nonmetallic covering, but not Type MI cable with an overall nonmetallic covering. Since Article 645 in the 2011 NEC permits Type MI cable with or without an overall nonmetallic covering, the recommended text for 645.36(B) Exception No. 2 permits plastic jacketed Type MI cable, i.e.; MI Cable with an overall nonmetallic covering.

The existing text of 300.22(C)(1) in the 2011 NEC and in the accepted text for the 2014 NEC, only permits Type MC cable without an overall nonmetallic covering, but not Type MC cable with an overall nonmetallic covering. Since Article 645 in the 2011 NEC permits Type MC cable with or without an overall nonmetallic covering, the recommended text for 645.36(B) Exception No. 2 permits plastic jacketed Type MC cable, i.e.; MC Cable with an overall nonmetallic covering.

The recommended text for 645.36(C) covers all the electrical cables and conductors permitted for electrical supply cords, data cables, interconnecting cables and grounding conductors. Type TC has been restored to Table 645.36 (renumbered Table 645.5) because it was inadvertently omitted in the processing of proposal 12-109. Optical fiber cables are deleted form Table 645.36 to avoid any possible misconception that they are substitutes for any of the electrical cables in the table.

The recommended text for 645.36(D) follows the same style as the recommended text for branch circuit conductors (645.36(B)), calling for compliance with the appropriate sections in Article 770 and then permitting other cables by exception.

IF THIS COMMENT IS ACCEPTED ARTICLE 645 WILL READ AS FOLLOWS:

ARTICLE 645

Information Technology Equipment

Informational Note: Text that is followed by a reference in brackets has been extracted from NFPA 75-2009, *Standard for the Protection of Information Technology Equipment*. Only editorial changes were made to the extracted text to make it consistent with this *Code*.

I. General

645.1 Scope. This article covers equipment, power-supply wiring, equipment interconnecting wiring, and grounding of information technology equipment and systems in an information technology equipment room.

Informational Note: For further information, see NFPA 75-2009, *Standard for the Protection of Information Technology Equipment*, which covers the requirements for the protection of information technology equipment and information technology equipment areas.

645.2 Definitions.

Abandoned Supply Circuits and Interconnecting Cables. Installed supply circuits and interconnecting cables that are not terminated at equipment and not identified for future use with a tag.

Critical Operations Data System. An information technology equipment system that requires continuous operation for reasons of public safety, emergency management, national security, or business continuity.

Information Technology Equipment (ITE). Equipment and systems rated 600 volts or less, normally found in offices or other business establishments and similar environments classified as ordinary locations, that are used for creation and manipulation of data, voice, video, and similar signals that are not communications equipment as defined in Part I of Article 100 and do not process communications circuits as defined in 800.2.

Informational Note: For information on listing requirements for both information technology equipment and communications equipment, see UL 60950-1-2011, *Information Technology Equipment - Safety - Part 1: General Requirements*.

Information Technology Equipment Room. A room within the information technology equipment area that contains the information technology equipment. [**75:**3.3.9]

Remote Disconnect Control. An electric device and circuit that controls a disconnecting means through a relay or equivalent device.

Zone. A physically identifiable area (such as barriers or separation by distance) within an information technology equipment room, with dedicated power and cooling systems for the information technology equipment or systems.

645.3 Other Articles. Circuits and equipment shall comply with 645.3(A) through (H), as applicable.

(A) Spread of Fire or Products of Combustion. The provisions of 300.21, 770.26, 800.26, and 820.26 shall apply to penetrations of the fire-resistant room boundary.

(B) Other Spaces Used for Environmental Air (Plenums). The provisions of 300.22(C)(1), 725.154(A), 760.53(B)(2), 760.154(A), 770.113(C), 800.113(C), and 820.113(C) and Tables 770.154(A), 800.154(A) and 820.154(A) shall apply to the space over a suspended ceiling used for environmental air handling purposes in an information technology equipment room.

(C) Grounding. The non–current-carrying conductive members of optical fiber cables in an information technology equipment room shall be grounded in accordance with the provisions of 770.114.

(D) Electrical Classification of Data Circuits. The provisions of 725.121(A)(4) shall apply to the electrical classification of listed information technology equipment signaling circuits. The provisions of 725.139(D)(1) and 800.133(A)(1)(b) shall apply to the electrical classification of Class 2 and Class 3 circuits in the same cable with communications circuits.

(E) Fire Alarm Equipment. The provisions of Parts I, II, and III of Article 760 shall apply to fire alarm systems equipment installed in an information technology equipment room.

(F) Communications Equipment. The provisions of Parts I, II, III, IV, and V of Article 800 shall apply to communications equipment installed in an information technology equipment room. Article 645 shall apply to the powering of communications equipment in an information technology equipment room.

Informational Note: See Part I of Article 100, Definitions, for a definition of communications equipment.

(G) Community Antenna Television and Radio Distribution Systems Equipment. The provisions of Parts I, II, III, IV, and V of Article 820 shall apply to community antenna television and radio distribution systems equipment installed in an information technology equipment room. Article 645 shall apply to the powering of community antenna television and radio distribution systems equipment installed in an information technology equipment room.

(H) Cables Not in Information Technology Equipment Room. Cables extending beyond the information technology equipment room shall be subject to the applicable requirements of this *Code*.

645.4 Special Requirements for Information Technology Equipment Room. This article shall be permitted to provide alternate wiring methods within the information technology room and under the raised floor to the provisions of Chapter 3 for power wiring, Parts I and III of Article 725 for signaling wiring and Parts I and V of Article 770 for optical fiber cabling when all of the following conditions are met:

(1) Disconnecting means complying with 645.32 are provided.

(2) A heating/ventilating/air-conditioning (HVAC) system is provided in one of the methods identified in 645.4(2)(a) or (b).

(a) a separate HVAC system that is dedicated for information technology equipment use and is separated from other areas of occupancy

(b) an HVAC system that serves other occupancies and:

(1) also serves the information technology equipment room; and

(2) provides fire/smoke dampers at the point of penetration of the room boundary; and

(3) activates the damper operation upon initiation by smoke detector alarms, by operation of the disconnecting means required by 645.32, or both.

Exception: Where information technology equipment is installed in a critical operations data system in compliance with 645.32(B), a procedure shall be permitted that controls the cessation of the air circulation within the room or zone.

Informational Note: For further information, see NFPA 75-2009, *Standard for the Protection of Information Technology Equipment*, Chapter 10, 10.1, 10.1.1, 10.1.2, and 10.1.3.

(3) All information technology and communications equipment installed in the room is listed.

(4) The room is occupied by, and accessible to, only those personnel needed for the maintenance and functional operation of the installed information technology equipment.

(5) The room is separated from other occupancies by fire-resistant-rated walls, floors, and ceilings with protected openings.

Informational Note: For further information on room construction requirements, see NFPA 75-2009, *Standard for the Protection of Information Technology Equipment*, Chapter 5.

(6) Only electrical equipment and wiring associated with the operation of the information technology room is installed in the room.

Informational Note: HVAC systems, communications systems, and monitoring systems such as telephone, fire alarm systems, security systems, water detection systems, and other related protective equipment are examples of equipment associated with the operation of the information technology room.

II Wiring Methods

645.20 Equipment Grounding and Bonding. All exposed non–current-carrying metal parts of an information technology system shall be bonded to the equipment grounding conductor in accordance with the provisions of Parts V, VI and VII of Article 250 or shall be double insulated. Where signal reference structures are installed, they shall be bonded to the equipment grounding conductor provided for the information technology equipment. Any auxiliary grounding electrode(s) installed for information technology equipment shall be installed in accordance with the provisions of 250.54.

Informational Note No. 1: The bonding requirements in the product standards governing this listed equipment ensure that it complies with Article 250.

Informational Note No. 2: Where isolated grounding-type receptacles are used, see 250.146(D) and 406.3(D).

645.21 System Grounding. Separately derived power systems shall be installed in accordance with the provisions of Part II or Article 250. Power systems derived within listed information technology equipment that supply information technology systems through receptacles or cable assemblies supplied as part of this equipment shall not be considered separately derived for the purpose of applying 250.30.

645.22 Engineering Supervision. As an alternative to the feeder and service load calculations required by Parts III and IV of Article 220, feeder and service load calculations for new or existing loads shall be permitted to be used if provided by qualified persons under engineering supervision.

645.23 Ampacity of Branch-Circuit Conductors. The branch-circuit conductors supplying one or more units of information technology equipment shall have an ampacity not less than 125 percent of the total connected load.

645.24 Equipment Marking. Each unit of an information technology system supplied by a branch circuit shall be provided with a manufacturer's nameplate, which shall also include the input power requirements for voltage, frequency, and maximum rated load in amperes.

645.25 Abandoned Supply Circuits and Interconnecting Cables. The accessible portion of abandoned supply circuits and interconnecting cables shall be removed unless contained in a raceway.

645.26 Installed Supply Circuits and Interconnecting Cables Identified for Future Use.

(1) Supply circuits and interconnecting cables identified for future use shall be marked with a tag of sufficient durability to withstand the environment involved.

(2) Supply circuit tags and interconnecting cable tags shall have the following information:

(1) Date identified for future use

(2) Date of intended use

(3) Information relating to the intended future use

645.27 Physical Protection of Supply circuits and Interconnecting Cables. Where exposed to physical damage, supply circuits and interconnecting cables shall be protected.

645.28 Securing in Place. Power cables; communications cables; connecting cables; interconnecting cables; and associated boxes, connectors, plugs, and receptacles that are listed as part of, or for, information technology equipment shall not be required to be secured in place.

645.30 Uninterruptible Power Supplies (UPSs). Except for installations and constructions covered in 645.30(1) or (2), UPS systems installed within the information technology equipment room, and their supply and output circuits, shall comply with 645.32. The disconnecting means shall also disconnect the battery from its load.

(1) Installations qualifying under the provisions of Article 685

(2) Power sources limited to 750 volt-amperes or less derived either from UPS equipment or from battery circuits integral to electronic equipment

645.31 Power Distribution Units. Power distribution units that are used for information technology equipment shall be permitted to have multiple panelboards within a single cabinet, if the power distribution unit is utilization equipment listed for information technology application.

645.32 Disconnecting Means. An approved means shall be provided to disconnect power to all electronic equipment in the information technology equipment room or in designated zones within the room. There shall also be a similar approved means to disconnect the power to all dedicated HVAC systems serving the room or designated zones and shall cause all required fire/smoke dampers to close. The installation of remote disconnect controls shall be in accordance with (A) through (B).

Exception No. 1: Installations qualifying under the provisions of Article 685.

(A) Remote Disconnect Controls.

(1) Remote disconnect means shall be located at approved locations readily accessible in case of fire to authorized personnel and emergency responders.

(2) The remote disconnect controls for the control of electronic equipment power and HVAC systems shall be grouped and identified. A single means to control both systems shall be permitted.

(3) Where multiple zones are created, each zone shall have an approved means to confine fire or products of combustion to within the zone.

(4) Additional means to prevent unintentional operation of remote disconnect controls shall be permitted.

Informational Note: For further information, see NFPA 75-2009, *Standard for the Protection of Information Technology Equipment*.

(B) Critical Operations Data Systems. Remote disconnecting controls shall not be required for critical operations data systems when all of the following conditions are met:

(1) An approved procedure has been established and maintained for removing power and air movement within the room or zone.

(2) Qualified personnel are continuously available to meet emergency responders and to advise them of disconnecting methods.

(3) A smoke-sensing fire detection system is in place.

Informational Note: For further information, see *NFPA 72*-2010, *National Fire Alarm and Signaling Code*.

(4) An approved fire suppression system suitable for the application is in place.

(5) Cables installed under a raised floor, other than branch-circuit wiring and power cords are installed in compliance with 645.36(A) and 645.36(A), (B) or (C), or in compliance with 300.22(C), 725.154 (A), 770.113(C) and Table 770.154(a), 800.113(C) and Table 800.154(a), or 820.113(C) and Table 820.154(a).

645.33 Selective Coordination. Critical Operations Data System(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices.

645.34 Power-Supply Cords. Information technology equipment shall be permitted to be connected to a branch circuit by a power-supply cord.

(1) Power-supply cords shall not exceed 4.5 m (15 ft).

(2) Power cords shall be listed and a type permitted for use on listed information technology equipment or shall be constructed of listed flexible cord and listed attachment plugs and cord connectors of a type permitted for information technology equipment.

Informational Note: One method of determining if cords are of a type permitted for the purpose is found in UL 60950-1-2011, *Safety of Information Technology Equipment - Safety - Part 1: General Requirements*.

645.35 Interconnecting Cables. Separate information technology equipment units shall be permitted to be interconnected by means of listed cables and cable assemblies. The 4.5 m (15 ft) limitation in 645.34(1) shall not apply to interconnecting cables.

645.36 Under Raised Floors. Power cables, connecting cables, interconnecting cables, cord-and-plug connections, and receptacles associated with the information technology equipment shall be permitted to be installed under a raised floor provided the conditions of 645.36(A) are met. The installation of branch circuit conductors shall be in accordance with the provisions of 645.36(B). The installation of electrical supply cords, data cables, interconnecting cables and grounding conductors shall be in accordance with the provisions of 645.36(C). The installation of optical fiber cables shall be in accordance with the provisions of 645. 36(D):

(A) **Conditions**

(1) The raised floor is of approved construction, and the area under the floor is accessible.

(2) Ventilation in the underfloor area is used for the information technology equipment room only, except as provided in 645.4(2). The ventilation system is arranged, with approved smoke detection devices, that upon the detection of fire or products of combustion in the underfloor space, the circulation of air will cease.

(3) Openings in raised floors for cords and cables protect cords and cables against abrasion and minimize the entrance of debris beneath the floor.

(B) Installation Requirements for Branch Circuit Supply Conductors Under a Raised Floor.

(1) The provisions of 300.11 shall apply.

(2) The provisions of 300.22(C) shall apply.

Exception No. 1: Rigid metal conduit with an overall nonmetallic covering, rigid nonmetallic conduit, electrical nonmetallic tubing, metal wireway without metal covers, nonmetallic wireway, surface nonmetallic raceway, liquidtight flexible metal conduit, liquidtight flexible nonmetallic conduit and associated nonmetallic boxes or enclosures shall be permitted to be installed under a raised floor.

Exception No. 2: Type MI cable with an overall nonmetallic covering and Type MC cable with an overall nonmetallic covering shall be permitted to be installed under a raised floor.

(C) Installation Requirements for Electrical Supply Cords, Data Cables, Interconnecting Cables and Grounding Conductors Under a Raised Floor. The following cords, cables and conductors shall be permitted to be installed under a raised floor.

(1) Supply cords of listed information technology equipment in accordance with 645.34

(2) Interconnecting cables enclosed in a raceway

(3) Equipment grounding conductors

(4) Listed Type DP cable having adequate fire-resistant characteristics suitable for use under raised floors of an information technology equipment room

Informational Note No. 1: One method of defining fire resistance is by establishing that the cables do not spread fire to the top of the tray in the "UL Flame Exposure, Vertical Tray Flame Test" in UL 1685-2011, Standard for Safety for Vertical-Tray Fire-Propagation and Smoke-Release Test for Electrical and Optical-Fiber Cables. The smoke measurements in the test method are not applicable.

Another method of defining fire resistance is for the damage (char length) not to exceed 1.5 m (4 ft 11 in.) when performing the CSA "Vertical Flame Test — Cables in Cable Trays," as described in CSA C22.2 No. 0.3-M- 2001, Test Methods for Electrical Wires and Cables.

Informational Note No. 2: Informational Note: For information on listing requirements for communications raceways and cable routing assemblies, see UL 2024-2011, Signaling, Optical Fiber and Communications Raceways and Cable Routing Assemblies.

(5) Cable type designations shown in Table 645.36

Table 645.36 Cable Types Permitted Under Raised Floors

Article	Plenum	Riser	General Purpose
336			TC
725	CL2P & CL3P	CL2R & CL3R	CL2, CL3 & PLTC
727			ITC
760	NPLFP & FPLP	NPLFR & FPLR	NPLF & FPL
800	CMP	CMR	CM & CMG
820	CATVP	CATVR	CATV

(D) Installation Requirements for Optical Fiber Cables Under a Raised Floor. Optical fiber cables under a raised floor shall be installed in accordance with the provisions of 770.113(C) and Table 770.154(a).

Exception: Types ORNR, OFCR, OFN and OFC shall be permitted to be installed under a raised floor.

Panel Meeting Action: Reject

Panel Statement: CMP-12 does not agree that the reorganization of Article 645 will add significant enough clarity to justify this change. The current organization of Article 645 is well understood and the major changes proposed will require a significant effort to understand the new location of requirements and update documentation, listing documents, and training information. The merit proposed by this reorganization does not outweigh the effort resulting from the changes.

The result of the voting on this comment rejects Proposal 12-109. The panel actions on the following proposals shall remain as balloted in the A2013 ROP: Proposals 12-110a, 12-111, 12-112, 12-114, 12-127, 12-128, 12-131, 12-132, 12-134, 12-137, 12-138, 12-139, 12-142, and 12-143.

Number Eligible to Vote: 13

Ballot Results: Affirmative: 11 Negative: 2

Explanation of Negative:

BROWN, T.: No information or data was presented to support the rationalization that re-organization of Article 645 presented any significant burden to the manufacturer's of equipment covered by this article. Since most product information is made available online or in digital format, there is little or no printing cost associated with the proposed changes. Equipment manufacturer's have an obligation to routinely update their user documentation. Including these types of reorganization changes, which would require little additional effort on their part.

KAUFMAN, S.: I disagree with the panel position that the reorganization will not add sufficient clarity to justify the change. The panel accepted virtually all the changes that were processed as separate proposals (in the ROP stage) and comments (in the ROC stage). I regret not having submitted the changes to the underfloor wiring wiring section as a separate comment because that part of Article 645 is the most confusing and most in need of reorganization.

12-56a Log #CC1204 NEC-P12 **Final Action: Reject**
(645.2)

TCC Action: The Correlating Committee directs that the action be reported as "Reject" because it adds requirements into an Informational Note.

Submitter: Code-Making Panel 12,

Comment on Proposal No: 12-136

Recommendation: Add new text following the definition of Critical Operations Data System to read as follows:

Informational Note: The designation of Critical Operations Data System does not necessarily imply the site requires a Critical Operations Power System, nor does the use of a Critical Operations Power System imply the installation is a Critical Operations Data System.

Substantiation: CMP-12 adds an informational note to 645.2 Critical Operations Data System for clarity.

Panel Meeting Action: Accept

Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

12-57 Log #576 NEC-P12 **Final Action: Hold**
(645.2, Informational Note)

TCC Action: The Correlating Committee directs that the action on Comment 12-57 be reported as a "Hold" because the comment contains new material that has not had public review

Submitter: Thomas M. Burke, UL LLC

Comment on Proposal No: 12-109

Recommendation: It appears that the Informational Note associated with the definition of Information Technology Equipment (ITE) will be kept, although it is not reflected in the draft ROP. If it will be kept, a reference also should be added to the new standard, UL 62368-1.

Informational Note: For information on listing requirements for both information technology equipment and communications equipment, see UL 60950-1-2007, *Information Technology Equipment - Safety - Part 1: General Requirements*; or UL 62368-1-2012, *Audio/Video, Information and Communication Technology Equipment – Part 1: Safety Requirements.*

Substantiation: This is one in a series of proposals to update NFPA 70 to add a reference to UL 62368-1.

ANSI/UL 62368-1, Audio/video, information and communication technology equipment – Part 1: Safety requirements, was published on February 17, 2012. This new standard will eventually replace (later this decade) both, UL 60065, Audio, Video, and Similar Electronic Apparatus-Safety Requirements, and UL 60950-1, Information Technology Equipment Safety - Part 1: General Requirements. In the meantime, multiple references to UL 60950-1 in the body of the Code should be supplemented by a reference to UL 62368-1 since similar equipment complying with, and Listed to both standards will be installed per the Code. In fact, equipment already is being Listed to UL 62368-1.

Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-58 Log #312 NEC-P12 **Final Action: Accept in Principle**
(645.3(B) and 645.32 (New))

TCC Action: The Correlating Committee directs that the words "the provisions of" be replaced with the word "sections." Although the NEC Style Manual does not permit the use of the word "Section", when section numbers are used in the beginning of a sentence it is appropriate to use the word "Section."

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 12-109
Recommendation: In 645.3(B) make the following changes:

(B) Plenums. The provisions of ~~Sections~~ 300.22(C)(1), 725.135(B) ~~725.154(A),~~ 760.53(B)(2), 760.135(B) ~~760.154(A),~~ 770.113(C), 800.113(C), and 820.113(C) and Tables 725.154, 760.154, 770.154(A), 800.154(A) and 820.154(A) shall apply to wiring and cabling in a plenum (other space used for environmental air) above an information technology equipment room.

In 645.32 (645.10(B) renumbered by CMP-12 action on proposal 12-109)

645.32 Under Raised Floors in a Critical Operations Data system. Signal wiring under a raised floor in a critical operations data system shall be in compliance with 300.22(C), 725.135(B) and Table 725.154 ~~(A),~~ 770.113(C) and Table 770.154(a), 800.113(C) and Table 800.154(a), or 820.113(C) and Table 820.154(a).

Substantiation: This is a correlating comment to our comments on proposal 3-144a and 3-154a to reorganize 725.154 and move the installation requirements out of 725.154 into a new section 725.135. If those comments are accepted, the references to 725.154(A) will need to be changed to correlate.

Panel Meeting Action: Accept in Principle

Revise 645.3(B) to read as follows:

(B) Plenums. The provisions of 300.22(C)(1), 725.135(B), 760.53(B)(2), 760.135(B), 770.113(C), 800.113(C), and 820.113(C) and Tables 725.154, 760.154, 770.154(A), 800.154(A) and 820.154(A) shall apply to wiring and cabling in a plenum (other space used for environmental air) above an information technology equipment room.

Revise 645.10(B)(5) to read as follows:

(5) Cables installed under a raised floor, other than branch circuit wiring and power cords installed in compliance with 645.5(E)(2) or (E)(3), or in compliance with 300.22(C), 725.135(B) and Table 725.154, 770.113(C) and Table 770.154(a), 800.113(C) and Table 800.154(a), or 820.113(C) and Table 820.154(a).

Panel Statement: CMP-12 accepts the submitter's text with regard to 645.3(B) and edits the text for 645.10(B)(5) to correlate with CMP-3 action on Comments 3-57, 3-63, 3-101 and 3-104. CMP-12 also revises 645.5(D)(2) and (D)(3) to 645.5(E)(2) and (E)(3) to point to the correct location. The panel is aware that errata was issued for 645.10(B)(5) numbered 70-11-1 item 20.

Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-59 Log #390 NEC-P12 **Final Action: Accept in Principle**
(645.4)

Submitter: Stanley Kaufman, CableSafe, Inc.
Comment on Proposal No: 12-112
Recommendation: Change the panel action from Accept to Accept in Principle and modify the text as shown:

This article shall be permitted to provide alternate wiring methods within the information technology room and under the raised floor to the provisions of Chapter 3 ~~Chapters 1 through 4~~ for power wiring, Parts I and III of Article 725 for signaling wiring, and Parts I and V of Article 770 for optical fiber cabling when all of the following conditions are met:

Substantiation: The recommended revision provides clarity and reflects the titles of the Articles. The title of Chapter 1 is "General"; Chapter 2, "Wiring and Protection"; Chapter 3, "Wiring Methods; and Chapter 4 "Equipment for General Use".

The intent of Article 645 is to provide "alternate wiring methods" that are commonly found in Chapter 3 of the National Electrical Code. Article 645 provides an option to Chapter 3 wiring methods when the facility and installation meets the qualification requirements contained within Article 645 to allow such an option. The non-wiring method requirements contained in Article 645 do supplement or modify the requirements contained within Chapters 1, 2, and 4 of the NEC as per 90.3.

This is one of several Comments prepared by the CMP 12 Article 645 Task Group consisting of CMP 12 members Tom Brown, Tim Croushore, Tom Hedges, Bob Johnson, Stan Kaufman, John Kovacik, Todd Lottmann and Jose Salazar.

Panel Meeting Action: Accept in Principle

Revise the first paragraph of 645.4 to read as follows:

645.4 Special Requirements for Information Technology Equipment Room. This article shall be permitted to provide alternate wiring methods to the provisions of Chapter 3 for power wiring, Parts I and III of Article 725 for signaling wiring, and Parts I and V of Article 770 for optical fiber cabling when all of the following conditions are met:

Panel Statement: CMP-12 revises the submitter's text to remove reference to "under the raised floor" and remove reference to "the information technology room". CMP-12 revises the text to make it concise.

Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-60 Log #1458 NEC-P12 **Final Action: Reject**
(645.4(2) Exception)

Submitter: Thomas J. Wysocki, Guardian Services, Inc.
Comment on Proposal No: 12-114
Recommendation: Delete text as follows:

~~*Exception: Where information technology equipment is installed in a critical operations data system in compliance with 645.10(B), a procedure shall be permitted that controls the cessation of the air circulation within the room or zone.*~~

Substantiation: Assuming my comment on Proposal 12-109 Paragraph 645.4 (8) to delete "The ventilation system shall also be so arranged, with approved smoke detection devices, that upon the detection of fire or products of combustion in the underfloor space, the circulation of air will cease." is accepted, the proposed 645.4 (2) Exception will not be pertinent.

Panel Meeting Action: Reject

Panel Statement: The rationale for 645 permitting non-plenum cables in the raised floor plenum is that there are fire protection requirements in the article. Conformance to NFPA 75 is not required by Article 645. All references to NFPA 75, *Standard for the Fire Protection of Information Technology Equipment*, are in informational notes only. The NEC Style Manual prohibits references to other standards in the mandatory text. The panel, in its action on Proposal 12-114, provided the relief that the submitter seeks for installations with a high level of fire protection, i.e., critical operations data systems.

Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-61 Log #1459 NEC-P12 **Final Action: Reject**
(645.4(8))

Submitter: Thomas J. Wysocki, Guardian Services, Inc.
Comment on Proposal No: 12-109
Recommendation: Revise text to read as follows:

(8) If a raised floor is present, ventilation in the underfloor area is used for the information technology equipment room only, except as provided in 645.4(2). ~~The ventilation system shall also be so arranged, with approved smoke detection devices, that upon the detection of fire or products of combustion in the underfloor space, the circulation of air will cease.~~

Substantiation: The text indicated for deletion deals with control of air circulation within the IT room and is outside the scope of NFPA 70 and sets forth a requirement which is often technically undesirable in modern information technology rooms.

The basis of the comment is twofold:

1) Responsibility for the protection of IT facilities is the scope of NFPA 75. Within that scope NFPA 75 covers risk considerations, construction, and operating (performance) requirements – control of airflow within an IT facility is the province of NFPA 75.

Acceptance of this comment would remove a conflict in requirements between NFPA 75 and NFPA 70 and clarify the demarcation between "what" (NFPA 75) must be done in IT facilities and "how" (NFPA 70) to accomplish the electrical installation.

The operating characteristics (performance) of an information technology equipment room are the province of NFPA 75. NFPA 70 addresses the "how" of accomplishing the functions required by NFPA 75 for operation of IT equipment and the utilities serving the IT facility. Several decisions of the Standards Council point to the responsibility of NFPA 75 with respect to control of combustible in IT facilities.

Standards Council decision 89-50 (April 1991) affirmed that the Committee on Electronic Computer Systems (NFPA 75) has responsibility for combustibles under the raised floor of a computer room. NFPA 90A 2012 Edition recognizes this fact and states the following with respect to materials installed within a raised floor plenum in a computer/data processing room:

4.3.11.5.5.5 Raised floors, intermachine cables, electrical wires, listed plenum optical fiber, communications and signaling raceways, and optical-fiber cables in computer/data processing rooms where these rooms are designed and installed in accordance with NFPA 75, Standard for the Protection of Information Technology Equipment, shall be permitted. (NFPA 90A 2012 Edition)

On March 6, 2012, the NFPA Standards Council issued a TIA which removed the paragraph 10.4.4 of NFPA 75 Edition 2009 which had extracted the exact verbiage of NFPA 70 645.5D(3) Edition 2005 (NFPA 70 645.5E(4) Edition 2011), verbiage which is now in the proposed NFPA 70 645.4(8). The NFPA 75 technical committee was clear in its intent that cessation of airflow in the underfloor space upon detection of fire or smoke under the raised floor should not be a general requirement for operation of an IT facility.

2) There is no technical basis for shutting down airflow in an IT facility upon detection of smoke or fire under a raised floor. The original basis for adding the sentence in question was not technical – rather it was an attempt to alleviate a problem related to application of building codes to underfloor spaces (NFPA 70 May 2001 ROP 12 – 100).

On the contrary in modern IT facilities, there is good technical basis not to shut down airflow upon detection of smoke or fire under the raised floor. In considering the technical merit of the 2012 TIA, the NFPA 75 technical committee took note of the following:

Today's IT servers run applications that are critical to business continuity and frequently have life safety implications. Unplanned shutdown of the IT equipment can cause loss of control over life support systems, emergency response systems, security systems and loss of essential data in process. Therefore, it may be undesirable – or even dangerous – to automatically shut down equipment that is not directly involved in a fire.

Modern server racks contain multiple processing units which can create a large amount of heat. If air conditioning equipment used to cool the servers is shut down, temperatures can increase by as much as 40 degrees in a matter of minutes, potentially causing more damage than the heat of a small electronic fire. Therefore, it is desirable to maintain cooling air flow for as long as possible.

Thermal overheat devices are built in to individual servers to immediately depower overheating components in an attempt to prevent permanent damage to entire server. If a single server or single server rack is shut down by thermal protective devices, other servers would generally remain available to maintain functionality. But if the room or area environmental cooling air suddenly would cease due to initiation of a fire detector under a raised floor, all equipment in the area could shut down on thermal overload. This would cause the uncontrolled loss of all function provided by the IT equipment and this can have serious consequences.

Fire suppression systems used in IT facilities are often designed to detect and extinguish fire in its incipient stage while cooling air flow through the facility is maintained and servers remain running. If depowering of equipment is required as part of the fire protection, such depowering is generally done in a planned, programmed sequence to minimize loss of data. When an IT facility is providing support or control related to life safety or security, the depowering sequence typically includes provision to transfer support or control functions to a backup IT facility. Determination of when it is safe to shut off ventilation to the IT equipment is part of the planned depowering sequence.

In IT facilities protected by automatic gaseous extinguishing systems, the activation of more than one detector is usually required to confirm existence of fire and thereby release the fire extinguishing gas. Air flow is taken into account in locating smoke detectors.

Cessation of normal air flow upon activation of a single smoke detector can delay the activation of additional smoke detectors in the IT facility and thereby delay release of automatic gaseous extinguishing agent in facilities equipped with such systems. The subject of airflow and its effect on fire detection in IT facilities and telecommunications facilities is the subject of ongoing research by the FPRF with the advice of a joint task group of NFPA 75 and NFPA 76 technical committee representatives. Again control of airflow is a subject for the occupancy standards rather than the NEC.

Furthermore, very recent research indicates that, for the type of fire typical in IT facilities, extinguishment may actually be aided by continuous flow of air through the fire zone. The airflow helps cool the fire zone and, because of the typically smoldering nature of these fires in their early stages, can reduce the amount of heat available to be carried by conduction to nearby materials. This is complex research to be made public shortly. The results of this research are further indication of the wisdom of the NFPA 75 technical committee's refusal to place a general requirement for cessation of airflow in the IT protection standard. Indeed the subject of airflow control in IT facilities is in the province and scope of the NFPA 75 technical committee, the membership of which includes persons closely involved with leading-edge IT technology and fire protection methods for such technology.

Upon detection of smoke or fire anywhere within the IT facility, personnel will be alerted to the danger by the fire alarm system. Personnel are given the opportunity for appropriate evacuation or response to the alarm. Cessation of airflow through the raised floor is not necessary. If personnel are not present, the features of the automatic fire protection systems are permitted to function per their design.

Panel Meeting Action: Reject

Panel Statement: The rationale for Article 645 permitting non-plenum cables in the raised floor plenum is that there are fire protection requirements in the Article. Conformance to NFPA 75 is not required by Article 645. All references to NFPA 75, *Standard for the Fire Protection of Information Technology Equipment*, are in informational notes only. The NEC Style Manual prohibits references to other standards in the mandatory text. The panel, in its action on Proposal 12-114, provided the relief that the submitter seeks for installations with a high level of fire protection, i.e., critical operations data systems.

Panel Meeting Action: Accept
Panel Statement: CMP-12 accepts the direction of the Correlating Committee to review the panel action on Proposal 12-137.
See panel action and statement on Comment 12-58. The panel is aware that errata was issued for 645.10(B)(5) numbered 70-11-1 item 20.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-67 Log #391 NEC-P12 **Final Action: Reject**
(645.10(B)(5))

Submitter: Stanley Kaufman, CableSafe, Inc.
Comment on Proposal No: 12-137
Recommendation: Change the panel action from Accept to Accept in Principle with the Panel statement "See panel action on Comment 12-xxx on Proposal 12-109.
Substantiation: In the Standards Council issued errata No. 70-11-1, item 20 fixed the renumbering of 645(D)(2) and 645(D)(3), so no action is required on that part of the Proposal.
The recommendation in the Proposal to improve clarity by adding the word "are" should be accepted in principle with reference to the Panel action on the Comment submitted on Proposal 12-109 by the CMP 12 Article 645 Task Group.
This is one of several Comments prepared by the CMP 12 Article 645 Task Group consisting of CMP 12 members Tom Brown, Tim Croushore, Tom Hedges, Bob Johnson, Stan Kaufman, John Kovacik, Todd Lottmann and Jose Salazar.
Panel Meeting Action: Reject
Panel Statement: Proposal 12-109 was rejected by the action on Comment 12-56 and the issue was corrected in Comment 12-66.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

12-68 Log #388 NEC-P12 **Final Action: Accept in Principle**
(645.15)

TCC Action: The Correlating Committee directs that the words "the provisions of" be deleted in all instances in the panel action.
In the Informational Note 2, delete the word "Sections."
Submitter: Stanley Kaufman, CableSafe, Inc.
Comment on Proposal No: 12-138
Recommendation: Change the panel action from Accept to Accept in Principle and modify the text of 645.15 as shown:
645.20 ~~**645.15**~~ **Equipment Grounding and Bonding.** All exposed non–current-carrying metal parts of an information technology system shall be bonded to the equipment grounding conductor in accordance with the provisions of Parts V, VI and VII of Article 250 or shall be double insulated. ~~Power systems derived within listed information technology equipment that supply information technology systems through receptacles or cable assemblies supplied as part of this equipment shall not be considered separately derived for the purpose of applying 250.30.~~ Where signal reference structures are installed, they shall be bonded to the equipment grounding conductor provided for the information technology equipment. Any auxiliary grounding electrode(s) installed for information technology equipment shall be installed in accordance with the provisions of 250.54.
Informational Note No. 1: The bonding requirements in the product standards governing this listed equipment ensure that it complies with Article 250.
Informational Note No. 2: Where isolated grounding-type receptacles are used, see Sections 250.146(D) and 406.3(D).
645.21 System Grounding. Separately derived power systems shall be installed in accordance with the provisions of Part II or Article 250. Power systems derived within listed information technology equipment that supply information technology systems through receptacles or cable assemblies supplied as part of this equipment shall not be considered separately derived for the purpose of applying 250.30.
Substantiation: The panel action on Proposal 12-138 to delete the reference to the entire Article 250 in order to comply with the NEC Style Manual prohibition on references to entire Articles provided less information than leaving the text unchanged. The preferred route to complying with the NEC Style Manual prohibition on references to entire Articles is to refer to specific Parts or sections within an Article; that's what this Comment recommends.
The recommendation divides the grounding requirements into two logical sections, one for equipment grounding and bonding and one for systems grounding, and adds requirements for separately derived power systems
The accepted text from the Panel action on Proposal 12-139 is included in the recommended text.
This is one of several Comments prepared by the CMP 12 Article 645 Task Group consisting of CMP 12 members Tom Brown, Tim Croushore, Tom Hedges, Bob Johnson, Stan Kaufman, John Kovacik, Todd Lottmann and Jose Salazar.
The sections are renumbered to coordinate with the Task Groups' Comment on Proposal 12-109.
Panel Meeting Action: Accept in Principle
Add new 645.14 to read as follows:
645.14 System Grounding. Separately derived power systems shall be installed in accordance with the provisions of Part I and II of Article 250. Power systems derived within listed information technology equipment that supply information technology systems through receptacles or cable assemblies supplied as part of this equipment shall not be considered separately derived for the purpose of applying 250.30.
Revise 645.15 to read as follows:
645.15 Equipment Grounding and Bonding. All exposed non–current-carrying metal parts of an information technology system shall be bonded to the equipment grounding conductor in accordance with the provisions of Parts I, V, VI, VII, and VIII of Article 250 or shall be double insulated. Where signal reference structures are installed, they shall be bonded to the equipment grounding conductor provided for the information technology equipment. Any auxiliary grounding electrode(s) installed for information technology equipment shall be installed in accordance with the provisions of 250.54.
Informational Note No. 1: The bonding requirements in the product standards governing this listed equipment ensure that it complies with Article 250.
Informational Note No. 2: Where isolated grounding-type receptacles are used, see Sections 250.146(D) and 406.3(D).
Panel Statement: CMP-12 agrees with the recommendation to divide the grounding requirements into two logical sections, one for equipment grounding and bonding and one for systems grounding. CMP-12 notes this will be a revision to the text in 645.15 of the 2011 NEC and the addition of a new section 645.14. In addition CMP-12 has revised the list of parts called out in reference to Article 250 to include Part I and Part VIII.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 646 — MODULAR DATA CENTERS (PROPOSED)

12-69 Log #174 NEC-P12 **Final Action: Accept**
(646X (New))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 12-147
Recommendation: The Correlating Committee advises that new articles and article scope statements are the responsibility of the Correlating Committee and the Correlating Committee Accepts the panel action.
The Correlating Committee directs that the new Article be reviewed to satisfy all NEC Style Manual requirements.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: CMP-12 accepts the direction of the Correlating Committee to clarify the wording to satisfy NEC Style Manual requirements in Article 646.
See panel action and statement on Comment 12-71.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

12-70 Log #1379 NEC-P12 **Final Action: Reject**
(646)

Submitter: Dennis R. Julian, Integrated Design Group Inc.
Comment on Proposal No: 12-147
Recommendation: Delete all text in Article 646 after paragraph 64X.4.
Substantiation: The text to be deleted mainly duplicates existing code requirements. Because it is a duplication of many specific requirements, it is confusing and may be contradictory to requirements in the code. In some aspects it is slightly different which may lead to confusion. A modular data center should follow the same code requirements as a data center. Any specific differences should be listed in this article. Because only parts of the code are repeated, it will lead to unintended consequences. For instance, Article 645

has exceptions for EPO requirements that are not repeated in Article 646. The requirement for EPO includes shutting down the entire MDC whether it includes raised floor areas or not and also includes the electrical and UPS areas. Stating similar requirements in multiple locations will allow for mis-interpretations and mis-applications as the two references are interchanged.

Panel Meeting Action: Reject

Panel Statement: New article 646 references parts of the NEC that are applicable to MDC constructions and includes changes and additions that are unique to such constructions. In some cases information is included to clarify what specifically in another article is applicable to an MDC. For example, 646.6 addresses supply conductors and overcurrent protection, 646.7 short-circuit current rating, and 646.3(N), disconnect requirements. Additionally, 646.3 states: "Wherever the requirements of other articles of this Code and Article 646 differ, the requirements of Article 646 shall apply."

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

12-71 Log #1467 NEC-P12 **Final Action: Accept in Principle**
(646 (New))

TCC Action: The Correlating Committee directs that the words "the provisions of" be replaced with the word "section" in 646.3(A), 646.3(B), and two locations in 646.3(D).

Although the NEC Style Manual does not permit the use of the word "Section", when section numbers are used in the beginning of a sentence it is appropriate to use the word "Section."

Submitter: John R. Kovacik, UL LLC

Comment on Proposal No: 12-147

Recommendation: Revise the Panel Meeting Action to Accept-in–Principle, Proposal 12-147 as follows;

ARTICLE 646

Modular Data Centers

~~Informational Note: Text that is followed by a reference in brackets has been extracted from NFPA 75-2009, Standard for the Protection of Information Technology Equipment. Only editorial changes were made to the extracted text to make it consistent with this Code.~~

I. General

646.1 Scope. This article covers modular data centers.

Informational Note 1: Modular data centers include the installed information technology equipment (ITE) ~~IT~~ and support equipment, electrical supply and distribution, wiring and protection, working space, grounding, HVAC and the like, located in ~~or associated with a modular data center~~ an equipment enclosure.

Informational Note 2: For further information, see NFPA 75-2013~~2009~~, Standard for the Protection of Information Technology Equipment, which covers the requirements for the protection of information technology equipment and systems in an information technology equipment ~~areas~~ room.

646.2 Definitions. ~~**See Article 100.**~~ The definitions in 645.2 shall apply. For the purposes of this article, the following additional definitions ~~apply~~ applies.

Modular Data Center (MDC). Prefabricated units rated 600 volts or less, consisting of an outer enclosure housing multiple racks of information technology equipment (ITE) (e.g. servers) and various support equipment such as electrical service and distribution equipment, HVAC systems and the like. ~~Some configurations may have the support equipment housed in a separate equipment enclosure.~~

Informational Note 1: A typical construction may use a standard ISO shipping container or other structure as the outer enclosure, racks or cabinets of ITE, service entrance equipment and power distribution components, power storage such as a UPS and an air or liquid cooling system. Modular data centers are intended for fixed installation either indoors or outdoors based on their construction and resistance to environmental conditions. MDCs can be configured as an all-in-one system housed in a single equipment enclosure or as a system with the support equipment housed in separate equipment enclosures.

Informational Note 2: For information on listing requirements for both information technology equipment and communications equipment, see UL 60950-1-~~2007~~ 2011, Information Technology Equipment - Safety - Part 1: General Requirements and UL 62368-1-2012, Audio/video, information and communication technology equipment - Part 1: Safety requirements.

Informational Note 3: Modular Data Centers as defined in this article are sometimes referred to as Containerized Data Centers.

Informational Note 4: Equipment enclosures housing only support equipment (e.g. HVAC or power distribution equipment) that are not part of a specific Modular Data Center are not considered a modular data center as defined in this article.

646.3 Other Articles. Circuits and equipment shall ~~also~~ comply with 646.3(A) through (N), the following, as applicable. Wherever the requirements of other articles of this Code and Article 646 differ, the requirements of Article 646 shall apply.

(A) Spread of Fire or Products of Combustion. The provisions of ~~Sections~~ 300.21, 770.26, 800.26, and 820.26 shall apply to penetrations of a fire-resistant room boundary, if provided.

(B) Plenums. The provisions of ~~Sections~~ 300.22(C)(1), 725.154(A), 760.53(B)(2), 760.154(A), 770.113(C), 800.113(C), and 820.113(C) and Tables 725.154(a), 760.154(a),770.154(a), 800.154(a) and 820.154(a) shall apply to wiring and cabling in a plenum (other space used for environmental air). Environmentally controlled working space, aisles and equipment areas in an MDC are not considered a plenum.

(C) Grounding. Grounding and bonding of a modular data center shall comply with Article 250. The non–current-carrying conductive members of optical fiber cables in an MDC shall be grounded in accordance with 770.114. Grounding and bonding of communications protectors, cable shields and non–current-carrying metallic members of cable shall comply with Part IV of Article 800.

(D) Electrical Classification of Data Circuits. The provisions of ~~Section~~ 725.121(A)(4) shall apply to the electrical classification of listed information technology equipment signaling circuits. The provisions of ~~Section~~ 725.139(D)(1) and 800.133(A)(1)(b) shall apply to the electrical classification of Class 2 and Class 3 circuits in the same cable with communications circuits.

(E) Fire Alarm Equipment. ~~The provisions of P~~parts I, II, and III of Article 760 shall apply to fire alarm systems equipment installed in a MDC, when provided.

(F) Communications Equipment. ~~The provisions of P~~parts I, II, III, IV, and V of Article 800 shall apply to communications equipment installed in an MDC.

Informational Note: See Part I of Article 100, Definitions, for a definition of communications equipment.

(G) Community Antenna Television and Radio Distribution Systems Equipment. ~~The provisions of P~~parts I, II, III, IV, and V of Article 820 shall apply to community antenna television and radio distribution systems equipment installed in an MDC.

(H) Storage Batteries. Installation of storage batteries shall comply with Article 480.

Exception: Batteries that are part of listed and labeled equipment and installed in accordance with the listing requirements.

(I) **Surge-Protective Devices (SPDs).** Where provided, surge protective devices shall be listed and labeled and installed in accordance with Article 285.

(J) Lighting. Lighting shall be installed in accordance with Article 410.

(K) Power Distribution Wiring and Protection. Power distribution wiring and wiring protection within a MDC shall comply with Article 210 for branch circuits and Article 215 for feeder circuits.

(L) Wiring Methods and Materials.

(1) Unless modified elsewhere in this article, wiring methods and materials for power distribution shall comply with Chapter 3. Wiring shall be suitable for its use and installation and shall be listed and labeled.

Exception: This requirement shall not apply to wiring that is part of listed and labeled equipment.

(2) The following wiring methods shall not be permitted:

a) Integrated Gas Spacer Cable: Type IGS (Article 326)

b) Concealed Knob-and-Tube Wiring (Article 394)

c) Messenger-Supported Wiring (Article 396)

d) Open Wiring on Insulators (Article 398)

e) Outdoor Overhead Conductors over 600 Volts (Article 399)

(3) Wiring under raised floors. Areas under a raised floor that are constructed and used for ventilation as described in 645.5(E) shall be permitted to use the wiring methods described in 645.5(E).

(4) Installation of wiring for remote-control, signaling, and power limited circuits shall comply with Part III Article 725.

(5) Installation of optical fiber cables shall comply with Part V of Article 770.

(6) Installation of wiring for fire alarm systems shall comply with Parts II and III of Article 760.

(7) Installation of communications wires and cables, raceways, and cable routing assemblies shall comply with Part V of Article ~~Chapter~~ 800.

(8) Alternate wiring methods as permitted by Article 645 shall be ~~are~~ permitted for MDCs provided all of the conditions stated in 645.4 are met.

(M) Service equipment. For an MDC that is designed such that it may be powered from a separate electrical service, the service equipment for control and protection of services and their installation shall comply with Article 230. The service equipment and their arrangement and installation shall permit the installation of the service entrance conductors in accordance with Article 230. Service equipment shall be listed and labeled and marked as being suitable for use as service equipment.

(N) Disconnecting Means. An approved means shall be provided to disconnect power to all electronic equipment in the MDC in accordance with Section 645.10. There shall also be a similar approved means to disconnect the power to all dedicated HVAC systems serving the MDC and shall cause all required fire/smoke dampers to close.

646.4 Applicable Requirements. All modular data centers shall:

~~(A)~~ (1) ~~B~~be listed and labeled and comply with 646.3(N) and 646.5 through 646.9, or,

Informational Note: One way to determine applicable listing requirements is to refer to UL Subject 2755, Outline of Investigation for Modular Data Centers.

~~(B)~~ (2) ~~C~~comply with the provisions of this article.

646.5 Nameplate Data. A permanent nameplate shall be attached to ~~the~~ each equipment enclosure of an MDC and shall be plainly visible after installation. The nameplate shall include the ~~following~~ information in 646.5(1) through (6), as applicable:

(1) Supply voltage, number of phases, frequency, and full load current. The full-load current shown on the nameplate shall not be less than the sum of the

full-load currents required for all motors and other equipment that may be in operation at the same time under normal conditions of use. Where unusual type loads, duty cycles, and so forth require oversized conductors or permit reduced-size conductors, the required capacity shall be included in the marked full-load current. Where more than one incoming supply circuit is to be provided, the nameplate shall state the preceding information for each circuit.

Informational Note 1: See 430.22(E) and 430.26 for duty cycle requirements. Informational Note 2: For listed equipment, the full-load current shown on the nameplate may be the maximum measured, 15 minute, average full load current.

(2) For MDCs powered by a separate service, the ~~S~~short-circuit current rating of the service equipment provided as part of the MDC.

Informational Note: This rating may be part of the service equipment marking.

(3) For MDCs powered by a separate service, if the required service as determined by Parts III and IV of Article 220 is less than the rating of the service panel used, the required service shall be included on the nameplate.

Informational Note: Branch circuits supplying ITE loads are assumed to be loaded no less than 80% of the branch circuit rating with a 100% duty cycle. As an alternative to the feeder and service load calculations required by Parts III and IV of Article 220, feeder and service load calculations for new, future or existing loads ~~shall be~~ may be permitted to be used if performed by qualified persons under engineering supervision.

(4) Electrical diagram number(s) or the number of the index to the electrical drawings.

(5) For MDC equipment enclosures that are not powered by a separate service, feeder or branch circuit, a reference to the powering equipment.

(6) The manufacturer's name or trademark

646.6 Supply Conductors and Overcurrent Protection.

(A) Size. The size of the supply conductor shall be such as to have an ampacity not less than 125 percent of the full load current rating~~, of all resistance heating loads plus 125 percent of the full-load current rating of the highest rated motor plus the sum of the full-load current ratings of all other connected motors and apparatus, based on their duty cycle, that may be in operation at the same time~~.

Informational Note No. 1: See the 0–2000-volt ampacity tables of Article 310 for ampacity of conductors rated 600 volts and below.

Informational Note No. 2: See 430.22(E) and 430.26 for duty cycle requirements.

(B) Overcurrent Protection. Where overcurrent protection for supply conductors is furnished as part of the MDC, overcurrent protection for each supply circuit shall comply with 646.6(B)(1) through (B)(2):

(1) Service Equipment — Overcurrent Protection. Service conductors shall be provided with overcurrent protection in accordance with 230.90 through 230.95.

(2) Taps and Feeders. Where overcurrent protection for supply conductors is furnished as part of the MDC as permitted by 240.21, the overcurrent protection shall comply with the following:

(1) The overcurrent protection shall consist of a single circuit breaker or set of fuses.

(2) The MDC shall be marked "overcurrent protection provided at MDC supply terminals".

(3) ~~and t~~The supply conductors shall be considered either as feeders or as taps ~~as covered by 240.21~~ and be provided with overcurrent protection complying with 240.21.

~~The rating or setting of the overcurrent protective device for the circuit supplying the MDC shall not be greater than 125 percent of the full-load current rating. the sum of the largest rating or setting of the branch-circuit short-circuit and ground-fault protective device provided with the machine, plus 125 percent of the full-load current rating of all resistance heating loads, plus the sum of the full-load currents of all other motors and apparatus that could be in operation at the same time.~~

~~*Exception: Where one or more instantaneous trip circuit breakers or motor short-circuit protectors are used for motor branch-circuit short-circuit and ground-fault protection as permitted by 430.52(C), the procedure specified in 670.4(C) for determining the maximum rating of the protective device for the circuit supplying the machine shall apply with the following provision: For the purpose of the calculation, each instantaneous trip circuit breaker or motor short-circuit protector shall be assumed to have a rating not exceeding the maximum percentage of motor full load current permitted by Table 430.52 for the type of machine supply circuit protective device employed.*~~

~~Where no branch-circuit short-circuit and ground-fault protective device is provided with the MDC, the rating or setting of the overcurrent protective device shall be based on 430.52 and 430.53, as applicable.~~

646.7 Short-Circuit Current Rating. ~~Modular data centers shall not be installed where the available fault current exceeds its short-circuit current rating as marked on the MDC service equipment.~~

(A) Service Equipment. Service equipment of a modular data center that connects directly to a service shall have a short-circuit current rating not less than the available fault current of the service.

(B) MDCs Connected to Branch Circuits and Feeders. Modular Data Centers that connect to a branch circuit or a feeder circuit shall have a short-circuit current rating not less than the available fault current of the branch circuit or feeder. The short circuit current rating of the MDC shall be based on the short-circuit current rating of a listed and labeled MDC or the short-circuit current rating established utilizing an approved method.

Informational Note 1: UL 508A-2001, Standard for Industrial Control Panels, Supplement SB, is an example of an approved method.

Informational Note 2: This requirement does not apply to listed and labeled equipment connected to branch circuits located inside of the MDC equipment enclosure.

(C) MDCs Powered from Separate MDC System Enclosures Connected to Power Modules. Modular Data Centers equipment enclosures that are powered from a separate MDC system enclosure connect to a power module that is part of the specific MDC system, shall have a short-circuit current rating coordinated with the powering module in accordance with 110.10. not less than the available fault current at the output of the power module. The short circuit current rating of the MDC shall be based on the short-circuit current rating of a listed and labeled MDC or the short-circuit current rating established utilizing an approved method.

Informational Note: UL 508A-2001, Standard for Industrial Control Panels, Supplement SB, is an example of an approved method for determining short circuit current ratings.

646.8 Field Wiring Compartments. A field-wiring compartment in which service or branch circuit connections are to be made shall comply with 646.8 (A) through (C):

~~a)~~ (A) Permit the connection of the supply wires after the MDC is installed;

~~b)~~ (B) Permit the connection to be introduced and connected easily; and

~~c)~~ (C) Be located so that the connections may be readily inspected after the MDC is installed

646.9 Flexible Power Cords and Cables for Connecting Equipment Enclosures of an MDC System.

(A) Uses Permitted. Flexible power cords and cables shall be permitted to be used for connections between equipment enclosures of an MDC system~~. Flexible cords or cables shall not be used for connection to the branch circuit or electrical service~~ where not subject to physical damage.

Informational Note: ~~For~~ One example of flexible power cords~~s~~ usage for connections between equipment enclosures of an MDC system is ~~may be used~~ between an MDC enclosure containing only servers and one containing power distribution equipment.

(B) Uses Not Permitted. Flexible power cords ~~or~~ and cables shall not be used for connection to external sources of power.

Informational Note: Examples of external sources of power are electrical services, feeders and premises branch circuits.

~~**(B)**~~**(C) Listing.** Where flexible power cords or cables are used, they shall be listed as suitable for extra-hard usage. Where used outdoors, flexible power cords and cables shall

also be listed as suitable for wet locations and shall be sunlight resistant. ~~Extra-hard usage flexible cords or cables shall be permitted for use as permanent wiring between MDC enclosures only where not subject to physical damage.~~

~~**(C)**~~**(D) Single-Conductor Cable.** Single-conductor power cable shall be permitted to be used only in sizes 2 AWG or larger.

II. Equipment

646.10 Electrical Supply and Distribution. Equipment used for the electrical supply and distribution in a modular data center including fittings, devices, luminaires, apparatus, machinery, and the like shall comply with ~~the appropriate requirements for its use and installation and shall be listed and labeled~~ Parts I and II of Article 110.

~~**646.11 Premises transformers.** Premise transformers installed in the MDC area shall be of the dry type or type filled with a noncombustible dielectric medium.~~

~~**646.12 Service entrance transformers.** Service entrance transformers shall not be permitted in an MDC.~~

~~*Exception: Service entrance transformers shall be permitted in a separate module or structure intended to house only service entrance equipment and power distribution and control equipment for the MDC.*~~

646.11 Distribution Transformers

(A) Utility-Owned Transformers. Service entrance Utility-owned distribution transformers shall not be permitted in an MDC.

(B) Non-Utility-Owned Premises Transformers. Non-utility-owned Ppremises distribution transformers installed in the vicinity of an MDC shall be of the dry type or type filled with a noncombustible dielectric medium. Such transformers shall be installed in accordance with the requirements of Article 450. Non-utility-owned Ppremises distribution transformers shall not be permitted in an MDC.

(C) Power Transformers. Power transformers that supply power only to the MDC shall be permitted to be installed in the MDC equipment enclosure. Only dry-type transformers shall be permitted to be installed in the MDC equipment enclosure. Such transformers shall be installed in accordance with the requirements of Article 450.

646.~~13~~ 12 Receptacles. At least one 125 volt AC, 15 or 20-ampere rated duplex convenience outlet shall be provided in each work area of the MDC to facilitate the ~~connection~~ powering of test and measurement equipment that may be required during routine maintenance and servicing without having to route flexible power cords through or across doorways, around line-ups of equipment or the like.

646.~~14~~ 13 Other Electrical Equipment. Electrical equipment that is an integral part of the MDC including lighting, control, power, HVAC (heating, ventilation and air-conditioning), emergency lighting, alarm circuits, and the like shall comply with the ~~appropriate~~ requirements for its use and installation and shall be listed and labeled.

646.~~15~~ 14 Installation and Use. Listed and labeled equipment shall be installed and used in accordance with any instructions or limitations included in the listing.

III. Lighting

646.~~16~~ 15 General Illumination. Illumination shall be provided for all workspaces~~.~~ and ~~A~~areas that are used for exit access and exit discharge~~, shall be illuminated to values of at least 1 ft.-candle (10.8 lux), measured at the floor.~~The illumination shall be arranged so that the failure of any single lighting unit does not result in a~~n~~ a complete loss of illumination ~~level of less than 0.2 ft.-candle (2.2 lux)~~.

Informational Note: See NFPA 101-2009, Life Safety Code, Section 7.8 for information on illumination of means of egress.

646.~~17~~ 16 Emergency Lighting. Areas that are used for exit access and exit discharge shall be provided with emergency lighting. Emergency lighting systems shall be listed and labeled equipment, installed in accordance with the manufacturer's instructions.

Informational Note: See NFPA 101-2009, Life Safety Code, Section 7.9 for information on emergency lighting.

646.~~18~~ 17 Emergency lighting circuits. No appliances and no lamps, other than those specified as required for emergency use, shall be supplied by emergency lighting circuits. These branch circuits supplying emergency lighting shall be installed to provide service from storage batteries, generator set, UPS, separate service, fuel cell or unit equipment. No other equipment shall be connected to these circuits, unless the emergency lighting system includes a back-up system, where only the lighting is supplied by battery circuits under power failure conditions. All boxes and enclosures (including transfer switches, generators, and power panels) for emergency circuits shall be marked to identify them as components of an emergency circuit or system.

IV. Work Space

646.~~19~~ 18 General. ~~Access and working space shall be provided and maintained about all electrical equipment to permit ready and safe operation and maintenance of such equipment.~~ Space about electrical equipment shall comply with 110.26. ~~The egress requirements for large equipment in 110.26(C)(2) and personnel door requirements in 110.26(C)(3) shall apply to an MDC even if the rating of the MDC is not 1200 amperes or more or if the MDC does not contain overcurrent devices, switching devices or control devices in areas that service personnel may occupy.~~

~~Exception - The depth of the workspace shall not be required to need not comply with Table 110.26(A)(1) if the equipment is marked "WARNING" and "De-energize Equipment before Servicing" or the equivalent.~~

646.19 Entrance to and Egress from Working Space. For equipment over 1.8 m (6 ft) wide or deep, there shall be one entrance to and egress from the required working space not less than 610 mm (24 in.) wide and 2.0 m (6½ ft) high at each end of the working space. The door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure. A single entrance to and egress from the required working space shall be permitted where either of the conditions in 646.20(1) or 646.20(2) is met.

(1) Unobstructed Egress. Where the location permits a continuous and unobstructed way of egress travel, a single entrance to the working space shall be permitted.

(2) Extra Working Space. Where the depth of the working space is twice that required by 110.26(A)(1), a single entrance shall be permitted. It shall be located such that the distance from the equipment to the nearest edge of the entrance is not less than the minimum clear distance specified in Table 110.26(A)(1) for equipment operating at that voltage and in that condition.

646.20 Working space for ITE.

(A) Low Voltage Circuits. The working space ~~depth in front of~~ about ITE where any live parts that may be exposed during routine servicing operate at not greater than 30 volts rms, 42 volts peak, or 60 volts dc shall not be required to comply with the workspace requirements of 646.19.

(B) Other Circuits. Any areas of ITE that require servicing of parts that are greater than 30 volts rms, 42 volts peak, or 60 volts dc shall comply with the workspace requirements of 646.19.

Informational Note 1: For example, field wiring compartments for ac mains connections, power distribution units, and the like.

Informational Note 2: it is assumed that ITE operates at voltages not exceeding 600 V.

646.21 Work areas and working space around batteries. Working space around a battery system shall comply with paragraph 110.26. Working clearance shall be measured from the edge of the battery rack.

646.22 Work space for routine service and maintenance. ~~Adequate w~~Work. space shall be provided ~~for~~ to facilitate routine servicing and maintenance (those tasks involving operations which can ~~safely~~ be accomplished by employees and where extensive disassembly of equipment is not required). Routine servicing and maintenance shall be able to be performed without exposing the worker to a risk of electric shock or personal injury.

Informational Note: An example of such routine maintenance is cleaning or replacing an air filter.

Substantiation: This comment was prepared by a CMP-12 Task Group that was formed to address concerns pertaining to Proposal 12-147.

The Task Group including the following members:

Task Group - Chair: John Kovacik

Members: Tim Croushore, Jeff Holmes, Philip Clark, Todd Konieczny, Jeff Menig, Bob Johnson, Ken White, Stan Kaufman, Steve McCluer and Randy Ivans.

The following changes were made to the Panel Meeting Action to Accept-in-Principle, Proposal 12-147. These changes take into account all of the comments expressed in the ROP balloting and comments from task group members. The revisions are organized by Sections of the Article. Section numbers below are from the original ROP proposal.

The opening note was deleted since there are no such references in this proposed Article.

646.1 Scope

Revised to help differentiate between an MDC as covered by this article (equipment in an enclosure) and a traditional computer room. Also updated the reference.

646.2 Definitions - Modular Data Center (MDC)

Revised and added information to help clarify what an MDC, as covered by this article, really is. Updated references.

646.3

Clarification information added and editorial corrections

646.4

Added a reference to appropriate requirements for the listing of MDCs. This standard was not published at the time of the original proposal.

646.5

Revised to make it clear that each equipment enclosure needs a nameplate. Added information on measuring full load current. Added required information relating to how an equipment enclosure that is not connected to a service, feeder or branch circuit receives its power.

646.6

Revised for clarity. Added a provision for service conductors since an MDC might be provided with service equipment. It was determined that overcurrent protection provisions could be referenced directly to 230.90-230.95 for service conductors and 240.21 for taps and feeders. It is intended to make sure the overcurrent protection provided in the MDC is suitable to protect the feeder or tap conductors.

646.7

This was split up to cover connections directly to a service, connection to a feeder or branch circuit and connection to a power module that is part of the MDC system. The short circuit ratings requirements for feeders and branch circuits are taken from NFPA 70, 409.110(4). An MDC enclosure that is powered from another MDC enclosure in the system (such as a system with an ITE module enclosure being powered from a separate power module enclosure) would not require a short circuit current rating since it does not connect directly to a service, feeder or branch circuit. Overcurrent and short circuit protection would be coordinated between the two modules. 110.10 addresses this and is referenced.

646.8

Editorial corrections.

646.9

Edited for clarity.

646.10

Parts I and II of Article 110 provide the necessary guidance on requirements for equipment and installations. Edited to eliminate possible conflicts with the NEC style manual regarding possibly vague or unenforceable terms.

646.11 and original 646.12

Edited for clarity and combined into one section. This revision clarifies the requirements for transformers in and around an MDC. The original 646.12 was eliminated as part of this revision.

646.13

Renumbered to 646.12. "Work Area" is used throughout the NEC and Life Safety Code without definition. Additional explanatory text was added for clarity.

646.14

Renumbered to 646.13. Edited to eliminate possible conflicts with the NEC style manual regarding possibly vague or unenforceable terms.

646.15

Renumbered to 646.14.

646.16

Renumbered to 646.15.Took out illumination level requirements and added informational note referencing NFPA 101.

646.17

Renumbered to 646.16. Took out illumination level requirements and added informational note referencing NFPA 101.

646.18

Renumbered to 646.17.

646.19

Renumbered to 646.18. Eliminated exception. Revised for clarity. Split out egress requirements. Took out reference to 110.26 for egress requirements and added appropriate text from 110.26 (B) and (C) into a new paragraph now numbered 646.19.

646.20.

Edited for clarity and editorial corrections

646.21

No changes.

646.22

Edited to eliminate possible conflicts with the NEC style manual regarding possibly vague or unenforceable terms.

Panel Meeting Action: Accept in Principle

This version of Article 646 incorporates all of the revisions to Proposal 12-147 the Panel has accepted via Comments 12-71, 12-74, 12-77 and 12-80.

ARTICLE 646

Modular Data Centers

I. General

646.1 Scope. This article covers modular data centers.

Informational Note 1: Modular data centers include the installed information technology equipment (ITE) and support equipment, electrical supply and distribution, wiring and protection, working space, grounding, HVAC and the like, located in an equipment enclosure.

Informational Note 2: For further information, see NFPA 75-2013, *Standard* for the Protection of Information Technology Equipment, which covers the requirements for the protection of information technology equipment and systems in an information technology equipment room.

646.2 Definitions. The definitions in 645.2 shall apply. For the purposes of this article, the following additional definition applies.

Modular Data Center (MDC). Prefabricated units rated 600 volts or less, consisting of an outer enclosure housing multiple racks or cabinets of information technology equipment (ITE) (e.g. servers) and various support equipment such as electrical service and distribution equipment, HVAC systems and the like.

Informational Note 1: A typical construction may use a standard ISO shipping container or other structure as the outer enclosure, racks or cabinets of ITE, service entrance equipment and power distribution components, power storage such as a UPS and an air or liquid cooling system. Modular data centers are intended for fixed installation either indoors or outdoors based on their construction and resistance to environmental conditions. MDCs can be configured as an all-in-one system housed in a single equipment enclosure or as a system with the support equipment housed in separate equipment enclosures.

Informational Note 2: For information on listing requirements for both information technology equipment and communications equipment, see UL 60950-1- 2011, Information Technology Equipment - Safety - Part 1: General Requirements and UL 62368-1-2012, Audio/video, information and communication technology equipment - Part 1: Safety requirements.

Informational Note 3: Modular Data Centers as defined in this article are sometimes referred to as Containerized Data Centers.

Informational Note 4: Equipment enclosures housing only support equipment (e.g. HVAC or power distribution equipment) that are not part of a specific Modular Data Center are not considered a modular data center as defined in this article.

646.3 Other Articles. Circuits and equipment shall ~~also~~ comply with 646.3(A) through (N) as applicable. Wherever the requirements of other articles of this Code and Article 646 differ, the requirements of Article 646 shall apply.

(A) Spread of Fire or Products of Combustion. The provisions of 300.21, 770.26, 800.26, and 820.26 shall apply to penetrations of a fire-resistant room boundary, if provided.

(B) Plenums. The provisions of 300.22(C)(1), 725.154(A), 760.53(B)(2), 760.154(A), 770.113(C), 800.113(C), and 820.113(C) and Tables 725.154(a), 760.154(a),770.154(a), 800.154(a) and 820.154(a) shall apply to wiring and cabling in other spaces used for environmental air (plenums).

Informational Note: Environmentally controlled working space, aisles and equipment areas in an MDC are not considered a plenum.

(C) Grounding. Grounding and bonding of a modular data center shall comply with Article 250. The non–current-carrying conductive members of optical fiber cables in an MDC shall be grounded in accordance with 770.114. Grounding and bonding of communications protectors, cable shields and non–current-carrying metallic members of cable shall comply with Part IV of Article 800.

(D) Electrical Classification of Data Circuits. The provisions of 725.121(A)(4) shall apply to the electrical classification of listed information technology equipment signaling circuits. The provisions of 725.139(D)(1) and 800.133(A)(1)(b) shall apply to the electrical classification of Class 2 and Class 3 circuits in the same
cable with communications circuits.

(E) Fire Alarm Equipment. The provisions of Parts I, II, and III of Article 760 shall apply to
fire alarm systems equipment installed in a MDC, when provided.

(F) Communications Equipment. The provisions of Parts I, II, III, IV, and V of Article 800
shall apply to communications equipment installed in an MDC.

Informational Note: See Part I of Article 100, Definitions, for a definition of communications equipment.

(G) **Community Antenna Television and Radio Distribution Systems Equipment.** The provisions of Parts I, II, III, IV, and V of Article 820 shall apply to community antenna television and radio distribution systems equipment installed in an MDC.

(H) Storage Batteries. Installation of storage batteries shall comply with Article 480.

Exception: Batteries that are part of listed and labeled equipment and installed in accordance with the listing requirements.

(I) Surge-Protective Devices (SPDs). Where provided, surge protective devices shall be listed and labeled and installed in accordance with Article 285.

(J) Lighting. Lighting shall be installed in accordance with Article 410.

(K) Power Distribution Wiring and Protection. Power distribution wiring and wiring protection within a MDC shall comply with Article 210 for branch circuits and Article 215 for feeder circuits.

(L) Wiring Methods and Materials.

(1) Unless modified elsewhere in this article, wiring methods and materials for power distribution shall comply with Chapter 3. Wiring shall be suitable for its use and installation and shall be listed and labeled.

Exception: This requirement shall not apply to wiring that is part of listed and labeled equipment.

(2) The following wiring methods shall not be permitted:

a) Integrated Gas Spacer Cable: Type IGS (Article 326)
b) Concealed Knob-and-Tube Wiring (Article 394)
c) Messenger-Supported Wiring (Article 396)
d) Open Wiring on Insulators (Article 398)
e) Outdoor Overhead Conductors over 600 Volts (Article 399)

(3) Wiring under raised floors. Areas under a raised floor that are constructed and used for ventilation as described in 645.5(E) shall be permitted to use the wiring methods described in 645.5(E).

(4) Installation of wiring for remote-control, signaling, and power limited circuits shall comply with Part III Article 725.

(5) Installation of optical fiber cables shall comply with Part V of Article 770.

(6) Installation of wiring for fire alarm systems shall comply with Parts II and III of Article 760.

(7) Installation of communications wires and cables, raceways, and cable routing assemblies shall comply with Part V of Article 800.

(8) Alternate wiring methods as permitted by Article 645 shall be permitted for MDCs provided all of the conditions stated in 645.4 are met.

(M) Service equipment. For an MDC that is designed such that it may be powered from a separate electrical service, the service equipment for control and protection of services and their installation shall comply with Article 230. The service equipment and their arrangement and installation shall permit the installation of the service entrance conductors in accordance with Article 230. Service equipment shall be listed and labeled and marked as being suitable for use as service equipment.

(N) Disconnecting Means. An approved means shall be provided to disconnect power to all electronic equipment in the MDC in accordance with Section 645.10. There shall also be a similar approved means to disconnect the power to all dedicated HVAC systems serving the MDC and shall cause all required fire/smoke dampers to close.

646.4 Applicable Requirements. All modular data centers shall:

(1) be listed and labeled and comply with 646.3(N) and 646.5 through 646.9, or,

Informational Note: One way to determine applicable listing requirements is to refer to UL Subject 2755, Outline of Investigation for Modular Data Centers.

(2) comply with the provisions of this article.

646.5 Nameplate Data. A permanent nameplate shall be attached to each equipment enclosure of an MDC and shall be plainly visible after installation. The nameplate shall include the information in 646.5(1) through (6), as applicable:

(1) Supply voltage, number of phases, frequency, and full load current. The full-load current shown on the nameplate shall not be less than the sum of the full-load currents required for all motors and other equipment that may be in operation at the same time under normal conditions of use. Where unusual type loads, duty cycles, and so forth require oversized conductors or permit reduced-size conductors, the required capacity shall be included in the marked full-load current. Where more than one incoming supply circuit is to be provided, the nameplate shall state the preceding information for each circuit.

Informational Note 1: See 430.22(E) and 430.26 for duty cycle requirements.

Informational Note 2: For listed equipment, the full-load current shown on the nameplate may be the maximum measured, 15 minute, average full load current.

(2) For MDCs powered by a separate service, the short-circuit current rating of the service equipment provided as part of the MDC.

Informational Note: This rating may be part of the service equipment marking.

(3) For MDCs powered by a separate service, if the required service as determined by Parts III and IV of Article 220 is less than the rating of the service panel used, the
required service shall be included on the nameplate.

Informational Note: Branch circuits supplying ITE loads are assumed to be loaded no less than 80% of the branch circuit rating with a 100% duty cycle. As an alternative to the feeder and service load calculations required by Parts III and IV of Article 220, feeder and service load calculations for new, future or existing loads may be permitted to be used if performed by qualified persons under engineering supervision.

(4) Electrical diagram number(s) or the number of the index to the electrical drawings.

(5) For MDC equipment enclosures that are not powered by a separate service, feeder or branch circuit, a reference to the powering equipment.

(6) The manufacturer's name or trademark

646.6 Supply Conductors and Overcurrent Protection.

(A) Size. The size of the supply conductor shall be such as to have an ampacity not less than 125 percent of the full load current rating.

Informational Note No. 1: See the 0–2000-volt ampacity tables of Article 310

for ampacity of conductors rated 600 volts and below.
Informational Note No. 2: See 430.22(E) and 430.26 for duty cycle requirements.
(B) Overcurrent Protection. Where overcurrent protection for supply conductors is furnished as part of the MDC, overcurrent protection for each supply circuit shall comply with 646.6(B)(1) through (B)(2):
(1) Service Equipment — Overcurrent Protection. Service conductors shall be provided with overcurrent protection in accordance with 230.90 through 230.95.
(2) Taps and Feeders. Where overcurrent protection for supply conductors is furnished as part of the MDC as permitted by 240.21, the overcurrent protection shall comply with the following:
(1) The overcurrent protection shall consist of a single circuit breaker or set of fuses.
(2) The MDC shall be marked "overcurrent protection provided at MDC supply terminals".
(3) The supply conductors shall be considered either as feeders or as taps and be provided with overcurrent protection complying with 240.21.
646.7 Short-Circuit Current Rating.
(A) Service Equipment. Service equipment of a modular data center that connects directly to a service shall have a short-circuit current rating not less than the available fault current of the service.
(B) MDCs Connected to Branch Circuits and Feeders. Modular Data Centers that connect to a branch circuit or a feeder circuit shall have a short-circuit current rating not less than the available fault current of the branch circuit or feeder. The short circuit current rating of the MDC shall be based on the short-circuit current rating of a listed and labeled MDC or the short-circuit current rating established utilizing an approved method.
Informational Note 1: UL 508A-2001, Standard for Industrial Control Panels, Supplement SB, is an example of an approved method.
Informational Note 2: This requirement does not apply to listed and labeled equipment connected to branch circuits located inside of the MDC equipment enclosure.
(C) MDCs Powered from Separate MDC System Enclosures. Modular Data Center~~s~~ equipment enclosures that are powered from a separate MDC system enclosure that is part of the specific MDC system, shall have a short-circuit current rating coordinated with the powering module in accordance with 110.10
Informational Note: UL 508A-2001, Standard for Industrial Control Panels, Supplement SB, is an example of an approved method for determining short circuit current ratings.
646.8 Field Wiring Compartments. A field-wiring compartment in which service or feeder connections are to be made shall be readily accessible, and comply with 646.8 (A) through (C):
(A) Permit the connection of the supply wires after the MDC is installed;
(B) Permit the connection to be introduced and readily connected ~~easily~~; and
(C) Be located so that the connections may be readily inspected after the MDC is installed.
646.9 Flexible Power Cords and Cables for Connecting Equipment Enclosures of an MDC System.
(A) **Uses Permitted.** Flexible power cords and cables shall be permitted to be used for connections between equipment enclosures of an MDC system where not subject to physical damage.
Informational Note: One example of flexible power cord~~s~~ usage for connections between equipment enclosures of an MDC system is between an MDC enclosure containing only servers and one containing power distribution equipment.
(**B**) **Uses Not Permitted.** Flexible power cords and cables shall not be used for connection to external sources of power.
Informational Note: Examples of external sources of power are electrical services, feeders and premises branch circuits.
(**C**) **Listing.** Where flexible power cords or cables are used, they shall be listed as suitable
for extra-hard usage. Where used outdoors, flexible power cords and cables shall
also be listed as suitable for wet locations and shall be sunlight resistant.
(**D**) **Single-Conductor Cable.** Single-conductor power cable shall be permitted to be used only in sizes 2 AWG or larger.
II. Equipment
646.10 Electrical Supply and Distribution. Equipment used for the electrical supply and distribution in a modular data center including fittings, devices, luminaires, apparatus, machinery, and the like shall comply with Parts I and II of Article 110.
646.11 Distribution Transformers
(A) Utility-Owned Transformers. Utility-owned distribution transformers shall not be permitted in an MDC.
(B) Non-Utility-Owned Premises Transformers. Non-utility-owned premises distribution transformers installed in the vicinity of an MDC shall be of the dry type or type filled with a noncombustible dielectric medium. Such transformers shall be installed in accordance with the requirements of Article 450. Non-utility-owned premises distribution transformers shall not be permitted in an MDC.
(C) Power Transformers. Power transformers that supply power only to the MDC shall be permitted to be installed in the MDC equipment enclosure. Only dry-type transformers shall be permitted to be installed in the MDC equipment enclosure. Such transformers shall be installed in accordance with the requirements of Article 450.
646.12 Receptacles. At least one 125 volt AC, 15 or 20-ampere rated duplex convenience outlet shall be provided in each work area of the MDC to facilitate the powering of test and measurement equipment that may be required during routine maintenance and servicing without having to route flexible power cords through or across doorways, around line-ups of equipment or the like.
646.13 Other Electrical Equipment. Electrical equipment that is an integral part of the MDC including lighting, control, power, HVAC (heating, ventilation and air-conditioning), emergency lighting, alarm circuits, and the like shall comply with the requirements for its use and installation and shall be listed and labeled.
646.14 Installation and Use. Listed and labeled equipment shall be installed and used in accordance with any instructions or limitations included in the listing.
III. Lighting
646.15 General Illumination. Illumination shall be provided for all Workspaces and areas that are used for exit access and exit discharge.
The illumination shall be arranged so that the failure of any single lighting unit does not result in a complete loss of illumination.
Informational Note: See NFPA 101-2009, Life Safety Code, Section 7.8 for information on illumination of means of egress.
646.16 Emergency Lighting. Areas that are used for exit access and exit discharge shall be provided with emergency lighting. Emergency lighting systems shall be listed and labeled equipment, installed in accordance with the manufacturer's instructions.
Informational Note: See NFPA 101-2009, Life Safety Code, Section 7.9 for information on emergency lighting.
646.17 Emergency lighting circuits. No appliances and no lamps, other than those specified as required for emergency use, shall be supplied by emergency lighting circuits. These branch circuits supplying emergency lighting shall be installed to provide service from storage batteries, generator set, UPS, separate service, fuel cell or unit equipment. No other equipment shall be connected to these circuits, unless the emergency lighting system includes a back-up system, where only the lighting is supplied by battery circuits under power failure conditions. All boxes and enclosures (including transfer switches, generators, and power panels) for emergency circuits shall be marked to identify them as components of an emergency circuit or system.
IV. Work Space
646.18 General. Space about electrical equipment shall comply with 110.27.
646.19 Entrance to and Egress from Working Space. For equipment over 1.8 m (6 ft) wide or deep, there shall be one entrance to and egress from the required working space not less than 610 mm (24 in.) wide and 2.0 m (6½ ft) high at each end of the working space. The door(s) shall open in the direction of egress and be equipped with panic bars, pressure plates, or other devices that are normally latched but open under simple pressure. A single entrance to and egress from the required working space shall be permitted where either of the conditions in 646.20(1) or 646.20(2) is met.
(1) Unobstructed Egress. Where the location permits a continuous and unobstructed way of egress travel, a single entrance to the working space shall be permitted.
(2) Extra Working Space. Where the depth of the working space is twice that required by 110.27 (A)(1), a single entrance shall be permitted. It shall be located such that the distance from the equipment to the nearest edge of the entrance is not less than the minimum clear distance specified in Table 110.27(A)(1) for equipment operating at that voltage and in that condition.
646.20 Working space for ITE.
(A) Low Voltage Circuits. The working space about ITE where any live parts that may be exposed during routine servicing operate at not greater than 30 volts rms, 42 volts peak, or 60 volts dc shall not be required to comply with the workspace requirements of 646.19.
(B) Other Circuits. Any areas of ITE that require servicing of parts that are greater than 30 volts
rms, 42 volts peak, or 60 volts dc shall comply with the workspace requirements
of 646.19.
Informational Note 1: For example, field wiring compartments for ac mains connections, power distribution units, and the like.
Informational Note 2: it is assumed that ITE operates at voltages not exceeding 600 V.
646.21 Work areas and working space around batteries. Working space around a battery system shall comply with paragraph 110.27. Working clearance shall be measured from the edge of the battery rack.
646.22 Work space for routine service and maintenance. Work space shall be provided to facilitate routine servicing and maintenance (those tasks involving operations which can be accomplished by employees and where extensive disassembly of equipment is not required). Routine servicing and maintenance shall be able to be performed without exposing the worker to a risk of electric shock or personal injury.
Informational Note: An example of such routine maintenance is cleaning or replacing an air filter.
Panel Statement: CMP-12 has revised the submitter's text and as follows:
(a) 646.2 added "or cabinets" in the definition of MDC to clarify what may be housed by an MDC.
(b) 646.3(B) deleted the last sentence of 646.3(B) as it is not mandatory text and moves it to an Informational Note.

(c) 646.3(B) revised to be consistent with the text of 300.22(C) regarding the reference to plenums.
(d) 646.8(B) replaced "easily" with "readily" to eliminate a vague term, and
This action correlates with the actions on Comments 12-74, 12-77 and 12-80.

Ballot Results: Affirmative: 10

12-72 Log #485 NEC-P12 **Final Action: Accept in Principle**
(646.2.Modular Data Center)

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 12-147
Recommendation: Revise text to read as follows:
646.2 Definitions. See Article 100. The definitions in 645.2 shall apply. For the purposes of this article, the following additional definitions apply.
Modular Data Center (MDC). Prefabricated units rated 600 volts or less, consisting of an outer enclosure housing information technology equipment (ITE) and various support equipment such as electrical service and distribution equipment, HVAC systems and the like. ~~Some configurations may have the support equipment housed in a separate enclosure.~~
Informational Note 1: A typical construction may use a standard ISO shipping container or other structure as the outer enclosure, racks or cabinets of ITE, service entrance equipment and power distribution components, power storage such as a UPS and an air or liquid cooling system. Modular data centers are intended for fixed installation either indoors or outdoors based on their construction and resistance to environmental conditions.
Informational Note 2: Some modular data center configurations may have the support equipment housed in a separate enclosure.
Informational Note 3: For information on listing requirements for both information technology equipment and communications equipment, see UL 60950-1-2007, *Information Technology Equipment - Safety - Part 1: General Requirements*.
Substantiation: The second sentence in this definition is clearly a piece of non-enforceable information and is best placed in an Informational Note. I understand that the NEC Manual of Style does not require definitions to be in single sentences but it also requires conciseness and it is best to include any additional information not intended for actual code use in such informational notes.
If the CMP believes that this information needs to be part of the definition, it might want to revise the definition, for example as follows:
Modular Data Center (MDC). Prefabricated units rated 600 volts or less, consisting of an outer enclosure housing information technology equipment (ITE) and various support equipment such as electrical service and distribution equipment, HVAC systems and the like, which are potentially housed in a separate enclosure,.
Panel Meeting Action: Accept in Principle
Panel Statement: The submitter's recommendation has been addressed in Comment 12-71, Section 646.2. The definition of MDC has been revised to meet the submitter's intent.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

12-73 Log #605 NEC-P12 **Final Action: Reject**
(646.2.Premises Transformer and Service Entrance Transformer (New))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 12-147
Recommendation: Revise text to read as follows:
646.2 Definitions.
Premises Transformer. A transformer that is fed by premises wiring.
Service Entrance Transformer. A transformer that feeds the service equipment.
Substantiation: 646.2, 646.11, & 646.12: The premises and service entrance transformers are new, undefined terms.
Panel Meeting Action: Reject
Panel Statement: No substantiation has been provided for the proposed definitions. Further, the definitions are considered unnecessary as the meaning of these terms has been clarified in Comment 12-71, Section 646.11.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

12-74 Log #606 NEC-P12 **Final Action: Accept in Principle in Part**
(646.8)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 12-147
Recommendation: Revise text to read as follows:
646.8 Field Wiring Compartments. ~~.~~A field-wiring compartment in which service or feeder ~~branch circuit~~ connections are to be made shall be readily accessible.~~:~~
~~(1) Permit the connection of the supply wires after the MDC is installed;~~
~~(2) Permit the connection to be introduced and connected easily; and~~
~~(3) Be located so that the connections may be readily inspected after the MDC is installed~~
Substantiation: 646.8 Typos delete extra period, delete the colon following *shall*. I believe the size of these MDCs is such that they will be fed from feeders or services. I believe that – internally – they will have branch circuit OCPDs.
Panel Meeting Action: Accept in Principle in Part
Revise 646.8 to read as follows:
646.8 Field Wiring Compartments. A field-wiring compartment in which service or feeder ~~branch circuit~~ connections are to be made shall be readily accessible, and comply with 646.8 (A) through (C).
Panel Statement: CMP-12 accepts revisions to 646.8 with the addition of the word "and" ahead of "comply with".
CMP-12 does not accept the deletion of list items 1, 2 and 3 (now A, B and C in Comment 12-71). These are necessary to clarify the requirement in 646.8.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

12-75 Log #607 NEC-P12 **Final Action: Accept in Principle**
(646.9(A))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 12-147
Recommendation: Revise text to read as follows:
646.9 Flexible Power Cable.
(A) Flexible cable shall be permitted to be used for connections between enclosures of a MDC system. Flexible cords or cables shall not be used for ~~connection to the branch circuit or electrical service~~. the external (not from another MDC) power feed.
Substantiation: 646.9 I believe the size of these MDCs is such that they will be fed from feeders or services. I believe that – internally – they will have branch circuit OCPDs.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 12-71.
The submitter's recommendation has been addressed in Comment 12-71, Section 646.9. The text has been revised to meet the submitter's intent.
Number Eligible to Vote: 10

12-77 Log #1525 NEC-P12 **Final Action: Reject**
(646.19)

TCC Action: The Correlating Committee directs that the Action on this comment be reported as "Reject" . The change from 110.26 to 110.27 was not accepted because of the Action on Comment 1-81. The remainder of the Comment 12-77 was not accepted as direct text but was incorporated into Comment 12-71.
Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 12-147
Recommendation: Revise text to read as follows:
646.19 General. Access and working space shall be provided and maintained about all electrical equipment to permit ready and safe operation and maintenance of such equipment. Space about electrical equipment shall comply with ~~110.26~~ 110.27. The egress requirements for large equipment in ~~110.26~~ 110.27 (C)(2) and personnel door requirements in ~~110.26~~ 110.27 (C)(3) shall apply to an MDC even if the rating of the MDC is not 1200 amperes or more or if the MDC does not contain overcurrent devices, switching devices or control devices in areas that service personnel may occupy.
Exception: The depth of the workspace shall not be required to comply with Table ~~110.26~~ 110.27 (A)(1) if the equipment is marked "WARNING" and "De-energize Equipment before Servicing" or the equivalent. 110.26 has been moved to 110.27.
Substantiation: 110.26 has been moved to 110.27.
Panel Meeting Action: Accept
Panel Statement: Note to Correlating Committee: There is a need to review this action for proper correlation with CMP-1 actions on Article 110.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1

Explanation of Negative:

CROUSHORE, T.: Comment 12-77 - should have been an Accept in Principle and referred back to Comment 12-71 for the recommended text of the complete Article 646. CMP-12 accepted the concept of renumbering 110.26 to 110.27. However, none of the exact text of the comment (including the suggested Exception) appears word for word in the intended text of Comment 12-71.

12-78 Log #609 NEC-P12 **Final Action: Accept in Principle**
(646.19 Exception)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 12-147
Recommendation: Revise text to read as follows:

646.19 General.

Exception: The depth of the workspace shall not be required to comply with Table 110.2~~6~~7(A)(1) if the equipment is marked with a warning sign which shall meet the requirements in 110.26 and shall read as follows:

"*WARNING~~" and "~~De-energize Equipment before Servicing*" ~~*or the equivalent.*~~

Substantiation: 646.19 <except>: The note refers to a non-existing paragraph. The standard way of defining labels and signs should be used. I have serious doubts that such a warning label will be heeded in the high pressure 24/365 environment these MDCs are used in. **This is a serious safety issue.**

Panel Meeting Action: Accept in Principle

Panel Statement: See action and statement on Comment 12-71.

The submitter's recommendation has been addressed in Comment 12-71, Section 646.18 (renumbered from the original 646.19). The exception has been deleted.

(646.20)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 12-147
Recommendation: Revise text to read as follows:

646.20 Working Space for ITE.

(A) The working space depth in front of ITE where any live parts that may be exposed during routine servicing operate at not greater than 30 volts rms, 42 volts peak, or 60 volts dc; with a fault current less than 200 Amperes shall not be required to comply with 646.19.

(B) Any areas of ITE that require servicing of parts that are greater than 30 volts rms, 42 volts peak, or 60 volts dc; or with a fault current of 200 Amperes or more shall comply with the workspace requirements of 646.19.

Substantiation: 646.20: The "safe" voltages in this section should also and safe amperages. I have no direct information about safe amperages but I have worked on ITE that had low voltage high amperage uninsulated bus bars. Because of the increased efficiencies of DC distribution and reduced cooling requirements, I believe it will become more prevalent in the future. See, for example:
http://hightech.lbl.gov/documents/data_centers/CEC-TB-40.pdf

Panel Meeting Action: Reject

Panel Statement: The recommendation is outside the scope of the NEC and more appropriate for NFPA 70E, *Standard for Electrical Safety in the Workplace*. Also, there is no substantiation for the addition of the 200 amp value.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

12-80 Log #1526 NEC-P12 **Final Action: Reject**
(646.21)

TCC Action: The Correlating Committee directs that the Action on this comment be reported as "Reject" because, per the Action on Comment 1-81, 110.26 was not changed to 110.27.

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 12-147
Recommendation: Revise text to read as follows:

646.21 Work Areas and Working Space Around Batteries.

Working space around a battery system shall comply with paragraph ~~110.26~~ 110.27. Working clearance shall be measured from the edge of the battery rack.

Substantiation: 110.26 has been moved to 110.27.

Panel Meeting Action: Accept

Panel Statement: Note to Correlating Committee: There is a need to review this action for proper correlation with CMP-1 actions on Article 110.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

12-81 Log #384 NEC-P12 **Final Action: Accept in Principle**
(646.26 Exception)

Submitter: Jeffrey L. Holmes, IBEW Local Union 1 JATC
Comment on Proposal No: 12-147
Recommendation: Delete exception entirely.

Substantiation: Working space is truly a safety requirement and should never be disregarded for convenience or to save money. These installations will need to be maintained, adjusted or components replaced. Ignoring worker safety should not be condoned.

Panel Meeting Action: Accept in Principle

Panel Statement: See action and statement on Comment 12-71.

CMP-12 understands the submitter is referring to 646.19 in the original proposal. The submitter's recommendation has been addressed in Comment 12-71, Section 646.18 (renumbered from the original 646.19). The exception has been deleted.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

12-82 Log #426 NEC-P12 **Final Action: Accept in Principle**
(646.26(C) (New))

Submitter: Robert A. Jones, Independent Electrical Contractors, Inc.
Comment on Proposal No: 12-147
Recommendation: Delete the following text:

~~**(C)** Adequate work space shall be provided for minor servicing and maintenance (those tasks involving operations which can be safely accomplished by employees and where extensive disassembly of equipment is not required). Minor servicing and maintenance shall be able to be performed without exposing the worker to a risk of electric shock or personal injury.~~

Substantiation: This requirement is unenforceable. The NEC Style Manual lists "adequate" as a possibly unenforceable and vague term in Table 3.2.1. "Minor servicing and maintenance" is not defined. Checking for proper voltage will expose the worker to a risk of electrical shock.

Panel Meeting Action: Accept in Principle

Panel Statement: See action and statement on Comment 12-71.

The submitter's recommendation has been addressed in Comment 12-71, Section 646.22. The term "adequate" has been deleted. "Routine servicing and maintenance" is understood and the requirement does not specify the need to check for proper voltage.

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

12-83 Log #425 NEC-P12 **Final Action: Accept in Principle**
(646.26(D) (New))

Submitter: Robert A. Jones, Independent Electrical Contractors, Inc.
Comment on Proposal No: 12-147
Recommendation: Revise text to read as follows:

(D) Space about electrical equipment shall comply with 110.26. Section 110.26(C) shall apply to an MDC regardless of the ampere rating of the MDC. ~~*Exception - The depth of the workspace need not comply with Table 110.26(A)(1) if the equipment is marked* "WARNING" and "De-energize Equipment before Servicing" or the equivalent.~~

Substantiation: Section 110.26 is intended to provide enough space for personnel to perform work without jeopardizing worker safety. NFPA 70E Article 130 details work involving electrical hazards and it recognizes that work may need to be performed while energized. In order to test a branch circuit for voltage or proper voltage, the equipment will have to be energized. Even with the proper PPE for the task the worker is still at risk of injury. Proper working space is crucial for the safety of the worker and this cannot be compromised.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Comment 12-71.

The submitter's recommendation has been addressed in Comment 12-71, Section 646.18 (renumbered from the original 646.19). The exception has been deleted.

ARTICLE 647 — SENSITIVE ELECTRONIC EQUIPMENT

12-84 Log #1457 NEC-P12 **Final Action: Reject**
(647)

Submitter: Martin Reid, Golden Era Productions
Comment on Proposal No: N/A
Recommendation: My comment is Article 647 should be deleted completely so as to allow 60/120V system to be universally used for the purpose of drastically increasing the level of electrical safety -- particularly in locations where there are children who would otherwise come into contact with 120VAC. 60/120VAC system should be widely used, so that children and adults making accidental contact with household and office branch circuits receive only 60V

shocks instead of 120V. Furthermore, as currently required in Article 647, 60/120V systems could be mandated to have GFCI protection. The combination of 60/120V distribution and two-pole GFCI branch circuit breaker protection feeding such branch circuits would mostly close the door on accidental electrocutions in residential and office occupancies wherever employed.

It is my understanding that 60/120V system is relegated only for sensitive electronic equipment instead of generally allowed solely because of lamp screw-shell s being energized at 60V with the 60/120V "balanced power" system. This is wrong-headed because the combination of 60/120V systems with two-pole standard 7 milliamp trip GFCI circuit breakers would basically close-the-door on residential and workplace electrocutions in the United States regardless of the "screw shell problem". It is well known that most electrocutions take place on 120V 60 Hertz standard branch circuits due to the sheer number of accidental contacts which take place.

Substantiation: Article 647 restricts use of 60/120V system with GFCIed branch circuits only for sensitive electronic equipment, yet the mandate and purpose is stated to be: "Committee Scope This Committee shall have primary responsibility for documents on minimizing the risk of electricity as a source of electric shock and as a potential ignition source of fires and explosions." Article 647 has blocked drastic and revolutionary increase in electrical safety for the entire US and parts of the world by prohibiting this much-safer electrical distribution method from being used generally. It is my contention this Article was formed due to interference with the purpose of the NEC and your committee, by entrepreneurial vested interests whose aim was to market products aimed for sound-studio use having nothing whatsoever to do with "minimizing the risk of electricity as a source of electric shock." The purpose was to develop a market for selling special "sensitive electronic equipment" power distribution equipment. I contend the entire reason Article 647 was developed was 100% entrepreneurial and 0% for the above altruistic Committee Scope and purpose. Thus, the actual exerted PURPOSE did not align with the purpose of your committee or your organization.

The PROBLEM: It is well known by most educated members of the Electrical Industry that 60 Hertz 120 volts and above were a very poor choice for electrical safety due to peaked ventricular fibrillation risk at this voltage and above and at this particular frequency. Serious students of electrical shock phenomena all must ask themselves the question: HOW DID WE END UP WITH PERHAPS THE WORST POSSIBLE FREQUENCY FOR HEART FIBRILLATION as the current United States standard? The answer is, it was entirely inadvertent and intended to reduce lamp flicker. It is generally well known that as AC voltage magnitude goes down from 120V 60 Hertz, and the closer it gets to 50V 60 Hertz, the more precipitous the drop in danger of heart fibrillation. At 60VAC, the heart fibrillation risk is almost nil, and becomes for all intents and purposes zero at 50VAC. The problem is the fact that this hazard need not be there generally. At all.

GFCIs are decades-old technology well proven to save lives. Had GFCIs been required for all general-use branch circuits, many lives, including the lives of innocent children would have been saved in the last 50 years. The lives of specific children would have been saved I know for an absolute fact – including one specific case I heard about from former Riverside County Chief Electrical Inspector. The combination of 60V-to-ground systems and double-pole 7 milliamp trip standard GFCI circuit breakers forms an unbeatable combination for preventing fatal electric shock in residences and offices. Those enjoying a drastically increased electrical safety-level in the United States are only the sound studio engineers in certain sound studios, and only they have benefited from this simple distribution type. This drastically increased safety must be broadened to include the next generations, so that innocents don't end up with their lives unnecessarily cut short. SPECIFIC REASON: My reasoning is connected with a valuation of human life. The question NFPA members must ask is, what is the value of a single human life? The answer to that question is impossible to answer, but approaches the infinite for a variety of reasons. Every single child deserves the chance to achieve greatness and a long, prosperous life filled with happiness, and their lives must not be allowed to be ever cut short due to a silly inadvertent bad decision --- the 60 Hertz operating frequency decision combined with 120V or greater. We in the electrical industry are charged with the responsibility to DO SOMETHING ABOUT IT. The contention has been that "general use equipment can't handle balanced power" and that "screw shells would be energized by 60VAC". Are these considerations sufficient to warrant unnecessary exposure of risk to individuals? A child contacting 60VAC with 6 milliamp GFCI protection from the circuit breaker is protected. An adult inadvertently contacting the branch circuit is protected. 99.9% of all utilization equipment intended for 120V 60 Hertz operation will plug in to "balanced power" system without the slightest hazard. The cost of upgrading or building a facility with 60/120V power is very low, as it involves a dry type transformer installed to feed the general-use branch circuits of the structure. For those choosing to essentially close-the-door in electric shock fatalities for the most part in their residences or workplaces, the cost is not major particularly if undertaken as part of the original construction and design of a building. Many would be happy to bear the small additional percentage cost if they knew they were securing a safety advantage enjoyed only by a few sound engineers currently. Eventually, the consideration of the valuation of human life could evolve into universal application of 60/120V system, even in Japan where it would be an even-safer 50/100V. Consideration about contacts with screw-shells should not stop a quantum-leap in electrical safety from taking place. That consideration can be dealt with easily – not so the inherent situation with 60 Hertz operating frequency which we are STUCK WITH. Equipment can be tested for being usable on balanced power, and it will be found 99.9% is suitable. For the sake of future generations the other.01 per cent can be dealt with.

I am asking you to honestly and carefully consider this comment. I am aware it has ramifications, but it would also promote business in that those wishing to upgrade the safety of their residences for the sake of their children's welfare would definitely pay for the necessary dry type transformers and double-pole GFCI breakers and additional panelboard to facilitate having highly upgraded safety. Sound Engineers could continue to be protected and safe, but we should revise the Code so that the same level of superlative safety can be expanded for all other uses, particularly for general use branch circuits which offer the highest percentage of accidental contacts that citizens make with our archaic electrical distribution system.

Panel Meeting Action: Reject

Panel Statement: The comment does not comply with the Regulations Governing Committee Projects, Section 4.4.5(b).

The submitter is requesting that Article 647 be deleted. CMP-12 does not agree with the submitter's recommendation or with the submitter's substantiation that 60/120 volt AC systems should be widely used. Article 647 is a very specific article for a very specific application where audio, video or similar electronic equipment is used in commercial and industrial facilities to reduce 60 Hz noise on this type of equipment. It is not used for normal power distribution nor is it permitted in residential applications due to the difference with standard residential wiring from a 120/240 volt, single-phase system.

Number Eligible to Vote: 11

Ballot Results: Affirmative: 11

ARTICLE 660 — X-RAY EQUIPMENT

12-85 Log #751 NEC-P12 **Final Action: Accept**

(660.4(C))

Submitter: James T. Dollard, Jr., IBEW Local 98

Comment on Proposal No: 12-152

Recommendation: Continue to Accept.

Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. Section 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 and 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

ARTICLE 665 — INDUCTION AND DIELECTRIC HEATING EQUIPMENT

12-86 Log #486 NEC-P12 **Final Action: Reject**
(665.2.Converting Device and 665.3 (New))

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 12-153
Recommendation: Revise text to read as follows:
Converting Device. That part of the heating equipment that converts input mechanical or electrical energy to the voltage, current, and frequency used for the heating applicator. ~~A converting device consists of equipment using mains frequency, all static multipliers, oscillator-type units using vacuum tubes, inverters using solid-state devices, or motor generator equipment.~~
<u>**665.3 General**</u>
<u>**6653.1** A converting device shall consist of equipment using mains frequency, all static multipliers, oscillator-type units using vacuum tubes, inverters using solid-state devices, or motor generator equipment.</u>
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains a list of examples and such examples are not usually contained in definitions but as information. If, on the other hand, the CMP believes that this list is a requirement it should place it somewhere else in Article 665, for example as a section 665.3 or a similar new location, since NEC definitions shall not contain requirements. Moreover, the NEC manual of style does not permit the definition to contain the defined term and the second sentence contains the defined term “converting device”.
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Suggested informational note as alternative:
<u>**Informational Note**: A converting device consists of equipment using mains frequency, all static multipliers, oscillator-type units using vacuum tubes, inverters using solid-state devices, or motor generator equipment.</u>
Panel Meeting Action: Reject
Panel Statement: CMP-12 disagrees with the submitter that the definition of converting device contains a requirement. Rather, the definition is stating a fact that the converting device consists of equipment with various attributes. These attributes add clarity to the definition.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

12-91 Log #752 NEC-P12 **Final Action: Accept**
(668.21(A))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 12-160
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. Section 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 and 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

17-27 Log #963 NEC-P17 **Final Action: Reject**
(680.22(A)(1))

Submitter: David H. Platt, Middle Atlantic Inspections Inc.
Comment on Proposal No: 17-101
Recommendation: Revise text to read as follows:
680.22 Area Lighting, Receptacles, and Equipment.
(A) Receptacles.
(1) Circulation and Sanitation System, Location. Receptacles that provide power for water-pump motors or for other loads directly related to the circulation and sanitation system shall be permitted to be located ~~at least 3.0 m (10 ft) from the inside walls of the pool, or not less than 1.83 m (6 ft)~~ between 1.5m (5 ft) and 1.83(6ft) from the inside walls of the pool ~~if they~~ and shall meet all of the following conditions:
(1) Consist of single receptacles
(2) Employ a locking configuration
(3) Are of the grounding type
(4) Have GFCI protection
Substantiation: Panel 17 has considered a reduction to 1.2m(4 ft) to be a reduction in the level of safety afforded by the Code, Not less than 1.5m(5 ft) was considered a safe distance prior to the change to 1.83m(6 ft) was accepted into the 2008 Code.
There need to be specific requirements for receptacles provided for circulation and sanitation equipment. 680.22(A)(2) states "Other receptacles shall be not less than 1.83 m (6 ft) from the inside walls of a pool." Regardless as to how many are installed or if they are single, duplex or quads, yes they too are required to be of the grounding type and have GFCI protection but other wiring methods may be used for other receptacles. If we do not keep specific provisions more than just being single, grounding type, and GFCI protected for the circulation and sanitation equipment, we will be providing the end user other improperly wired receptacle locations possibly installed using UF cable that may be inadvertently used to connect circulation and associated equipment.
Panel Meeting Action: Reject
Panel Statement: The proposed amendment does not provide the level of safety that is currently mandated by the Code. The proposed language eliminates the requirement for locating the circulation and sanitation system receptacle at least 10 feet from the inside wall of the pool and allows the receptacle to be placed at any location, thus decreasing the level of safety currently provided. Further, CMP-17 does not agree that employing a locking configuration receptacle will prevent the end user from having an improperly wired receptacle location.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

Comment on Proposal No: 17-103
Recommendation: Revise text to read as follows:
680.22 Area Lighting, Receptacles, and Equipment.
(A) Receptacles.
(1) Circulation and Sanitation System, Location. Receptacles that provide power for water-pump motors or for other loads directly related to the circulation and sanitation system shall be permitted to be located ~~at least 3.0 m (10 ft) from the inside walls of the pool, or not less than 1.83 m (6 ft)~~ between 1.5m (5 ft) and 1.83(6ft) from the inside walls of the pool ~~if they~~ and shall meet all of the following conditions:
(1) Consist of single receptacles
(2) Employ a locking configuration
(3) Are of the grounding type
(4) Have GFCI protection
Substantiation: Panel 17 has considered a reduction to 1.2m(4 ft) to be a reduction in the level of safety afforded by the Code, Not less than 1.5m(5 ft) was considered a safe distance prior to the change to 1.83m(6 ft) was accepted into the 2008 Code.
There need to be specific requirements for receptacles provided for circulation and sanitation equipment. 680.22(A)(2) states "Other receptacles shall be not less than 1.83 m (6 ft) from the inside walls of a pool." Regardless as to how many are installed or if they are single, duplex or quads, yes they too are required to be of the grounding type and have GFCI protection but other wiring methods may be used for other receptacles. If we do not keep specific provisions more than just being single, grounding type, and GFCI protected for the circulation and sanitation equipment, we will be providing the end user other improperly wired receptacle locations possibly installed using UF cable that may be inadvertently used to connect circulation and associated equipment.
1.5m 5(ft) is currently considered a safe distance for Switching devices in 680.22 (D) as well as GFCI protected Luminaires,lighting outlets in 680.22(C) (4)
680.24(B)(2) currently allows a junction box or other electrical enclosure for a GFCI Device obviously not a receptacle to be located.1.2 m (4) ft from the inside wall of a pool.
680.24 Junction Boxes and Electrical Enclosures for Transformers or Ground-Fault Circuit Interrupters.
680.24(B) (2) Installation (b) Horizontal Spacing Junction Boxes and Electrical Enclosures for Transformers or Ground-Fault Circuit Interrupters. The enclosure shall be located not less than 1.2 m (4 ft) from the inside wall of the pool,
There need to be specific requirements for receptacles as there is for the wiring provided for circulation and sanitation equipment. Permitting a closer installation will assist along with the other requirements of 680.22(A)(1) to ensure that the circulation system and sanitation equipment if cord and plug connected get plugged into the the Receptacle(s) with the proper wing method feeding them. If all (4) of the specific requirements are not kept in place we will be providing the end user other improperly wired receptacle locations possibly installed using UF cable or some other non approved wiring method that may be inadvertently used to connect circulation and associated equipment.
Panel Meeting Action: Reject
Panel Statement: See panel action and panel statement in Comment 17-27.

Comment on Affirmative:
COOK, D.: I agree with the Panel Meeting Action, but the text related to that action is not completely clear. Since revisions were accepted in the ROP, I hope the following description of proposed text is what we are voting on:
680.22(A) Receptacles
(1) Required Receptacle, Location. Where a permanently installed pool is installed, no fewer than one 125-volt, 15-or 20-ampere receptacle on a general-purpose branch circuit shall be located not less than 1.83 m (6 ft) from, and not more than 6 m (20 ft) from, the inside wall of the pool. This receptacle shall be located not more than 2.0 m (6 ft 6 in.) above the floor, platform, or grade level serving the pool.

(2) Circulation and Sanitation System, Location. Insert text from 2011 NEC 680.22 (A) (1) without condition (2) which was deleted by Proposals 17-101, 17-104, and 17-105.
(3) Other Receptacles, Location. Insert text from 2011 NEC 680.22 (A) (2).
(4) GFCI Protection. No change from 2011 NEC.
(5) Measurements. No change from 2011 NEC.

17-32 Log #1003 NEC-P17 **Final Action: Accept in Principle**
(680.22(B)(6))

Submitter: David Clements, International Association of Electrical Inspectors
Comment on Proposal No: 17-108
Recommendation: Add new text to read as follows:
Low voltage Class 2 lighting that conforms with low voltage contact limit levels shall be permitted to be located at the edge of a pool.
Substantiation: Even though a new definition for low voltage contact limits has been inserted into Section 680.2. Current language in Section 680.22 does not allow low voltage lighting to be installed in close proximity to the swimming pool. This will permit installations that are already being installed around most swimming pools and are in conflict with the existing NEC. Section 680.3 and Table 680.3 references 411.4(B) for these low voltage lighting systems but creates a Code loop without actually giving permission in Section 680.22 for site lighting to be installed within close proximity to the pool edge. Limiting the power supply to a Class 2 wet location voltage will ensure that the voltage source will be limited to the same low voltage limitation for low voltage swimming pool lighting.
Panel Meeting Action: Accept in Principle
Add a new 680.22(B)(6) to read as follows:
(6) Low-Voltage Luminaires. Listed low-voltage luminaires not requiring grounding, not exceeding the low-voltage contact limit, and supplied by listed transformers or power supplies that comply with 680.23(A)(2) are permitted to be located less than 1.5m (5 ft) from the inside walls of the pool.
Panel Statement: CMP-17 agrees that certain types of low-voltage luminaires should be permitted to be installed less than 5 ft. from the inside walls of the pool. To be acceptable for this location, the luminaires must have a rating that corresponds to the defined low-voltage contact limit and be supplied from a power source meeting the isolation requirements for swimming pool lighting. For example, listed low-voltage landscape lighting power units complying with UL 1838 and marked “For Use with Submersible Fixtures” comply with the low voltage contact limit (680.2) and are isolated as specified in 680.23(A)(2).
The panel does not agree that “Class 2” should be specified as this term would additionally limit the available power to the lighting.
There are a number of different locations in the article that these provisions could be placed but the panel believes a separate heading would provide the most clarity.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

17-33 Log #424 NEC-P17 **Final Action: Accept in Principle**
(680.22(D))

Submitter: Mark C. Ode, UL LLC
Comment on Proposal No: 17-108
Recommendation: Modify the exception proposed in this proposal to the following text:
Exception: Low voltage Class 2 lighting that conforms with low voltage contact limit levels shall be permitted to be located at the edge of a pool.
Substantiation: Even though a new definition for low voltage contact limits has been inserted into 680.2, 680.22 does not permit low voltage lighting to be installed in close proximity to the swimming pool. This new exception to (D) will permit installations that are already being installed around most swimming pools and are in conflict with the existing NEC. Section 680.3 and Table 680.3 references 411.4(B) for these low voltage lighting systems but creates a Code loop without actually giving permission in 680.22 for site lighting to be installed within close proximity to the pool edge. Limiting the power supply to a Class 2 wet location voltage will ensure that the voltage source will be limited to the same low voltage limitation for low voltage swimming pool lighting.
Panel Meeting Action: Accept in Principle
See panel action on Comment 17-32.
Panel Statement: The action on Comment 17-32 accomplishes the submitter’s intent.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

17-34 Log #1333 NEC-P17 **Final Action: Reject**
(680.23(A)(3))

Submitter: David Williams, Delta Township
Comment on Proposal No: 17-112
Recommendation: Revise text to read as follows:
680.23(A)(3) GFCI Protection, Relamping. A ~~g~~Ground-fault circuit interrupter protection shall be ~~installed in the~~ provided for ~~branch circuit supplying~~ luminaires operating at more than the low voltage contact limit such that there is no shock hazard during relamping. The installation of the ground-fault circuit interrupter shall be such that there is no shock hazard with any likely fault-condition combination that involves a person in a conductive path from any ungrounded part of the branch circuit or the luminaire to ground.
Substantiation: The code is not a design manual and the requirements in this section should require GFCI protection. It should be up to the installer on how to apply the rule. This wording has been in the code a number of decades and needs to be revised. GFCI protection in the feeder does not reduce the level of ground fault protection as referenced in the panel statement. The selective coordination issue also addressed in the panel statement is not correct.
Panel Meeting Action: Reject
Panel Statement: This comment reduces safety by potentially allowing disruption of power to unintended circuits.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 8 Negative: 2
Explanation of Negative:
COOK, D.: Discussion associated with committee action to reject and the Panel Statement indicates use of a GFCI in feeders rather than branch circuits reduces safety by potentially allowing disruption to unintended circuits. The proposed revision allowing GFCI protection to be provided in feeders or branch circuits is permissive, not required. Any installation where designers or owners desire to limit an outage, that option would be permitted. The same concern expressed by the Committee Statement could be extended to the feeder overcurrent device. Any equipment, lighting or other type that warrants that type of concern, would seem to be covered by the “Emergency” requirements in Article 700 and be provided with an emergency power source. NEC 210.70 includes required lighting outlets and lighting is not required in many of the areas of concern expressed in the Panel discussion. Committee concerns related to loss of area lighting that is not required by the NEC, IRC, or IBC, doesn’t seem to be a technical reason to exclude GFCI protection in a feeder if that is the desire of the designer and owner. Comment should be accepted.
SCHAPP, R.: I agree with the comments of D. Cook.

17-35 Log #1442 NEC-P17 **Final Action: Reject**
(680.23(A)(3))

Submitter: Brian Myers, IBEW Local Union 98
Comment on Proposal No: 17-112
Recommendation: This proposal should have been an Accept in Principal. To read as follows:
A GFCI shall be installed in accordance with one of the following
a) A ground fault circuit interrupter shall be installed in the branch circuit supplying luminaries operating at more than the low voltage contact limit such that there is no shock hazard during relamping. The installation of the ground fault interrupter shall be such that there is no shock hazard with any likely fault condition combination that involves a person in a conductive path from any ungrounded part of the branch circuit or luminarie to ground.
b) A ground fault circuit interrupter shall be installed in the feeder circuit supplying luminaries operating at more than the low voltage contact limit such that there is no shock hazard during relamping. The installation of the ground fault interrupter shall be such that there is no shock hazard with any likely fault condition combination that involves a person in a conductive path from any ungrounded part of the branch circuit or luminarie to ground. The feeder shall not supply interior lighting or lighting for egress.
Substantiation: The rule was separated into two list items for clarity. The last sentence in list item (b) will prevent imminent nuisance tripping of interior lighting as well as lighting for egress. These changes meet the submitter’s intent.
Panel Meeting Action: Reject
Panel Statement: This comment reduces safety by potentially allowing disruption of power to unintended circuits.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 8 Negative: 2

COOK, D.: See Cook statement on 17-34.
SCHAPP, R.: I agree with the comments of D. Cook.

17-36 Log #1517 NEC-P17 **Final Action: Reject**
(680.23(A)(3))

Submitter: Donald R. Cook, Shelby County Department of Development Services
Comment on Proposal No: 17-112
Recommendation: Reconsider proposed text and accept.
Substantiation: Panel statement indicated adding the words “feeder” reduces protection. Class A GFCI protective devices provide 4-6 mA ground-fault protection for personnel regardless of their location in the electrical system and the location of GFCI devices has no impact on selective coordination as used in the NEC. Providing GFCI protection at larger feeder devices could certainly be questioned from a design standpoint as the operation of that feeder device could cause an undesirable power outage if a ground-fault occurred. However, many smaller pool installations include a feeder supplying a limited number of branch circuits that only supply pool equipment. Allowing consumers to utilize a less costly option of feeder GFCI protection does not compromise the safety

of the installation. Feeder capacity and length varies tremendously and consumers, designers, and installers should be allowed to make that choice. NEC 90.1(B) indicates this Code contains provisions considered necessary for safety and 90.1(C) indicates the Code is not a design manual. This proposed text would not require the GFCI protection to be provided at the feeder, but simply permit that option. See Panel statements on Proposals 17-136 and 17-147.

Panel Meeting Action: Reject

SCHAPP, R.: I agree with the comments of D. Cook.

17-37 Log #1513 NEC-P17 **Final Action: Accept**

(680.25)

Submitter: Donald R. Cook, Shelby County Department of Development Services

Comment on Proposal No: 17-119

Recommendation: Revise text to read as follows:

~~*Exception: An existing feeder between an existing remote panelboard and service equipment shall be permitted to run in flexible metal conduit or an approved cable assembly that includes an equipment grounding conductor within its outer sheath. The equipment grounding conductor shall comply with 250.24(A)(5).*~~

(2) Aluminum Conduit. Aluminum conduit shall not be permitted in the pool area where subject to corrosion.

(B) Grounding. An equipment grounding conductor shall be installed with the feeder conductors between the grounding terminal of the pool equipment panelboard and the grounding terminal of the applicable service equipment or source of a separately derived system. For other than ~~(I) existing feeders covered in 680.25(A), exception, or (2)~~ feeders to separate buildings that do not utilize an insulated equipment grounding conductor in accordance with 680.25(8)(2), this equipment grounding conductor shall be insulated.

(1) Size. This conductor shall be sized in accordance with 250.122 but not smaller than 12 AWG. On separately derived systems, this conductor shall be sized in accordance with 250.30(A)(3) but not smaller than 8 AWG.

(2) Separate Buildings. A feeder to a separate building or structure shall be permitted to supply swimming pool equipment branch circuits, or feeders supplying swimming pool equipment branch circuits, if the grounding arrangements in the separate building meet the requirements in 250.32(8). ~~Where installed in other than existing feeders covered in 680.25(A), Exception, a separate equipment grounding conductor shall he an insulated conductor.~~

Substantiation: Panel action on Proposals 17- 119 and 17-120 deleted the exception in 680.25(A). 2011 NEC references to that exception in 680.25(B) and 680.25(B){2) must be eliminated to correlate with the panel action on those proposals.

Panel Meeting Action: Accept

Revise 680.25 to read:

Exception: A~~n existing~~ feeder within a one-family dwelling unit or two-family dwelling unit between ~~an existing~~ remote panelboard and service equipment shall be permitted to run in flexible metal conduit or an approved cable assembly that includes an insulated equipment grounding conductor within its outer sheath. The equipment grounding conductor shall comply with 250.24(A)(5).

(2) Aluminum Conduit. Aluminum conduit shall not be permitted in the pool area where subject to corrosion.

(B) Grounding. An equipment grounding conductor shall be installed with the feeder conductors between the grounding terminal of the pool equipment panelboard and the grounding terminal of the applicable service equipment or source of a separately derived system. For other than (I) existing feeders covered in 680.25(A), exception, or (2) feeders to separate buildings that do not utilize an insulated equipment grounding conductor in accordance with 680.25(8)(2), this equipment grounding conductor shall be insulated.

(1) Size. This conductor shall be sized in accordance with 250.122 but not smaller than 12 AWG. On separately derived systems, this conductor shall be sized in accordance with 250.30(A)(3) but not smaller than 8 AWG.

(2) Separate Buildings. A feeder to a separate building or structure shall be permitted to supply swimming pool equipment branch circuits, or feeders supplying swimming pool equipment branch circuits, if the grounding arrangements in the separate building meet the requirements in 250.32(8). Where installed in other than existing feeders covered in 680.25(A), Exception, a separate equipment grounding conductor shall he an insulated conductor.

Substantiation: Panel action (HI Proposals 17- 119 and 17-120 deleted the exception in 680.25(A). 2011 NEC references to that exception in 680.25(B) and 680.25(B){2) must be eliminated to correlate with the panel action on those proposals.

Panel Meeting Action: Accept

Number Eligible to Vote: 10

Ballot Results: Affirmative: 10

Comment on Affirmative:

HUNTER, R.: In 680.25(A)(1) the elimination of the Exception allowing existing flexible metal conduit or cable assemblies, has removed the acceptance of these methods without any technical substantiation. The issue for removal was the enforcement of "Existing". There have been no reported issues with these methods feeding pool equipment panelboards. This will now require residential dwellings to use wiring methods completely foreign to the constructions of a dwelling if they choose to pass through the interior of a dwelling.

17-39 Log #877 NEC-P17 **Final Action: Reject**

(680.26(B)(2)(b))

Submitter: C. Douglas White, Center Point Energy / Rep. Edison Electric Institute/Electric Light & Power Group

Comment on Proposal No: 17-126

Recommendation: The proposal should have been accepted.

Substantiation: Testing done by the Electric Power Research Institute (and cited by EnerNex in their NFPA research report as the best available data on the topic) clearly shows that under certain situations involving intermediate voltage short circuits, the alternate single loop method of constructing an equipotential plane as allowed by the current NEC will NOT protect the public from the possibility of serious shock or electrocution. For Panel 17 to require a documentation of hazards to persons before considering change when testing clearly predicts the potential of harm is a completely unacceptable position. In addition, the Panel statement alludes to a willingness to consider alternate technologies or methods to provide better protection. When an attempt at the Panel meeting was made to compromise by looking at other than copper grid solutions, the compromise was voted down with no discussion. The Panel's rejection of this proposal fails to recognize that the current Code does not meet the requirements set forth in 90.1(B) that requires an "installation that is essentially free from hazard". This proposal is an attempt to effect change that would meet this minimum requirement. The panel should be proactive considering the testing evidence of record and not wait on a death or injury statistic.

Panel Meeting Action: Reject

Panel Statement: No new substantiation has been submitted since the Report on Proposals to support this amendment. CMP-17 reiterates its position: CMP-17 disagrees that a copper bonding grid is justified for perimeter bonding to the exclusion of all other technologies. The panel has performed an extensive review, including commissioning a study, and has seen no definitive information demonstrating that the current alternate means is unsafe or results in a demonstrated hazard of death or injury. The panel has seen no evidence of incidents resulting in death or injury attributable to use of the alternate bonding means.

Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
RICHBOURG, S.: Testing done by the Electric Power Research Institute on pools with nonconductive shells clearly shows that under certain situations involving intermediate voltage short circuits, the alternate single loop method of constructing an equipotential plane as allowed by the current NEC will not protect the public from the possibility of serious shock or electrocution. The alternate single loop method of constructing an equipotential plane should only be allowed for the pools with conductive shells as specified in 680.26(B)(1).
Comment on Affirmative:
COOK, D.: I agree with the Panel Action to reject the comment. However, I do not agree with all the Panel Statement. Evidence has clearly been provided that stray voltage exists in many areas and in some areas the current permission to use a single # 8 will not eliminate the stray voltage conditions and may not reduce the condition to an acceptable level. I also don't believe enough substantiation has been submitted to determine an acceptable level of voltage and current and don't believe enough substantiation has been submitted to require the proposed bonding requirement at ALL pools.
WEST, L.: The Panel action to reject is correct. The present alternate means of perimeter bonding, which is a minimum requirement, was not demonstrated to be unsafe. Perimeter bonding utilizing a single buried conductor has been employed successfully and without known injury or fatality in a widespread fashion across the United States for over 30 years. Further, materials presented to the Panel do not document stray current issues except in certain geographically localized areas. The studies cited in the comments address pool types that are not in nationally widespread use and do not represent the construction of the vast majority of in-ground pools in the United States. The copper grid proposed by the Commenter is already allowed under this Article.

17-40 Log #1358 NEC-P17 **Final Action: Reject**
(680.26(B)(2)(b))

Submitter: Reuben E. Clark, Consolidated Manufacturing International
Comment on Proposal No: 17-127
Recommendation: Revise text to read as follows: 680.26(B)(2)(b) *Alternate Means*. Where structural reinforcing steel is not available or is encapsulated in a nonconductive compound, a copper conductor(s) grid shall be utilized where the following requirements are met: ~~(1) At least one minimum 8 AWG bare solid copper shall be provided.~~ (1) The copper grid shall be constructed of 8 AWG solid bare copper and be arranged meeting the requirements of 680.26(B)(1)(b)(3).(2) ~~The conductors shall follow the contour of the perimeter surface.~~ (2) The copper grid shall follow the contour of the perimeter surface extending 1 m (3 ft) horizontally beyond the inside walls of the pool. (3) Only listed splices shall be permitted. ~~(4) The required conductor shall be 450 to 600 mm (18 to 24 in.) from the inside walls of the pool. (5) The required conductor shall be secured with in or under the perimeter surface 100 mm to 150 mm (4 in. to 6 in.) from the inside walls of the pool. (5) The required conductor shall be secured with in or under the perimeter surface 100 mm to 150 mm (4 in. to 6 in.) below subgrade.~~ (4) Be secured within or under the deck or unpaved surfaces no more than 150 mm to 600 mm (4 in. to 6 in.) from the underside of the deck
Substantiation: I ask CMP17 to reconsider Proposal 17-127 Log #2716. In the Panel Statement it is written "The panel has performed an extensive review, including commissioning a study, and has seen no definitive information demonstrating that the current alternate means is unsafe or results in a demonstrated hazard of death or injury." However, in the proposal it is pointed out that the NEETRAC test of an actual field condition proves this. The testing conducted by ERPI proves this. Also, the NFPA's own report by EnerNEx states this. The proposal actually states the section of the EnerNex that declares "the only option that appears to keep the voltages under "arbitrarily safe levels" of a few volts was the "Copper Grid" option. "Therefore, the Panel cannot use the statement that the current alternative means is unsafe as justification to reject this proposal.
Simple internet searches will show a steadily growing number of problems with stray voltage presenting on the unprotected pool deck. This submitter has been contacted by many new pool owners who are angry that a pool could be built per code and they can't use the expensive pool they just purchased because they and their family members are getting shocked. Many are worried about the negative and potentially fatal effects of this stray voltage on their very young children and aging members, some who have pace makers and use the benefits of exercise in the water to maintain their health!
Furthermore, this lack of adequate protection is now creating an UNFAIR level of competition in the industry. The most recent example is that a homeowner contacted this submitter on October 16th with stray voltage on his deck and was furious because everyone was placing blame on someone else, after he had saved money "for years" and was finally able to install a pool and now he and his family are getting shocked on the deck and can't use it! He had researched the information on the internet, including the problems with dairy cows in WI. He printed off product information on Copper Bonding Grids that will eliminate the stray voltage or mitigate it successfully, because the single wire used per code did not! He gave it to the pool builder and declared the builder should not install another pool without rebar or copper bonding grid in the deck. Now it is on record that this particular pool builder is aware of a KNOWN PROBLEM, and he needs to execute an installation in EXCESS of the minimum level of safety the NEC currently provides. If he installs a deck without rebar or copper grid, he is subjecting himself to lawsuits as a Licensed Contractor. This puts the builder at an unfair DISADVANTAGE versus the other builders in the area who may not be aware of the new stray voltage in their area. He now has to factor in the cost of the rebar or copper grid just as he did years ago, while the other builders can quote jobs without this product and simply declare they are building "per code." Additionally, what does this builder do with the pools that he has sold but not yet started? He can't install with the single wire in the deck because he and the Electric Utility Company have determined there is a stray voltage in the area. He will have to absorb this cost, and again, while cost should not be an issue with respect to safety, the lack of effect codes has begun creating an unfair level of competition in the industry.
Also, in the Panel Statement is "The panel disagrees that a copper bonding grid is justified for perimeter bonding to the exclusion of all other technologies." This proposal addresses an ALTERNATE MEANS, not excluding anything, by definition, "alternate means" declares there is another means to accomplish the objective. Putting the copper bonding grid back into the code does NOT exclude all others, ONLY the single wire, which has been proven over and over to not provide adequate protection. The proposal reads that including the copper grid is only an OPTION, the installer always can use the preferred means stated in the earlier section of this code (rebar). Accepting this proposal simply eliminates the ineffective single wire, and elevates the minimum level of safety!
Finally, the conflict the proposal pointed out between allowing a single wire in the deck but not the shell, still has not been addressed. Leaving a single wire for the deck, but not the shell is a conflict in the code and cannot exist. If this proposal is not accepted, then this submitter requests an explanation as to how this conflict can exist.
I ask CMP-17 to ACCEPT this proposal and increase the level of safety back to the 2005 level, eliminate the unfair advantage the current alternate means is creating, and adhere to its own commissioned study by the EnerNex. Finally, all experts in this field have supported this proposal; NEETRAC, EPRI, IEEE, EEI and many Electric Utilities, the Electrical Section of the NFPA (2010 Annual Meeting voting to support NITMAM) and almost the entire body of the NFPA. The overwhelming support and evidence from testing, as well as increasing field problems should make this an easy decision.
Panel Meeting Action: Reject

17-41 Log #1004 NEC-P17 **Final Action: Accept in Part**
(680.27(B)(2))

Submitter: David Clements, International Association of Electrical Inspectors
Comment on Proposal No: 17-136
Recommendation: Accept the proposal as submitted:
(2) Protection. The electric motor and controller shall be connected to a branch circuit or feeder protected by a ground-fault circuit interrupter.
Substantiation: The Panel stated that GFCI protection is currently allowed for either a branch circuit or feeder for electrically operated pool covers. That may be the interpretation of the Panel, but the current requirement states that the electrically operated pool cover shall be connected to a circuit protected by a GFCI. The wording implies that the only acceptable protection is protection of the branch circuit. Providing GFCI protection in either the branch circuit or the feeder will provide equivalent protection and will offer more flexibility in design and installation. The proposal will also add clarity as to the intent of this requirement.
Panel Meeting Action: Accept in Part
Accept only the addition of the word "branch" and not addition of the phrase "or feeder".
Panel Statement: To adopt the second of the two suggested amendments would reduce safety by allowing unintended disruption of power to lighting circuits.

Explanation of Negative:
COOK, D.: See Cook statement on Comment 17-46.

17-48 Log #407 NEC-P17 **Final Action: Accept in Principle in Part**
(680.57(B))

Submitter: Russel LeBlanc, The Peterson School of Engineering
Comment on Proposal No: 17-147
Recommendation: This proposal should be accepted. The present wording in the NEC should not be applicable to ALL circuits.
Substantiation: Some signs are connected to communication or signaling circuits. How can GFCI protection be provided for a communication circuit (Article 800) or a Class 2 remote control and signaling circuit (Article 725) that sends data or signals to an electronic sign? I don't believe a GFCI device exists for these types of circuits! Nor would it be necessary. Also, GFCI protection is not simultaneously required for the service, feeder AND the branch circuit. This needs to be made clear. Only of of those power circuits needs to be GFCI protected either the branch circuit or the feeder, but not both. That is presently not permitted since ALL CIRCUITS, no matter the type, feeding the sign need to be GFCI protected. The present wording literally means it would be a violation if ONLY the branch circuit, and not the feeder, feeding the sign was GFCI protected, since the feeder is another circuit feeding the sign too. I don't believe it is the intent of this section to require GFCI protection for the feeder AND the branch circuit simultaneously. Not do I believe that communication circuits, fire alarm circuits or remote control and signaling circuits are intended to be included in this requirement. My proposed wording will help make this clear.
Panel Meeting Action: Accept in Principle in Part
Revise 680.57(B) to read:
Ground-Fault Circuit-interrupter Protection for Personnel. ~~All circuits~~ Branch circuits or feeders supplying the sign shall have ground-fault circuit-interrupter protection for personnel.
Panel Statement: The exception is not adopted because it is redundant. The revised wording is simpler and satisfies the intent of the submitter.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

ARTICLE 682 — NATURAL AND ARTIFICALLY MADE BODIES OF WATER

17-49 Log #1225 NEC-P17 **Final Action: Reject**
(682.16)

Submitter: Carson Day, Gerogia Institute of Technology - NEETRAC
Comment on Proposal No: 17-154
Recommendation: The following text would be a new paragraph under section 682. Below are the changes recommended to the original change proposal submitted in November 20 I I.
682.16 Mitigation of Neutral Related Stray Voltages and Currents
To provide protection for neutral related stray voltages and currents, a suitably rated isolated transformer (a separately derived system) at the branch circuit service panel supplying the shore power shall be permitted.
The following ~~shall be required~~ configuration is recommended for the isolated system:
~~(1) The isolation transformer should be double insulated or its equivalent and shall have an internal shield between the windings that is rated to carry full fault current.~~
(1) The isolation transformer shall have overcurrent protection on the supply side as required in 450.3.
(2) The isolation transformer shall be provided with a ground fault protection device on the load side ~~30MA (UL943C Class B Ground Fault Circuit Interrupter).~~
(3) Metal enclosure ~~and internal shield conductor~~ of the transformer shall be connected to the supply side neutral and grounding system as required by 250.4 (A).
(4) The load side neutral and equipment grounding conductors shall be connected together and grounded on the secondary side of the transformer as required by 250.20(8). To provide adequate isolation, the installed grounding electrode shall ~~should~~ be located at least 6' from the nearest grounding electrode of the supply side and shall ~~should~~ be connected to the transformer by an insulated grounding conductor.
(5) The location of the isolation transformer shall be on the load side of the service disconnecting means ~~panel containing breaker and/or disconnecting means~~ and shall not be below the electrical datum plane.
Substantiation: Last summer, four children and one adult died in a two week period around July 4 due to electrocution while swimming around boat docks. These occurred in Missouri and Tennessee. The source of the electricity, whether contact voltage or stray voltage, was not detailed in the reports. During testing at similar boat docks, in North Carolina and Georgia, the stray voltage was great enough to pose a similar risk. Application of the isolation transformer, as described in the change proposal, effectively mitigates the risk to
people swimming near docks. In the case of single branch circuit, the isolation transformer can also serve as a back up to GFCI outlets and provide effective protection against contact voltages.
The changes presented here address some of the committee member comments to the original change proposal. This includes, changing the verbiage which makes this application mandatory and removing references to obsolete GFCI circuits.
A more detailed description of the isolation transformer application and the test results for contact voltage and stray voltage scenarios
is presented in the report, "Summary of NEC Change Proposal for Mitigation of Neutral Related Exposure Voltages at Marinas and Boat Docks."
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: This comment is a recommendation to allow what is already permitted in the NEC.

17-50 Log #1355 NEC-P17 **Final Action: Reject**
(682.16)

Submitter: Robert Metz, Duke Energy
Comment on Proposal No: 17-154
Recommendation: The following text would be a new paragraph under section 682. Below are the changes recommended to the original change proposal submitted in November 2011.
682.16 Mitigation of Neutral Related Stray Voltages
To provide protection for neutral related stray voltages, a suitably rated isolation transformer at the branch circuit service panel supplying the shore power may be permitted.
The following configuration is recommended for the isolated system:
(1) The isolation transformer should be double insulated or its equivalent and shall should have an internal shield between the windings that is rated to carry full fault current.
(2) The isolation transformer should have overcurrent protection on the supply side as required in 450.3.
(3) The isolation transformer should be provided with a ground fault protection device on the load side.
(4) Metal enclosure an internal shield conductors of the transformer should be connected to the supply side neutral and grounding system as required by 250.4(A).
(5) The load side neutral and equipment grounding conductors should be connected together and grounded at the transformer as required by 250.20(B). To provide adequate isolation, the installed grounding electrode should be located at least 6 ft. from the nearest grounding electrode and should be connected to the transformer by an insulated grounding conductor.
(6) The location of the isolation transformer should be on the load side of the service panel containing breaker and/or disconnecting means and should not be below the electrical datum plane.
Substantiation: This change proposal was submitted by Carson Day from Georgia Tech NEETRAC. Duke Energy supports this change to provide a method for boat dock owners to mitigate both stray voltage and contact voltage problems. As a registered professional engineer in North and South Carolina and as a Power Quality Specialist with Duke Energy. I have worked to address numerous contact and stray voltage issues at docks on Lakes Jocassee, Keowee and Hartwell in south Carolina. Years of monitoring shows that dock safety is a serious issue that is not adequately addressed in the NEC.
The five deaths due to electrocution around boat docks show the importance of this change proposal. contact voltage problems are possible at any boat dock that has electric service. Stray voltage is a problem that can occur even when the dock is wired correctly due to current NEC requirements.
During their testing, NEETRAC has shown that both contact voltage and stray voltage can be fatal. The testing also showed that the use of an isolation transformer can successfully mitigate these dangers.
Panel Meeting Action: Reject
Panel Statement: This comment is a recommendation to allow what is already permitted in the NEC.

ARTICLE 690 — SOLAR PHOTOVOLTAIC (PV) SYSTEMS

4-79 Log #912 NEC-P04 **Final Action: Reject**
(690.1)

Submitter: Dale Rooney, Municipality of Anchorage
Comment on Proposal No: 4-168
Recommendation: Accept the proposal with the additional text for Class 2 systems not exceeding 30 volts after the words Tables 11(A) or (B).
Substantiation: The added text is needed to correlate with stated intend to establish limits below which the shock and fire hazards are reduced. The reference to Class 2 is in keeping with standards that are already recognized within the electrical industry as having reduced hazards. If the panel is not satisfied with a reference outside of Article 690 they should restate those limits or establish and state their own limits. Is a system operating at 12 volts and 5 amps safe enough to not require additional regulation or perhaps 5 volts and 1 amp? Logically there must be some limit below which the panel is just making rules for the sake of regulation, which I believe is wrong.
Panel Meeting Action: Reject
Panel Statement: PV modules below Class 2 limits can become a fire hazard when backfed by other energy sources.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
ROGERS, J.: As the submitter has referenced even class 2 systems are covered by the NEC when they are installed so why should PV systems at restricted power levels not be covered? The small stand alone systems that are integrated into products, and that are not used to connect into the premises wiring, are already exempt from complying with the NEC. If any size PV system is used within buildings, especially in an emergency situation, there should be a set of requirements to be certain the systems and their interconnection is safe.

4-80 Log #529 NEC-P04 **Final Action: Reject**
(690.2)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 4-184
Recommendation: Revise text to read as follows:
690.2 Definitions.
Photovoltaic System. The total components and subsystems that, in combination, convert solar energy into electric energy suitable for connection to a utilization load and/or the electrical production and distribution network.
Substantiation: To cover net metering (or production metering) should the text in *italics* below be included?
Inverter Input Circuit. Conductors between the inverter and the battery in stand-alone systems or the conductors between the inverter and the photovoltaic output circuits for *electrical production and distribution network*.
Panel Meeting Action: Reject
Panel Statement: Connection to a utilization load includes the electrical production and distribution network.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

4-81 Log #1070 NEC-P04 **Final Action: Reject**
(690.2)

TCC Action: The Correlating Committee directs that this Comment be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative. The Correlating Committee understands, based on the comments on voting, that consensus still exists on Proposal 4-173.
Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University
Comment on Proposal No: 4-173
Recommendation: Revise text to read as follows:
Direct Current (dc) Combiner. A ~~device~~ junction box or an enclosed and listed assembly of components used in the PV Source and PV Output circuits to combine two or more dc circuit inputs and provide one or more dc circuit outputs.
Substantiation: There was no intent to include listed cable assemblies in this definition. The use of listed (UL 6703) cable assemblies (aka harnesses) which include in-line fusing and electrical taps have become a popular method of combining strings before terminating into a combiner box. The language as written could be interpreted to include cable harnesses in the definition of Direct Current (dc) Combiner. Further, there are designs for ungrounded PV arrays that employ a split bus combiner box that technically have two outputs. The above changes make it clear that the above definition is meant to define an enclosed assembly of fuse holders, terminals, bus bar, power distribution blocks etc and not listed cable harnesses.
Panel Meeting Action: Accept in Principle
Revise proposed text as follows:
Direct Current (dc) Combiner. A ~~device~~ junction or pull box, or an enclosed and listed assembly of components used in the PV Source and PV Output circuits to combine two or more dc circuit inputs and provide one or more dc circuit outputs.
Panel Statement: The panel added the words "pull box".
Number Eligible to Vote: 14
Ballot Results: Affirmative: 9 Negative: 5
Explanation of Negative:
ALLISON, M.: Pull boxes and junction boxes have not been investigated for use as combiner boxes.
BOWER, W.: The addition of the word "pull box" by the panel may have unintended consequences. A PV module junction box is typically a part of a PV module. Adding the term "pull box" could allow for an assembly of components in the field that escapes the listing and safety process and may include components that are not rated or listed for the application. I strongly recommend the panel addition of "pull box" be deleted until clarifications on what can be installed within the "pull box" are added. Article 314.24(B)(2) Exception allows for devices or utilization equipment be located within a pull box under some conditions.
Rejecting this comment will allow the original proposal 4-199 that requires in 690.4(B) that combiner boxes be listed for the PV application. Furthermore, the panel accepted modifications to 690.31(A) which states "(A) Wiring Systems. All raceway and cable wiring methods included in this Code, other wiring systems and fittings specifically listed for use on PV arrays, and wiring as part of a listed system shall be permitted."
ROGERS, J.: This comment should have been rejected. The original proposal was fine as it was originally submitted in limiting the DC combiner to a specified product. This is a definition and should be based on an identified product that can be listed. Many of the field related problems and fires have actually resulted from improper connections using parts that do not meet the product standards for combiners but are being used as such. Even if this definition were to be accepted other means could be approved by the AHJ on smaller systems. In addition manufacturers have already responded and they are making listed DC combiners for use on small systems.
STAFFORD, T.: By allowing a junction or pull box into the definition, it has provided confusion not clarity of the definition for the installer. By allowing those terms, a 4 square box can be considered a combiner because it can be a junction box and/or a pull box. Overcurrent devices used in some combiners, could now be placed into junction boxes, and pull boxes without regard to spacing requirements or heating concerns that the current listing requirement includes.
NEC 314.16 applies to box fill, but not for overcurrent devices. By allowing this addition of these two terms, we will see more problems with this in the future as companies trying to compete for PV installations will replace a listed combiner with anything that could be considered a junction or pull box such as a 4 square box.
ZGONENA, T.: The panel should have rejected the comment thereby reverting back to the text accepted in the ROP. 690.4 requires combiner boxes to be listed for the PV application which would prevent cable assemblies that are not listed for the application.
The commenter's concern about PV harnesses and cable assemblies were addressed in the ROP stage. Under proposal 4-287 we accepted the following:
690.31 Methods Permitted.
(A) Wiring Systems. All raceway and cable wiring methods included in this Code, other wiring systems and fittings specifically listed for use on photovoltaic arrays, and wiring as part of a listed system shall be permitted.
Allowing the addition of junction or pull boxes will create additional confusion and permit the building of combiner boxes in the field from components without testing. When combiner boxes are assembled from various components, it is very common that the assembly will not meet the temperature test requirements, therefore the use of field assembled combiner boxes may result in assemblies that could overheat in use.

4-82 Log #60 NEC-P04 **Final Action: Accept**
(690.2.Solar Photovoltaic System)

TCC Action: The Correlating Committee understands that the definition for Photovoltaic System will be placed in Article 100 per the panel action on Proposal 4-8a. The text of the definition is not identical in Proposals 4-8a and 4-184. Hence, the Correlating Committee clarifies the text of the definition as follows: "Photovoltaic (PV) System. The total components and subsystems that, in combination, convert solar energy into electric energy suitable for connection to a utilization load."
Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 4-184
Recommendation: The Correlating Committee directs that the panel clarify the panel action on this proposal to correlate with the panel action on Proposal 4-8a and determine the placement of the definition, Article 100 or 690.2.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Move definition of solar photovoltaic system to Article 100.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

Comment on Affirmative:

BOWER, W.: Although it is proper that this definition be in the definition section of the Code, I recommend that since this is one of the first times "photovoltaic" is used, the term "PV" be added to set the stage for the use of PV as appropriate in the rest of the code. (e.g. "Solar Photovoltaic (PV) System") (This is an editorial change only)

4-83 Log #1198 NEC-P04 **Final Action: Accept in Principle**
(690.4. DC to DC Converter)

TCC Action: The Correlating Committee directs that the panel action on Comment 4-83 be reported as "Accept in Principle" and the text revised editorially for proper grammar and for conformance with the NEC Style Manual regarding the use of the abbreviation "dc". The text is revised as follows: "DC to DC Converter. A device installed in the PV source circuit or PV output circuit that can provide an output dc voltage and current at a higher or lower value than the input dc voltage and current."
Submitter: Marvin Hamon, Hamon Engineering
Comment on Proposal No: 4-172
Recommendation: Revise text to read as follows:

DC to DC Converter. ~~DC utilization equipment in the PV Source Circuit or PV Output Circuit, or integrated into the PV module, used to modify and control DC power.~~ Device installed in the PV Source or PV Output Circuit that can output a DC voltage and current at a higher or lower value than the input DC voltage and current.

Substantiation: DC to DC Converters are in Article 690, and are used more and more in PV systems, but not defined in the NEC. Since the output parameters of these devices can be different than the input parameters users of the code need to be made aware of this so they will be aware that the rating of equipment on the output side may need to be different than that on the input.
Panel Meeting Action: Accept
Panel Statement: The comment corrects the definition to address the panel statement in the proposal stage.

The panel recognizes the correct print line should be 690.2.

Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:

STAFFORD, T.: This panel member feels that a combiner box or a y-connector falls under this definition. A y-connector outputs a current at twice the level of the two inputs

Comment on Affirmative:

BOWER, W.: The term DC should be "dc" in two places for consistency in the Code. Also "output is not normally a verb so I recommend a change to the wording of the definition to "...that can provide at the output a dc voltage and/or current...." (This is an editorial change only)

4-84 Log #61 NEC-P04 **Final Action: Accept**
(690.4(B))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 4-194
Recommendation: It was the action of the Correlating Committee that this proposal be reconsidered and correlated with the panel actions taken on Proposals 4-188a, 4-190, and 4-284a since the accepted text in this proposal is not the same as the revised text in the other proposals.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the Correlating Committee. The panel reviewed this and the language was inserted into 690.31(B) with Proposal 4-284a.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

4-85 Log #1285 NEC-P04 **Final Action: Accept in Principle in Part**
(690.5)

TCC Action: See panel action on Comment 4-87.
Submitter: Jim Eichner, Schneider Electric - Solar Business
Comment on Proposal No: 4-214
Recommendation: Original Proposal 4-214 was as follows:

The ground-fault protection device or system shall:

1) determine the pv input circuit has a minimum acceptable level of isolation prior to export of current,
2) be capable of detecting a ground-fault current,
3) interrupting the flow of fault current, and
4) provide ~~providing~~ an indication of the fault.

Automatically opening the grounded conductor for measurement purposes or ~~of the faulted circuit~~ to interrupt the ground-fault current path shall be permitted. If a grounded conductor is opened to interrupt the ground-fault current path, all conductors of...".

Schneider Electric supports improved GFP and suggests the following improvements to the above proposal (strike-through and underline in the following are relative to the above original proposal):

"The ground-fault protection device or system shall:

1) determine the ~~pv input circuit~~ Photovoltaic Power Source has a ~~minimum acceptable level of~~ isolation from ground from ground prior to export of current,
2) be capable of detecting a ground-fault,
3) interrupt the flow of fault current, and
4) ~~provide an indication of the fault~~ have an annunciator that provides both a visual or audible indication, and an indication capable of being remotely monitored, that the ground fault protection system has operated, and
5) be approved for the purpose.

Automatically opening or ungrounding the grounded conductor, for measurement purposes or to interrupt the ground-fault current path shall be permitted. If a grounded conductor is opened to interrupt the ground-fault current path, all conductors of...".

Substantiation: The proposal as originally submitted is not as clear as it could be, uses a term that is not defined, could be interpreted as disallowing a commonly accepted method, and does not require approved device or system. We feel these changes make the proposal more accurate and clear.

1. "a minimum acceptable level of" is deleted as per the Panel Statement in the ROP
2. "pv input circuit" is not a defined term - the intent of the requirement is to check the whole array - i.e. the "Photovoltaic Power Source" which is the defined NEC term.
3. "from ground" is added to make it clear what the isolation is with respect to (as opposed to isolation from the AC part of the system, or from other circuits, etc.)
4. "or ungrounding" (the grounded conductor) is added because that is what many approved GFP systems actually do today, rather than opening the ungrounded conductor - the existing and originally proposed wording could be interpreted as disallowing a commonly accepted method
5. in sub-section (4) we propose requiring additional annunciation that is able to be monitored remotely, since a local visual or audible annunciator is useless if the PV plant is 100 miles from the nearest person or on a rooftop that rarely gets accessed
6. sub-section 5) "be approved for the purpose" is added because the proposal contains no values for the required isolation or ground fault current detection levels and therefore the equipment standards (UL1741) must be used to determine if the system addresses the requirement properly.

Panel Meeting Action: Accept in Principle in Part

The panel rejects the changes in item 4.

Panel Statement: Specific product requirements and the remote monitoring and annunciator belong in the product standard.

The correct section reference is 690.5(A).

See panel action on Comment 4-87, which addresses the concerns of the submitter.

Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:

BOWER, W.: It appears the panel has accepted this modification to (a)(1) through this comment, but has then eliminated the (a)(1) in 4-85, 4-86, and 4-87. This panel statement should have also rejected the changes in (a)(1) with the acceptance of 4-87 being the Final Action.

4-86 Log #1071 NEC-P04 **Final Action: Accept in Principle**
(690.5(A))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University
Comment on Proposal No: 4-214
Recommendation: Revise 4-214 as shown:

(A) Ground-Fault Detection and Interruption. The ground-fault protection device or system shall:

~~(1) Determine the pv input circuit has isolation prior to export of current,~~
(1) ~~(2)~~ Be capable of detecting a ground-fault in the PV array dc current carrying conductors and components including any intentionally grounded conductors,
(2) ~~(3)~~ Interrupt the flow of fault current, ~~and~~
(3) ~~(4)~~ Provide an indication of the fault, and
(4) Be listed for providing PV ground fault protection.

Substantiation: Undetected ground faults on grounded conductors have caused several fires in PV systems over the last half decade. Clearly ground fault protection (GFP) capabilities need to be improved in new PV systems. As result, we applaud and support the Code Making Panel in addressing this important issue. In the end, however, the ground fault protection sensitivity requirements in the standards, which are too lenient for modern PV systems, need to be updated to resolve this problem. The modifications proposed in this comment will help drive changes to the standards so as to eliminate this problem and will require that GFP used in PV systems comply with these new standards.

The modifications included in Proposal 4-214 successfully address several issues with the NEC requirements for GFP. First, the 2011 Code is sometimes interpreted to require a current based detection method because it reads GFP "…shall be capable of detecting a ground-fault current". Unfortunately, current based detection methods are not always the most effective GFP solutions for all PV system designs. Second, some inspectors view the 2011 Code as not allowing for insulation resistance measurements on grounded conductors in solidly grounded systems because it would require disconnecting these conductors from ground during the measurement. Insulation resistance measurements can be a very effective GFP method in some system designs and will help improve detection of grounded conductor ground faults. It is tremendous that the Code Making Panel has addressed both of these issues with Proposal 4-214 by removing current from requirement #2 and adding “for measurement purposes or” to the supporting paragraph.

Now then, the new 2014 language does raise a new problem as result of this proposal. It requires the use of insulation resistance measurements in all systems. This method is not universally effective and will not be the best GFP for all PV system designs. Furthermore, as new technologies come to market, GFP methods superior to insulation resistance measurements may emerge. We want the 2014 NEC to address the inadequacies of present GFP once and for all and not legislate the use of a specific solution. For this reason, we would request that you adapt 690.5(A) to read as modified above. This will stimulate UL 1741 to be updated to reflect the needs for improved GFP in PV systems and to ensure that the new functional requirements are met without requiring a specific implementation/solution.

Lastly, the statement of “… prior to the export of current” is not enforceable. It is unclear how frequently this test would have to be performed. It could be interpreted to be: 1) before the system is turned on for the first time; 2) every night; or 3) every time the inverter starts up.

Panel Meeting Action: Accept in Principle

5. Tim Zgonena, UL

Undetected ground faults on grounded conductors have caused several fires in PV systems over the last half decade. Clearly ground fault protection (GFP) capabilities need to be improved in new PV systems. As result, we applaud and support the Code Making Panel in addressing this important issue. In the end, however, the ground fault protection sensitivity requirements in the standards, which are too lenient for modern PV systems, need to be updated to resolve this problem. The modifications proposed in this comment will help drive changes to the standards so as to eliminate this problem and will require that GFP used in PV systems comply with these new standards.

The modifications included in Proposal 4-214 successfully address several issues with the NEC requirements for GFP. First, the 2011 Code is sometimes interpreted to require a current based detection method because it reads GFP “…shall be capable of detecting a ground-fault current”. Unfortunately, current based detection methods are not always the most effective GFP solutions for all PV system designs. Second, some inspectors view the 2011 Code as not allowing for insulation resistance measurements on grounded conductors in solidly grounded systems because it would require disconnecting these conductors from ground during the measurement. Insulation resistance measurements can be a very effective GFP method in some system designs and will help improve detection of grounded conductor ground faults. It is tremendous that the Code Making Panel has addressed both of these issues with Proposal 4-214 by removing current from requirement #2 and adding “for measurement purposes or” to the supporting paragraph.

Now then, the new 2014 language does raise a new problem as result of this proposal. It requires the use of insulation resistance measurements in all systems. This method is not universally effective and will not be the best GFP for all PV system designs. Furthermore, as new technologies come to market, GFP methods superior to insulation resistance measurements may emerge. We want the 2014 NEC to address the inadequacies of present GFP once and for all and not legislate the use of a specific solution. For this reason, we would request that you adapt 690.5(A) to read as modified above. This will stimulate UL 1741 to be updated to reflect the needs for improved GFP in PV systems and to ensure that the new functional requirements are met without requiring a specific implementation/solution.

Lastly, the statement of “… prior to the export of current” is not enforceable. It is unclear how frequently this test would have to be performed. It could be interpreted to be: 1) before the system is turned on for the first time; 2) every night; or 3) every time the inverter starts up.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

BOWER, W.: The accepted language for (a)(1) uses the words “Be capable of detecting”. That does not appear enforceable or prescriptive enough to meet the intent. Changing the language to “Detect a ground-fault in the PV array dc current carrying conductors and components including any intentionally grounded conductors,” is much more prescriptive and meets the intent of the action and is enforceable. (This is an editorial change only)

4-88 Log #1199 NEC-P04 **Final Action: Reject**

(690.7)

Submitter: Marvin Hamon, Hamon Engineering

Comment on Proposal No: 4-220

Recommendation: Revise text to read as follows:

(F) DC to DC Converter. The maximum system voltage on the output of one or more DC to DC Converters in series shall be ~~determined in accordance with the manufacturer’s instructions~~ calculated as the sum of the rated maximum output voltages of the series-connected DC to DC Converters.

Substantiation: There is currently no authoritative guideline, based on the NEC or UL Standards, for a PV installer or AHJ to use to determine what the voltage rating of equipment connected to the output of a DC to DC Converter or series string of converters should be. Since a boost type device can output a voltage higher than the input voltage the maximum output voltage cannot be based on the PV module voltage. Manufacturers are allowing the connection of a number of these devices in series that if the listed maximum output voltage of the devices were added up would exceed the voltage rating of the connected equipment.

To insure that equipment and conductors are correctly rated for the maximum system voltage they may be exposed to it is recommended that the wording in this proposal be adopted. This wording is based on the existing wording in 690.72(C)(2) for DC Charge Controllers and 690.7(A) for PV modules operating in series strings.

As CMP 4 often states, “Even if a product is listed, the only enforcement tool that an AHJ has is to utilize a requirement that is found in the NEC. Although 110.3(B) could be used that does not always suffice in the same fashion as a direct NEC requirement.”

Panel Meeting Action: Reject

Panel Statement: The output of dc to dc converters do not necessarily sum at maximum voltage.

Number Eligible to Vote: 14

4-89 Log #642 NEC-P04 **Final Action: Reject**

(690.7(C))

Submitter: James T. Dollard, Jr., IBEW Local 98

Comment on Proposal No: 4-223

Recommendation: Continue to Accept in Principle.

Substantiation: This comment is submitted by a single individual and does not represent the work or input of the high voltage task group (HVTG). This comment attempts to address concerns stated in the negative. Safety of all electrical workers must be the first consideration when the technical committee considers raising the voltage threshold. This submitter greatly appreciates the technical committee members concern for the safety of all electrical workers. I have reviewed the impact on worker safety in each of these proposals. As the safety coordinator for IBEW Local 98 in Philadelphia, I could not support raising the voltage threshold if I felt there was a safety concern that we could not address. If there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.

The work of the high voltage task group was very broad in nature. It is widely recognized and understood that emerging technologies such as small wind and PV are breaking the 600-volt threshold making these alternative energy sources more efficient. The HVTG was directed to review this issue and to submit proposals to generate a shift in NEC requirements to specifically address these new system voltages. The HVTG submitted proposals to the technical committees with specific expertise to let each individual CMP make the decision on raising the voltage threshold. We needed a placeholder in all locations. Any CMP that felt there was a safety issue rejected the proposal. The HVTG supported those rejections in each case. The final decision lies with the technical committee.

It is important to note that if this technical committee raises the voltage threshold from 600 to 1000-volts in the NEC, the only change is the " voltage threshold level" of the installation requirement. This change in the voltage threshold level does not permit conductors and equipment rated at 600-volts to be used at 1000-volts. That would require the conductors and equipment to be tested and listed for such use. See NFPA 70 110.3(B). There are many products that are already listed and marked for this use.

NFPA 70E requires that all employees who face a risk of electrical hazard that is not reduced to a safe level by the applicable electrical installation requirements be trained to understand the specific hazards they face. See 70E 110.2. Qualified persons are required. Energized work is only permitted where justified. See 130.2. Personal Protective equipment, including but not limited to voltage rated gloves and arc rated clothing are readily available. Training programs for electrical safe work practices for voltages over 600-volts are readily available.

There are meters and other test instruments readily available for use to day at 1000-volts. It should be noted that NFPA 70E 110.4 requires all test instruments to be properly rated and used only by qualified persons. NFPA 70E 110.2(D)(1)(4)(e) requires the qualified person be trained on the proper use and limitations of the test instrument. A quick Google search revealed the following, there are more:

Fluke 77IV, general purpose digital meter, 1000-vac, 1000-vdc

Ideal 490, general-purpose digital meter, 1000-vac, 1000-vdc

In closing, I would like to repeat that if there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.

Panel Meeting Action: Reject

Panel Statement: The panel action on this proposal was accept in part not accept in principle.

Number Eligible to Vote: 14

4-90 Log #679 NEC-P04 **Final Action: Accept**

(690.7(C))

Submitter: James T. Dollard, Jr., IBEW Local 98

Comment on Proposal No: 4-223

Recommendation: Continue to Accept in Part.

Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 2

Explanation of Negative:

STAFFORD, T.: See comment on 4-3.

ZINNANTE, V.: See my Explanation of Negative vote on Comment 4-2.

4-91 Log #1382 NEC-P04 **Final Action: Accept**

(690.7(H))

Submitter: Chad Kennedy, Schneider Electric

Comment on Proposal No: 4-325

Recommendation: Revise text to read as follows:

(H) Disconnects and Overcurrent Protection. Where energy storage device ~~input and~~ output ~~terminals~~ <u>conductor length exceeds</u> ~~are more than~~ 1.5 meters (5 feet) ~~from connected equipment,~~ or where the circuits ~~from these terminals~~ pass through a wall or partition the installation shall comply with (1) through (~~4~~ <u>5</u>):

Substantiation: Schneider Electric supports the enhancements to safety provided in this proposal but requests clarification that the 1.5 meter measurement pertains to the unprotected conductor length and not the physical arrangement of the equipment to the storage device. In addition, the input conductors to the storage device will be required to have overcurrent protection based on other code requirements so these requirements apply to the output conductors. Finally, an editorial correction is needed to correlate with the number of list items provided in the requirements.

(690.9)

Submitter: Chad Kennedy, Schneider Electric
Comment on Proposal No: 4-232a
Recommendation: Revise text to read as follows:
690.9(A) Circuits and Equipment. PV source circuit, PV output circuit, inverter output circuit, and storage battery circuit conductors and equipment shall be protected in accordance with the requirements of Article 240. Protection devices for PV source circuits and PV output circuits shall be ~~listed for use in PV systems~~ in accordance with the requirements of 690.9(B) - (E). Battery system conductors shall be installed in accordance with the requirements of Article 480. Circuits, either ac or dc, connected to current limited supplies (e.g. PV modules, ac output of utility-interactive inverters) and also connected to sources having significantly higher current availability (e.g. parallel strings of modules, utility power) shall be protected at the source from overcurrent.
Exception: An overcurrent device shall not be required for PV modules or PV source circuit conductors sized in accordance with 690.8(B) where one of the following applies:
(a) There are no external sources such as parallelconnected source circuits, batteries, or backfeed from inverters.
(b) The short-circuit currents from all sources do not exceed the ampacity of the conductors and the maximum overcurrent protective device size specified on the PV module nameplate.
690.9(B) Overcurrent Devices. Overcurrent devices, where required, shall be rated as required by 690.9(B)(1) through (4).
(1) To carry not less than 125 percent of the maximum currents calculated in 690.8(A).
Exception: Circuits containing an assembly, together with its overcurrent device(s), that is listed for continuous operation at 100 percent of its rating shall be permitted to be used at 100 percent of its rating.
(2) Terminal temperature limits shall be in accordance with 110.3(B) and 110.14(C).
(3) Where operated at temperatures greater than 40°C (104°F), the manufacturer's temperature correction factors shall apply.
(4) The rating or setting of overcurrent devices shall be permitted in accordance with 240.4(B), (C), and (D).
690.9(C) Direct-Current Rating. Overcurrent devices, either fuses or circuit breakers, used in any dc portion of a PV power system shall be listed ~~for use in PV systems~~ and shall have the appropriate voltage, current, and interrupt ratings.
690.9(D) Photovoltaic Source and Output Circuits. ~~Listed PV overcurrent devices shall be required to provide overcurrent protection in photovoltaic source and output circuits. The o~~Overcurrent devices in PV source and output circuits shall be accessible but shall not be required to be readily accessible.
Substantiation: Schneider Electric supports the committee actions in ROP 4-232a to the overcurrent protection requirements for PV circuits and recommends the following revisions to further clarify the provisions of this section. For the circuits and equipment requirements in 690.9(A), it is important to also reference sections 690.9(B) - (E) as these provide specific detail to the overcurrent protection required. The exception to 690.9(A) and section 690.9(B) are unchanged from the ROP 4-232a action. In 690.9(C) it is important that the overcurrent protection provided has the appropriate dc ratings and the proposed changes align with the committee action on ROP 4-278a. Finally, the overcurrent protection requirements in 690.9(D) are redundant with the requirements in 690.9(A) and 690.9(C) and should be removed.
Panel Meeting Action: Accept in Part
Reject the recommended 690.9(A) statement: Battery system conductors shall be installed in accordance with the requirements of Article 480.
Reject changes in 690.9(D).
Accept the remainder of the changes to 690.9(A) and the changes in (C).
Panel Statement: The panel rejects the change in 690.9(A) that states: Battery system conductors shall be installed in accordance with the requirements of Article 480. The sentence adds no beneficial information to this section.
The panel rejects the changes to 690.9(D). The panel retains the first sentence in 690.9(D) in order to require PV overcurrent devices for those circuits.
The remainder of the changes to 690.9(A) and the changes in (C) are accepted.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
STAFFORD, T.: By removing the wording "for use in PV systems" in 690.9(C) it allows Overcurrent devices to be listed, but not specifically for PV systems. We rejected the deletion of the language in 690.9(D), why did we accept the removal of those words in 690.9(C) without any substantiation from the submitter? This panel member feels that installers reading this code will make sure the OCPD is listed and not knowing about the specific requirements to list a device for a PV system will install improper devices that provide a false sense of security.

4-99 Log #1073 NEC-P04 **Final Action: Accept in Principle**
(690.11)

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University
Comment on Proposal No: 4-246a
Recommendation: Modify the text of 4-246a as shown:
(1) The system shall detect and interrupt arcing faults <u>resulting from a failure in the intended continuity of a conductor, connection, module, or other system component</u> in dc PV source and output circuits.
(2) The system shall require that the disabled or disconnected equipment be manually restarted.
(3) The system shall have an annunciator that provides a visual indication that the circuit interrupter has operated. This indication shall not reset automatically.
Substantiation: The comment limits the arc-fault protection requirements in PV-DC systems to <u>series</u> arcs by re-inserting existing language from the 2011 NEC.
The PV Industry Forum Task Group welcomes the 4-246a proposed changes in clauses (1)-(3) to simplify language and to remove prescribed methods, thereby allowing alternate methods. We recommend however that arc-fault protection should be limited to series arcs and not include parallel arcs at this time for the following reasons:

- <u>Parallel arc-fault protection technology has significant implementation implications and needs further development:</u> Parallel arc-fault protection technology has much greater implications for the industry than series arc-fault technology, effectively requiring module level control or string/array short-circuiting. Module level methods have been developed and tested in limited settings, but still have complex control, communication, field-reliability, and therefore safety considerations that are of concern, especially for larger systems. String/array short-circuiting methods are known to have caused thermal overheating in modules, and possibly will be avoided altogether. We acknowledge and encourage the progress being made in parallel arc-fault protection technology, particular with detection, but believe that more research is needed on mitigation/implementation techniques before protection should be mandated by code.
- Industry data being collected in the United States and Germany, among others, indicates that PV failures leading to fire are overwhelmingly initiated by ground faults and series arcs, not parallel arcs. Where parallel (line-line) faults have occurred, they have been precipitated by ground faults or series arcs. This data corroborates the experience of Industry Forum participants, IEC experts, and others throughout the industry.
- <u>The CMP is already (appropriately) tackling the important sources of failure:</u>

Ground-fault protection: The CMP has approved PV Industry Forum proposals addressing known deficiencies in PV ground-fault protection, the most important of which is 690.5.

Series-arc fault protection (expanded): We support proposal 4-251, which extends (series) arc-fault protection to all systems rather than building systems only, for the reasons described in the 4-251 proposal substantiation. Fires have occurred in building and ground mount systems alike as a result of <u>series</u> arcs, and protection is needed.

Although parallel arcing faults are rare, they are even less likely to occur with improved ground fault protection and series AF protection which would detect and mitigate those faults before they progress to a parallel arc fault.

By approving proposals 4-246a and 4-251 together, we believe the CMP is inadvertently extending module level control requirements to all systems, including ground mounted systems. This would have significant implications for the PV industry, and is not justified given the points described above.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 4-105, which addresses the concerns of the submitter.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

4-100 Log #1158 NEC-P04 **Final Action: Accept in Part**
(690.11)

Submitter: Joerg Grosshennig, SMA Solar Technology AG
Comment on Proposal No: 4-246a
Recommendation: Revise text to read as follows:

690.11 Arc-Fault Circuit Protection (Direct Current).

Photovoltaic systems with dc source circuits, dc output circuits, or both, ~~on or penetrating a building~~ operating at a PV system maximum system voltage of 80 volts or greater, shall be protected by a listed (dc) arc-fault circuit interrupter, PV type, or other system components listed to provide equivalent protection. The PV arc-fault protection means shall comply with the following requirements:

(1) The system shall detect and interrupt arcing faults<u> resulting from a failure in the intended continuity of a conductor, connection, module, or other system component i</u>n <u>the</u> dc PV source and output circuits.<u> Systems on or penetrating a building shall detect and interrupt arcing faults in general.</u>

(2) The system shall disable or disconnect one of the following:

a. Inverters or charge controllers connected to the fault circuit when the fault is detected

b. System components within the arcing circuit

(3) The system shall require that the disabled or disconnected equipment be manually restarted.

(4) The system shall have an annunciator that provides a visual indication that the circuit interrupter has operated. This indication shall not reset automatically.

Substantiation: Proposal 4-246a extends the requirement of detection and interruption of arcing faults to ground mount PV installations.

Proposal 4-251 extends the requirement of detection and interruption of arcing faults to parallel arcs.

This comment is to exempt ground mount installations from the parallel arc fault detection requirement.

The central argument for requiring AFCI is to lower the fire risk to buildings and people inside. For a ground mounted PV installation, the risk to people and property is dramatically lower than for a rooftop system. These areas are generally inaccessible to the public (or present barriers to access), and are only serviced by qualified personnel, in their vicinity for maintenance purposes.

The hazard posed by the systems to the general public is that of a fire started by ignition of nearby organic plant matter with a spark, which may spread to surrounding areas. Parallel arc fault protection, which has never been recorded in a single installation, does not credibly lower this general risk and does not substitute proper installation methods, a thorough inspection, and adherence to fire prevention guidelines such as fire breaks, which are proven methods for minimizing this risk. The extended use of proven and existing technology such as isolation tests (690.35), residual current measurements (690.35), and serial arc fault detection (existing 690.11) can reduce this risk in a quantifiable and reliable manner. Large, non-utility owned, PV plants of which there are thousands in the country, do not pose health risks to the public. These power plants would be adversely impacted from the financial cost of additional equipment, nuisance tripping, with no material safety benefit.

There is no field experience of AFCI in general in PV systems today and implications of parallel (in particular) AFCI are not fully understood. The impact on large PV plants are expected to be even higher. (stronger noise coupling, highly branched DC-circuits, …) Therefore the influence of parallel AFCI on large PV plants (e.g. fuses and interaction between affected and non-affected circuits) needs to be thoroughly investigated before its introduction.

Parallel AFCI and Emergency Shutdown/Deenergization (690.12) cannot be generally performed at the same time. Since deenergization minimizes shock risks to firefighters in action it should be favored to parallel AFCI.

Panel Meeting Action: Accept in Part

Reject the addition in 690.11(1) of "Systems on or penetrating a building shall detect and interrupt arcing faults in general"

Accept the remainder of the recommendation.

Panel Statement: The panel rejects the addition of "systems on or penetrating a building shall detect and interrupt arcing faults in general" in 690.11(1) which would add parallel arc-fault protection to buildings.

See panel action and statement on Comment 4-105.

4-103 Log #1289 NEC-P04 **Final Action: Hold**
(690.11)

Submitter: Fred Kracke, Schneider Electric - Solar Business

Comment on Proposal No: 4-246a

Recommendation: Revise text to read as follows:

Schneider Electric feels that addition of parallel arc fault detection and interruption is premature given the current state of the PV AFDI technology and experience, and the different methods required to properly deal with parallel arcs. We recommend reverting to the series-only approach in the 2011 NEC, and making the following revisions:

Original ROP 4-246a was as follows…

(1) The system shall detect and interrupt arcing faults in dc PV source and output circuits.

(2) The system shall require that the disabled or disconnected equipment be manually restarted.

(3) The system shall have an annunciator that provides a visual indication that the circuit interrupter has operated. This indication shall not reset automatically.

Schneider Electric proposal (strike-through and underline in the following are relative to the above original proposal, not the current NEC wording):

"(1) The system shall detect and interrupt arcing faults resulting from a failure in the intended continuity of a conductor, connection, module, or other system component in a Photovoltaic Power source operating at a PV system maximum system voltage of 20 volts or greater ~~dc PV source and output circuits.~~

(2) The system shall require that the disabled or disconnected equipment be manually restarted.

(3) The system shall have an annunciator that provides both a visual or audible indication, and an indication capable of being remotely monitored, that the PV arc fault protection means ~~circuit interrupter~~ has operated. This indication shall not reset automatically."

Substantiation: The proposal as originally submitted was intended to increase the scope to include parallel arcs. While Schneider Electric supports improvements in safety, we feel that there are implementation difficulties associated with parallel arc fault interruption, which requires different action than series arc interruption, and therefore also requires the ability for the system to discriminate between series and parallel arcs. The current state of the PV AFDI industry is very immature, and we feel these developments need to be postponed until the industry has more experience with AFDI and is better prepared to distinguish series arcs from parallel arcs and to extinguish parallel arcs. Therefore we suggest reverting back to the 2011 language that limited the scope to series arcs. We are also proposing other wording changes as substantiated below:

Substantiation:

1. "resulting from a failure in the intended continuity of a conductor, connection, module, or other system component" is added back in to limit the scope to series arcs. The substantiation for this is given in the paragraph above.

2. "dc PV source and output circuits" is replaced by "Photovoltaic power source" so that arcs within the modules themselves are included in the coverage; this is needed to provide full coverage, as arcing faults have occurred within the modules or their junction boxes.

3. the lower limit of 20V is added. We feel the removal of the lower limit of 80V was a good step, but removing it altogether is not necessary. A lower limit of 20V is suggested above so that the requirement does not apply at voltages too low to strike or maintain an arc. Research may be needed to determine if 20V is low enough to achieve that goal.

4. in sub-section (3) we propose allowing either audible or visual location indication, since they are equivalent local annunciation means

5. in sub-section (3) we propose requiring additional annunciation that is able to be monitored remotely, since a local visual or audible annunciator is useless if the PV plant is 100 miles from the nearest person or on a rooftop that rarely gets accessed.

6. in sub-section (3) we propose replacing "circuit interrupter" with "PV arc fault protection means" which is the existing term in the 2011 NEC.

Panel Meeting Action: Hold

Panel Statement: The addition of the words "system voltage of 20V.." and "being remotely monitored" is new language. The comment includes language in (1) as accepted in Comment 4-105. See panel action for Comment 4-105.

The remainder of the comment includes new requirements (20V and remote monitoring) that were not accepted or discussed during the proposal period, are new technical requirements and will not be available for public comment in this code cycle. The annunciator details should be found in the standard and not the code.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

BOWER, W.: This comment should have been rejected instead of placed on hold. It introduced new material including a 20 V voltage constraint that had no solid substantiation. Rather than be put on hold, the panel should have rejected with comments that the submitter should introduce a new proposal for the next code cycle. The new material included in the comment "provides both a visual or audible indication, and an indication capable of being remotely monitored, that the PV arc fault protection means circuit interrupter has operated." I see no reason to automatically introduce this comment as a proposal into the next code cycle when many technical changes will likely be in effect. Also note the comment says "(3) The system shall have an annunciator that provides both a visual or audible indication, and an indication capable of being remotely monitored, that the PV arc fault protection means circuit interrupter has operated." The sentence is convoluted and should not be something the panel must fix during the next code cycle.

4-104 Log #1453 NEC-P04 **Final Action: Reject**
(690.11)

Submitter: Lee Charles Martin, Sensata Technologies

Comment on Proposal No: 4-251

Recommendation: Modify text of 690.11 as shown:

690.11 Arc-Fault Circuit Protection (Direct Current). Photovoltaic systems with dc source circuits, dc output circuits, or both, operating at a PV system maximum system voltage of 80 volts or greater, shall be protected by a UL <u>1699B</u> listed <u>PV</u> (dc) arc-fault circuit protection, <u>PV</u> type <u>2 device</u>, or other system components listed to provide equivalent protection. The ~~PV~~ arc-fault protection means shall...".

Substantiation: The arc-fault detection performance is not specified, the inclusion of the UL1699B document explicitly defines the performance required for this arc-fault protection application. Performance that is equivalent to the type 2 device performance requirements of UL 1699B are important for the following reasons:

• Significant development progress has been realized toward the practical implementation of a parallel arc-fault protection technology: Most significant damage occurs as the direct result of a parallel arc-fault. Parallel arc fault protection developers have made significant progress toward parallel arc detection and these type 2 performance requirements are large part of the market considerations that have allowed Sensata to get such a large jump on this development. This progress puts cost effective parallel arc detection development on a track to intersect the adoption expectations of the 2014 NEC.

• While series arc mitigation is essential it drives a different system response than parallel arc mitigation. As such, any situations that start as parallel arcs and any situations that progress from a series arc or a ground fault to a parallel arc before mitigation will result in an unchecked parallel with no effective improvement over a system with absolutely no arc fault protection.

• Anecdotally speaking, many ground faults are caused by installation practices, and as such multiple faults are present at a given sight, as soon as there is a single high side and a single low side fault even the improved ground fault mitigation practices will again result in an unchecked parallel fault with no effective improvement over a system with no arc fault protection.

• Having the type 2 requirements in the CMP will considerably accelerate parallel arc protection development. Protection developers like Sensata, et al, will be able to justify solution projects and funding levels with this statement of importance by the industry standard. The effects of the 2011 NEC series arc protection requirements are beginning to increase the safety of PV installations, the increases would surely be delayed had series arc protection been left out of the 2011 NEC. In the same way these type 2 equivalent requirements will drive parallel arc benefit PV systems.

Panel Meeting Action: Reject

Panel Statement: Mandatory references (to UL1699B) are not allowed per the NEC Style Manual. The comment to include PV type 2 device would be in error without reference to 1699B. PV type 2 devices are typically for surge protection and not arc fault detection as defined in IEC 61643-11.

See the panel action on Comment 4-105 for additional information.

10. Mark Albers, SunPower Corporation
11. Keith Davidson, Suntech Power
12. Tim Zgonena, UL

The comment limits the arc-fault protection requirements in PV-DC systems to <u>series</u> arcs by re-inserting existing language from the 2011 NEC.

The Solar Energy Industries Association welcomes the 4-246a proposed changes in clauses (1)-(3) to simplify language and to remove prescribed methods, thereby allowing alternate methods. We recommend however that arc-fault protection should be limited to series arcs and not include parallel arcs at this time for the following reasons:

● <u>Parallel arc-fault protection technology has significant implementation</u>

implications and needs further development: Parallel arc-fault protection technology has much greater implications for the industry than series arc-fault technology, effectively requiring module level control or string/array short-circuiting. Module level methods have been developed and tested in limited settings, but still have complex control, communication, field-reliability, and therefore safety considerations that are of concern, especially for larger systems. String/array short-circuiting methods are known to have caused thermal overheating in modules, and possibly will be avoided altogether. We acknowledge and encourage the progress being made in parallel arc-fault protection technology, particular with detection, but believe that more research is needed on mitigation/implementation techniques before protection should be mandated by code.

● Industry data being collected in the United States and Germany, among others, indicates that PV failures leading to fire are overwhelmingly initiated by ground faults and series arcs, not parallel arcs. Where parallel (line-line) faults have occurred, they have been precipitated by ground faults or series arcs. This data corroborates the experience of Industry Forum participants, IEC experts, and others throughout the industry.

● The CMP is already (appropriately) tackling the important sources of failure:

● Ground-fault protection: The CMP has approved PV Industry Forum proposals addressing known deficiencies in PV ground-fault protection, the most important of which is 690.5.

● Series-arc fault protection (expanded): We support proposal 4-251, which extends (series) arc-fault protection to all systems rather than building systems only, for the reasons described in the 4-251 proposal substantiation. Fires have occurred in building and ground mount systems alike as a result of series arcs, and protection is needed.

● Although parallel arcing faults are rare, they are even less likely to occur with improved ground fault protection and series AF protection which would detect and mitigate those faults before they progress to a parallel arc fault.

● By approving proposals 4-246a and 4-251 together, we believe the CMP is inadvertently extending module level control requirements to all systems, including ground mounted systems. This would have significant implications for the PV industry, and is not justified given the points described above.

Panel Meeting Action: Accept in Principle

Revise proposed text in 690.11(1) as follows:

(1) The system shall detect and interrupt arcing faults resulting from a failure in the intended continuity of a conductor, connection, module, or other system component in dc PV source and dc PV output circuits.

Panel Statement: The panel added "dc PV" to output circuits to clarify the circuits in question.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

BOWER, W.: This action has provided practical arc fault protection for PV systems. However, the language now requires arc fault detection and mitigation for ALL systems including single module PV systems that are not on roofs such as those that provide water pumping AND for ac PV modules that have a fault detection function built into the micro-inverter. Single module PV systems often do not have control devices that provide support for an arc fault detection method plus >80V systems are likely by 2014. A separate arc-fault detection devise offers no advantage over a micro-inverter that can perform the same function and should not be added to a listed micro-inverter coupled to a single module. An exception is needed to cover these simple systems.

This comment is not intended to cause the accepted language to be deleted because the requirement is needed. The comment points out there are instances where a separate series arc fault detection device is not needed and only adds complexity and points of failure.

The requirement for manual restart will be difficult for pole-mount systems. Note that the addition of remote restart would have been new material during this comment period.

It will likely be necessary to bring listing standards (for stand-alone components or for functions integrated into other devices) up to date to test for the arc-fault functionality in a variety of devices.

4-106 Log #1066 NEC-P04 **Final Action: Reject**
(690.12 (New))

Submitter: Michael J. Johnston, National Electrical Contractors Association

Comment on Proposal No: 4-253

Recommendation: Continue to accept in principle Proposal 4-253 and revise as follows:

690.12 PV Arrays on Buildings Response to Emergency Shutdown. For PV Systems installed on roofs of buildings, photovoltaic source circuits shall be deenergized from all sources within 10 seconds of when emergency shutdown is initiated or when the PV power source disconnecting means is opened. When the source circuits are deenergized, the maximum voltage at the module and module conductors shall be ~~80~~ less than 50 volts.

Substantiation: CMP-4 has taken a huge step to reduce hazards for first and second responders by accepting the concepts in proposal 4-253. This comment attempts build on the affirmative comments and refine the proposal further by reducing the voltage level to less than 50 volts. No new material or concept is being introduced. NFPA 70E has established 50 volts as a safety threshold. Contact with 50 to 80 volt circuits is still capable of resulting shock and electrocution. This proposed reduction in voltage output limit during emergency shutdown, provides for consistency with those values in NFPA 70E. The reduction in voltage level output also reduces fire ignition possibilities to lower levels.

Panel Meeting Action: Reject

Panel Statement: See panel action on Comment 4-113 and the corresponding substantiation. The original Proposal 4-253 specified module level control. The research has led away from module level to a specified distance from the module at this time.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

STAFFORD, T.: This panel member feels that the safety of first responders and electrical workers who are the first to respond when a fault has occurred should be a primary concern. Not reducing the voltage level to a point where it could be considered touch safe does not allow for a level of safety that could be obtained by accepting this comment. During the ROP stage, the panel accepted the need for a reduced voltage threshold to 80 volts and there has been no technical substantiation to raise that level but evidence does exist to limit voltage threshold(s) to 50 volts.

4-107 Log #1286 NEC-P04 **Final Action: Accept in Principle**
(690.12)

Submitter: Jim Eichner, Schneider Electric - Solar Business

Comment on Proposal No: 4-253

Recommendation: Delete text to read as follows:

690.12 PV Arrays on Buildings Response to Emergency Shutdown.

For PV Systems installed on roofs of buildings, photovoltaic source or output circuits conductors entering the building shall be disconnected from the PV array ~~deenergized from all sources~~ within 10 seconds of when the emergency shutdown is initiated. ~~utility supply is deenergized or when the PV power source disconnecting means is opened.~~

~~When the source circuits are deenergized, the maximum voltage at the module and module conductors shall be 80 volts.~~

Substantiation: Schneider Electric supports reducing hazards faced by fire fighters, but the proposed change has a large impact on the design of PV modules and/or PV combiners without adequate improvement in fire fighter safety to justify the change and its challenges (see Substantiation below). We suggest revising the proposed rule to address conductors inside the building rather than requiring ways to open the series strings of modules.

Substantiation:

1. The arbitrary 80V limit proposed is not based on protection against shock hazard (which would require a much lower number, especially under wet conditions) but rather on convenience. It seems to have been selected to eliminate the need for automatic disconnecting means able to separate the strings of cells within a module that would be required if limit lower than the voltage of one module was selected. However the 80V threshold is likely to be exceed by commercially available modules by 2014, if it hasn't already been exceeded, so the arbitrary limit does not meet either goal - reducing voltages to below shock hazard levels, or allowing solutions external to modules.

2. The proposal presumes a lot of technology development. Systems would require non-existent technology: modules that contain externally controllable switching devices that would open the series strings of modules, or a new type of string combiner that connects to both ends of each module and opens or closes the series connections. Both add expense and a lot of potential points of failure to the system. Furthermore, the proposed system must be able to do its intended function during a fire. The switching devices, control signal wiring, etc. must be able to ensure open circuiting of the string connections, on command, even when the system is potentially engulfed in flames. Creating electronics that can be relied on to function under those conditions is extremely difficult and may in fact not be possible. If it is not possible then the firefighters will not be able to rely on the systems except in conditions where they are reasonably sure that none of the various parts of the system have been exposed to the fire. This seriously undermines the claimed benefits of such a system.

3. The proposed trigger "when the PV power source disconnecting means is opened" is not well defined - there may be many disconnecting means, and many source circuits, and the NEC does not define "PV power source disconnecting means". The intent was likely to disconnect within 10s of activating the emergency shutdown system, whatever that is - whether it is de-energizing the utility, pushing a PV Kill Switch, or whatever - so let's say that.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Comment 4-113, which addresses the concerns of the submitter.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

STAFFORD, T.: See comment on 4-106. In addition, this proposal is an improvement over existing conditions that mandate safety for first responders and electrical workers. It is hoped that this comment acceptance is the first of many steps to address the hazards that are present on a PV system that is inoperable. Reducing the threshold voltage of any portion of a PV source circuit or module to a touch safe threshold should be of first concern to all involved with determining the safety of PV installation, operation and maintenance as well as shutdown voltages that are present.

4-108 Log #1352 NEC-P04 **Final Action: Accept in Principle in Part**
(690.12 (New))

Submitter: Joerg Grosshennig, SMA Solar Technology AG
Comment on Proposal No: 4-167
Recommendation: Revise text to read as follows:
~~690.12 PV Arrays on Buildings Response to Emergency Shutdown.~~
~~For PV Systems installed on roofs of buildings, photovoltaic source circuits shall be deenergized from all sources within 10 seconds of when emergency shutdown is initiated or when the PV power source disconnecting means is opened. When the source circuits are deenergized, the maximum voltage at the module and module conductors shall be 80 volts.~~
690.12 Rapid Shutdown of PV Systems on Buildings.
PV system circuits installed on or in buildings shall include a rapid shutdown function that controls specific conductors in accordance with 690.12(A) through (D).
(A) Requirements for controlled conductors apply only to PV system conductors of more than 1.5 meters (5 feet) in length inside a building, or more than 3 meters (10 feet) from a PV array. Exception: Systems smaller than 5 kWp where the inverter is mounted next to the main service panel with less than 7 meters (25 feet) of wiring from the PV array and routed outside the house straight to the inverter with no more than two quarter bends (180 degrees total) should be excluded.
(B) Controlled conductors shall be limited to no more than 30 volts and 1 A within 10 seconds of rapid shutdown initiation. Voltage shall be measured between any two conductors and between any conductor and ground.
(C) The rapid shutdown initiation methods shall be labeled in accordance with 690.56(B)
(D) Equipment that performs the rapid shutdown shall be listed and identified.
Substantiation: SMA is following the comment from Bill Brooks and the PV Industry Forum for 4-253 with two changes.
(1) The power limitation of 240 VA is not a safe limit (up to 8 A / 30 V). A current limit of 1 A is a safe limit and would allow the operation and control of switching devices at the module. Power ratings of modules are according to standard test conditions (STC) and therefore the maximum power in certain conditions is not clearly defined. (e.g. higher currents due to reflections)
(2) The other difference is the exclusion of small residential PV installations (< 5kWp) on single floor dwellings, where the most common place to install the inverter is at the main service panel, or meter. In these cases the conduit containing the PV conductors exits the PV array, makes one turn and then is run to the inverter. This conduit is so obvious to the firefighter that it can be easily avoided and hence, doesn't pose a serious health risk or restriction in firefighter work.
Panel Meeting Action: Accept in Principle in Part
Reject the exception in (A).
Reject the changes in (B).
Accept in principle the remainder of the changes.
Panel Statement: See panel action and statement on Comment 4-113, which addresses the concerns of the submitter.
The panel rejects the exception in (A) because there is no technical substantiation to limit 5 KW peak or less systems.
The panel rejects the change in (B) because there is no technical substantiation for selection of 1 amp.

STAFFORD, T.: See Comment for 4-107.

4-109 Log #1454 NEC-P04 **Final Action: Reject**
(690.12)

Submitter: Lee Charles Martin, Sensata Technologies
Comment on Proposal No: 4-253
Recommendation: Replace the title and entire text in the proposal with this revised title and text:
690.12 PV Arrays on Buildings Response to Emergency
Shutdown. For PV Systems installed on roofs of buildings, photovoltaic source circuits shall be de-energized from all sources within 10 seconds of when emergency shutdown is initiated or when the PV power source disconnecting means is opened. When the source circuits are de-energized, the maximum voltage ~~at~~ <u>shall be limited to</u> the <u>voltage output of the individual</u> module ~~and module conductors shall be 80 volts.~~
Substantiation: There are several reasons that the 80V requirement should be replaced with a requirement for explicitly de-energizing to the module level. Two of those reasons are as follows:
First, the 80V limit is a snapshot that risks falling behind or limiting module improvements. As module improvements move to the unsafe region, the voltage issue will again arise and can be addressed.
The second and more important reason is that this allows multiple modules to remain in series for lower voltage modules. This is especially true if the installer is unclear on the voltage rating to be used (Vmp vs. Voc vs. Voc on the coldest day expected).
The above notwithstanding, it should be noted and applauded that the intent to limit power sources on any conductor in the installation to the module level is a tremendous improvement over any policy that allows the voltage to remain at the string level anywhere in the installation. This improvement is, in turn, important for two main reasons.
Specifically:
• Fire protection responders will eventually come in contact with string voltages that they assume have been reduced or de-energized as implied by an emergency "shutdown" status.
• Structural damage that often drives the need for an Emergency Shutdown (e.g. a fire) will result in insulation and isolation breakdown that results in string level voltages being applied to other system conductors that fire protection responders expect to be low voltage or de-energized. Reducing the power sources to the minimum
practical level, specifically the individual module level provides the optimum balance between safety and a cost effective application.
Panel Meeting Action: Reject
Panel Statement: See panel action on Comment 4-113 and the corresponding substantiation. The original Proposal 4-253 specified module level control. The research has led away from module level to a specified distance from the module at this time.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

4-110 Log #1491 NEC-P04 **Final Action: Accept in Principle**
(690.12)

Submitter: John Smirnow, Solar Energy Industries Association
Comment on Proposal No: 4-253
Recommendation: Revise text to read as follows:
~~**690.12 PV Arrays on Buildings Response to Emergency Shutdown.**~~
~~For PV Systems installed on roofs of buildings, photovoltaic source circuits shall be deenergized from all sources within 10 seconds of when emergency shutdown is initiated or when the PV power source disconnecting means is opened. When the source circuits are deenergized, the maximum voltage at the module and module conductors shall be 80 volts.~~
690.12 Rapid Shutdown of PV Systems on Buildings.
PV system circuits installed on or in buildings shall include a rapid shutdown function that controls specific conductors in accordance with 690.12(A) through (D).
(A) Requirements for controlled conductors apply only to PV system conductors of more than 1.5 meters (5 feet) in length inside a building, or more than 3 meters (10 feet) from a PV array.
(B) Controlled conductors shall be limited to no more than 30 volts and 240VA within 10 seconds of rapid shutdown initiation. Voltage and power shall be measured between any two conductors and between any conductor and ground.
(C) The rapid shutdown initiation methods shall be labeled in accordance with 690.56(B).
(D) Equipment that performs the rapid shutdown shall be listed and identified.
Substantiation: 1. This comment is the result of a consensus process established among three groups of stakeholders: 1) CMP4 Firefighter Safety Task Group; 2) SEIA Codes and Standards Working Group; and 3) PV Industry Forum. Participants in these groups included the following individuals:
CMP4 Firefighter Safety Task Group
1. Ward Bower, CMP4 representing SEIA

The individuals listed above have worked together to develop a consensus comment on proposals 4-167 and 4-253. Consensus was established among these individuals to make substantial improvements in the safety of PV arrays as it relates to emergency response personnel in the 2014 National Electrical Code (NEC) cycle. The comment period has afforded these organizations and individuals the opportunity to see CMP4's response to proposals in this area and to deliberate on the impact that these proposals will have on safety and the solar industry in general. There is consensus that key elements of proposals of 4-167 and 4-253, both of which were accepted in principle by CMP4, need to be included in the 2014 NEC. This comment focuses on the details of the methods used to provide the desired safety levels. Included in these comments are the broader perspectives of electrical worker safety, system reliability of safety components, and needed standards development to advance these important safety capabilities.

In order to show that the revised language is consistent with the original focus of the CMP4 Firefighter Safety Task Group (TG), here is the main focus and research areas of this task group as outlined by Michael Johnston, Chair of the TCC, on February 2, 2011:

1. The scope of this TG is to address concerns of first responders (fire fighters and others) in regards to the PV system remaining energized after the service disconnecting means has been opened during an emergency event.
2. We should look at the possibility of including disconnects for the DC output circuits in the same location as the normal service disconnects for the building or structure served.
3. Another alternative to look at is to require some type of interlock that provides a means of disconnect for DC output circuits when the service disconnect is opened in an emergency condition.
4. Another item to look at is providing a control circuit disconnect for a PV system output relay. This control circuit disconnect could be clearly marked and located at the normal service disconnection means so an emergency responder could readily disconnect the PV output from the building.
5. Another item to look at is additional marking requirements in Article 230 and 690 that alert first responders and instruct them as to the appropriate course of action to remove the output power from the PV system.
6. We suggest that the panel review the electrical protection requirements in Article 690 to ensure that they provide adequate electrical protection during fault conditions.

The CMP4 Firefighter Safety Task Group has acted consistently with the original focus of task group. The current wording in this comment meets the intent as directed by NFPA.

2. Proposal 4-167 (accepted in principle) provides for shutdown of all dc conductors entering a building. The consensus of the group is that this provision is a substantial and necessary safety improvement. This requirement is also consistent with many local fire service rules that currently exist.
3. Proposal 4-167 (accepted in principle) limits the control of exterior circuits on buildings to larger circuits of 100-amps and higher. Since the concern is shock hazard not limited to current flow, the consensus of the group is that shutdown requirements be consistent regardless of the current levels involved. Therefore the recommendation is that the shutdown safety requirements relate to all systems on buildings.
4. Proposal 4-253 (accepted in principle) establishes a voltage of 80-volts for modules. This requires devices connected to every module which greatly increases the number required switches to create a safe environment for firefighters. Since the product standards for the safety and reliability of these devices have yet to be developed, the safety and reliability issues related to these future devices are likely to be significant over the next several years. Poor reliability will not only negatively impact public perception of the solar industry, but it will expose technicians to greater safety hazards as they will be required to make many more service calls to address product defects. These service calls are often in areas where fall and electrocution hazards are high, increasing the likelihood of workplace accidents. While firefighter safety is the primary focus of these code changes, electrical worker safety needs to be a strong consideration of such large system design changes.
5. Proposal 4-253 proposes 80-volts as a potentially safe condition for firefighters. While 80-volts is certainly safer than 600-volts or 1000-volts. It is not a touch safe condition and still remains as a shock hazard. Rather than supporting a voltage level that is somewhat hazardous, this provision should establish a touch-safe zone that is clearly defined for emergency responders. This allows products to be developed that can create a touch safe environment for the required areas and also allows product development that will enable manufacturers to go well beyond the requirements and develop fully touch safe PV arrays.
6. The consensus of the stakeholders recommends that the Emergency Shutdown, renamed Rapid Shutdown, instead establish a safe zone around a PV array using concepts already introduced in other ROPs and elsewhere in the NEC. This safe zone would be unambiguous and enable personnel to confidently enter buildings without fear of contacting live conductors. Most significantly, the devices used to create a safe zone can be placed in enclosures away from the hot PV modules, greatly improving their reliability and life expectancy.
7. A voltage limit of 30-volts and a power limit of 240VA is established as a safe power limited environment, consistent with international standards including IEC61730, *Photovoltaic (PV) Module Safety Qualification*, that establish safety of PV modules. It also allows for 24-volt control circuits throughout the array that are currently used in products that employ contactors for shutting down combiner boxes.
8. ROP 4-167 (accepted in principle) introduces a requirement for conductors entering a building to become deenergized. This intent is incorporated into the current proposal.
9. ROP 4-325 (accepted) introduces a distance of 1.5m (5 feet) to disconnection means of indoor battery-backup wiring. This distance is recognized as an acceptably short conduit length that allows for best practices in workmanship, and can be applied to PV wires entering a building in addition to conductors in and out of inverters and conductors coming out of a battery.
10. ROP 4-167 (accepted in principle) introduces a requirement to reduce fault current. It is recommended that the IEC 61730 value of 240VA be used in lieu of a new current requirement.
11. The 2012 IFC requires labeling of conduit every 10 feet, which is used here as the boundary for the safe zone in the recommendation. This distance is sufficiently large to include row-to-row spacing on commercial arrays.
12. Both ROP 4-167 (accepted in principle) and ROP 4-253 (accepted in principle) introduce a timing requirement of 10 seconds for the shutdown. This is intended to allow dc-side capacitor banks time to discharge with means other than contactors and shunt-trip devices, and has been acknowledged by the solar industry stakeholders as reasonable.
13. Although NEC section 100 defines the phrase "Voltage to Ground" for ungrounded systems as "the greatest voltage between the given conductor and any other conductor of the circuit", this does not align with the phrase itself and has caused confusion. The phrase "measured between any two conductors and between any conductor and ground" was added for this reason.
14. The means for rapid shutdown was a topic of much discussion at the ROP meeting and among the stakeholders during the comment period and it was decided among the stakeholders that the devices and methods of compliance should be left open to the standards process so long as proper markings are provided and that special products developed to meet the requirement be listed and identified for the purpose.
15. ROP 4-320 (accepted) revises 690.56(B) to include labels for the rapid shutdown function. This is referenced for clarity. A separate comment addresses the need to reword the 4-320 proposal for consistency with this comment.
16. NEC section 100 defines "listed" and "identified". The use of these terms will allow much of the existing hardware already on the market to be used without additional certification, which in turn enables faster implementation in the field.

Panel Meeting Action: Accept in Principle
Panel Statement: See panel action on Comment 4-113, which addresses the concerns of the submitter.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
STAFFORD, T.: See Comment for 4-107.

4-111 Log #1497 NEC-P04 **Final Action: Reject**
(690.12)

Submitter: Timothy P. Zgonena, UL LLC
Comment on Proposal No: 4-253
Recommendation: Propose to reject proposal 690.12 completely.
~~**690.12 PV Arrays on Buildings Response to Emergency Shutdown..** For PV Systems installed on roofs of buildings, photovoltaic source circuits shall be deenergized from~~
~~all sources within 10 seconds of when emergency shutdown is initiated or when the PV power source disconnecting means is opened. When the source circuits are deenergized, the maximum voltage at the module and module conductors shall be 80 volts. **[ROP 4-253]**~~
Substantiation: 690.12 is well intended to increase PV system safety for fire fighters. After further review, 690.12 relies upon a new type of PV module output control device that is required to disconnect or reduce a pv module output terminals or wiring to touch safe level in an effort to prevent electric shock for fire fighters. UL1741 is the standard for most PV electronics equipment and it has a maximum 30V DC voltage limit for wet locations to prevent electric shock. 80V is a significant shock hazard in wet locations.
This 690.12 concept presents technical problems and will take at least 4 years to address and implement. First it requires the development and consensus publication of new product safety requirements within at least two different UL product safety standards (UL1741 and UL1703). The requirements for this new equipment need to include a functional safety evaluation of both the hardware and software such that the equipment operates properly or shuts down safely and enunciates it has faulted, as a result of any single point failure within its hardware or software. After the publication of these future requirements, 690.12 would then require mfrs to design, build and certify the equipment. Addition of any such "PV off" devices incorporated into a PV module or PV module junction box would then require a redesign and recertification of any the PV modules that would include this functionality. These evaluations take multiple months of laboratory testing.
If for any reason a fire fighter questions the presence, functionality or reliability of such a PV off system, they are likely to treat the system as if the functionality did not exist. It is also very important to note that while functional safety standards address the extremes of an equipment's normal and abnormal electrical and environmental operating conditions, the requirements do not include being exposure to flames or high heat of a fire. While PV modules are evaluated for a fire rating, the standards do not include any requirements or evaluation of electrical isolation following the fire exposure to prevent an electric shock.
This proposal should be further developed with the help of a larger section of the PV industry including both the UL1741 and UL1703 standards technical panels to define the PV off functionality and start the development of appropriate requirements.
Panel Meeting Action: Reject
Panel Statement: The substantiation provided by the submitter is correct in that the technology available to the industry today limits the application of Proposal 4-253.
A means for rapid shut down is covered by the panel action on Comment 4-113.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
BOWER, W.: This comment was rejected by the panel based on the premise that 4-113 would be accepted by the TCC. It should be considered as a standby should comment 4-113 be rejected by the TCC. Under those circumstances the panel action on this comment should be to reject the original proposal as well. This panel member believes the original proposal is NOT an acceptable solution for rapid shut down, uses the unacceptable term emergency shutdown and specifies conditions that would cause many unnecessary operations of safety switches when utility systems operate near ANSI limits for voltage. The resulting reliability of the system as required in the original proposal would be so bad that firefighters would ignore the rapid shut down signs and labels and the installed system.
STAFFORD, T.: See comment on 4-106. In addition, this proposal is an improvement over existing conditions that mandate safety for first responders and electrical workers. Reducing the threshold voltage of any portion of a PV source circuit or module to a touch safe threshold should be of first concern to all involved with determining the safety of PV installation, operation and maintenance as well as shutdown voltages that are present. An 80 volts threshold would be a step in the right direction but it does not go far enough.

4-112 Log #1498 NEC-P04 **Final Action: Reject**
(690.12)

Submitter: Timothy P. Zgonena, UL LLC
Comment on Proposal No: 4-253
Recommendation: Propose future effective date.
690.12 PV Arrays on Buildings Response to Emergency Shutdown.. For PV Systems installed on roofs of buildings, photovoltaic source circuits shall be deenergized from
all sources within 10 seconds of when emergency shutdown is initiated or when the PV power source disconnecting means is opened. When the source circuits are deenergized, the maximum voltage at the module and module conductors shall be 80 volts.
Future effective date 2017.
Substantiation: Based upon the below justification it will take significant time to develop requirements and equipment to comply with 690.12.
690.12 is well intended to increase PV system safety for fire fighters. After further review, 690.12 relies upon a new type of PV module output control device that is required to disconnect or reduce a pv module output terminals or wiring to touch safe level in an effort to prevent electric shock for fire fighters. UL1741 is the standard for most PV electronics equipment and it has a maximum 30V DC voltage limit for wet locations to prevent electric shock. 80V is a significant shock hazard in wet locations.
This 690.12 concept presents technical problems and will take at least 4 years to address and implement. First it requires the development and consensus publication of new product safety requirements within at least two different UL product safety standards (UL1741 and UL1703). The requirements for this new equipment need to include a functional safety evaluation of both the hardware and software such that the equipment operates properly or shuts down safely and enunciates it has faulted, as a result of any single point failure within its hardware or software. After the publication of these future requirements, 690.12 would then require mfrs to design, build and certify the equipment. Addition of any such "PV off" devices incorporated into a PV module or PV module junction box would then require a redesign and recertification of any the PV modules that would include this functionality. These evaluations take multiple months of laboratory testing.
If for any reason a fire fighter questions the presence, functionality or reliability of such a PV off system, they are likely to treat the system as if the functionality did not exist. It is also very important to note that while functional safety standards address the extremes of an equipment's normal and abnormal electrical and environmental operating conditions, the requirements do not include being exposure to flames or high heat of a fire. While PV modules are evaluated for a fire rating, the standards do not include any requirements or evaluation of electrical isolation following the fire exposure to prevent an electric shock.
This proposal should be further developed with the help of a larger section of the PV industry including both the UL1741 and UL1703 standards technical panels to define the PV off functionality and start the development of appropriate requirements.
Panel Meeting Action: Reject

The individuals listed above have worked together to develop a consensus comment on proposals 4-167 and 4-253. Consensus was established among these individuals to make substantial improvements in the safety of PV arrays as it relates to emergency response personnel in the 2014 National Electrical Code (NEC) cycle. The comment period has afforded these organizations and individuals the opportunity to see CMP4's response to proposals in this area and to deliberate on the impact that these proposals will have on safety and the solar industry in general. There is consensus that key elements of proposals of 4-167 and 4-253, both of which were accepted in principle by CMP4, need to be included in the 2014 NEC. This comment focuses on the details of the methods used to provide the desired safety levels. Included in these comments are the broader perspectives of electrical worker safety, system reliability of safety components, and needed standards development to advance these important safety capabilities.

In order to show that the revised language is consistent with the original focus of the CMP4 Firefighter Safety Task Group (TG), here is the main focus and research areas of this task group as outlined by Michael Johnston, Chair of the TCC, on February 2, 2011:

1. The scope of this TG is to address concerns of first responders (fire fighters and others) in regards to the PV system remaining energized after the service disconnecting means has been opened during an emergency event.
2. We should look at the possibility of including disconnects for the DC output circuits in the same location as the normal service disconnects for the building or structure served.
3. Another alternative to look at is to require some type of interlock that provides a means of disconnect for DC output circuits when the service disconnect is opened in an emergency condition.
4. Another item to look at is providing a control circuit disconnect for a PV system output relay. This control circuit disconnect could be clearly marked and located at the normal service disconnection means so an emergency responder could readily disconnect the PV output from the building.
5. Another item to look at is additional marking requirements in Article 230 and 690 that alert first responders and instruct them as to the appropriate course of action to remove the output power from the PV system.
6. We suggest that the panel review the electrical protection requirements in Article 690 to ensure that they provide adequate electrical protection during fault conditions.

The CMP4 Firefighter Safety Task Group has acted consistently with the original focus of task group. The current wording in this comment meets the intent as directed by NFPA.

2. Proposal 4-167 (accepted in principle) provides for shutdown of all dc conductors entering a building. The consensus of the group is that this provision is a substantial and necessary safety improvement. This requirement is also consistent with many local fire service rules that currently exist.
3. Proposal 4-167 (accepted in principle) limits the control of exterior circuits on buildings to larger circuits of 100-amps and higher. Since the concern is shock hazard not limited to current flow, the consensus of the group is that shutdown requirements be consistent regardless of the current levels involved. Therefore the recommendation is that the shutdown safety requirements relate to all systems on buildings.
4. Proposal 4-253 (accepted in principle) establishes a voltage of 80-volts for modules. This requires devices connected to every module which greatly increases the number required switches to create a safe environment for firefighters. Since the product standards for the safety and reliability of these devices have yet to be developed, the safety and reliability issues related to these future devices are likely to be significant over the next several years. Poor reliability will not only negatively impact public perception of the solar industry, but it will expose technicians to greater safety hazards as they will be required to make many more service calls to address product defects. These service calls are often in areas where fall and electrocution hazards are high, increasing the likelihood of workplace accidents. While firefighter safety is the primary focus of these code changes, electrical worker safety needs to be a strong consideration of such large system design changes.
5. Proposal 4-253 proposes 80-volts as a potentially safe condition for firefighters. While 80-volts is certainly safer than 600-volts or 1000-volts. It is not a touch safe condition and still remains as a shock hazard. Rather than supporting a voltage level that is somewhat hazardous, this provision should establish a touch-safe zone that is clearly defined for emergency responders. This allows products to be developed that can create a touch safe environment for the required areas and also allows product development that will enable manufacturers to go well beyond the requirements and develop fully touch safe PV arrays.
6. The consensus of the stakeholders recommends that the Emergency Shutdown, renamed Rapid Shutdown, instead establish a safe zone around a PV array using concepts already introduced in other ROPs and elsewhere in the NEC. This safe zone would be unambiguous and enable personnel to confidently enter buildings without fear of contacting live conductors. Most significantly, the devices used to create a safe zone can be placed in enclosures away from the hot PV modules, greatly improving their reliability and life expectancy.
7. A voltage limit of 30-volts and a power limit of 240VA is established as a safe power limited environment, consistent with international standards including IEC61730, Photovoltaic (PV) Module Safety Qualification, that establish safety of PV modules. It also allows for 24-volt control circuits throughout the array that are currently used in products that employ contactors for shutting down combiner boxes.
8. ROP 4-167 (accepted in principle) introduces a requirement for conductors entering a building to become deenergized. This intent is incorporated into the current proposal.
9. ROP 4-325 (accepted) introduces a distance of 1.5m (5 feet) to disconnection means of indoor battery-backup wiring. This distance is recognized as an acceptably short conduit length that allows for best practices in workmanship, and can be applied to PV wires entering a building in addition to conductors in and out of inverters and conductors coming out of a battery.
10. ROP 4-167 (accepted in principle) introduces a requirement to reduce fault current. It is recommended that the IEC 61730 value of 240VA be used in lieu of a new current requirement.
11. The 2012 IFC requires labeling of conduit every 10 feet, which is used here as the boundary for the safe zone in the recommendation. This distance is sufficiently large to include row-to-row spacing on commercial arrays.
12. Both ROP 4-167 (accepted in principle) and ROP 4-253 (accepted in principle) introduce a timing requirement of 10 seconds for the shutdown. This is intended to allow dc-side capacitor banks time to discharge with means other than contactors and shunt-trip devices, and has been acknowledged by the solar industry stakeholders as reasonable.
13. Although NEC section 100 defines the phrase "Voltage to Ground" for ungrounded systems as "the greatest voltage between the given conductor and any other conductor of the circuit", this does not align with the phrase itself and has caused confusion. The phrase "measured between any two conductors and between any conductor and ground" was added for this reason.
14. The means for rapid shutdown was a topic of much discussion at the ROP meeting and among the stakeholders during the comment period and it was decided among the stakeholders that the devices and methods of compliance should be left open to the standards process so long as proper markings are provided and that special products developed to meet the requirement be listed and identified for the purpose.
15. ROP 4-320 (accepted) revises 690.56(B) to include labels for the rapid

shutdown function. This is referenced for clarity. A separate comment addresses the need to reword the 4-320 proposal for consistency with this comment.
16. NEC section 100 defines "listed" and "identified". The use of these terms will allow much of the existing hardware already on the market to be used without additional certification, which in turn enables faster implementation in the field.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
BOWER, W.: This panel member believes this is a major step toward fire-fighter safety but the language does not provide for a requirement for the reliability, default modes, annunciation or restart functionality. Reliability is essential and may require new testing during the certification processes. Annunciation can provide and additional degree of confidence that the system is in a safe mode for fire fighter. The environment associated with PV modules and arrays is brutal for electronic devices and failure modes must be failed "safe".
In 690.12(D) the language "(D) Equipment that performs the rapid shutdown shall be listed and identified" does leave open the possibility of using listed equipment that is not suitable for the environment. I lobbied that using the language "(D) Equipment that performs the rapid shutdown shall be listed and identified for the application" but upon further study it was determined that "identified for the application" language could be extended to all components on the dc side of PV systems and that is not the intent. Still the next code cycle should include enough clarifications that only listed for the function of rapid shutdown equipment and devices be included for the rapid shutdown related hardware.
STAFFORD, T.: See Comment for 4-107.

4-114 Log #68 NEC-P04 **Final Action: Accept**
(690.13)

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 4-254a
Recommendation: It was the action of the Correlating Committee that further consideration be given to the comments expressed in the voting and Section 3.2.3 of the NEC Style Manual suggesting use of the acronym (PV) throughout Article 690.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Replace "photovoltaic" with "PV" throughout Article 690 with the following listed below. (These sections are to retain the term photovoltaic).

690.7(E)(3) – The equipment is clearly marked with a label as follows:

WARNING
BIPOLAR PHOTOVOLTAIC ARRAY.
DISCONNECTION OF NEUTRAL
OR GROUNDED CONDUCTORS
MAY RESULT IN OVERVOLTAGE
ON ARRAY OR INVERTER.

690.31 (C) – Single-conductor cable type USE-2 and single-conductor cable listed and labeled as photovoltaic (PV) wire…
690.31(C) – Informational note - do not revise
690.31 (E) (3) Marking and Labeling Required. The following wiring methods and enclosures that contain PV power source conductors shall be marked with the wording "Warning: Photovoltaic Power Source" by means of permanently affixed labels or other approved permanent marking.
690.35(D)(3) Conductors listed and identified as Photovoltaic (PV) Wire installed as exposed, single conductors.
690.35(F) The PV power source shall be labeled with the following warning at each junction box, combiner box, disconnect, and device where energized, ungrounded circuits may be exposed during service:

WARNING
ELECTRIC SHOCK HAZARD.
THE DC CONDUCTORS OF THIS
PHOTOVOLTAIC SYSTEM ARE UNGROUNDED
AND MAY BE ENERGIZED.

690.56(C) - as shown in the meeting action on Comment 4-159, 690.56(C) should have photovoltaic in the plaque/directory.
Panel Statement: The panel accepts the direction of the Correlating Committee to change "photovoltaic" to "PV" throughout Article 690 with exception noted in the panel action.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

4-115 Log #1606 NEC-P04 **Final Action: Reject**
(690.13 and 690.15)

Submitter: Mark Albers, SunPower Corp.
Comment on Proposal No: 4-254a
Recommendation: Revise text to read as follows:
690.13 Disconnection of PV DC Conductors on Buildings or Other Structures ~~Supplied by a Photovoltaic System.~~ Means shall be provided to disconnect all ungrounded dc conductors of a PV system from all other conductors in a building or other structure.
(A) Location. The PV disconnecting means shall be installed at a readily accessible location either on the outside of a building or structure or inside nearest the point of entrance of the system conductors.
Exception: Installations that comply with 690.31(F) shall be permitted to have the disconnecting means located remote from the point of entry of the system conductors.
The PV system disconnecting means shall not be installed in bathrooms.
(B) Marking. Each PV ~~system~~ disconnecting means shall be permanently marked to identify it as a PV system disconnect.
(C) Suitable for Use. Each PV ~~system~~ disconnecting means shall not be required to be suitable as service equipment.
(D) Maximum Number of Disconnects. The PV ~~system~~ disconnecting means shall consist of not more than six switches or six circuit breakers mounted in a single enclosure, or in a group of separate enclosures.
(E) Grouping. The PV ~~system~~ disconnecting means shall be grouped with other PV disconnecting means for the system in accordance with 690.13(D). A PV disconnecting means shall not be required at the PV module or array location.
(F) DC Combiner Disconnects. The direct current (dc) output of dc combiners mounted on roofs of dwellings or other buildings shall have a load break disconnecting means located in the combiner or within 1.8 m (6 ft) of the combiner. The disconnecting means shall be permitted to be remotely controlled, but shall be manually operable locally when control power is not available.
690.15 Disconnection of PV Equipment from Other Sources.
Means shall be provided to disconnect equipment, such as inverters, batteries, and charge controllers, from all ungrounded conductors of all sources. If the equipment is energized from more than one source, the disconnecting means shall be grouped and identified.
A single source disconnecting means in accordance with 690.17 shall be permitted for the combined ac output of one or more inverters or ac modules in an interactive system.
(A) Utility Interactive Inverters Mounted in Not Readily Accessible Locations. Utility interactive inverters shall be permitted to be mounted on roofs or other exterior areas that are not readily accessible and shall comply with (1) through (4):
(1) A ~~direct-current~~ PV disconnecting means shall be mounted within sight of or in each inverter that will disconnect it from all DC conductors connected to it.
(2) A source ~~n alternating-current~~ disconnecting means shall be mounted within sight of or in each inverter that will disconnect it from all other sources.
(3) The alternating-current output conductors from the inverter and the source ~~an additional alternating-current~~ disconnecting means for the inverter shall comply with 690.13(A).
(4) A plaque shall be installed in accordance with 705.10.
(B) Equipment. Equipment such as PV source circuit isolating switches, overcurrent devices, dc–to–dc converters, and blocking diodes shall be permitted on the PV side of the PV disconnecting means.
~~**(C) DC Combiner Disconnects.** The direct current (dc) output of dc combiners mounted on roofs of dwellings or other buildings shall have a load break disconnecting means located in the combiner or within 1.8 m (6 ft) of the combiner. The disconnecting means shall be permitted to be remotely controlled, but shall be manually operable locally when control power is not available.~~
Substantiation: CMP 4 has made significant improvement in the clarity of the disconnecting means require for PV Systems in section III of article 690. Unfortunately, there is one point of confusion that still remains. The proposed language still references at least 7 different disconnect means (PV System Disconnecting Means, PV Disconnecting Means, Source Disconnecting Means, DC PV Disconnecting Means, AC Disconnecting Means, DC Combiner Disconnecting Means, and Fuse Service Disconnecting Means) with significant overlap between the different disconnect means. The overlap and inconsistent naming causes confusion about what functionality is require for a given disconnecting means. As a result, SunPower proposes to consolidate the terms PV System Disconnecting Means, PV Disconnecting Means, and DC PV Disconnecting Means into one term, PV Disconnecting Means. Similarly, we propose to consolidate Source Disconnecting Means and AC Disconnecting Means into Source Disconnecting Means. The two titles that were selected focus on the functionality provided by the disconnecting means. These changes will greatly improve interpretation of this important section of article 690.
Given these changes, the addition of the DC combiner disconnecting means was moved from 690.15 to 690.13. With the proposed changes, 690.13 is focused on the disconnecting means required for equipment on the PV side of the inverter, which is where the DC Combiner resides. Thus, we feel this new

requirement is more appropriately added in 690.13.

Lastly, I have replaced all instances of photovoltaic with PV to comply with the new style guide requirements.

Panel Meeting Action: Reject

Panel Statement: The term PV system disconnecting and PV disconnecting means is not defined in the NEC. Familiar terms are being changed which could cause confusion with the restructure of the main body of Article 690.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

Comment on Affirmative:

BOWER, W.: The comment provides for excellent clarifications and a reduction of sometimes confusing terminology that is often used in today's code. I agree with the reject because new terminology and changes were not appropriate for the comment period and new definitions will be needed. But this is an area that needs detailed consideration during the next code cycle.

(690.14(D)(1))

Submitter: Teri Dwyer, Wells Fargo
Comment on Proposal No: 4-272
Recommendation: Revise text to read as follows:

690.14 Additional Provisions.

Photovoltaic disconnecting means shall comply with 690.14(A) through (D).

(D) Utility-Interactive Inverters Mounted in Not-Readily-Accessible Locations. Utility-interactive inverters shall be permitted to be mounted on roofs or other exterior areas that are not readily accessible. These installations shall comply with (1) through (4):

(1) A direct-current photovoltaic disconnecting means shall be mounted within sight of or in the inverter.

Exception: Where micro-inverters are installed, a direct-current disconnect shall not be required where the dc conductor is 12 in. or less in length, has a connector per 690.33(E)(2) and the ac required disconnect is mounted within 10 ft of the array. Where more than one array is present, the ac disconnect shall be identified to the corresponding array.

Informational Note: The reduced distance and identification requirements for the ac disconnect where micro-inverters are install has been added to facilitate the dc connectors requirement "Do Not Disconnect Under Load."

Substantiation: CMP-4 did not address the substantiation in original proposal within their panel statement, "Current code allows ac disconnect to be remote from the PV array - at ground level - much more than 10 ft. The NEC permits the use of connectors to meet the disconnect requirements of 690.17 Exception."

690.14(D)(1) does not apply to PV arrays at ground level, it is specifically for utility interactive inverters mounted on roofs. Also, as for the NEC permitting the use of connectors as a disconnect means per 690.17 exception, "a connector shall be permitted to be used as an ac or dc disconnecting means, provided that it complies with the requirements of 690.33 and is listed and identified for the use." This exception requires that the connector be listed and identified for the use, currently used connectors are not listed and identified for the use, in fact, they are at best UL recognized components with conditions of acceptability covered by UL category QU2:
http://database.ul.com/cgi-bin/XYV/template/LISEXT/1FRAME/showpage.html?&name=QUQ2.GuideInfo&cnnshorttitle=Connectors+for+Use+in+Photovoltaic-Systems+-+Component&objid=1080909233&efgid=1073741824&version=versionless&parent_id=1080909232&sequence=1

The devices covered under this category are incomplete in certain constructional features or restricted in performance capabilities and are intended for use as components of complete equipment submitted for investigation rather than for direct separate installation in the field. The final acceptance of the component is dependent upon its installation and use in complete equipment submitted to UL.

These devices have only been investigated to mate with the same line of connectors/devices within their product family. These devices have not been investigated to mate with any other similar devices from other manufacturers. Currently, there are seventy-two (72) manufactures of these types of products covered by UL, category QUQ2 alone; this does not include the possibility of similar products certified by other NRTLs. Currently, there is no compatibility/configuration standard, since this connector is not permitted to be field installed, is intended for use as components of complete listed equipment and has not been investigated to mate with any other similar devices from other manufacturers, what is the probability that a listed micro-inverter and a listed PV module will have a set of connectors evaluated to be mated together? I would suggest that you have a one (1) in seventy-two (72) chance.
http://database.ul.com/cgi-bomXYV/cgifind.new/LISEXT/1FRAME/stehres.html

Per the UL White Book, the Recognized Component Mark does not provide evidence of listing or labeling, which may be required by installation codes or standards.

Please address original substantiation:

690.14(D)(1) as currently written is practically impossible to comply with when micro-inverters are installed. Currently micro-inverters are being installed and the only dc disconnecting means are the connectors required by 690.33. This type of connector is a recognized component covered by UL category QUQ2 which requires them to be marked "Do Not Disconnect Under Load." Therefore, the need to have the ac disconnect located in close proximity (10 ft) of the associated PV array. These connectors are single-pole latching and locking type connectors which will not permit quick disconnecting without the use of a tool or special knowledge.

Panel Meeting Action: Reject
Panel Statement: Micro-Inverters are not defined. The panel's action and statement on Proposal 4-272 are still valid.

The panel action on Proposal 4-278a incorporated language suitable to the submitter's concern in the substantiation by the revision to the last exception that added the words "for use with specific equipment".

Ballot Results: Affirmative: 14

4-122 Log #15 NEC-P04 **Final Action: Reject**
(690.14(D)(1))

Submitter: Joseph Amato, Delaware County
Comment on Proposal No: 4-272
Recommendation: Add new text to read as follows:
690.14 Additional Provisions.
Photovoltaic disconnecting means shall comply with 690.14(A) through (D).
(D) Utility-Interactive Inverters Mounted in Not-Readily-Accessible Locations. Utility-interactive inverters shall be permitted to be mounted on roofs or other exterior areas that are not readily accessible. These installations shall comply with (1) through (4):
(1) A direct-current photovoltaic disconnecting means shall be mounted within sight of or in the inverter.
Exception: Where micro-inverters are installed, a direct-current disconnect shall not be required where the dc conductor is 12 in. or less in length, has a connector per 690.33(E)(2) and the dc required disconnect is mounted within 10 ft of the array. Where more than one array is present, the dc disconnect shall be identified to the corresponding array.
Informational Note: The reduced distance and identification requirements for the ac disconnect where micro-inverters are installed has been added to facilitate the dc connector's requirement "Do Not Disconnect Under Load."
Substantiation: I do not feel as if CMP-4 addressed the substantiation of this proposal. The concern was the use of the micro-inverters that have short DC leads with connectors on the ends being used as the required DC disconnects. AS a Plan reviewer and a inspector out in the field we are having to get permission from the Building Official to accept these non-listed connectors used as disconnects in lieu of other listed type disconnects. 690.17 Exception says, "A connector shall be permitted to be used as an ac or a dc disconnecting means, provided that it complies with the requirements of 690.33 and is listed and identified for the use".
I feel it is a violation of the code as written and either needs manufactures to have these connectors evaluated so they are listed and identified for use or consider this exception proposal to which would at least provide the needed protection for personnel working on this equipment.
Conclusion: I feel the submitter of this proposal is making a reasonable suggestion to correct this problem. If we allow something like this in this situation we open ourselves up to people who will want to use products not listed for other projects.

Comment on Proposal No: 4-275
Recommendation: It was the action of the Correlating Committee that this proposal be reconsidered and correlated with the action on proposal 4-274a.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the recommendation of the Correlating Committee. The panel action on Proposal 4-274a is intended to address the concerns of the submitter of Proposal 4-275. The action on Proposal 4-275 should have been "accept in principle" with statement "see panel action and statement on Proposal 4-274a".
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

4-125 Log #1168 NEC-P04 **Final Action: Reject**
(690.15)

Submitter: Greg Pitz, Logos Solar
Comment on Proposal No: 4-274a
Recommendation: Revise text to read as follows:
690.15 Disconnection of Photovoltaic Equipment. Means shall be provided to disconnect equipment, such as inverters, batteries, and charge controllers, from all ungrounded conductors of all source sources. If the equipment is energized from more than one source, the disconnecting means shall be grouped and identified. A single disconnecting means in accordance with 690.17 shall be permitted for the combined ac output of one or more inverters or ac modules in an interactive system.
(A) Utility Interactive Inverters Mounted in Not Readily Accessible Locations. Utility interactive inverters shall be permitted to be mounted on roofs or other exterior areas that are not readily accessible and shall comply with (1) through (4):
(1) ~~A direct-current PV disconnecting means shall be mounted within sight of or in each inverter.~~ A DC disconnecting means shall be installed within sight of the inverter to which it is electrically connected.
(2) ~~An alternating-current disconnecting means shall be mounted within sight of or in each inverter.~~ An AC disconnecting mean shall be installed within sight of the inverter(s) to which it is electrically connected.
(3) The ~~alternating-current~~ AC output conductors from the inverter and an additional ~~alternating-current~~ AC disconnecting means for the inverter shall comply with 690.13(A).
(4) A ~~plaque~~ directory shall be installed in accordance with 705.10.
(B) ~~Equipment~~. Equipment such as PV source circuit isolating switches, overcurrent devices, ~~dc-to-dc~~ DC-to-DC converters, and blocking diodes shall be permitted on the PV side of the PV disconnecting means.
(C) DC Combiner Disconnects. ~~The direct current (dc) output of dc combiners mounted~~ installed on roofs of dwellings or other buildings shall have a load break listed disconnecting means for the output located ~~in the combiner or~~ within 1.8 m (6ft) of the combiner. The disconnecting means ~~shall be permitted to be remotely controlled, but~~ shall be manually operable locally ~~when control power is not available~~ at all times.
Substantiation: A1) A DC disconnect is only connected to one inverter, it isn′t necessarily mounted, and if it is ″in″ the inverter, it is visible, so the wording is unnecessary.
Addition of ″PV″ to text inconsistent. Why hasn′t the descriptor been added to all other parts of this paragraph?
Especially the very next line that is worded identically, except that DC is replaced with AC? Or similar descriptors in any other portions of The Code that use DC generated by sources other than PV? This is the PV article of the code, so of course it is for PV.
A2) An AC disconnect can be connected to more than one inverter, it isn't necessarily mounted, and if it is "in" the inverter, it is visible, so the wording is unnecessary,
A 1 & A2) If multiple inverters, disconnects, combiners, are all in one area, don' t the disconnects mentioned here need to be related to the appropriate inverter(s)?
A3) And other locations - I like Mr Bower's consistency & format preferences,
A4) The wording in 705,10 needs to be changed, as plagues aren't synonymous with directories, but directories may be plaques,
B) Consistency, None of the other lines have given a short top ic description at the start.
C) Same consistency remark as immediately preceding. The "direct current" (spelled out for emphasis) isn't mounted anywhere, so poor sentence construction, The disconnect might be integral to other equipment, so installed versus mounted, I'm sure the omission of "listing" was just an oversight as otherwise all disconnects will meet this criteria, If the
disconnect is integral to the combiner, that is within 1.8m, so unnecessary wording has been removed. Remotely controlled has been removed as this isn't a design manual.
Panel Meeting Action: Reject
Panel Statement: Remote control is a technical requirement that improves safety and is a safety requirement that needs to remain. The changes to AC and DC (capitals) is not in accordance with the NEC Style Manual. Familiar terms are being changed which could cause confusion with the restructure of the main body of Article 690.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

4-126 Log #1381 NEC-P04 **Final Action: Reject**
(690.15(C))

Submitter: Chad Kennedy, Schneider Electric
Comment on Proposal No: 4-274a
Recommendation: Revise text to read as follows:
(C) DC Combiner Disconnects. The direct current (dc) output of dc combiners ~~mounted on roofs of dwellings or other buildings~~ shall have a load break disconnecting means located in the combiner or within 1.8 m (6 ft) of the combiner and comply with the requirements of 690.17. The disconnecting means shall be permitted to be remotely controlled, but shall be manually operable locally when control power is not available.
Substantiation: Schneider Electric supports the enhancements to safety and fire service operations in the committee action on ROP 4-274a. However, the benefits of having dc combiner disconnects extend beyond just roof installations and the requirements should be extended to apply in general.
Panel Meeting Action: Reject
Panel Statement: This comment to include all systems is too restrictive for some systems. Load break disconnecting means on ground mounted PV system combiners may unnecessarily limit current practices.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 11 Negative: 3
Explanation of Negative:
ROGERS, J.: This comment should be accepted. The submitter is correct that there is no technical merit to limit these requirements to roof top installations. The Panel statement relative to “current practices” is not a good reason to negate the requirement for this additional safety item for ground mounted systems. If the installation of these disconnects is important for roof mounted systems it is equally important for ground mounted systems.
STAFFORD, T.: The safety of installers and maintainers is not limited to the roof. DC disconnects on the output would allow for isolation of typically larger conductors with higher amounts of current.
ZGONENA, T.: The panel should have accepted this comment because it is a safety enhancement. Without the proposed text, the disconnect for ground mounted arrays may be located anywhere, including locations far away or out of sight of the array.

4-127 Log #71 NEC-P04 **Final Action: Accept**

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 4-278a
Recommendation: The Correlating Committee directs that the panel clarify the action on this proposal to correlate with the panel action taken on Proposal 4-264.
The Correlating Committee further directs that this proposal be clarified by modifying the accepted text based on the NEC Style Manual by removing the titles in the list of devices and changing the “(a) through (i)” to “(1) through (9).”
In addition, the Correlating Committee directs that the panel reconsider the Informational Notes as related to the use of permissive and mandatory text, in accordance with the NEC Style Manual.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise proposed text of 690.17(A) as follows:
(A) Manually Operable. The disconnecting means for ungrounded PV conductors shall consist of a manually operable switch(es) or circuit breaker(s). The disconnecting means shall be permitted to be power operable with provisions for manual operation in the event of a power supply failure. The disconnecting means shall be one of the following listed devices:
1) An industrial control switch marked for use in PV systems.
2) A molded case circuit breaker marked for use in PV systems
3) A molded case switch marked for use in PV systems.
4) An enclosed switch marked for use in PV systems.
5) An open type switch marked for use in PV systems.
6) A dc rated molded case circuit breaker suitable for backfeed operation.
7) A dc rated, molded case switch suitable for backfeed operation.
8) A dc rated enclosed switch.
9) A dc rated open type switch.
10) A dc rated low voltage power circuit breaker.
Delete Informational Note in 690.17(D)
Panel Statement: The panel accepts the recommendation of the Correlating Committee. See panel statement on Comment 4-118. The informational notes were not necessary and were removed. The panel action on Comment 4-129 was incorporated into this comment.

Ballot Results: Affirmative: 14

4-129 Log #836 NEC-P04 **Final Action: Accept in Principle in Part**
(690.17)

Submitter: Thomas Hattert, SMA Solar Technology AG
Comment on Proposal No: 4-278a
Recommendation: Revise text to read as follows:
690.17 Disconnect Type.
(A) Manually Operable. The disconnecting means for ungrounded PV conductors shall consist of a manually operable switch(es) or circuit breaker(s). The disconnecting means shall be permitted to be power operable with provisions for manual operation in the event of a power supply failure. The disconnecting means shall be one of the following devices:
(a) PV Industrial Control Switch. A listed industrial control switch marked for use in PV systems.
(b) PV Molded Case Circuit Breaker. A listed molded case circuit breaker marked for use in PV systems
(c) PV Molded Case Switch. A listed molded case switch marked for use in PV systems.
(d) PV Enclosed Switch. A listed, enclosed switch marked for use in PV systems.
(e) PV Open Type Circuit Breaker. A listed, open type circuit breaker marked for use in PV systems.
(~~e~~f) PV Open Type Switch. A listed, open type switch marked for use in PV systems.
(~~f~~g) Molded Case Circuit Breaker. A listed, dc rated molded case circuit breaker suitable for backfeed operation.
(~~g~~h) Molded Case Switch. A listed, dc rated, molded case switch suitable for backfeed operation.
(~~h~~i) Enclosed Switch. A listed, dc rated enclosed switch.
(k) Open Type Circuit Breaker. A listed, dc rated open type circuit breaker.
(~~i~~j) Open Type Switch. A listed, dc rated open type switch.
Informational Note: Devices marked with “line” and “load” are not suitable for backfeed or reverse current.
(B) Simultaneous Opening of Poles. The PV disconnecting means shall simultaneously disconnect all ungrounded supply conductors that it controls from the building or structure wiring system.
(C) Externally Operable and Indicating. The PV disconnecting means shall be externally operable without exposing the operator to contact with live parts and indicate whether in the open or closed position
(D) Disconnection of Grounded Conductor. A switch, circuit breaker, or other device shall not be installed in a grounded conductor if operation of that switch, circuit breaker, or other device leaves the marked, grounded conductor in an ungrounded and energized state.
Exception No. 1: A switch or circuit breaker that is part of a ground-fault detection system required by 690.5, or that is part of an arc-fault detection/interruption system required by 690.11, shall be permitted to open the grounded conductor when that switch or circuit breaker is automatically opened as a normal function of the device in responding to ground faults.
Exception No. 2: A disconnecting switch shall be permitted in a grounded conductor if all of the following conditions are met:
(1) The switch is used only for PV array maintenance.
(2) The switch is accessible only by qualified persons.
(3) The switch is rated for the maximum dc voltage and current that could be present during any operation, including ground-fault conditions.
Informational Note: The grounded conductor may have a bolted or terminal disconnecting means to allow maintenance or troubleshooting by qualified personnel.
(F) Interrupting Rating. The building or structure disconnecting means shall have an interrupting rating sufficient for the maximum circuit voltage and current that is available at the line terminals of the equipment. Where all terminals of the disconnecting means may be energized in the open position, a warning sign shall be mounted on or adjacent to the disconnecting means. The sign shall be clearly legible and have the following words or equivalent:
WARNING
ELECTRIC SHOCK HAZARD.
DO NOT TOUCH TERMINALS.
TERMINALS ON BOTH THE LINE AND LOAD SIDES

MAY BE ENERGIZED IN THE OPEN POSITION.

Exception: A connector shall be permitted to be used as an ac or a dc disconnecting means, provided that it complies with the requirements of 690.33 and is listed and identified for use with specific equipment.

Substantiation: The original proposal would exclude open type circuit breakers that are covered by UL1066. For AC applications these type of breakers are commonly used as disconnecting means. Right now UL 1066 also permits them to have a DC rating up to 300V DC.

Since the open type circuit breakers are able to carry much more current than molded case circuit breakers, it is very likely that they will be used more often for large PV inverters in the future. Although there is no standard yet that covers specific PV open type circuit breakers, it is not assured that there won't be an extension of UL1066 like the extension from UL489 to UL489b or UL98 to UL98b in the next years.

Knowing that open type circuit breakers can have a DC rating right now and are also used for disconnecting means, they should be included in the list of permitted disconnecting types.

Panel Meeting Action: Accept in Principle in Part

Reject the addition of (e).

Revise proposed (k) as last item on list to read:

(k) Low Voltage Power Circuit Breaker. A listed DC rated low voltage power circuit breaker.

Panel Statement: The panel rejects the proposed new (e) because it does not exist at this time.

The proper terminology and description for proposed (k) is as shown in the revised panel action.

The action has been incorporated into Comment 4-128.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

4-130 Log #1169 NEC-P04 **Final Action: Accept in Part**
(690.17)

Submitter: Greg Pitz, Logos Solar

Comment on Proposal No: 4-278a

Recommendation: Revise text to read as follows:

(13) Simultaneous Opening of Poles. The PV disconnecting means shall simultaneously disconnect all ungrounded supply conductors ~~that it controls from the building or structure wiring system~~.

(D) Disconnection of Grounded Conductor. A switch, circuit breaker, or other device shall not be installed in a grounded conductor ~~if operation of that switch, circuit breaker, or other device leaves the marked, grounded conductor in an ungrounded and energized state.~~

No comments on the rest of the proposal.

Substantiation: (B) Deleted superfluous, confusing. wording.

(D) The only time it is permissible to open a grounded conductor is given in the two exceptions that follow, therefore the previous wording was made more succinct per Style Manual.

Panel Meeting Action: Accept in Part

Reject deletion of the phrase "if operation... :" in (D).

Accept deletion of the phrase "that it controls from the building or structure wiring system" in (B)(3).

Panel Statement: The section number should be (B3) instead of (13).

The panel accepts removing superfluous wording "that it controls from the building or structure wiring system" in (B)(3).

The panel rejects deleting the phrase "if operation... :" in (D) as it is a removes details needed for safety.

(690.31)

Submitter: Technical Correlating Committee on National Electrical Code®

Comment on Proposal No: 4-284a

Recommendation: It was the action of the Correlating Committee that the panel action on this proposal be reconsidered and the text be rewritten to use letters rather than numbers for each list item in the sub-list of 690.31(G)(3) in compliance with 2.1.5.3, Level 3 of the NEC Style Manual.

The Correlating Committee directs that the panel change the word "when" to "where" in the first sentence in this proposal and in 690.31(D) since this is not a condition of time.

The Correlating Committee further directs the panel to address the permissive use of the word "may" in the Informational Notes in accordance with the NEC Style Manual.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.

Panel Meeting Action: Accept

Revise the proposed Informational Note to 690.31(A) to read as follows:

Informational Note: Photovoltaic modules operate at elevated temperatures when exposed to high ambient temperatures and to bright sunlight. These temperatures routinely exceed 70°C (158°F) in many locations. Module interconnection conductors are available with insulation rated for wet locations and a temperature rating of 90°C (194°F) or greater.

Revise Informational Note to 690.31(C) to read as follows:

Informational Note: Photovoltaic (PV) wire [also photovoltaic (PV) cable] has a nonstandard outer diameter. Conduit fill is calculated using Table 1 of Chapter 9.

Revise 690.31(D) to read as follows:

(D) Multi-conductor Cable. Multi-conductor cable type TC-ER or USE-2 shall be permitted in outdoor locations in PV inverter output circuits <u>where</u> used with utility-interactive inverters mounted in not-readily-accessible locations. The cable shall be secured at intervals not exceeding 1.8m (6 ft.). Equipment grounding for the utilization equipment shall be provided by an equipment grounding conductor within the cable.

Revise 690.31(G) to read read as follows:

(G) Direct-Current Photovoltaic Source and DC Output Circuits On or Inside a Building. Where dc PV source or dc PV output circuits from a building-integrated or other PV systems are run inside a building or structure, they shall be contained in metal raceways, Type MC metal-clad cable that complies with 250.118(10), or metal enclosures from the point of penetration of the surface of the building or structure to the first readily accessible disconnecting means. The disconnecting means shall comply with 690.13(B), (C), and 690.15(A), (B). The wiring methods shall comply with the additional installation requirements in (1) through (4)

(<u>a</u>) Embedded in Building Surfaces. Where circuits are embedded in built-up, laminate, or membrane roofing materials in roof areas not covered by PV modules and associated equipment, the location of circuits shall be clearly marked using a marking protocol that is approved as being suitable for continuous exposure to sunlight and weather.

(b) Flexible Wiring Methods. Where flexible metal conduit (FMC) smaller than metric designator 21 (trade size 3/4) or Type MC cable smaller than 25 mm (1 in.) in diameter containing PV power circuit conductors is installed across ceilings or floor joists, the raceway or cable shall be protected by substantial guard strips that are at least as high as the raceway or cable. Where run exposed, other than within 1.8 m (6 ft) of their connection to equipment, these wiring methods shall closely follow the building surface or be protected from physical damage by an approved means.

(c) Marking or Labeling Required. The following wiring methods and enclosures that contain PV power source conductors shall be marked with the wording Warning: Photovoltaic Power Source" by means of permanently affixed labels or other approved permanent marking:

(1) Exposed raceways, cable trays, and other wiring methods

(2) Covers or enclosures of pull boxes and junction boxes

(3) Conduit bodies in which any of the available conduit openings are unused

(4) Marking and Labeling Methods and Locations. The labels or markings shall be visible after installation. The labels shall be reflective and shall have all letters capitalized with a minimum height of 9.5 mm (3/8 inch) white on red background. PV power circuit labels shall appear on every section of the wiring system that is separated by enclosures, walls, partitions, ceilings, or floors. Spacing between labels or markings, or between a label and a marking, shall not be more than 3 m (10 ft). Labels required by this section shall be suitable for the environment where they are installed.

Panel Statement: The panel accepts the recommendation of the Correlating Committee. In part (D) the word "when" was change to "where". In part (G)

the section numbers were changed to letters. The word "may" was removed from the (A) informational note and changed to "is" in the (C) informational note.

(690.31)

Submitter: Greg Pitz, Logos Solar
Comment on Proposal No: 4-284a
Recommendation: Revise text to read as follows:

(4) Marking and Labeling Methods and Locations. The labels or markings shall be visible after installation. The labels shall be reflective and shall have all letters capitalized with a minimum height of 9.5 mm (3/8 inch) ~~white~~ <u>black</u> on ~~red~~ <u>orange</u> background. PV power circuit labels shall appear on every section of the wiring system that is separated by enclosures, walls, partitions, ceilings, or floors. Spacing between labels or markings, or between a label and a marking, shall not be more than 3 m (10 ft). Labels required by this section shall be suitable for the environment where they are installed.

No comments on the rest of the proposal.

Substantiation: This Comment is to make the Proposal consistent with United States standards (ANSI standards Z35.1-1968, Z53.1-1967, Z535.2, Z535.1-6), international standards (ISO 3864 & 7010:2011), and to make it legal in the USA (OSHA federal laws, 29 CFR 1910.144 & 1910.145).

ANSI is the standards organization in the USA. The ANSI committee on Safety Signs and Colors has been keeping signage in the USA in agreement with the rest of the world since 1998. OSHA regulations are usually closely linked to ANSI standards. The IFC recently adopted the standard mentioned in the proposal, which, unfortunately, was done before checking other existing standards & laws. Attempts are being made to change said IFC standard so that it is in agreement with the standards & federal laws quoted above.

OHSA does not recognize the use of the word ″label″, formally defining all means of notification as ″signs″. ANSI & OSHA explicitly tell us that warning signs are to have black letters & symbols on orange background.

References, including OSHA interpretations of their standards (laws), available upon request.

This comment is also to coordinate with accepted proposal 1-114 Log #847, article 110.21(A) and (B)), markings.

Panel Meeting Action: Reject
Panel Statement: The panel rejects the black on orange OSHA color scheme in favor of the firefighters required color scheme.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

4-134 Log #1074 NEC-P04 **Final Action: Reject**
(690.31(B))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University
Comment on Proposal No: 4-284a
Recommendation: Delete the inserted text and retain the 2011 language.
(B) Identification and Grouping. PV source circuits and PV output circuits shall not be contained in the same raceway, cable tray, cable, outlet box, junction box, or similar fitting as conductors, feeders, branch circuits of other non-PV systems, ~~or inverter output circuits~~ unless the conductors of the different systems are separated by a partition. PV system conductors shall be identified and grouped as required by 690.31(B)(1) through (4). The means of identification shall be permitted by separate color coding, marking tape, tagging, or other approved means.
Substantiation: The panel was in error in accepting the proposal 4-194. The original language of 690.31(B) provides protections specific to the unique nature of PV sources by limiting conductors, feeders or branch circuits of **non-PV** systems within the same raceway, cable tray, cable, outlet box, junction box, or similar fitting as PV source and output circuits, because a typical person servicing a non-PV circuit expects it to be deenergized after opening all OCPD at the service panel, whereas PV source and output circuits may remain energized whenever the sun is shining. This proposal attempts to layer additional theoretical protections against the potential risk to equipment due to a double fault condition. However, the proposed inclusion of "or inverter output circuits" is contrary to the specific nature of solar inverters, places an unrealistic burden on installers and inspectors, and does not provide the safety the submitter intends.
300.3(C)(1) allows conductors of ac and dc circuits to occupy the same equipment wiring enclosure, cable, or raceway, provided all conductors have an insulation rating equal to at least the maximum circuit voltage applied to any conductor within the enclosure, cable, or raceway. Inverters have, by definition, both AC and DC inputs and outputs, and multi-mode inverters may have multiple inputs and outputs. Many manufacturers have developed balance of system components with both AC and DC circuit routing and OCPD to accommodate these multiple inputs and outputs, and enable safe and practical installation of listed inverters. This proposal would call into question whether those products could be installed as designed and intended. Adequate provisions currently exist to ensure safety in photovoltaic systems – Chapter 3 provides the wiring methods required for safety, 690.15, 16 and 17 require that devices be identified if energized from multiple sources, and 690.4(E) requires service on these systems to be performed only by qualified persons.
The 2011 NEC handbook includes commentary which clarifies the intent of this section by specifically stating this "does not permit the alternating-current branch-circuit conductors that supply an exterior luminaire installed near a roof-mounted PV array to share the same raceway or cable with the conductors of PV source circuits or PV output circuits. Conductors directly related to a specific PV system, such as those in dc and ac output power circuits, may be contained in the same raceway as PV source and output conductors, providing they meet the requirements of 690.4(B)(1) through (B)(4) and 300.3(C).
Panel Meeting Action: Reject
Panel Statement: The submitter is correct that there are allowances in Chapter 3 of the NEC for combinations of conductors in cables or raceways provided they all have appropriate insulation levels and are of the proper type circuit classification. That being said it is not commonplace for this to happen and even if it does the systems do not have the same characteristics as other electrical systems and thus have their own Article. Bringing these circuits together within listed equipment is not an issue as the equipment has been evaluated for that, the issue is outside of that equipment. Failures in conductor insulation that impose AC voltages on DC circuits of PV systems would most likely not facilitate over-current devices and could cause catastrophic damage to the circuitry within PV modules leading to module failure and potentially fires. The issue is a matter of workmanlike installations by qualified persons that have the knowledge and ability to route electrical installations and maintain separation all the way from the source to the listed equipment.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

4-135 Log #1075 NEC-P04 **Final Action: Accept in Principle**
(690.31(C)(1))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University
Comment on Proposal No: 4-290
Recommendation: Proposed Text (Modified from Proposal 4-290):
<u>PV source circuits and PV output circuits using single-conductor cable listed and labeled as PV wire of all sizes with or without a CT marking/rating shall be permitted in cable trays provided the cables are secured and supported in accordance with 338.10(B)(4)(b) and are not on or penetrating a building. PV systems using cable trays on buildings must comply with 392.</u>
Substantiation: We want to thank the CMP for considering Proposal 4-290 and request that the proposal be reconsidered. The CMP was concerned about Cable Trays being limited to Industrial Establishments in its Panel Statement. As Jim Rogers pointed out in his comment, this was a misunderstanding. The permissibility of Cable Trays outside of Industrial Establishments is directly addressed in 392.10, which states "… Cable tray installations shall not be limited to industrial establishments …" Nonetheless, after discussing the proposal with representatives of Code Making Panels 7 and 8 as suggested by Jim Rogers, we have modified the proposed modification to streamline the revision request and better align the language with the NEC style and language requirements.
In an attempt to reduce the impact of the requested revision, we have modified the proposed language to reduce its scope to PV Wire only. Also, we have focused the language on permitting the use of these cables in ground mount systems only (systems not on or penetrating a building) and have eliminated the cable tray fill and conductor ampacity guidelines. We have also made it very clear that the cables must continue to meet the support requirements that are currently required in 33810(B)(4)(b). Given that cable trays provide a superior protection and support for the PV Source circuits relative to what is already required in 690, we ask that the CMP reevaluate this proposal and adopt the streamlined language proposed in this comment.
As additional background information, it became clear during conversations with CMP 4 representatives that the problem being addressed by this revision was not well understood. Based on the Working Group's experience with designing ground mount PV systems, AHJ's have difficultly interpreting the NEC requirements for installing single conductor PV Wire cables smaller than #1/0 AWG in cable trays. The difficulty is that section 392 does NOT address installation of single conductor cables smaller than #1/0AWG in cable trays, suggesting that it is not permitted. Similarly, the TC ratings in the standards are not available for single conductor cables smaller than #1/0AWG. Using this line of reasoning, AHJs sometimes reject installing these cables in cable trays. On the other hand, the NEC permits the use of USE-2 or PV wire in PV systems (exposed, outdoor environments 690.31(B)) because these cables are designed for outdoor use. Furthermore, the support requirements for USE cables in exterior locations is only every 4.5 feet as defined in 334.30, which is referenced by 338.10(B)(4)(b). All cable tray designs are superior to both of these conditions in that they provide protection from physical damage for these cables and the maximum support spans are much less than 4.5 feet. As a result, AHJs often approve the use of cable trays in this application. As a PV System design, this uncertainty and contradiction in the NEC adds unnecessary complexity to the design process. Thus, we ask that the CMP revise 690 to resolve this contradiction.
From an engineering standpoint, we learned from conversations with UL representatives that the #1/0 AWG single conductor restriction was imposed long before our application was envisioned. Additionally, the TC rating deals

with spread of flame prevention, which is required for applications inside of buildings. Since the PV Wire standard already includes a flame resistance test, the TC rating adds no value for ground mount PV systems. The TC spread of flame test was designed to prevent cable trays that pass through firewalls from allowing a fire to breech the firewall. Clearly, this requirement is not needed for ground mount PV systems. By eliminating the TC requirement for ground mounted PV systems, it would allow PV Wire cables smaller than #1/0 AWG, which are outside of the scope of the TC standard, to be installed in cable trays. Lastly, ladder style cable trays have rung spacings ranging from 6” to 18”, with spacings between 6” and 12” typically being used for PV systems. Thus, the support provided to the cables in a cable tray is vastly superior to the requirements stipulated in 334.30.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement on Comment 4-136, which addresses the concerns of the submitter.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

ALLISON, M.: CMP-4’s changes to the proposed language would allow non-CT rated conductors on buildings, which was not the intent of the submitter.

4-136 Log #1511 NEC-P04 **Final Action: Accept in Principle in Part**
(690.31(C)(1))

TCC Action: The Correlating Committee directs that second level subdivision titles be added as follows:
(C)(1) General
(C)(2) Cable Tray
The Correlating Committee directs that the Informational Note be revised to comply with the NEC Style Manual as follows: “Informational Note: Photovoltaic (PV) wire and photovoltaic (PV) cable have a nonstandard outer diameter. See Table 1 of Chapter 9 for conduit fill calculations.”

Submitter: Mark Albers, SunPower Corp.

Comment on Proposal No: 4-290

Recommendation: **Proposed Text *(Modified from Proposal 4-290)*:**

PV source circuits and PV output circuits using single-conductor cable listed and labeled as PV wire of all sizes with or without a Cable Tray marking/rating shall be permitted in cable trays provided the cables are supported at intervals not to exceed 12 in and the cable trays are not on or penetrating a building. PV systems using cable trays on buildings must comply with 392.

Substantiation: I support the comment submitted by the PV Industry Forum. However, since this comment was submitted, a concern was raised that the requirement should be more self-sufficient and not reference Article 338 because it is defining a requirement unique to PV Systems. Consequently, I replaced the reference to 338.10(B)(4)(b) with a
requirement that the cables be supported every 12”. This maximum span is significantly smaller than the 4.5’ required in 338. It is also the largest support span typically used for cable trays currently designed into ground mounted PV systems. Since the insulation used in PV Wire cables is more robust than USE cables, it is very capable of safely spanning 12”.

I have also replaced the reference to CT with Cable Tray as the markings used for cables with the optional designation for use in Cable Trays have many different forms, CT being one of them. The term Cable Tray marking/rating will encompass all of the optional designations that might otherwise be required. As additional supporting documentation, the attached document prepared by Christel Hunter, Engineering Manager at General Cable, summarizes the additional testing required for the optional Cable Tray designations. Clearly, the designation in these two standards only requires the addition of a vertical tray flame test. As stated in the PV Industry Forum Comment Substantiation, this capability is intended to prevent the spread of fire in an indoor application and was not intended to be applied to an outdoor application. Thus, the Cable Tray rating is not necessary for a ground mounted PV system.

Panel Meeting Action: Accept in Principle in Part

The panel rejects the proposed wording “and the cable trays are not on or penetrating a building. PV systems using cable trays on buildings must comply with 392.”

Revise 690.31(C) to read as follows:

(C) Single-Conductor Cable.

(1) Single-conductor cable type USE-2, and single-conductor cable listed and labeled as photovoltaic (PV) wire shall be permitted in exposed outdoor locations in PV source circuits for PV module interconnections within the PV array.

Exception: Raceways shall be used when required by 690.31(A).

(2) PV source circuits and PV output circuits using single-conductor cable listed and labeled as Photovoltaic (PV) wire of all sizes with or without a Cable Tray marking/rating shall be permitted in cable trays installed in outdoor locations provided the cables are supported at intervals not to exceed 30cm (12 in.) and secured at intervals not to exceed 1.4m (4.5’).

Informational Note: Photovoltaic (PV) wire [also photovoltaic (PV) cable] has a nonstandard outer diameter. Conduit fill may be calculated using Table 1 of Chapter 9.

Panel Statement: The panel rejects the proposed wording “and the cable trays are not on or penetrating a building. PV systems using cable trays on buildings must comply with 392.” Outdoor locations is used for clarity and the reference to Article 392 is redundant. The panel acknowledges that PV circuits are allowed in cable trays inside a building but they must meet other applicable code requirements.

The secure interval meets the requirement of 338.10(B)(4)(b) and the support interval exceeds the requirement of 338.10(B)(4)(b).

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

ALLISON, M.: CMP-4’s changes to the proposed language would allow non-CT rated conductors on buildings, which was not the intent of the submitter.

Comment on Affirmative:

BOWER, W.: This panel member noticed two places for editorial changes in this comment. The term Photovoltiac (PV) wire capitalizes Photovoltaic because it is a wire designation. Please change photovoltaic (PV) wire in (C)(1) to Photovoltaic wire. The designation for 4.5 feet should be (4.5 ft) not (4.5’). The informational note also does not capitalize photovoltaic and it should be changed to Photovoltaic.

The panel statement is confusing where it says the support interval exceeds the requirement of 338.10(B)(4)(b). The statement could mean the support is better than required or is out of compliance. It would be better if stated “the support interval exceeds meets the requirement of 338.10(B)(4)(b).” (These are an editorial changes only)

4-137 Log #1171 NEC-P04 **Final Action: Reject**
(690.31(E))

Submitter: Greg Pitz, Logos Solar

Comment on Proposal No: 4-296

Recommendation: Revise text to read as follows:

Marking or Labeling Required. The following wiring methods and enclosures that contain PV power source conductors shall be marked with the wording “WARNING: PHOTOVOLTAIC POWER SOURCE” by means of permanently affixed labels or other approved permanent marking:

(1) Exposed raceways, cable trays, and other wiring methods

(2) Covers or enclosures of pull boxes and junction boxes

(3) Conduit bodies in which any of the available conduit openings are unused

(4) Marking and Labeling Methods and Locations. The labels or markings shall be visible after installation. The labels shall be reflective, shall have all letters capitalized with a minimum height of 9.5 mm (3/8 inch) ~~white~~ black on ~~red~~ orange background. Photovoltaic power circuit labels shall appear on every section of the wiring system that is separated by enclosures, walls, partitions, ceilings, or floors. Spacing between labels or markings, or between a label and a marking, shall not be more than 3 m (10 ft). Labels required by this section shall be suitable for the environment ~~where~~ in which they are installed.

Substantiation: This Comment is to make the Proposal consistent with United States standards (ANSI standards Z35.1-1968, Z53.1-1967, Z535.2, Z535.1-6), international standards (ISO 3864 & 7010:2011), and to make it legal in the USA (OSHA federal laws, 29 CFR 1910.144 & 1910.145).

ANSI is the standards organization in the USA. The ANSI committee on Safety Signs and Colors has been keeping signage in the USA in agreement with the rest of the world since 1998. OSHA regulations are usually closely linked to ANSI standards. The IFC recently adopted the standard mentioned in the proposal, which, unfortunately, was done before checking other existing standards & laws. Attempts are being made to change said IFC standard so that it is in agreement with the standards & federal laws quoted above.

OHSA does not recognize the use of the word ″label″, formally defining all means of notification as ″signs″. ANSI & OSHA explicitly tell us that warning signs are to have black letters & symbols on orange background.

References, including OSHA interpretations of their standards, available upon request.

″Where″ vs ″in which″: The former doesn′t precisely define which environment. Indoor? Outdoor? The site environment?

This comment is also to coordinate with accepted proposal 1-114 Log #847, article 110.21(A) and (B)), markings.

(690.35)

Submitter: Jim Eichner, Schneider Electric - Solar Business

Comment on Proposal No: 4-302

Recommendation: Revise text to read as follows:

Original ROP 4-302 was as follows:

690.35 C) Ground Fault Protection: All photovoltaic source and output circuits shall be provided with a ground-fault protection device or system that complies with (1) through(4) ~~(3)~~:

(1) <u>Determine the pv input circuit has a minimum acceptable level of isolation prior to export of current,</u>

(2) ~~Detects a ground fault.~~ Detect ground fault(s).

<u>(3)</u> Indicates that a ground fault has occurred

<u>(4)</u> Automatically disconnects all conductors or causes the inverter or charge controller connected to the faulted circuit to automatically cease supplying power to output circuits.

Schneider Electric supports improved GFP and suggests the following improvements to the above proposal (strike-through and underline in the following are relative to the above original proposal):

690.35 C) Ground Fault Protection: All photovoltaic source and output circuits shall be provided with a ground-fault protection device or system that <u>shall</u>: ~~complies with (1) through (4):~~

(1) determine the ~~pv input circuit~~ <u>Photovoltaic Power Source</u> has ~~a minimum acceptable level of~~ isolation <u>from ground</u> prior to export of current,

(2) detect ground fault(s).

(3) ~~Indicates that a ground fault has occurred~~ <u>have an annunciator that provides both a visual or audible indication, and an indication capable of being remotely monitored, that the ground fault protection system has operated</u>

(4) Automatically disconnects all conductors <u>of the faulted circuit</u> or causes the inverter or charge controller connected to the faulted circuit to automatically cease supplying power to output circuits, <u>and</u>

<u>5) be approved for the purpose.</u>

We feel these changes make the proposal more accurate and clear.

Substantiation: The proposal as originally submitted is not as clear as it could be, uses a term that is not defined, could be interpreted as disallowing a commonly accepted method, and does not require approved device or system.

Substantiation:

1. "a minimum acceptable level of" is deleted as per the Panel Statement in the ROP
2. "pv input circuit" is not a defined term - the intent of the requirement is to check the whole array - i.e. the "Photovoltaic Power Source" which is the defined NEC term.
3. "from ground" is added to make it clear what the isolation is with respect to (as opposed to isolation from the AC part of the system, or from other circuits, etc.)
4. in sub-section (3) we propose requiring additional annunciation that is able to be monitored remotely, since a local visual or audible annunciator is useless if the PV plant is 100 miles from the nearest person or on a rooftop that rarely gets accessed
5. in sub-section (4) we propose adding "of the faulted circuit" because it is not necessary to disconnect the entire array if the fault can be localized; we believe this to have been the intent of the existing requirement, but grammatically this change is needed to make that intent clear.
6. sub-section 5) "be approved for the purpose" is added because the proposal contains no values for the required isolation or ground fault detection levels and therefore the equipment standards (UL1741) must be used to determine if the system addresses the requirement properly.
7. to address grammatical problems, the opening sentence is revised to end in "shall", and the word "and" is added between items 4 and 5

Panel Meeting Action: Accept in Principle in Part

Panel Statement: See panel action on Comment 4-141.
The panel rejects the changes in 3). Specific product requirements and the remote monitoring and annunciator belong in the product standard.

The correct section reference is 690.35(C).

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

4-140 Log #1076 NEC-P04 **Final Action: Accept in Principle**
(690.35(C))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University

Comment on Proposal No: 4-302

Recommendation: Revise the text from proposal 4-302 as follows:

(C) Ground-Fault Protection. All photovoltaic source and output circuits shall be provided with a ground-fault protection device or system that complies with (1) through (4):

~~(1) Determine the pv input circuit has isolation prior to export of current~~

(1) ~~(2)~~ Detect<u>s</u> ground fault(s) <u>in the PV array dc current carrying conductors and components</u>

(2) ~~(3)~~ Indicates that a ground fault has occurred

(3) ~~(4)~~ Automatically disconnects all conductors or causes the inverter or charge controller connected to the faulted circuit to automatically cease supplying power to output circuits, and

<u>(4) Be listed for providing PV ground fault protection</u>**.**

Substantiation: Inadequate ground fault protection has caused several fires in PV systems over the last half decade. Clearly ground fault protection (GFP) capabilities need to be improved in new PV systems. As result, we applaud and support the Code Making Panel in addressing this important issue. However, the newly proposed 2014 language does raise very serious concerns. It requires the use of insulation resistance measurements in all systems at some unknown frequency. The statement of "… prior to the export of current" is not enforceable because it is unclear how frequently this test would have to be performed. It could be interpreted to be: 1) before the system is turned on for the first time; 2) every night; or 3) every time the inverter starts up. Furthermore, the new language could be interpreted to mean that the system needs to test for a ground fault <u>only</u> at this undefined time, leaving the system free to operate with a ground fault in between tests.
Additionally, insulation resistance measurements are not universally effective and will not be the best GFP for all PV system designs. Moreover, as new technologies come to market, GFP methods superior to insulation resistance measurements may emerge. We want the 2014 NEC to address the inadequacies of present GFP once and for all and not legislate the use of a specific solution. Additionally, we propose to add a requirement that the GFP be listed for protection PV systems. This will allow the inspector to rely upon the listing to verify the functionality of this extremely important protection system, which will improve the enforceability of the GFP requirements. For these reasons, we request that you adapt 690.35(C) to read as modified above. This will stimulate UL 1741 to be updated to reflect the needs for improved GFP in PV systems and to ensure that the new functional requirements are met without requiring a specific implementation/solution.

BOWER, W.: The term photovoltaic should be PV. (This is an editorial change only)

4-142 Log #1081 NEC-P04 **Final Action: Accept in Principle**
(690.35(D))

TCC Action: The Correlating Committee directs that the Panel Action on this Comment be reported as "Accept in Principle" and in addition to the revisions accepted by the Panel, revise 690.35(D)(1) as accepted in Proposal 4-305a to read as follows: "(1) Metallic or nonmetallic jacketed multiconductor cables,"
The Correlating Committee notes that the reference to Proposal 4-403 on this comment is incorrect as that proposal deals with Section 705.12(D)(7). The proper reference is Proposal 4-303.
Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University
Comment on Proposal No: 4-403
Recommendation: Revise 690.35(D) as follows adding an additional item.
690.35(D) The photovoltaic source conductors shall consist of the following:
(1) Nonmetallic jacketed multiconductor cables
(2) Conductors installed in raceways~~, or~~
(3) Conductors listed and identified as Photovoltaic (PV) Wire installed as exposed, single conductors, or
(4) Direct-buried conductors Conductors that are direct-buried and identified for direct-burial use.
Substantiation: Clarifies intent and language of previously rejected proposal. It is believed that the proposal was originally rejected because the language was incomplete and could be interpreted to allow use of direct-burial conductors anywhere in the PV system. The revised language clarifies that PV source conductors can be direct-buried underground as long as the conductors are identified for such use. "Direct-buried" means physically installed underground, not listed for direct burial. The language is consistent with other parts of the code.
Panel Meeting Action: Accept

(690.41)

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University
Comment on Proposal No: 4-307
Recommendation: Replace the text of 4-307 with the modified text as shown:
690.41 System Grounding. ~~For a photovoltaic power source, systems shall comply with 690.35, or one conductor of a 2-wire system with a photovoltaic system voltage over 50 volts, but not greater than 300 volts, and the reference (center tap) conductor of a bipolar system shall be solidly grounded or shall use other methods that accomplish equivalent system protection in accordance with 250.4(A) and that utilize equipment listed and identified for the use.~~ **[ROP 4–307]**
690.41 System Grounding. Photovoltaic systems shall comply with one of the following:
(1) Ungrounded systems shall comply with 690.35 or
(2) Grounded 2-wire systems shall have one conductor grounded or be impedance grounded, and the system shall comply with 690.5 or
(3) Grounded bipolar systems shall have the reference (center tap) conductor grounded or be impedance grounded, and the system shall comply with 690.5 or
(4) Use other methods that accomplish equivalent system protection in accordance with 250.4 (A) with equipment listed and identified for the use.
Substantiation: The reformatting as a numbered list is in response to the TCC request.
Sentence structure was modified to create parallel construction per the NEC Style Manual.
Restricting PV systems operating over 300 volts to have only ungrounded PV arrays is unnecessary for improved safety and imposes severe constraints on the design and development of future (demand response, intelligent) PV systems where other renewable resources will be interacting with PV. The US has successfully and safely operated grounded electrical systems at 600 volts and higher for more than a century. Safety issues in grounded PV systems are being addressed in both the UL Standards and in other sections of the NEC. This restriction, if instituted, would prevent the use of one of the more widely installed, highest efficiency PV modules in the world. Both small residential and large commercial installations would be impacted with no improvements in safety. Technology versus Safety would likely be compromised because additional less-efficient modules would have to be installed decreasing safety (both roof and electrical) and system reliability could be compromised.
The reference to "over 50" volts has been deleted since the list now includes all types of systems at any voltage.
Removing the "solidly" requirement makes the Code language consistent with

the PV inverters and other equipment that is manufactured and listed to UL Standards where an overcurrent device is allowed to make the dc grounding bonding jumper as a part of the NEC required ground fault protection device. Adding the allowance for impedance grounding and the reference the 690.5 adds clarity when grounded 2-wire and bipolar PV systems are installed.

4-146 Log #1290 NEC-P04 **Final Action: Reject**
(690.41)

Submitter: Fred Kracke, Schneider Electric - Solar Business
Comment on Proposal No: 4-307
Recommendation: Proposal 4-307 should be rejected for the reasons below.
Substantiation: Schneider Electric recommends rejecting this proposal and keeping the existing 690.41 from the 2011 NEC.

Substantiation: This proposal is intended to reduce fire hazards from grounded arrays, under the assumption that floating arrays are less prone to fire hazard than grounded systems. However actions by the code panel in the 2014 ROP will significantly improve ground fault protection for grounded systems, and we have already added arc fault protection in the 2011 NEC but it is just beginning to be implemented. Those improvements will accomplish more in reduction of the fire hazard than limiting the DC voltage to 300V for grounded systems, and should be allowed to be implemented for some period of time before considering further actions as impactful as the banning of grounded systems in this proposal. Grounded systems, if properly protected, have some benefits such as reduced occurrence of Potential Induced Degradation (PID) that affects module performance and lifetime, and should not be banned outright.
Panel Meeting Action: Reject
Panel Statement: See panel action and statement on Comment 4-147. The submitter's substantiation concerns are addressed by the panel action taken on Comment 4-147.

4-147 Log #1493 NEC-P04 **Final Action: Accept in Principle**
(690.41)

TCC Action: The Correlating Committee directs that the text be editorially revised to be consistent with the introductory text as follows: "(4) Other methods that accomplish equivalent system protection in accordance with 250.4(A) with equipment listed and identified for the use".
Submitter: John Smirnow, Solar Energy Industries Association
Comment on Proposal No: 4-307
Recommendation: Revise text to read as follows:

690.41 System Grounding. ~~For a photovoltaic power source, systems shall comply with 690.35, or one conductor of a 2-wire system with a photovoltaic system voltage over 50 volts, but not greater than 300 volts, and the reference (center tap) conductor of a bipolar system shall be solidly grounded or shall use other methods that accomplish equivalent system protection in accordance with 250.4(A) and that utilize equipment listed and identified for the use.~~ **[ROP 4–307]**

690.41 System Grounding. <u>Photovoltaic systems shall comply with one of the following:</u>
(1) <u>Ungrounded systems shall comply with 690.35 or</u>
(2) <u>Grounded 2-wire systems shall have one conductor grounded or be impedance grounded, and the system shall comply with 690.5 or</u>
(3) <u>Grounded bipolar systems shall have the reference (center tap) conductor grounded or be impedance grounded, and the system shall comply with 690.5 or</u>
<u>(4) Use other methods that accomplish equivalent system protection in accordance with 250.4 (A) with equipment listed and identified for the use.</u>
Substantiation: This comment is the result of a consensus process established among two groups of stakeholders: 1) the SEIA Codes and Standards Working Group, and 2) the PV Industry Forum. Participants in these groups included the following individuals:

SEIA Codes and Standards Working Group
1. Mark Albers, SunPower
2. Mark Baldassari, Enphase Energy
3. Ward Bower, SEIA
4. Bill Brooks, Brooks Engineering/SEIA
5. Joe Cain, Chair of SEIA Codes and Standards Working Group
6. Keith Davidson, SunTech
7. Darrel Higgs, Dow Solar
8. Lee Kraemer, First Solar
9. Carl Lenox, SunPower
10. Charles Luebke, Eaton
11. Martin Mesmer, E.ON
12. Steve Pisklak, Dow Solar
13. Robert Rynar, First Solar
14. Michael Schenck, First Solar
15. John Smirnow, SEIA
16. Kris VanDerzee, First Solar
17. Leo Wu, SolarCity
18. Tilak Gopalarathnam, REFUsol Incorporated

PV Industry Forum
1. Greg Ball, BEW Engineering
2. Robert Rynar, First Solar
3. Bill Brooks, Brooks Engineering
4. Jim Rogers, Town of Oak Bluffs

6. John Smirnow, SEIA
7. Keith Davidson, Suntech Power
8. Mark Albers, SunPower Corporation
9. Marv Dargatz, SolarEdge
10. Phil Undercuffler, Outback Power
11. Lee Kraemer, First Solar Robert Rynar, First Solar
12. Michael Schenck, First Solar

The reformatting as a numbered list is in response to the TCC request.

Sentence structure was modified to create parallel construction per the NEC Style Manual.

Restricting PV systems operating over 300 volts to have only ungrounded PV arrays is unnecessary for improved safety and imposes severe constraints on the design and development of future (demand response, intelligent) PV systems where other renewable resources will be interacting with PV. The US has successfully and safely operated grounded electrical systems at 600 volts and higher for more than a century. Safety issues in grounded PV systems are being addressed in both the UL Standards and in other sections of the NEC.

This restriction, if instituted, would prevent the use of one of the more widely installed, highest efficiency PV modules in the world. Both small residential and large commercial installations would be impacted with no improvements in safety. Technology versus Safety would likely be compromised because additional less-efficient modules would have to be installed decreasing safety (both roof and electrical) and system reliability could be compromised.

The reference to "over 50" volts has been deleted since the list now includes all types of systems at any voltage.

Removing the "solidly" requirement makes the Code language consistent with the PV inverters and other equipment that is manufactured and listed to UL Standards where an overcurrent device is allowed to make the dc grounding bonding jumper as a part of the NEC required ground fault protection device.

Adding the allowance for impedance grounding and the reference the 690.5 adds clarity when grounded 2-wire and bipolar PV systems are installed.
Panel Meeting Action: Accept in Principle
Revise 690.41 to read as follows:

690.41 System Grounding. Photovoltaic systems shall comply with one of the following:
(1) Ungrounded systems shall comply with 690.35
(2) Grounded 2-wire systems shall have one conductor grounded or be impedance grounded, and the system shall comply with 690.5
(3) Grounded bipolar systems shall have the reference (center tap) conductor grounded or be impedance grounded, and the system shall comply with 690.5
(4) Use other methods that accomplish equivalent system protection in accordance with 250.4 (A) with equipment listed and identified for the use.
Panel Statement: The panel removed the word "or" from the items in the list.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:

BOWER, W.: Item (4) of the list is somewhat awkward. The term "Use" to begin the sentence that ends with identified for the use is superfluous and should be deleted. The item should read "(4) Use Other methods that accomplish equivalent system protection in accordance with 250.4 (A) with equipment listed and identified for the use." (This is an editorial change only)

4-148 Log #899 NEC-P04 **Final Action: Reject**
(690.43(E))

Submitter: Paul Kovalov, Burndy LLC
Comment on Proposal No: 4-308
Recommendation: Revise text to read as follows:

690.43 (E) Adjacent Modules. Devices identified and listed for bonding the metallic frames of PV modules shall be permitted to bond the exposed metallic frames of PV modules to the metallic frames of adjacent PV modules<u>, only when such PV modules are listed and identified for the purpose of grounding and bonding</u>.
Substantiation: The joints connecting each separate section of a PV module frame, and the frame as a whole, are not tested or listed as bonding/grounding devices. The joints are evaluated for continuity within the frame so that a connection to the Equipment Grounding Conductor (EGC) can be made on only one (of the typically 4) sections of the PV module frame. By bonding the frames of adjacent PV module together, without bonding them to a continuous conductor, a device not listed for grounding the metallic frames of PV modules (the connection at the corners of each frame) is introduced into the ground path. The requirements for electrical bonds within a module frame are different from the requirements for bonding and grounding devices used for connection to the EGC.

Panel Meeting Action: Reject
Panel Statement: This comment does not comply with Section 4.4.5(b) of the NFPA Regulations Governing Committee Projects in that it does not identify the document, proposal number to which the comment is directed, and paragraph of the document to which the comment is directed.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

4-149 Log #1234 NEC-P04 **Final Action: Accept in Principle**
(690.45)

Submitter: Richard E. Loyd, Sun Lakes, AZ
Comment on Proposal No: 4-308a
Recommendation: Revise text to read as follows:
690.45 Size of Equipment Grounding Conductors. Equipment Grounding conductors for PV source and PV output circuits shall be sized in accordance with ~~Table 250.122~~ Part IVArticle 250. Where no overcurrent protective device is used in the circuit, an assumed overcurrent device rated at the PV maximum circuit current shall be used to determine the size of wire type equipment grounding conductor in Table 250.122.
Increases in equipment grounding conductor size to address voltage drop considerations shall not be required. An equipment grounding conductor shall not be smaller than 14 AWG.
Substantiation: There is some who interpret the present language to limit equipment grounding to only wire types. This change will clarify that any suitable equipment grounding conductors listed in Section 250.118 are acceptable.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
690.45 Size of Equipment Grounding Conductors. Equipment Grounding conductors for PV source and PV output circuits shall be sized in accordance with ~~Table~~ 250.122. Where no overcurrent protective device is used in the circuit, an assumed overcurrent device rated at the PV maximum circuit current shall be used when applying Table 250.122.
Increases in equipment grounding conductor size to address voltage drop considerations shall not be required. An equipment grounding conductor shall not be smaller than 14 AWG.
Panel Statement: The panel accept the concept and corrects the reference to Part IV Article 250 to 250.122. The change to "when applying" simplifies the reference to Table 250.122.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

4-150 Log #77 NEC-P04 **Final Action: Accept**
(690.46)

TCC Action: The Correlating Committee directs that the text be revised for clarity and conformance with the NEC Style Manual as follows: "For PV modules, equipment grounding conductors smaller than 6 AWG shall comply with 250.120(C)".
Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 4-309
Recommendation: The Correlating Committee directs that this proposal be reconsidered and the use of the term "solid" be clarified with respect to the use of equipment grounding conductors and grounding electrode conductors.
The Correlating Committee further directs that this proposal be clarified with respect to the use of the phrase "of 6 AWG and smaller", as it applies to equipment grounding conductors and grounding electrode conductors.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise proposed 690.46 text to read as follows.
690.46 Array Equipment Grounding Conductors. Equipment grounding conductors for PV modules smaller than 6 AWG shall comply with 250.120(C). Where installed in raceways, equipment grounding and grounding electrode conductors not larger than 6 AWG shall be permitted to be solid.
Panel Statement: The panel accepts the recommendation of the Correlating Committee. The language was changed for clarity.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14
Comment on Affirmative:
BOWER, W.: The new sentence structure is still awkward. It now reads "Equipment grounding conductors for PV modules smaller than 6 AWG shall comply with 250.120(C). The PV modules are not smaller than 6 AWG. In order to clarify the sentence it is recommended that it read "Equipment grounding conductors for PV modules sized smaller than 6 AWG that are used on PV modules shall comply with 250.120(C). (This is an editorial change only)

4-151 Log #78 NEC-P04 **Final Action: Accept in Principle**
(690.47(B), 690.47(C)(3))

TCC Action: The Correlating Committee understands that the only revision is to add a new sentence to to the end of 2011 text of 690.47(C)(3).
Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 4-310a
Recommendation: The Correlating Committee directs that Panel 4 clarify the panel action on this proposal by adding the word "for" to the final phrase of the text appended to 690.47(B) as follows: "…and for the ground-fault detection reference for ungrounded PV systems".
The Correlating Committee also directs that Panel 4 clarify the term "combined bonding grounding conductor" in the proposed revised text for 690.47(C)(3).
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept in Principle
Add the following sentence to the end of existing 2011 text of 690.47(C)(3):
For ungrounded systems, this conductor shall be sized in accordance with 250.122 and shall not be required to be larger than the largest ungrounded phase conductor.
Panel Statement: The panel revises Proposal 4-310a to remove the objectionable language as recommended by the Correlating Committee and CMP 5. A new sentence is added to the end of existing 690.47(C)(3) to acknowledge the use of an equipment grounding conductor for ground fault sensing on ungrounded systems.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

4-152 Log #277 NEC-P04 **Final Action: Accept in Principle**
(690.47(B) and 690.47(C)(3))

Submitter: Code-Making Panel 5,
Comment on Proposal No: 4-310a
Recommendation: Code-Making Panel 5 recommends rejecting this proposal.
Substantiation: The proposed language is unclear and uses undefined terms such as "equipment grounding system" and "grounding bonding conductor." It is also unclear if the proposed language modifies or enhances existing requirements in Article 250. For example, the proposal seems to restate the requirement in Article 250 that only one grounding electrode system is permitted for all of the wiring systems installed in a building or structure.
This comment was developed by a CMP-5 Task Group and balloted through the entire panel with the following ballot results:
16 Eligible to Vote
15 Affirmative
1 Ballot Note Returned (W.J. Helfrich)
The following AFFIRMATIVE comments on vote were received:
T.N. BOWMER: I agree with CMP-5's recommendation to Reject the proposal and the CMP-5 statement. The current language in 690.47(B) and 640.47(C)(3) are sufficiently clear.
P. SIMMONS: This proposal is an example of the provisions stated in 90.3 in that general grounding and bonding requirements reside in Article 250 and amendments or modification of the general rules can be made in Article 690. Minor editorial corrections can be made to make this proposal acceptable. The TCC made a required change to 690.47(B). While it is better for Code Panels to use defined terms, it is most important that the rule is clear. If CMP-4 feels the rule is important to Solar PV systems, it is suggested it be revised as follows:
690.47(C)(3) Combined Direct-Current Grounding Electrode Conductor, PV Bonding Jumper,
and Alternating-Current Equipment Grounding Conductor.
A combined dc grounding electrode conductor, PV bonding jumper, and ac equipment grounding
conductor shall comply with all the following:
1. Be unspliced or spliced in accordance with applicable requirements of 250.64(C)
2. Be connected to the connection points for the dc grounding electrode conductor or PV bonding jumper
3. Be routed with the ac circuit conductors
4. Be connected to the terminal bar for the grounded conductor or equipment grounding conductor terminal bar located in the service equipment or in the first disconnecting means for a separately derived system
5. Be the larger of the sizes specified by 250.122 based on the rating of the inverter output circuit overcurrent device or in 250.168 or 250.166
6. Be installed in accordance with 250.64(E) if applicable
Panel Meeting Action: Accept in Principle
Panel Statement: CMP 4 acknowledges the concerns expressed by CMP 5 and the Correlating Committee. As a result, CMP 4 acts on Comment 4-151 and retains only language that is necessary to facilitate ground fault detection on ungrounded systems. The remainder of Proposal 4-310a is rejected.
See panel action and statement on Comment 4-151 which addresses the concerns of the submitter.
Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

4-153 Log #79 NEC-P04 **Final Action: Accept in Principle**
(690.47(C)(2))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 4-312
Recommendation: The Correlating Committee directs that this proposal be clarified by adding "by a" before "connector listed for grounding and bonding" as an editorial correction.
This action will be considered a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept in Principle
Panel Statement: The panel accepts the intent of the Correlating Committee. See panel action on Comment 4-154.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

4-154 Log #530 NEC-P04 **Final Action: Accept**
(690.47(C)(2))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 4-312
Recommendation: Revise text to read as follows:
690.47 Rounding Electrode System.
(C) Systems with Alternating-Current and Direct-Current Grounding Requirements.
(2) Common Direct-Current and Alternating-Current Grounding Electrode. A dc grounding electrode conductor of the size specified by 250.166 shall be run from the marked dc grounding electrode connection point to the ac grounding electrode. Where an ac grounding electrode is not accessible, the dc grounding electrode conductor shall be connected to the ac grounding electrode conductor in accordance with 250.64(C)(1), 250.64(C)(2), or <u>using a</u> connector listed for grounding and bonding. **[ROP 4–312]**
Substantiation: The "or" list *250.64(C)(1), 250.64(C)(2), or connector* lacks parallelism for the third item.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

4-155 Log #1001 NEC-P04 **Final Action: Accept**
(690.47(D))

Submitter: David Clements, International Association of Electrical Inspectors
Comment on Proposal No: 4-314
Recommendation: Accept proposal 4-315 as submitted.
Substantiation: This concept of the proposed language should have been accepted with the recommended action to add new text as there is currently no 690.47(D) to revise. During the 2011 code making process a proposal was submitted to delete this section, 4-238 Log #2509 NEC-p04. This proposal was rejected by the panel. During the rewrite of this Article, this paragraph was apparently left out and does not appear in the 2011 code. This section needs to be in the code to make it clear that PV arrays require an additional grounding electrode system.
Panel Meeting Action: Accept
Panel Statement: The assumption has been made that the correct proposal in the recommendation is 4-314.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 10 Negative: 4
Explanation of Negative:
BOWER, W.: Accepting this comment and proposal 4-315 results in extraordinary expenses with little or no safety advantages for many PV systems, and is often one step too far for requirements for safety. The grounding methods specified in the proposal are not always consistent with grounding methods used for lightning protection and if the purpose of the additional electrode is lightning protection then the requirements spelled out in NFPA 780 should be used. Further, the additional electrode for grounding can lead to a ground loop with continuous earth generated currents resulting in accelerated corrosion of connections and frames resulting in loss of all ground connections.
The effectiveness of the additional grounding electrode will vary according the location of the electrode and the site of possible ground faults by external sources. The requirement is unclear. 690.47(D) says that the electrode must be "as close as practicable" to the PV array. This statement is clearly unenforceable since the practicability of locating an additional electrode is open to far too much subjectivity. This puts enforcement, designers and electricians at odds when their respective interpretations differ. The exceptions are also unclear. If the electrode is not required, does an electrode conductor still need to be run? It does not say. What is a load integral with an array? That is just another unclear statement in the proposal.
As far as applying the new requirements to smaller residential systems the additional electrode for array grounding can double the installation time and costs with little or no safety advantage. Again if lightning protection is the purpose, then the NFPA 780 requirements should dictate methodology. Some exceptions are absolutely necessary for these systems.
As for very large ground mount arrays that are now measuring miles by miles in size, where does this additional electrode reside? The same question can be asked for warehouse systems that measure city blocks long? Installation per 250.52 does not provide a location for the additional grounding electrode, just the acceptable methods. Article 260.166 only specifies the required sizes of the conductors. 250.54 does allow for multiple addition grounding electrodes, but the issues for system operation and especially ground fault protection are not studied in any detail yet.
The compromise that the panel agreed upon with an overwhelming vote at the proposal review meeting in January 2012 should be reconsidered. The panel vote kept the provision for grounding ground-mounted arrays but removed the ambiguous language related to roof mounting. By voting down the split decision (8 to 5 --insufficient to pass with the required 2/3 vote) at the comment review meeting in Redondo Beach in December 2012, the panel is simply stating that the old version of 690.47(D) needs revising to be useful for safety. Since the panel statement in the 2008 NEC cycle clearly acknowledges that they intended 690.47(D) for lightning protection and not for the safety issue of local earth potential, it appears that CMP13 was attempting to establish lightning requirements for safety reasons whereas the rest of the code does not require lightning protection for safety. Those that are concerned about providing lightning protection, which should include those installing PV systems in lightning prone areas, should follow NFPA780. NFPA780 is currently being updated to include additional detail on how to protect PV systems.
To help the panel properly come to a final decision on this issue, the history of this provision is provided. It began with the 2008 NEC. It all started with a proposal that Brooks helped develop with the PV industry. This proposal addressed PV installations where the PV array is mounted on a separate building or structure and the dc conductors are run to a different structure where the inverter and service entrance are located. In this case it can be argued that the structure that supports the PV array is required to have a grounding electrode as required by 250.52.
The 2008 NEC contained an article 690.47(D), however, in the field, it has been reported that many contractors were not installing electrodes and jurisdictions were missing the importance of having this electrode at the separate structure. The purpose of this electrode is two-fold. The primary safety concern is to hold the frames of the PV array on the separate structure to as close to local earth potential as possible --rather than relying on a long equipment grounding conductor to reference to an electrode on another structure. This is a potential shock hazard and why separate structures should always be grounded to a local electrode. The secondary purpose of the electrode on the separate structure is to provide a simple and direct path to earth for any static charge that may build up in storm activity. Hence the 2008 version created more issues than it solved and proposal 4-315 is a virtual duplication of the 2008 version of 690.47(D) except for the exceptions that did provide some clarifications. The 2011 version of the code did not include 690.47(D) at all and that appears to be a processing error.
An unintended consequence of a wide variety of installs of additional grounding electrodes is the possible interference with required ground-fault protection for PV arrays due to earth generated currents or noise in the ground loop. Published data is not yet available for the redundant grounding system of the additional grounding electrode and no study results are published.
Rejecting this comment and accepting Comment 4-158 brings the code to a neutral point where lightning protection is covered by NFPA 780 and additional electrodes, when determined to be necessary, are already covered by 250.52, 250.54 and 250.166.
One alternative being circulated among the panel is also to reject this comment and accept proposal 4-315 as modified below:
1. Reject comment 4-155, which will return the language to the action taken by the panel on proposal 4-315.
(D) Additional Electrodes for Array Grounding.
Grounding electrodes shall be installed in accordance with 250.52 at the location of all ground- and pole-mounted photovoltaic arrays. The electrodes shall be connected directly to the array frame(s) or structure. The dc grounding electrode conductor shall be sized according to 250.166. Additional electrodes are not permitted to be used as a substitute for equipment bonding or equipment grounding conductor requirements. [ROP 4 -315]
then
2. Accept in part comment 4-156 to accept the phrase, "Mounting poles or structures meeting the requirements of 250.52 shall be acceptable."
3. Accept comment 4-157 as proposed.
The result is the following:
690.47(D) Additional Auxiliary Electrodes for Array Grounding. A grounding electrode shall be installed in accordance with 250.52 and 250.54 at the location of all ground- and pole-mounted photovoltaic arrays. The electrodes shall be connected directly to the array frame(s) or structure. Mounting poles or structures meeting the requirements of 250.52 shall be acceptable. The dc grounding electrode conductor shall be sized according to 250.166. Additional electrodes are not permitted to be used as a substitute for equipment bonding or equipment grounding conductor requirements.
FRIES, R.: the panel-approved show of hands vote resulted in language that severely penalizes all small PV installations and is not a requirement that will make a small PV system operation any more safe that it already is.

Additionally, the following is what is needed but will not likely be approved by the TCC since it has not had thorough public approval or comments.
This is the recommended language.
1. Reject comment 4-155 which will return the language to the action taken by the panel on proposal 4-315.
Proposal 4-315:
(D) Additional Electrodes for Array Grounding.
Grounding electrodes shall be installed in accordance with 250.52 at the location of all ground- and pole-mounted photovoltaic arrays. The electrodes shall be connected directly to the array frame(s) or structure. The dc grounding electrode conductor shall be sized according to 250.166. Additional electrodes are not permitted to be used as a substitute for equipment bonding or equipment grounding conductor requirements. [ROP 4–315]
2. Accept in part comment 4-156 to accept the phrase, "Mounting poles or structures meeting the requirements of 250.52 shall be acceptable."
3. Accept comment 4-157 as proposed.
The final language after taking these actions will read:
690.47(D) Additional Auxiliary Electrodes for Array Grounding. A grounding electrode shall be installed in accordance with 250.52 and 250.54 at the location of all ground- and pole-mounted photovoltaic arrays. The electrodes shall be connected directly to the array frame(s) or structure. Mounting poles or structures meeting the requirements of 250.52 shall be acceptable. The dc grounding electrode conductor shall be sized according to 250.166. Additional electrodes are not permitted to be used as a substitute for equipment bonding or equipment grounding conductor requirements.

MCDANIEL, R.: This comment should have been Accepted in Principal. Accepting this proposal will REQUIRE additional grounding electrodes to ground PV arrays mounted on buildings. The requirement should permit arrays mounted on buildings to connect to the building's Grounding Electrode System.

WILLS, R.: Reject: lightning protection can and should be recommended, but not mandated, in the NEC.
The 2011 causes many problems in the field. It uses imprecise terms such as "as close as practicable".
I support Bill Brooks view and recommendation on this.

Comment on Affirmative:
STAFFORD, T.: This panel member agrees that the initial intent during the 2008 code cycle to provide additional paths to ground at or near the array was correct. The 2014 code will restore that requirement.

4-156 Log #1078 NEC-P04 **Final Action: Accept in Principle in Part**
(690.47(D))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University
Comment on Proposal No: 4-315
Recommendation: Revise the proposed text as follows
(D) Additional Electrodes for Array Grounding.
Grounding electrodes shall be installed in accordance with 250.52 at the location of all ground- and pole-mounted photovoltaic arrays. The electrodes shall be connected directly to the array frame(s) or structure. <u>Mounting poles or structures meeting the requirements of 250.52 shall be acceptable.</u> The dc grounding electrode conductor shall be sized according to 250.166. <u>Bonding this grounding electrode to other grounding electrodes in the system shall not be required.</u> Additional electrodes are not permitted to be used as a substitute for equipment bonding or equipment grounding conductor requirements.
Substantiation: The first added sentence allows the use of the mounting poles and structures to meet this requirement where they meet 250.52 requirements. Adding the second sentence shown removes any confusion in this area. The required equipment-grounding conductor connects all grounding electrodes together. An additional bonding connection between electrodes which may be hundreds or thousands of feet apart is not required or warranted, and will create parallel paths of currents in the equipment-grounding conductor. This requirement now follows practice established in 250.54 and in 250.32.
A note to CMP-4. The panel actions as published in the Draft NEC and the panel statements are not consistent and are confusing. The original proposal did not include roof top installations. The panel actions added roof top installations. The panel statement said that roof top installations were not to be included. The draft NEC follows the original proposal, not the panel actions, and does not include roof top installations.
We agree with the panel statement and the draft NEC. **Do not include roof-top installations.**
Panel Meeting Action: Accept in Principle in Part
The panel rejects the additional text: Bonding this grounding electrode to other grounding electrodes in the system shall not be required.
Panel Statement: The intent of the submitter is already met in Proposal 4-314 recognizes the use of mounting poles and structures.
The requirement to bond grounding electrodes to one another is only at a single building or structure not at separate locations. This requirement is already covered in Article 250.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:
BOWER, W.: This panel member believes it best to vote negative on the panel decision. If 4-155 is rejected and 4-158 is accepted then this comment must be rejected.
WILLS, R.: Accept in part: accept the phrase, "Mounting poles or structures meeting the requirements of 250.52 shall be acceptable."
This per Bill Brooks recommendation.

4-157 Log #1200 NEC-P04 **Final Action: Accept in Principle**
(690.47(D))

Submitter: Marvin Hamon, Hamon Engineering
Comment on Proposal No: 4-315
Recommendation: Revise text to read as follows:
690.47(D) Additional <u>Auxiliary</u> Electrodes for Array Grounding. <u>A</u> ~~G~~grounding electrodes shall be installed in accordance with 250.52 <u>and 250.54</u> at the location of all ground- and pole-mounted photovoltaic. The electrodes shall be connected directly to the array frame(s) or structure. The dc grounding electrode conductor shall be sized according to 250.166.
Additional electrodes are not permitted to be used as a substitute for equipment bonding or equipment grounding conductor requirements.
Substantiation: Change plural to singular to indicate that multiple grounding electrodes are not necessarily a requirement. One grounding electrode may be all that is needed and would follow the wording of 250.32.
Add the term "Auxiliary" to indicate that this grounding electrode is not required to be tied into the premises grounding electrode system and if multiple grounding electrodes are installed they do not need to be bonded together by a dedicated bonding conductor. The PV array grounding electrode system is a separate standalone structure and 250.50 does not require the grounding electrode systems of different structures to be bonded together. The equipment grounding conductor is sized based on 250.166 and will serve to bond the electrodes in the PV array together. A separate bonding conductor would be duplicative. All this can be written out in the article or the wording change to Auxiliary and reference to 250.54 will do the same thing.
Panel Meeting Action: Accept in Principle
The panel accepts the addition of the words "auxiliary", "and 250.54" and the change to "a grounding".
Panel Statement: See panel action and statement on Comment 4-155.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 2
Explanation of Negative:
BOWER, W.: This comment provides an improvement over the original proposal in that more than one additional electrode is allowed. Still I see ground loops being created and the uncertainty of proper operation of ground fault and arc fault protection is a major concern. This comment does not improve the original proposal or comment 4-155 enough approve it. I reject based on the uncertainties and enforcement concerns of comment 4-155. This comment must be rejected if 4-155 is rejected and 4-158 is accepted.
WILLS, R.: Accept comment 4-157 as originally proposed. 690.47(D) should then read:
690.47(D) Additional <u>Auxiliary</u> Electrodes for Array Grounding. <u>A</u> grounding electrode shall be installed in accordance with 250.52 <u>and 250.54</u> at the location of all ground- and pole-mounted photovoltaic arrays. The electrodes shall be connected directly to the array frame(s) or structure. <u>Mounting poles or structures meeting the requirements of 250.52 shall be acceptable.</u> The dc grounding electrode conductor shall be sized according to 250.166. Additional electrodes are not permitted to be used as a substitute for equipment bonding or equipment grounding conductor requirements.

4-158 Log #1201 NEC-P04 **Final Action: Reject**
(690.47(D))

Submitter: Marvin Hamon, Hamon Engineering
Comment on Proposal No: 4-315
Recommendation: Delete text to read as follows:
~~690.47(D) Additional Electrodes for Array Grounding. Grounding electrodes shall be installed in accordance with 250.52 at the location of all ground- and pole-mounted photovoltaic. The electrodes shall be connected directly to the array frame(s) or structure. The dc grounding electrode conductor shall be sized according to 250.166. Additional electrodes are not permitted to be used as a substitute for equipment bonding or equipment grounding conductor requirements.~~
Substantiation: Request that the CMP reject this proposal in its entirety. The substantiation given for this proposal is not a technical substantiation but only states that the submitter thinks that the section was deleted from the 2011 NEC in error. A review of the 2011 ROC shows that the final vote of the CMP was clearly to delete 690.47(D) from the 2011 NEC.
This article wording was initially added to the 2008 NEC for the purpose of mitigating the effects of lightening strikes but the NEC does not promulgate safety requirements relating to lightning. Article 250.54 allows the addition of grounding electrodes if desired in the PV array.
Panel Meeting Action: Reject
Panel Statement: The panel has reinstated the requirement in 690.47(D) because the installation of auxiliary grounding electrodes increases safety.
See panel action and statement on Comment 4-155.
Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
BOWER, W.: This panel member votes to reject the reject on this comment (in other words Accept). Please see my ballot comments on 4-155. Comment 4-155 rejects the original proposal and will give valuable time to study the effects of the additional electrode, the added safety versus costs, and the overall long term effects of ground loops on large systems. Accepting this comment allows 250.52, 250.54 and 250.166 to cover the additional electrode methods. Guidelines need to be published in the 2014 NEC Handbook for determination of the need for additional grounding electrodes.

4-159 Log #1506 NEC-P04 **Final Action: Accept in Principle in Part**
(690.56(B))

Submitter: William F. Brooks, Brooks Engineering
Comment on Proposal No: 4-320
Recommendation: Revise the text proposed by 4-320 with the modified text as shown:
(B) Facilities with Utility Services and PV Systems. Buildings or structures with both utility service and a photovoltaic system shall have a permanent plaque or directory providing the location of the service disconnecting means and the photovoltaic system disconnecting means if not located at the same location. The marking shall be in accordance with 690.31(E). For PV systems complying with 690.12, the plaque or directory shall include the <u>following</u> wording <u>or equivalent:</u> <u>PV SYSTEM EQUIPPED WITH RAPID SHUTDOWN. OPERATION OF RAPID SHUTDOWN REDUCES VOLTAGE OF PV SYSTEM CONDUCTORS TO NO MORE THAN 30 VOLTS INSIDE BUILDING AND 10 FEET FROM ARRAY</u>. ~~MAXIMUM VOLTAGE AT ARRAY 80VDC AFTER SHUTDOWN~~
<u>The warning sign(s) or label (s) shall comply with 110.21(B).</u>
Substantiation: The rewording is necessary for consistency with the significant rewording of 690.12 that is referenced in 690.56(B). The words “following” and “or equivalent” were added to the sentence before the sign language so that products that exceed these requirements can reword the sign to accurately state additionally where voltage is reduced. The reference to 110.21(B) was added for consistency with other additions throughout this Code.
Panel Meeting Action: Accept in Principle in Part
Reject the plaque wording.
Reject the last sentence in (B).
Revise the proposed text to read as follows:
(B) Facilities with Utility Services and PV Systems.
Buildings or structures with both utility service and a PV system shall have a permanent plaque or directory providing the location of the service disconnecting means and the PV system disconnecting means if not located at the same location. The warning sign(s) or label (s) shall comply with 110.21(B).
(C) Facilities with Rapid Shutdown Buildings or structures with both utility service and a PV system, complying with 690.12, shall have a permanent plaque or directory including the wording:
PHOTOVOLTAIC SYSTEM EQUIPPED WITH RAPID SHUTDOWN
The plaque or directory shall be reflective and shall have all letters capitalized with a minimum height of 9.5 mm (3⁄8 in.) white on red background.
Panel Statement: The new 690.56(C) was formed entitled “Facilities with Rapid Shutdown” with revised language. The sign configuration is according to NFPA 1, *Fire Code*, 2012. The panel rejected the lengthy plaque wording. The panel rejects the last sentence in (B) since it was incapable with the requirements of 110.21(B).

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 4-327
Recommendation: Continue to Accept in Principle.
Substantiation: This comment is submitted by a single individual and does not represent the work or input of the high voltage task group (HVTG). This comment attempts to address concerns stated in the negative. Safety of all electrical workers must be the first consideration when the technical committee considers raising the voltage threshold. This submitter greatly appreciates the technical committee members concern for the safety of all electrical workers. I have reviewed the impact on worker safety in each of these proposals. As the safety coordinator for IBEW Local 98 in Philadelphia, I could not support raising the voltage threshold if I felt there was a safety concern that we could not address. If there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.
The work of the high voltage task group was very broad in nature. It is widely recognized and understood that emerging technologies such as small wind and PV are breaking the 600-volt threshold making these alternative energy sources more efficient. The HVTG was directed to review this issue and to submit proposals to generate a shift in NEC requirements to specifically address these new system voltages. The HVTG submitted proposals to the technical committees with specific expertise to let each individual CMP make the decision on raising the voltage threshold. We needed a placeholder in all locations. Any CMP that felt there was a safety issue rejected the proposal. The HVTG supported those rejections in each case. The final decision lies with the technical committee.
It is important to note that if this technical committee raises the voltage threshold from 600 to 1000-volts in the NEC, the only change is the “ voltage threshold level” of the installation requirement. This change in the voltage threshold level does not permit conductors and equipment rated at 600-volts to be used at 1000-volts. That would require the conductors and equipment to be tested and listed for such use. See NFPA 70 110.3(B). There are many products that are already listed and marked for this use.
NFPA 70E requires that all employees who face a risk of electrical hazard that is not reduced to a safe level by the applicable electrical installation requirements be trained to understand the specific hazards they face. See 70E 110.2. Qualified persons are required. Energized work is only permitted where justified. See 130.2. Personal Protective equipment, including but not limited to voltage rated gloves and arc rated clothing are readily available. Training programs for electrical safe work practices for voltages over 600-volts are readily available.
There are meters and other test instruments readily available for use to day at 1000-volts. It should be noted that NFPA 70E 110.4 requires all test instruments to be properly rated and used only by qualified persons. NFPA 70E 110.2(D)(1)(4)(e) requires the qualified person be trained on the proper use and limitations of the test instrument. A quick Google search revealed the following, there are more:
Fluke 77IV, general purpose digital meter, 1000-vac, 1000-vdc
Ideal 490, general-purpose digital meter, 1000-vac, 1000-vdc
In closing, I would like to repeat that if there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.

4-164 Log #680 NEC-P04 **Final Action: Accept**
(690.80)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 4-327
Recommendation: Continue to Accept in Principle.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 4-342
Recommendation: Continue to Accept in Principle.
Substantiation: This comment is submitted by a single individual and does not represent the work or input of the high voltage task group (HVTG). This comment attempts to address concerns stated in the negative. Safety of all electrical workers must be the first consideration when the technical committee considers raising the voltage threshold. This submitter greatly appreciates the technical committee members concern for the safety of all electrical workers. I have reviewed the impact on worker safety in each of these proposals. As the safety coordinator for IBEW Local 98 in Philadelphia, I could not support raising the voltage threshold if I felt there was a safety concern that we could not address. If there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.

The work of the high voltage task group was very broad in nature. It is widely recognized and understood that emerging technologies such as small wind and PV are breaking the 600-volt threshold making these alternative energy sources more efficient. The HVTG was directed to review this issue and to submit proposals to generate a shift in NEC requirements to specifically address these new system voltages. The HVTG submitted proposals to the technical committees with specific expertise to let each individual CMP make the decision on raising the voltage threshold. We needed a placeholder in all locations. Any CMP that felt there was a safety issue rejected the proposal. The HVTG supported those rejections in each case. The final decision lies with the technical committee.

It is important to note that if this technical committee raises the voltage threshold from 600 to 1000-volts in the NEC, the only change is the " voltage threshold level" of the installation requirement. This change in the voltage threshold level does not permit conductors and equipment rated at 600-volts to be used at 1000-volts. That would require the conductors and equipment to be tested and listed for such use. See NFPA 70 110.3(B). There are many products that are already listed and marked for this use.

NFPA 70E requires that all employees who face a risk of electrical hazard that is not reduced to a safe level by the applicable electrical installation requirements be trained to understand the specific hazards they face. See 70E 110.2. Qualified persons are required. Energized work is only permitted where justified. See 130.2. Personal Protective equipment, including but not limited to voltage rated gloves and arc rated clothing are readily available. Training programs for electrical safe work practices for voltages over 600-volts are readily available.

There are meters and other test instruments readily available for use to day at 1000-volts. It should be noted that NFPA 70E 110.4 requires all test instruments to be properly rated and used only by qualified persons. NFPA 70E 110.2(D)(1)(4)(e) requires the qualified person be trained on the proper use and limitations of the test instrument. A quick Google search revealed the following, there are more:

Fluke 77IV, general purpose digital meter, 1000-vac, 1000-vdc

Ideal 490, general-purpose digital meter, 1000-vac, 1000-vdc

In closing, I would like to repeat that if there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.

4-171 Log #646 NEC-P04 **Final Action: Accept**

(692, Part VIII Title)

Submitter: James T. Dollard, Jr., IBEW Local 98

Comment on Proposal No: 4-343

Recommendation: Continue to Accept in Principle.

Substantiation: This comment is submitted by a single individual and does not represent the work or input of the high voltage task group (HVTG). This comment attempts to address concerns stated in the negative. Safety of all electrical workers must be the first consideration when the technical committee considers raising the voltage threshold. This submitter greatly appreciates the technical committee members concern for the safety of all electrical workers. I have reviewed the impact on worker safety in each of these proposals. As the safety coordinator for IBEW Local 98 in Philadelphia, I could not support raising the voltage threshold if I felt there was a safety concern that we could not address. If there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.

The work of the high voltage task group was very broad in nature. It is widely recognized and understood that emerging technologies such as small wind and PV are breaking the 600-volt threshold making these alternative energy sources more efficient. The HVTG was directed to review this issue and to submit proposals to generate a shift in NEC requirements to specifically address these new system voltages. The HVTG submitted proposals to the technical committees with specific expertise to let each individual CMP make the decision on raising the voltage threshold. We needed a placeholder in all locations. Any CMP that felt there was a safety issue rejected the proposal. The HVTG supported those rejections in each case. The final decision lies with the technical committee.

It is important to note that if this technical committee raises the voltage threshold from 600 to 1000-volts in the NEC, the only change is the " voltage threshold level" of the installation requirement. This change in the voltage threshold level does not permit conductors and equipment rated at 600-volts to be used at 1000-volts. That would require the conductors and equipment to be tested and listed for such use. See NFPA 70 110.3(B). There are many products that are already listed and marked for this use.

NFPA 70E requires that all employees who face a risk of electrical hazard that is not reduced to a safe level by the applicable electrical installation requirements be trained to understand the specific hazards they face. See 70E 110.2. Qualified persons are required. Energized work is only permitted where justified. See 130.2. Personal Protective equipment, including but not limited to voltage rated gloves and arc rated clothing are readily available. Training programs for electrical safe work practices for voltages over 600-volts are readily available.

There are meters and other test instruments readily available for use to day at 1000-volts. It should be noted that NFPA 70E 110.4 requires all test instruments to be properly rated and used only by qualified persons. NFPA 70E 110.2(D)(1)(4)(e) requires the qualified person be trained on the proper use and limitations of the test instrument. A quick Google search revealed the following, there are more:

Fluke 77IV, general purpose digital meter, 1000-vac, 1000-vdc

Ideal 490, general-purpose digital meter, 1000-vac, 1000-vdc

In closing, I would like to repeat that if there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.

4-172 Log #682 NEC-P04 **Final Action: Accept**

(692.80)

Submitter: James T. Dollard, Jr., IBEW Local 98

Comment on Proposal No: 4-342

Recommendation: Continue to Accept in Principle.

Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

ARTICLE 694 — WIND ELECTRIC SYSTEMS

4-174 Log #466 NEC-P04 **Final Action: Accept in Principle in Part**
(694.2.Rated Power)

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 4-348
Recommendation: Revise text to read as follows:
~~**Rated Power.** The wind turbines output power at a wind speed of 11 m/s (24.6 mph). If a turbine produces more power at lower wind speeds, the rated power is the wind turbines output power at a wind speed less than 11 m/s that produces the greatest output power.~~
~~**Informational Note:** The method for measuring wind turbine power output is specified in IEC 61400-12-1, *Power Performance Measurements of Electricity Producing Wind Turbines*.~~
<u>**694.4 Rated Power**</u>
<u>**694.4.1** Rated power shall be the wind turbines output power at a wind speed of 11 m/s (24.6 mph), except as indicated in 694.4.2.</u>
<u>**694.4.2** If a turbine produces more power at lower wind speeds, the rated power shall be the wind turbines output power at a wind speed less than 11 m/s that produces the greatest output power.</u>
<u>**Informational Note:** The method for measuring wind turbine power output is specified in IEC 61400-12-1, *Power Performance Measurements of Electricity Producing Wind Turbines*.</u>
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains the defined term and the NEC manual of style does not permit the definition to contain the defined term. It also contains requirements not allowed in definitions. It is probably best to eliminate this from the definition section altogether and incorporate this information as a requirement somewhere else in Article 694, for example as 694.4.
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Panel Meeting Action: Accept in Principle in Part
Reject moving definition out of 690.2
Revise rated power definition to read as follows:
Rated Power. The output power of a wind turbine at its rated wind speed.
Informational Note: The method for measuring wind turbine power output is specified in IEC 61400-12-1, Power Performance Measurements of Electricity Producing Wind Turbines.
Panel Statement: The panel accepts the submitter's proposal to correct the style manual infraction. The panel eliminated extraneous text of product specific wind speed ratings that is better addressed in product standards. As 694 applies to both large and small turbines, the revised text is now correct for all turbines. Additional proposed sections are unnecessary.
Style Manual 2.2.2.2 requires definitions to be in section.2.

4-177 Log #1455 NEC-P04 **Final Action: Accept in Principle**
(694.7(B))

Submitter: Robert H. Wills, Intergrid, LLC
Comment on Proposal No: 4-353
Recommendation: Recommendation: Revise Clause 694.7(B) as follows:
(B) Equipment. ~~Inverters used in small w~~ Wind electric systems <u>electrical</u> equipment, <u>electrical</u> subassemblies and <u>electrical</u> components shall be ~~identified and~~ listed for the application.
(Deletes are from 4-354. Inserts are new to this comment)
Substantiation: The original (2011) language was "Inverters used in small wind electric systems shall be identified and listed for the application.". The intent of the change is to require that other <u>**electrical**</u> equipment be listed, but the change proposed in 4-354 resulted in a much broader requirement – potentially that <u>**all**</u> equipment, subassemblies and components (including mechanical and passive components, nuts and bolts..) would need to be listed. The change proposed here clarifies that the listing requirement is only for electrical devices. The repeated use of the word "electrical" is awkward, but does eliminate ambiguity.
Panel Meeting Action: Accept in Principle
Panel Statement: See panel action and statement on Comment 4-178 which addresses the submitter's concerns.
Number Eligible to Vote: 13

Ballot Results: Affirmative: 13

4-178 Log #1456 NEC-P04 **Final Action: Accept in Principle**
(694.7(B))

TCC Action: The Correlating Committee directs that the Informational Note be deleted because it does not comply with the NEC Style Manual as it contains a permissive statement of compliance.
Submitter: Robert H. Wills, Intergrid, LLC
Comment on Proposal No: 4-353
Recommendation: Recommendation: Revise Clause 694.7(B) as follows:
(B) Equipment. ~~Inverters used in small w~~ Wind electric systems ~~equipment, subassemblies components~~ shall be ~~identified and~~ listed for the application.
Substantiation: The original (2011) language was "Inverters used in small wind electric systems shall be identified and listed for the application.".
Proposal 4-354 broadened the scope to include all equipment, subassemblies and components.
This has two problems:
1/ it implies that non-electrical components are required to be listed
2/ it implies that individual components are required to be listed even if the complete wind electric system is listed "as a system". This is akin to requiring that all components in a listed TV be themselves listed.
This change proposed here encompasses the intent of proposal 4-353 and 4-354 (that NRTLs review and list wind electric systems for safety), without the problems noted above.
Panel Meeting Action: Accept in Principle
Revise 694.7(B) Equipment to read as follows:
694.7(B) Equipment. Wind electric systems shall be listed and labeled for the application.
Informational Note: Compliance with this requirement may be achieved by field evaluation.
Panel Statement: The addition of the words "and labeled" addresses Comment 4-175. The term "labeled" is used rather than "marked" as the former is a defined term. The informational note was added to recognize the possible need for field evaluations of wind turbines.

694.23 Turbine Shutdown. [ROP 4–364a]
(A) Manual Shutdown.
Exception: *Turbines with a ~~swept area of less than 50 m2~~ blade length of 4 m (13 ft) or less shall not be required to have a manual shutdown button or switch.*
Substantiation: Why make it hard?
Panel Meeting Action: Reject
Panel Statement: The convention of the wind industry is to categorize turbine size by swept area rather than blade length. The blade length does not account for the diameter of the hub. No technical substantiation was provided by the submitter to justify the change.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

4-185 Log #85 NEC-P04 **Final Action: Accept**
(694.40)

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 4-370a
Recommendation: The Correlating Committee directs that the panel clarify the text in (A) with respect to the use of the word "grounded".

The Correlating Committee further directs that this proposal be forwarded to Code-Making Panel 5 for comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the recommendation of the Correlating Committee. The Correlating Committee's request to clarify use of the term "grounded" is satisfied by the panel action on Comment 4-186.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

4-186 Log #278 NEC-P04 **Final Action: Accept in Principle in Part**
(694.40)

Submitter: Code-Making Panel 5,
Comment on Proposal No: 4-370a
Recommendation: Code-Making Panel 5 recommends amending 694.40 as follows:
694.40 Equipment Grounding:
(A) General. Exposed non-current-carrying metal parts of towers, turbine nacelles, other equipment, and conductor enclosures shall be grounded in accordance with Parts IV, V and VI of Article 250. ~~Turbine output circuits shall be permitted to be grounded but shall not be required to be grounded.~~ Attached metal parts such as turbine blades and tails that ~~have no source of electrical energization~~ that are not likely to become energized ~~are~~ shall not be required to be grounded or bonded.
(B) Tower Grounding and Bonding
(1) ~~Auxiliary~~ Grounding Electrodes and Grounding Electrode Conductors. A wind turbine tower shall be connected to a grounding electrode system. ~~one or more auxiliary grounding electrodes to limit voltages imposed by lightning. The auxiliary grounding electrodes shall comply with 250.52(A) in form and 250.54 for connections using a grounding electrode conductor that complies with 250.166 for dc systems and 250.62 through 250.70 for ac systems. Electrodes that are part of the tower foundation and meet the requirements for concrete encased electrodes in accordance with 250.52(A)(3) shall be acceptable. A grounded metal tower support shall be considered acceptable where meeting the requirements of 250.136(A).~~ Where installed in close proximity to galvanized foundation or tower anchor components, galvanized grounding electrodes shall be used.
Informational Note: Copper and copper-clad grounding electrodes, where used in highly conductive soils, can cause electrolytic corrosion of galvanized foundation and tower anchor components.
~~(2) Tower Bonding. An equipment grounding conductor or supply side bonding jumper shall connect a turbine to the main or system bond and premises grounding system in accordance with 250.110.~~
~~(3) Tower Connections. Equipment grounding conductors and grounding electrode conductors, where used, shall be connected to the metallic tower by exothermic welding, listed lugs, listed pressure connectors, listed clamps, or other listed means. Devices, such as connectors and lugs, shall be suitable for the material of the conductor and the structure to which the devices are connected. Where practicable, contact of dissimilar metals shall be avoided anywhere in the system to eliminate the possibility of galvanic action and corrosion. All mechanical elements used to terminate these conductors shall be accessible.~~
~~(4) Lightning Protection. Where a lightning protection system is present, its ground terminals shall be bonded to the tower grounding electrode system as required by 250.106. Where the tower is remote from the building or structure served, the tower grounding electrode system shall be permitted to be made a part of the lightning protection system.~~
Informational Note: See NFPA 780-2011, Standard for the Installation of Lightning Protection Systems, Informative Annex N, Wind Turbine Generator System
(~~5~~2) Guy Wires. Guy wires used to support turbine towers shall not be required to be connected to an equipment grounding or bonding conductor or to comply with the requirements of 250.110.
Informational Note: Guy wires supporting grounded towers are unlikely to become energized. Grounding of metallic guy wires may be required by lightning codes. ~~See 694.40(B)(4).~~
Substantiation: In 694.40(A), Code-Making Panel 5recommends revising the text for clarity and compliance with the style manual. The requirement for grounding turbine output circuits does not belong in the Equipment Grounding section and should be relocated.

In 694.40(B)(1), Code-Making Panel 5has determined that the grounding electrodes described do not fit the definition of an auxiliary grounding electrode but agrees that a clear requirement for the installation of a grounding electrode system at the tower location is necessary. Text that restates the requirements of Article 250 has been deleted. Duplicating requirements already found in other sections of the Code creates confusion.

In 694.40(B)(2), Code-Making Panel 5 recommends deleting this section because it is unclear and does not appear to introduce requirements that are not found in Article 250. Duplicating requirements already found in other sections of the Code creates confusion. It is not clear if this section is intended to refer to tower bonding, turbine bonding or the connection to the premises wiring system grounding and bonding conductors. Furthermore, this section uses terms that are not defined such as "main or system bond."

In 694.40(B)(3), Code-Making Panel 5 recommends deleting this section because it does not appear to introduce requirements that are not already found in Article 250. The requirements for avoiding contact of dissimilar metals are found in 110.14. Duplicating requirements already found in other sections of the Code creates confusion.

In 694.40(B)(4), Code-Making Panel 5 recommends deleting this section because the requirements are already found in Article 250. Duplicating requirements already found in other sections of the Code creates confusion. The Informational Note should be relocated to another section or deleted.

In 694.40(B)(5), the section has been renumbered and the reference to

694.40(B)(4) in the Informational Note has been deleted because the section has been deleted.

This comment was developed by a CMP-5 Task Group and balloted through the entire panel with the following ballot results:

16 Eligible to Vote

15 Affirmative

1 Ballot Note Returned (W.J. Helfrich)

The following AFFIRMATIVE comments on vote were received:

T.N. BOWMER: I concur in general with the CMP5 recommended changes but do not fully agree with the substantiation; in particular, I agree with CMP5 proposed changes to proposed 694.40 (A) and introduction of reference to Parts IV, V and VI of Article 250. However, I disagree that duplication of requirements that are already found in other sections of the code necessarily creates confusion. For example, the text in section 690.40 (B) items (1), (2), (3) and (4) is useful information to have explicitly referenced in Article 694 and it could be included in a informational note. Secondly, I disagree with the removal of the sentence "Turbine output circuits shall be permitted to be grounded but shall not be required to be grounded" from article 690.40. This observation on output circuits should be included somewhere in the Article 690.

P. SIMMONS: Revise CMP-5's recommendation in part as follows:

694.40 Equipment Grounding and Bonding

(A) General. Exposed non-current-carrying metal parts of towers, turbine nacelles, other equipment, and conductor enclosures shall be grounded and bonded in accordance with Parts IV, V and VI of Article 250.

(B)(1) Grounding Electrodes and Grounding Electrode Conductors. A wind turbine tower shall be connected to a grounding electrode or grounding electrode system in compliance with Part III of Article 250. Statement: 694.40 covers both grounding and bonding so the bold-face title and text of (A) must contain both words.

The text in (B)(1) requires revision since a single grounding electrode may satisfy the requirements and not be referred to as a grounding electrode system. The sentence should contain the reference to Part III of Article 250 as that is the part where the selection and installation requirements for grounding electrodes and grounding electrode conductors are located.

Panel Meeting Action: Accept in Principle in Part

Reject the deletion of (B)(2) and (B)(3).

Revise 694.40 to read as follows:

694.40 Equipment Grounding:

(A) General. Exposed non-current-carrying metal parts of towers, turbine nacelles, other equipment, and conductor enclosures shall be grounded in accordance with Parts IV, V and VI of Article 250. Attached metal parts such as turbine blades and tails that that are not likely to become energized shall not be required to be grounded or bonded.

(B) Tower Grounding and Bonding

(1) Grounding Electrodes and Grounding Electrode Conductors. A wind turbine tower shall be connected to a grounding electrode system. Where installed in close proximity to galvanized foundation or tower anchor components, galvanized grounding electrodes shall be used.

Informational Note: Copper and copper-clad grounding electrodes, where used in highly conductive soils, can cause electrolytic corrosion of galvanized foundation and tower anchor components.

(2) Bonding Conductor. Equipment grounding conductors or supply side bonding jumpers as applicable shall be required between turbines, towers and the premises grounding system in accordance with Parts V and VI of Article 250.

(3) Tower Connections. Equipment grounding conductors and grounding electrode conductors, where used, shall be connected to metallic towers using listed means. All mechanical elements used to terminate these conductors shall be accessible.

(4) Guy Wires. Guy wires used to support turbine towers shall not be required to be connected to an equipment grounding or bonding conductor or to comply with the requirements of 250.110.

Informational Note: Guy wires supporting grounded towers are unlikely to become energized. Grounding of metallic guy wires may be required by lightning codes. For information on lightning protection systems, see NFPA 780-2011, Standard for the Installation of Lightning Protection Systems, Informative Annex N, Wind Turbine Generator Systems.

Panel Statement: The panel simplified and clarified the proposed language. It is important to state the requirement for bonding as turbines are often located far from the premises and some installers wrongly assume that electrodes can perform the bonding function.

The proposed language for (B)(3) [Tower Connections] is retained in part to ensure that a reliable connection is made to the tower, and to maintain the important requirement for accessibility to connections (for inspection) which is not included in Article 250.

The informational notes were combined for clarity.

(694.80)

Submitter: James T. Dollard, Jr., IBEW Local 98

Comment on Proposal No: 4-373

Recommendation: Continue to Accept in Principle.

Substantiation: This comment is submitted by a single individual and does not represent the work or input of the high voltage task group (HVTG). This comment attempts to address concerns stated in the negative. Safety of all electrical workers must be the first consideration when the technical committee considers raising the voltage threshold. This submitter greatly appreciates the technical committee members concern for the safety of all electrical workers. I have reviewed the impact on worker safety in each of these proposals. As the safety coordinator for IBEW Local 98 in Philadelphia, I could not support raising the voltage threshold if I felt there was a safety concern that we could not address. If there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.

The work of the high voltage task group was very broad in nature. It is widely recognized and understood that emerging technologies such as small wind and PV are breaking the 600-volt threshold making these alternative energy sources more efficient. The HVTG was directed to review this issue and to submit proposals to generate a shift in NEC requirements to specifically address these new system voltages. The HVTG submitted proposals to the technical committees with specific expertise to let each individual CMP make the decision on raising the voltage threshold. We needed a placeholder in all locations. Any CMP that felt there was a safety issue rejected the proposal. The HVTG supported those rejections in each case. The final decision lies with the technical committee.

It is important to note that if this technical committee raises the voltage threshold from 600 to 1000-volts in the NEC, the only change is the " voltage threshold level" of the installation requirement. This change in the voltage threshold level does not permit conductors and equipment rated at 600-volts to be used at 1000-volts. That would require the conductors and equipment to be tested and listed for such use. See NFPA 70 110.3(B). There are many products that are already listed and marked for this use.

NFPA 70E requires that all employees who face a risk of electrical hazard that is not reduced to a safe level by the applicable electrical installation requirements be trained to understand the specific hazards they face. See 70E 110.2. Qualified persons are required. Energized work is only permitted where justified. See 130.2. Personal Protective equipment, including but not limited to voltage rated gloves and arc rated clothing are readily available. Training programs for electrical safe work practices for voltages over 600-volts are readily available.

There are meters and other test instruments readily available for use to day at 1000-volts. It should be noted that NFPA 70E 110.4 requires all test instruments to be properly rated and used only by qualified persons. NFPA 70E 110.2(D)(1)(4)(e) requires the qualified person be trained on the proper use and limitations of the test instrument. A quick Google search revealed the following, there are more:

Fluke 77IV, general purpose digital meter, 1000-vac, 1000-vdc

Ideal 490, general-purpose digital meter, 1000-vac, 1000-vdc

In closing, I would like to repeat that if there is any concern that the safety of electrical workers is impacted, CMP-4 should reject all proposals seeking to raise the voltage threshold.

4-189 Log #685 NEC-P04 **Final Action: Accept**
(694.80)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 4-373
Recommendation: Continue to Accept in Principle.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

ARTICLE 695 — FIRE PUMPS

13-32 Log #795 NEC-P13 **Final Action: Accept**
(695.1(B)(3))

TCC Action: The Correlating Committee advises that article scope statements are the responsibility of the Correlating Committee and the Correlating Committee accepts the panel action.
Submitter: John R. Kovacik, UL LLC
Comment on Proposal No: 13-48a
Recommendation: Revise text to read as follows:
(3) Transfer equipment upstream of the fire pump transfer switch<u>(es)</u>
Substantiation: The revision of "switch" from singular to plural will correlate with Section 10.8.2.3 of NFPA 20-2013 which permits a fire pump to have one or more dedicated transfer switches where a transfer switch or switches are required. A transfer switch dedicated to a fire pump is a fire pump transfer switch.
NFPA 20 - 10.8.2.3 Transfer Switch. Each fire pump shall have its own dedicated transfer switch(es) where a transfer switch(es) is required.
Panel Meeting Action: Accept
Number Eligible to Vote: 21
Ballot Results: Affirmative: 20 Negative: 1
Explanation of Negative:
CARON, D.: 695.1(B)(3) was added to eliminate confusion with switching between 2 sources that takes place upstream in main electric rooms in multi-building Campus-style Complexes. Distribution systems that utilize 2 main switchboards with a tie circuit breaker, that have a feeder from each side of the tie breaker serving a transfer switch upstream of the fire pump controller/transfer switch combination, that also serve only fire pump loads, are not required to be in the pump room or listed for fire pump use. There is almost no instance where a fire pump motor would have two transfer switches listed for fire pump use. CMP-13 needs to eliminate the conflicting text between NFPA 20 9.2.2(4) and NFPA 70 695.3(C). NFPA 20 has it right.

13-33 Log #290 NEC-P13 **Final Action: Hold**
(695.3 and 695.4(A))

TCC Action: The Correlating Committee directs that the items referenced in panel action be reported as "Hold."
Submitter: Richard Schneider, Lancaster, SC
Comment on Proposal No: 13-55a
Recommendation: Retain text as per ROP which is:
Change existing 695.3(F) to 695.3(G). NEW 695.3(F) to read:
695.3(F) Transfer of Power. Transfer of power to the fire pump controller between the individual source and one alternate supply shall take place within the pump room. (20:9.6.4)
695.3(G) Phase Converters. Phase converters shall not be permitted to be used for fire pump service. (20:9.1.7)
Reject Comment on Affirmative for 695.3(F):
Overcurrent Device Selection
Delete/reject the entire proposed 695.3(F) text pertaining to Overcurrent Device Protection proposed by Mr. Neil Czarnecki. There was no Panel action on this proposed text - it was merely a comment on the affirmative.
Add new New 695.3(H)
<u>Individually, Listed Fire Pump Controller and Power Transfer Switch Assembly (20:10.8.2.2 & 10.8.2.3).</u>
<u>a) Each fire pump shall have its own dedicated transfer switch, listed for fire service, where a transfer switch is required (20:10.8.2.3)</u>
<u>b) A transfer switch separate from the fire pump controller is to be enclosed and contain its own overcurrent device in the same enclosure. The overcurrent device shall be selectively coordinated as required in 695.3(C)(3)</u>
<u>c) This transfer switch assembly shall be SUSE (Suitable for Use as Service Equipment) rated when so used</u>
<u>d) The disconnect contained therein shall not count against the quota established in 695.4(B)(1)</u>
Revising 695.4(A) as follows:
695.4(A) Direct Connection. The supply conductors shall directly connect the power source to either a listed fire pump controller or listed combination fire pump controller and power transfer switch <u>or the listed transfer switch assembly described in 695.3(H).</u>
Substantiation: NEMA Proposal 13-55a was to commensurate changes in NEC 695 as extracted from revised NFPA 20 (2013), 10.8.2.2 (aka Fig. A.10.8 ARRANGEMENT II). One of the changes was that the CB contained in the upstream ATS Assembly (being an upstream disconnect) was NOT to count against the quota (of 1 max) established in NFPA 20, 9.2.3. That statement did not get included in 13-55a as proposed, but should have.
The intent is to have the Upstream ATS Assembly comply with Article 230, using a THERMAL-MAGNETIC CB, since it needs most often to be SUSE rated. Proposal 13-55a purports to permit the use of an INSTANTANEOUS CB which has RESTRICTED APPLICATION per NEC 430.52(C)(3) thus making the upstream ATS assembly noncompliant with the requirements of Article 230. Additionally, there is a safety concern since the load wiring to the fire pump controller is FIELD WIRING which would remain unprotected up to >20 times the FLC of the motor (NEC 700.27).
The correct Proposal should not permit the use of an Instantaneous CB and leave it as a Thermal Mag thus making this upstream transfer switch assembly compliant with the remainder of the NEC.
(UL 1008 will be updated accordingly at a future time.)
Panel Meeting Action: Accept in Principle in Part
CMP-13 holds the proposed new 695.3(H) and the reference in 695.4(A). Reject the recommendation in reference to the affirmative comment. The remainder is accepted in principle.
Panel Statement: The proposed new 695.3(H) has not had public review and is new material. A technical committee cannot reject an affirmative comment. See the action and statement on Comment 13-37.

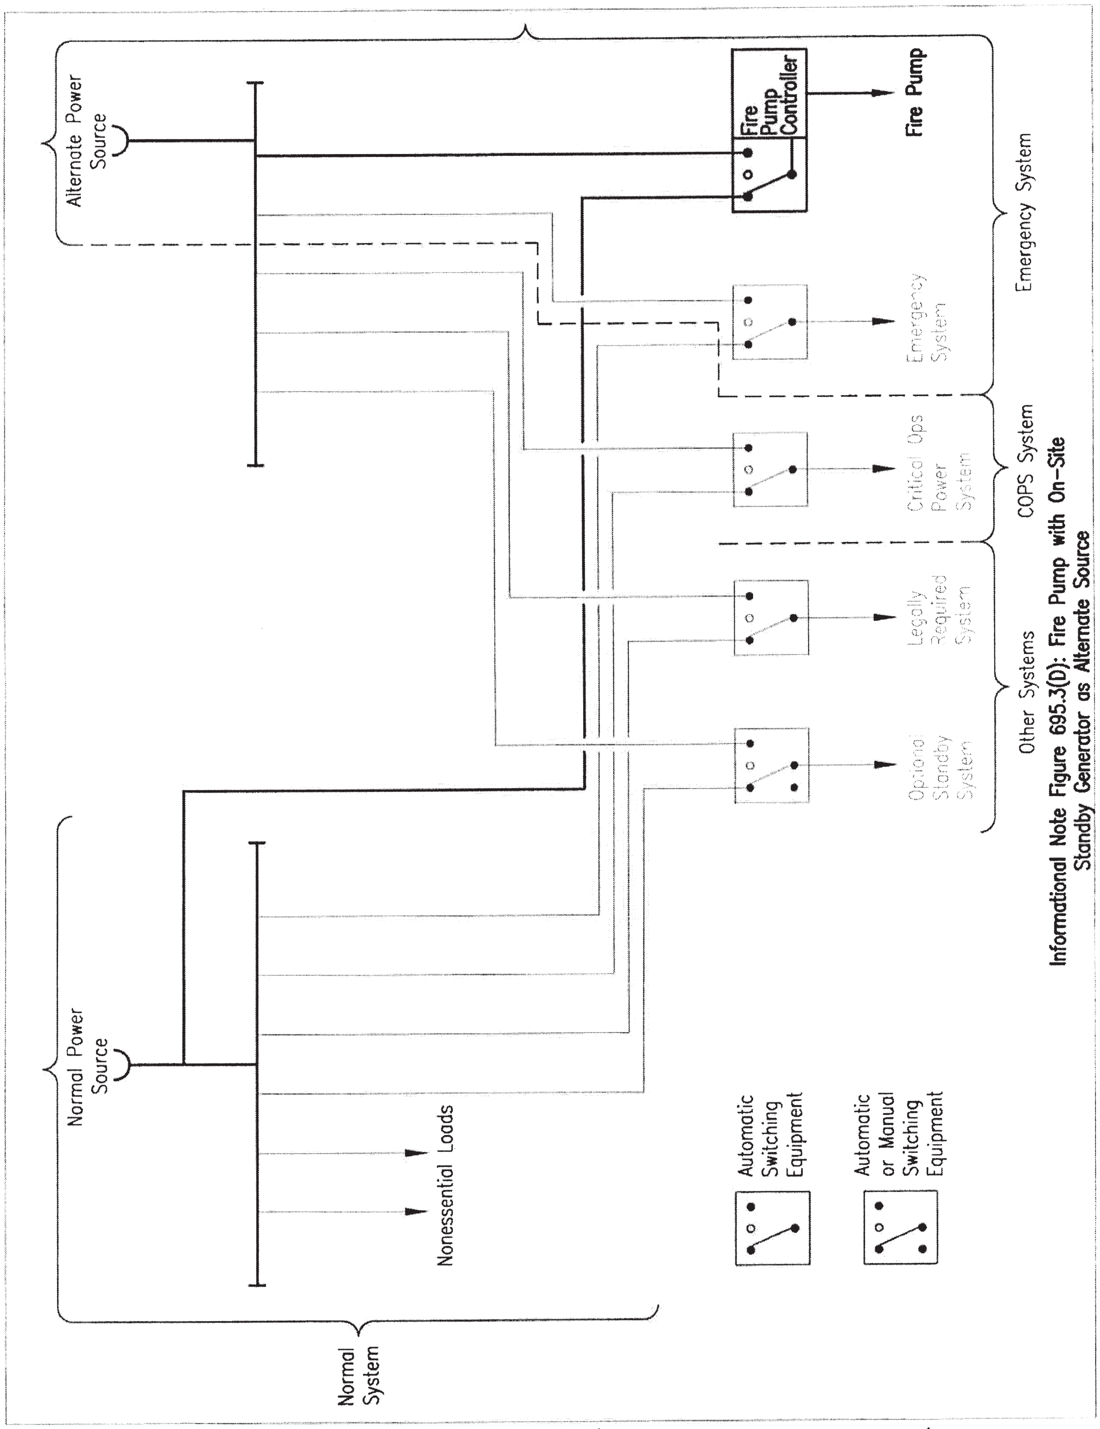
13-35 (Log #413) Figure 695(D)



Informational Note Figure 695.3(D): Fire Pump with On-Site Standby Generator as Alternate Source

13-37 Log #434 NEC-P13 **Final Action: Accept in Principle**
(695.3(F))

Submitter: William F. Stelter, Master Control Systems, Inc.
Comment on Proposal No: 13-55a
Recommendation: Revise text to read as follows:
(F) Transfer of Power. Transfer of power to the fire pump controller between the individual source and one alternate source shall take place within the pump room. ~~The transfer switch shall be listed for fire pump service.~~ [20:9.6.4] ~~[20:10.8.1.1]~~
(1) Power Source Selection. Selection of power source shall be performed by a transfer switch listed for fire pump service. [20:10.8.1.1]
(2) Overcurrent Device Selection. An instantaneous trip circuit breaker shall be permitted in lieu of the overcurrent devices specified in 695.4(B)(2)(a)(1) provided it is part of a transfer switch assembly listed for fire pump service which complies with 695.4(B)(2)(a)(2). [20:10.8.2.2(2)]
Substantiation: The overcurrent protection for the fire pump circuit must be coordinated with the fire pump controller circuit breaker such that the fire pump controller circuit breaker is the only device to trip. This is to assure that emergency personnel entering a building during a fire only have to evaluate the fire pump controller for a locked rotor trip. It also allows the circuit to operate at 300 percent current continuously, to allow for single phase running, until failure occurs. Further, it assures that an immediate restart won't trip the circuit breaker. 695.4(B)(2)(a)(2) identifies that minimum overcurrent characteristics for any overcurrent device in this circuit to assure this coordination.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
(F) Transfer of Power. Transfer of power to the fire pump controller between the individual source and one alternate source shall take place within the pump room. ~~The transfer switch shall be listed for fire pump service.~~ [20:9.6.4] ~~[20:10.8.1.1]~~
(1) Power Source Selection. Selection of power source shall be performed by a transfer switch listed for fire pump service. [20:10.8.~~1~~.3.1]
(2) Overcurrent Device Selection. An instantaneous trip circuit breaker shall be permitted in lieu of the overcurrent devices specified in 695.4(B)(2)(a)(1) provided it is part of a transfer switch assembly listed for fire pump service which complies with 695.4(B)(2)(a)(2). ~~[20:10.8.2.2(2)]~~
Panel Statement: CMP 13 has corrected extract reference numbers by revising and deleting the extract reference number where necessary for consistency.

13-38 Log #1360 NEC-P13 **Final Action: Accept in Principle**
(695.3(F))

Submitter: Douglas Stephens, ASCO Power Technologies (Firetrol)
Comment on Proposal No: 13-55a
Recommendation: Add text to read as follows:
(2) Overcurrent Device Selection. An instantaneous trip circuit breaker shall be permitted in lieu of the overcurrent devices specified in 695.4(B)(2) provided it is part of a transfer switch assembly listed for fire pump service.
Substantiation: This comment is submitted in support of the addition to 695.3(F) made by Mr. Czarnecki. A listed power transfer switch assembly with factory installed instantaneous trip circuit breakers for overcurrent protection in accordance with Arrangement II of NFPA20-2013 [10.8.2.2 and 9.2.3.4.1] is suitable for providing factory set, selective coordination of the overcurrent devices for both the normal and alternate sources with the downstream fire pump controller. These instantaneous trip breakers need only provide short-circuit protection since motor overload protection is provided by the circuit breaker locked rotor protector in the fire pump controller where the overload needs to be cleared.
A listed assembly provides certain protections to the owner and his property. It thwarts the wide-spread, improper use of instantaneous trip circuit breakers as standalone, overcurrent protection devices installed upstream of the traditional power transfer switch outside of a listed assembly. Including these devices in a listed assembly means that components, ratings, markings, testing, coordination, safety, instructions, etc. must all be investigated and approved by the agency. Further, it would mean that the isolating switch (optional) and circuit breaker are properly "supervised" as required by existing code. The bottom line is that the listed assembly takes all of the guess work out of coordination and supervision of the transfer switch with the fire pump controller and provides reliable power with proper protection for the owner and his property. The industry can install these listed assemblies ahead of the fire pump controller and use them with confidence.
Panel Meeting Action: Accept in Principle
Panel Statement: See the action on Comment 13-37.

13-41 Log #1468 NEC-P13 **Final Action: Accept**
(695.4(A))

Submitter: John R. Kovacik, UL LLC
Comment on Proposal No: 13-55a
Recommendation: Add new text to read as follows:
695.4 Continuity of Power
Circuits that supply electric motor-driven fire pumps shall be supervised from inadvertent disconnection as covered in 695.4(A) or (B).
(A) Direct Connection. The supply conductors shall directly connect the power source to ~~either~~ a listed fire pump controller, or listed combination fire pump controller and power transfer switch, or a listed fire pump power transfer switch.
Substantiation: Proposal 13-55a clarified that the fire pump transfer switch shall be located in the pump room. Fire pump transfer switches are provided in two types, a combination fire pump controller and transfer switch, or a stand-alone fire pump transfer switch. The latter is omitted from 695.4 which define the permissible connection means from the power source to the fire pump equipment. The added text corrects this omission and correlates with the requirements of NFPA 20-2013.

See Figure A.10.8 of NFPA 20-2013 on Page 381.

Recommendation: Revise the proposal by referring to the new section 110.25.
(2) Be lockable in accordance with 110.25 ~~in the closed position.~~ Delete the remainder of (2).
Substantiation: This proposal satisfies the intent of the submitter while maintaining consistency with other sections of the Code that refer to the new section 110.25.
Panel Meeting Action: Reject
Panel Statement: The requirements of 110.25 are only for disconnects locked in the open position.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 21

13-46 Log #558 NEC-P13 **Final Action: Accept in Principle**
(695.6(A)(2)(d)(1))

Submitter: Richard E. Loyd, Sun Lakes, AZ
Comment on Proposal No: 13-68
Recommendation: Reconsider and retain (1) be encased in 50mm (2 inches) of concrete.
Substantiation: I agree with Degnan and Ode's comments on their negative voting.
This requirement has been in the code continuously since Article 695 first appeared in the NEC. The submitter is in error as the 2 hour fire rating being discussed was never a condition for using 695.6(A)(2)(d)(1). The committee's substantiation is also in error in comparing the 2 inches of concrete with a 2 hr fire rating.
There has been no substantiation to remove this useful condition of use, nor has there been any substantiation submitted that it compromises the safety of the building or that it has ever failed to provide protection during an actual fire.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
(d) Inside of a Building. Where routed through a building, the conductors shall be installed using one of the following methods:
(1) Be encased in a minimum ~~50~~ 100 mm (~~2~~ 4 in.) of concrete~~-~~
(2) Be installed under not less than 50 mm (2 in.) of concrete on grade
(~~2~~3) Be protected by a fire-rated assembly listed to achieve a minimum fire rating of 2 hours and dedicated to the fire pump circuit(s)
(~~3~~4) Be a listed electrical circuit protective system with a minimum 2-hour fire rating
Informational Note: UL guide information for electrical circuit protective systems (FHIT) contains information on proper installation requirements to maintain the fire rating.
Exception to (A)(2)(d): The supply conductors located in the electrical equipment room where they originate and in the fire pump room shall not be required to have the minimum 2-hour fire separation or fire resistance rating, unless otherwise required by 700.10(D) of this Code.
Panel Statement: The committee acknowledges that 2 in. of concrete is not sufficient to provide 2 hours of fire rating for areas other than a slab on grade. The committee continues to accept the 4 in. of concrete concept that was submitted during the 2011 cycle.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 18 Negative: 3
Explanation of Negative:
DEGNAN, J.: The submitter commented in support of retaining the 2" of concrete that is in the 2011 code, the panel's action to double the distance is not accepting the principle of the submitter's proposal, it is completely changing the submitter's intent.
While temperature performance issues have been identified with 2" of concrete, it is not clear that they will be resolved with 4" concrete. If the panel changes the code they should be able to cite field performance data that substantiates that 2" of concrete has resulted in loss of life in a statistically significant number of building fires, and that this will be corrected by extension to 4" of concrete.
ODE, M.: I agree with negative votes of Mr. Degnan and Mr. Spina. The Comment did not provide any technical substantiation for the change from 2 inches of concrete in the existing NEC text to 4 inches of concrete. There are many different factors that can affect heat transfer, other than the thickness of concrete. Pre-stressed concrete has a different heat transfer ratio than lightweight concrete, steel reinforcement within concrete will affect heat transfer, and the type of aggregate used within the concrete will also affect heat transfer. The NFPA Fire Protection Handbook states the following: "Reinforcing steel can also affect the amount of heat transfer that can occur within the concrete floor or wall." Concrete has a low thermal conductivity and a low thermal capacity. One of the more significant factors in determining the thermal characteristics of reinforced concrete is the type of aggregate used in the concrete and can vary throughout the United States. Concrete in direct contact with earth will have a different heat transfer than concrete installed as a wall or floor ceiling installation for multiple floor locations. Moisture content of the concrete will affect heat transfer. Furthermore, lightweight concrete has much different heat transfer rates than regular, reinforced, or pre-stressed concrete. The submitter could have provided a Fact Finding Study on the different types of concrete that could be used, the recommended thickness, and addressed the variables with the amount of heat transfer for each application so the Panel could act on the technical merits for this change, rather than just guessing at a depth of concrete. The 2-inch concrete thickness has been used for many NEC cycles to provide physical protection with some limited protection from heat transfer and should not be changed without proper technical substantiation for this change.
SPINA, M.: No technical substantiation of any safety concerns or evidence of failures has been provided to change the 2-inch requirement which has been part of the NEC for many cycles. Many factors play into the ability of concrete to transfer heat therefore any simple prescriptive requirement for a thickness does not guarantee any fire rating and is somewhat arbitrary. Furthermore, absolutely no technical substantiation was provided which supports the panel's assertion that conductors installed in conduits under a concrete slab on grade can be considered to have a 2-hour fire rating. The 2-inch requirement should remain intact until such time that a thorough study on the topic be performed and sound technical substantiation can accompany a proposal to change this time honored requirement.

13-47 Log #956 NEC-P13 **Final Action: Reject**
(695.6(A)(2)(d)(1))

Submitter: William A. Wolfe, Steel Tube Institute
Comment on Proposal No: 13-67
Recommendation: Reject the proposal and retain the text in the 2011 NEC.
Substantiation: This proposal removes the allowance for 2" of concrete which has for years been a recognized method of providing fire and mechanical protection for conductors. Sufficient substantiation for removing this long-held

option was not provided. The submitter states that it is documented in the International Building Code (IBC) that 2 inches of concrete is not eqllivalelll to 2-hr. fire protection. In fact, the 2012 mc Section 909.20.6.1 (provided) allows control and power wiring to be encased in 2" of concrete as an alternative to the use of 2 hour rated cable. fire barriers, etc. The IBC does not require a "listed" concrete assembly.

The permission for concrete encasement should also be retained in the NEC as a viable alternative to the other methods listed. The NEC 20 II Handbook describes the difference between - not eqllivalency of - the other 2 methods allowed in 695.6(A)(2)(d): a 2-hour fire rating of an electrical circuit and a 2-hour fire-resistance rating of a structural member, such as a wall. In September 2012, UL removed several Electrical Circuit Protective Systems as allowed in 695.6(A)(2)(d)(3) from the UL Fire Resistive Directory.

Note: Supporting material is available for review at NFPA Headquarters.

Submitter: James S. Nasby, Skokie, IL

Comment on Proposal No: 13-67

Recommendation: Reject this proposal.

Substantiation: I agree with the negative vote comments by M. Ode. Also, the 2" concrete requirement appears over a dozen times in NFPA-70 and has been as such for many editions. No problem or difficulty was offered for changing this requirement. No cost-benefit data was given. This is a very ornerous requirement. This would require 280% more concrete for a 3-1/2" conduit installation; plus twice the floor area. This would be even more horrendous on retrofit installations. While I did agree with increasing the requirement for wire protective systems from one hour to two hours, this requirement does not correlate with how much concrete is equivalent. This also invalidates almost all UL Listed wiring systems.

(695.6(A)(2)(d)(1))

Submitter: John R. Kovacik, UL LLC

Comment on Proposal No: 13-67

Recommendation: Reject Proposal 13-67.

Substantiation: I have discussed the content of this proposal with the NFPA 20 Fire Pump Committee and there is general agreement among the Committee members that there is no justification for removing the allowance for 2 in. of concrete. There were no incidents cited or problems identified that justify the removal of this requirement. The 2 in of concrete is a long-standing requirement that has a history and proven track record of providing adequate fire protection for conductors.

The added requirement that concrete or other material be listed to achieve a minimum fire rating is impractical for concrete. UL does not test concrete alone for a fire rating and such a program would be difficult if not impossible to develop based on the variables involved in preparation, finishing, curing, treating, etc.

The proponents of this proposal have argued that 2 in. of concrete does not equate to 2 hours of fire protection on the basis that the 2 in. concrete requirement was in NFPA 20 when the required fire rating for conductors was 1 hour, and the 2 in. concrete requirement was left unchanged when the fire rating for conductors was increased to 2 hours. The 2 in. of concrete has never been claimed to provide a specific time-sensitive fire rating or been considered to equate to a specific fire rating. It is an alternative method of protection for conductors and its removal from the NEC will cause a hardship in that it will force installers to use protection methods that may not be superior to 2 in. of concrete.

Comment on Proposal No: 13-68
Recommendation: Reject the proposal.
Substantiation: I agree with Mr. Ode. Concrete encasement is a time-proven effect method for protecting conductors and wiring methods, not only in this article but in article 230 as well.
Panel Meeting Action: Reject
Panel Statement: See the panel action and statement on comment 13-46.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 18 Negative: 3
Explanation of Negative:
DEGNAN, J.: See my statement on comment 13-46.
ODE, M.: See my statement on Comment 13-46.
SPINA, M.: See my statement on comment 13-46.

13-54 Log #1213 NEC-P13 **Final Action: Accept in Principle**
(695.6(B))

Submitter: James S. Nasby, Skokie, IL
Comment on Proposal No: 13-68
Recommendation: Do not remove the option of 2 in. of concrete. Do not delete said text.
Substantiation: I agree with the negative vote comment by J. Degnan. Further, also, 2" concrete requirement appears over a dozen times in NFPA 70 and has been as such for many additions. No problem or difficulty was offered for changing this requirement. No cost-benefit data was given. This is a very onerous requirement. This would require 280% more concrete for a 3-1/2 conduit installation: plus twice the floor area. This would be even more horrendous on retrofit installations. While I didn't agree with increasing the requirements for wire protective systems from one hour to two hours, this requirement does not correlate with how much concrete is equivalent. This also invalidates almost all UL Listed wiring systems.
Panel Meeting Action: Accept in Principle
Panel Statement: See the panel action and statement on comment 13-46. CMP 13 does not agree with the submitter's substantiation.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 19 Negative: 2
Explanation of Negative:
DEGNAN, J.: See my statement on comment 13-46.
ODE, M.: See my statement on Comment 13-46.

13-55 Log #179 NEC-P13 **Final Action: Accept**
(695.6(D))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 13-70
Recommendation: It was the action of the Correlating Committee that the panel clarify the panel action on this proposal with respect to the panel actions taken on Proposals 13-71 and 13-75 relative to the order of the appearance of the accepted text in 695.6(D).
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: CMP-13 accepts the direction of the Correlating Committee to provide clarity. CMP-13 has accepted comments 13-57 and 13-58 to reject proposal 13-75.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 21

13-56 Log #1212 NEC-P13 **Final Action: Reject**
(695.6(D))

Submitter: James S. Nasby, Skokie, IL
Comment on Proposal No: 13-69
Recommendation: Accept this proposal. Specifically, remove the option of using "electrical metallic tubing," which was added during the last cycle.
Substantiation: EMT is not suitable for carrying conductors not protected at their rated ampacity. Fire pump circuits are protected at not less than 300% of the conductor rated ampacity. This is serifical on purpose, as required by NFPA 20. Further FMT has only 57% of the conductance of IMC and only 40% that of RC. Worse yet, is that the fault current will likely have to flow thru set-screw connections rather than threaded fittings (couplers). The result can be a hot motor, especially since many, if not most, fire pump circuit faults occur in the motor or its junction box. This is both a safety hazard as well as a fire hazard. For example, 3" EMT cross section is around 0.717in^2 but can house at least three 600 MCM wire at 0.471 in^2 each; but, steel is 10 to 12 times higher in resistivity. Hence the conduit will be at least five time higher in resistance and heating.
Panel Meeting Action: Reject
Panel Statement: The submitter has not provided adequate technical substantiation. A substantial amount of testing has been performed, including but not limited to the modeling and testing performed by the Georgia Institute of Technology proving that EMT is suitable for this application.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 21

13-57 Log #1377 NEC-P13 **Final Action: Accept**
(695.6(D))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 13-75
Recommendation: This proposal should be rejected.
Substantiation: This revision to 695.6(D) was based on a comment on a proposal to NFPA 20 that had been rejected. The actual text from NFPA 20 now reads: "Where the raceway (conduit) between the controller and motor is not capable of conducting ground fault current sufficient to trip the circuit breaker when a ground fault occurs, a separate equipment grounding conductor shall be installed between the controller and motor." The substantiation for the NFPA 20 comment was incorrect since it stated: "EMT is suitable for normal branch circuits; but, not for fire pump circuits since these circuits must hold 300% forever downstream of the controller, 600% upstream, are often service entrance and are almost always high fault sources." This comment shows a misunderstanding of the use and sizing of conduit. A NEMA/Georgia Tech research report on grounding (attached) states the following:
- Comparably sized steel EMT, IMC and RIGID conduit will allow the flow of higher fault current than an equipment grounding conductor as listed in NEC Table 250-95
- Steel EMT, IMC and RIGID conduit are of sufficiently low impedance to limit the voltage to ground and facilitate the operation of the circuit protective devices in runs not exceeding the maximum allowable lengths detailed in this report. In most cases, the maximum allowable lengths exceed those permitted by the IAEI Soares Book on Grounding [1] using the same arc voltage and ground fault current.
- Where lengths do not exceed the maximum allowable computed by the method, supplemental grounding conductors in secondary power systems enclosed in steel EMT, IMC or RIGID conduit are not necessary.

In addition, the substantiation submitted with Proposal 13-75 is incorrect. It includes a reference to EMT and set-screw fittings as an example of a raceway that is not capable of conducting sufficient ground-fault to open the overcurrent protective device. Effective February 1996, UL 514B, the Standard for Safety for Conduit, Tubing and Cable Fittings required that all EMT fittings be subjected to a current test to determine if the EMT and the interface between the EMT and the fitting can effectively carry fault current, in order to permit operation of the overcurrent device and terminate fault current flow. In order to carry a UL listing, EMT fittings must pass this test. Article 358 (Electrical Metallic Tubing) requires the use of listed fittings.
NFPA 20 has jurisdiction over fire pumps. The NFPA 20 text has not been extracted - CMP 13 changed the wording and now has surpassed the requirements in NFPA 20 by requiring an equipment grounding conductor in all raceways without substantiation.
Panel Meeting Action: Accept

Ballot Results: Affirmative: 21

13-58 Log #1471 NEC-P13 **Final Action: Accept**
(695.6(D))

Submitter: John R. Kovacik, UL LLC
Comment on Proposal No: 13-75
Recommendation: Reject Proposal 13-75 and return the text of 695.6(D) to the 2011 Edition of the NEC.
Substantiation: Proposal 13-75 was the result of action taken by the NFPA 20 Committee on Stationary Fire Pumps in the 2013 Edition of their document to address reports of shorting of motor conductors and their connectors to the grounded metal of the motor termination box. After further consideration of this issue it is not clear that the problem cited is the result of inadequate equipment grounding provided by the raceway and its associated fittings. As such, there is no need to call into question the suitability of the allowable metallic raceways and fittings to serve as an equipment grounding conductor in this application. These raceways and their associated fittings perform adequately as an equipment grounding conductor when installed in accordance with the NEC. This includes electrical metallic tubing with set-screw fittings. In the absence of any clearly identified problem, the use of an additional grounding conductor would be redundant. It is also noted that the Panel Meeting Action does not align with the text of NFPA 20 that is identified as extract material. [20:9.9.5] The NFPA 20 text does not mandate the use of an additional grounding conductor. It is recommended that no action be taken on 695.6(D) until the Fire Pump Committee conducts an in-depth analysis of the problem to determine the proper corrective action.
Panel Meeting Action: Accept
Number Eligible to Vote: 21
Ballot Results: Affirmative: 21

13-58a Log #CC1302 NEC-P13 **Final Action: Accept**
(695.14(F))

Submitter: Code-Making Panel 13,
Comment on Proposal No: 13-85
Recommendation: Revise the action on Proposal 13-85 as follows:
(F) Generator Control Wiring Methods. Control conductors installed between the fire pump power transfer switch and the standby generator supplying the fire pump during normal power loss shall be kept entirely independent of all other wiring. They shall be protected to resist potential damage by fire or structural failure. They shall be permitted to be routed through a building(s) using one of the following methods:
(1) Be encased in a minimum ~~50~~ 100 mm (~~2~~ 4 in.) of concrete~~.~~
(2) Be installed under not less than 50 mm (2 in.) of concrete on grade
(~~2~~3) Be protected by a fire-rated assembly listed to achieve a minimum fire rating of 2 hours and dedicated to the fire pump circuits.
(~~3~~4) Be a listed electrical circuit protective system with a minimum 2-hour fire rating. The installation shall comply with any restrictions provided in the listing of the electrical circuit protective system used.
Informational Note: UL guide information for electrical circuit protective systems (FHIT) contains information on proper installation requirements to maintain the fire rating.
Substantiation: The committee acknowledges that 2 inches of concrete is not sufficient to provide 2 hours of fire rating for areas other than a slab on grade. The committee continues to accept the 4 inches of concrete concept that was submitted during the 2011 cycle. The committee considers the 4 inch concept to be enforceable.
Panel Meeting Action: Accept
Number Eligible to Vote: 21
Ballot Results: Affirmative: 17 Negative: 4
Explanation of Negative:
CZARNECKI, N.: The allowance for 2" concrete encasement has been an acceptable method for providing protection for years in this section of the Code and no substantiation has been provided to show there is a problem with its use. Contrary to the substantiation in Proposal 13-68, Section 909.20.6.1 of the International Building code does allow control and power wiring to be encased in 2" of concrete as an alternative to the use of 2 hour rated cable, fire barriers, etc. The NEC has long allowed the use of 2" concrete as a viable alternative to other methods allowed and the 2011 NFPA Handbook describes the difference between the allowable methods in 695.6(A)(2)d), not necessarily their equivalency.
DEGNAN, J.: See my statement on comment 13-46.
ODE, M.: I agree with the negative votes of Mr. Degnan, Mr. spina, and Mr. Czarnecki. See my statement on Comment 13-46.
SPINA, M.: See my statement on comment 13-46.

13-59 Log #958 NEC-P13 **Final Action: Reject**
(695.14(F))

Submitter: William A. Wolfe, Steel Tube Institute
Comment on Proposal No: 13-85
Recommendation: Reject the proposal and retain 2011 NEC text.
Substantiation: This proposal removes the allowance for 2" of concrete which has for years been a recognized method of providing fire and mechanical protection for conductors. Sufficient substantiation for removing this long-held option was not provided. The submitter states in his similar proposal to 13-67 that it is documented in the International Building Code (IBC) that 2 inches of concrete is not equivalelll to 2-hr. fire protection. In fact, the 2012 IBC Section 909.20.6.1 (provided) allows control and power wiring to be encased in 2" of concrete as an alternative to the use of 2 hour rated cable, fire barriers, etc. The IBC does not require a "listed" concrete assembly.
The permission for concrete encasement should also be retained in the NEC as a viable alternative to the other methods listed. The NEC 201 I Handbook describes the difference between - not equivalency of - the other 2 methods allowed in 695.6(A)(2)(d): a 2-hour fire rating of an electrical circuit and a 2-hour fire-resistance rating of a structural member, such as a wall. In September 2012, UL removed several Electrical Circuit Protective Systems as allowed in 695.6(A)(2)(d)(3) from the UL fire Resistive Directory.
Note: Supporting material is available for review at NFPA Headquarters.

13-60 Log #1472 NEC-P13 **Final Action: Reject**
(695.14(F))

Submitter: John R. Kovacik, UL LLC
Comment on Proposal No: 13-85
Recommendation: Reject Proposal 13-85.
Substantiation: I have discussed the content of this proposal with the NFPA 20 Fire Pump Committee and there is general agreement among the Committee members that there is no justification for removing the allowance for 2 in. of concrete. There were no incidents cited or problems identified that justify the removal of this requirement. The 2 in of concrete is a long-standing requirement that has a history and proven track record of providing adequate fire protection for conductors.
The added requirement that concrete or other material be listed to achieve a minimum fire rating is impractical for concrete. UL does not test concrete alone for a fire rating and such a program would be difficult if not impossible to develop based on the variables involved in preparation, finishing, curing, treating, etc.
The proponents of this proposal have argued that 2 in. of concrete does not equate to 2 hours of fire protection on the basis that the 2 in. concrete requirement was in NFPA 20 when the required fire rating for conductors was 1 hour, and the 2 in. concrete requirement was left unchanged when the fire rating for conductors was increased to 2 hours. The 2 in. of concrete has never been claimed to provide a specific time-sensitive fire rating or been considered to equate to a specific fire rating. It is an alternative method of protection for conductors and its removal from the NEC will cause a hardship in that it will force installers to use protection methods that may not be superior to 2 in. of concrete.

ARTICLE 696 —ENERGY STORAGE SYSTEM (PROPOSED)

13-63 Log #86a NEC-P13 **Final Action: Accept**
(696 (New))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 4-375
Recommendation: The Correlating Committee advises that the location and assignment of new Articles is the responsibility of the Correlating Committee and the Correlating Committee Rejects the panel action.
The Correlating Committee directs that the Chairs of Code-Making Panels 4, 13, the Chair of the Correlating Committee DC Task Group, and the Chair of the NEC Smart Grid Task Group form a Task Group to reconsider this proposal, as the proposed text may be more suitable in this and other Articles. The Correlating Committee further directs that this proposal be forwarded to Code-Making Panels 4 and 13 for action.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: CMP 13 holds Proposal 4-375 in accordance with 4.4.6.2.2(c) of the Regulations Governing Committee Projects because it could not be properly handled within the timeframe for the report. CMP 13 will participate in the task group as directed by the correlating committee.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 21

13-64 Log #1079a NEC-P13 **Final Action: Hold**
(696 (New))

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University
Comment on Proposal No: 4-375
Recommendation: Restore all of Part VII of Article 690, Storage Batteries to the text in the 2011 NEC Edition.
[Staff Note: This comment has also been submitted to Panel 4 for action.]
Substantiation: While this section was stricken in the Draft 2014 NEC, none of the requirements appear elsewhere in the Draft Code and the proposed new Article 696 addressing energy storage systems was NOT ADDED. Many of these requirements are critical to the safe installation and use of storage batteries and must remain in the NEC.
We suggest that these requirements remain in Article 690 Part VII for at least one edition of the Code after they have been firmly, correctly and completely established elsewhere in an appropriate section of the NEC.
Panel Meeting Action: Hold
Panel Statement: See the panel action and statement on Comment 13-63.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 21

13-65 Log #1383a NEC-P13 **Final Action: Hold**
(696 (New))

Submitter: Chad Kennedy, Schneider Electric
Comment on Proposal No: 4-375
Recommendation: Delete all proposed text.
Substantiation: Schneider Electric recognizes that energy storage solutions can have unique requirements and warrant specific requirements for a safe installation. However, there are concerns that the proposed requirements need more industry review and input prior to being included in the code. For example the requirements in the proposed 69X.11(C) seem to conflict with the committee action on 690.71(H) in ROP 4-325. The proposed text also contains a number of requirements for battery systems which may be better located in Article 480. In addition, some of the requirements seem to be directed at a particular installation type or size. The proposed 69X.11(F) would require a battery system disconnect to be accessible only to qualified personnel even in a dwelling installation. A better solution would be obtained through a task group working on this subject with new requirements proposed next cycle.
Panel Meeting Action: Hold
Panel Statement: See the panel action and statement on Comment 13-63.

ARTICLE 700 — EMERGENCY SYSTEMS

13-65a Log #CC1301 NEC-P13 **Final Action: Accept**
(700.2, 700.27, 701.12(D), and 702.13)

Submitter: Code-Making Panel 13,
Comment on Proposal No: 13-91
Recommendation: By this committee comment CMP 13 rejects proposal 13-91, 13-130, 13-141, and 13-156.
Substantiation: CMP 13 rejects these proposals as they are better suited as Handbook material.
Panel Meeting Action: Accept
Number Eligible to Vote: 21
Ballot Results: Affirmative: 19 Negative: 2
Explanation of Negative:
CARON, D.: The figures presented were intentionally designed to be in the same format as the figures in Article 517.30, and convey similar information. They seek to clarify the many components making up the fire pump, emergency, legally required, optional standby, and COPS distribution systems that have a common connection to the stand-by source (the generator), but follow differing requirements. To coin a phrase; “a picture tells a thousand words”.
CZARNECKI, N.: The figures, as originally proposed in Proposals 13-91, 13-130, 13-141, and 13-156 provide guidance and clarity to the specifications

and divisions between emergency, legally-required, optional standby, and critical operations devices and wiring. The proposal to move them to the Code Handbook denies the readers of the Code the benefit of this clarification. Further, the action of CC1301 seeks only to request that NFPA Staff consider including the figures in the Code Handbook, as the Committee cannot direct Staff to make this addition. Finally, the action of CC1301 has the effect of removing the figures from the Code, an action in direct conflict with the Committee's original vote on the proposals, and in direct conflict with the received comments, and does so with no technical substantiation.

13-66 Log #414 NEC-P13 **Final Action: Reject**
(700.2)

Submitter: Daniel J. Caron, Bard, Rao + Athanas Consulting Engineers, LLC
Comment on Proposal No: 13-91
Recommendation: Revise figure as shown:

13-67 Log #754 NEC-P13 **Final Action: Accept**
(700.5(C))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 13-95
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. Section 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 and 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.
Panel Meeting Action: Accept
Panel Statement:
Number Eligible to Vote: 21
Ballot Results: Affirmative: 20 Negative: 1
Explanation of Negative:
BROWN, J.: It is recognized that increasing voltage from 600 volts to 1000 volts may be applicable to specific installations. However, adequate technical substantiation has not been provided to support the change in this Article.

13-68 Log #366 NEC-P13 **Final Action: Accept in Principle**
(700.8 (New))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 13-98
Recommendation: Add text to read as follows:
<u>700.8 Surge Protection. A listed SPD of at least 10 kA Nominal Discharge Current I(n) shall be installed in or on all emergency system switchboards and panelboards.</u>
Substantiation: NEMA respectfully requests the code panel to reconsider its action. The revised text proposed as well as the additional substantiation below attempt to respond to the code panel's statement.
1) Why should surge protection be recommended for emergency systems?
Electronics are embedded within the infrastructure of facilities. These electronics monitor and control all aspects of the building with fire alarm systems, emergency lighting and exit lighting, generator and transfer equipment, and automatic load control relays. We are a reliant society on electronic control and communication, surge protection has the opportunity to ensure critical safety systems are not compromised and property damage within businesses are mitigated.
2) Levels of surge protection
a) The consulting and specifying engineering community through the American Institute of Architects (AIA) has a MasterSpec document referencing a level of 250 kA be used at service entrance location. While this document is not an absolute standard it is a common guideline and further work is being done to establish a recommendation. Additional consideration for support is found in NFPA 780 and their use of per phase surge protection of 20 kA nominal discharge current. All listed SPDs are qualified with surge rating per mode and this level supports the NFPA 780 recommendation.
b) Field Investigation from a utility distribution perspective. The use of surge protection in their distribution systems recognizes the need. Where the distribution system extends beyond the scope of NFPA 70, a recommended practice should be established from the NFPA standpoint.
Panel Meeting Action: Accept in Principle
Panel Statement: See the action on Comment 13-69. CMP 13 recognizes that UL 1449 3rd edition covers the required level of discharge current.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 20 Negative: 1
Explanation of Negative:
CARON, D.: See my explanation of Negative vote on Comment 13-69.

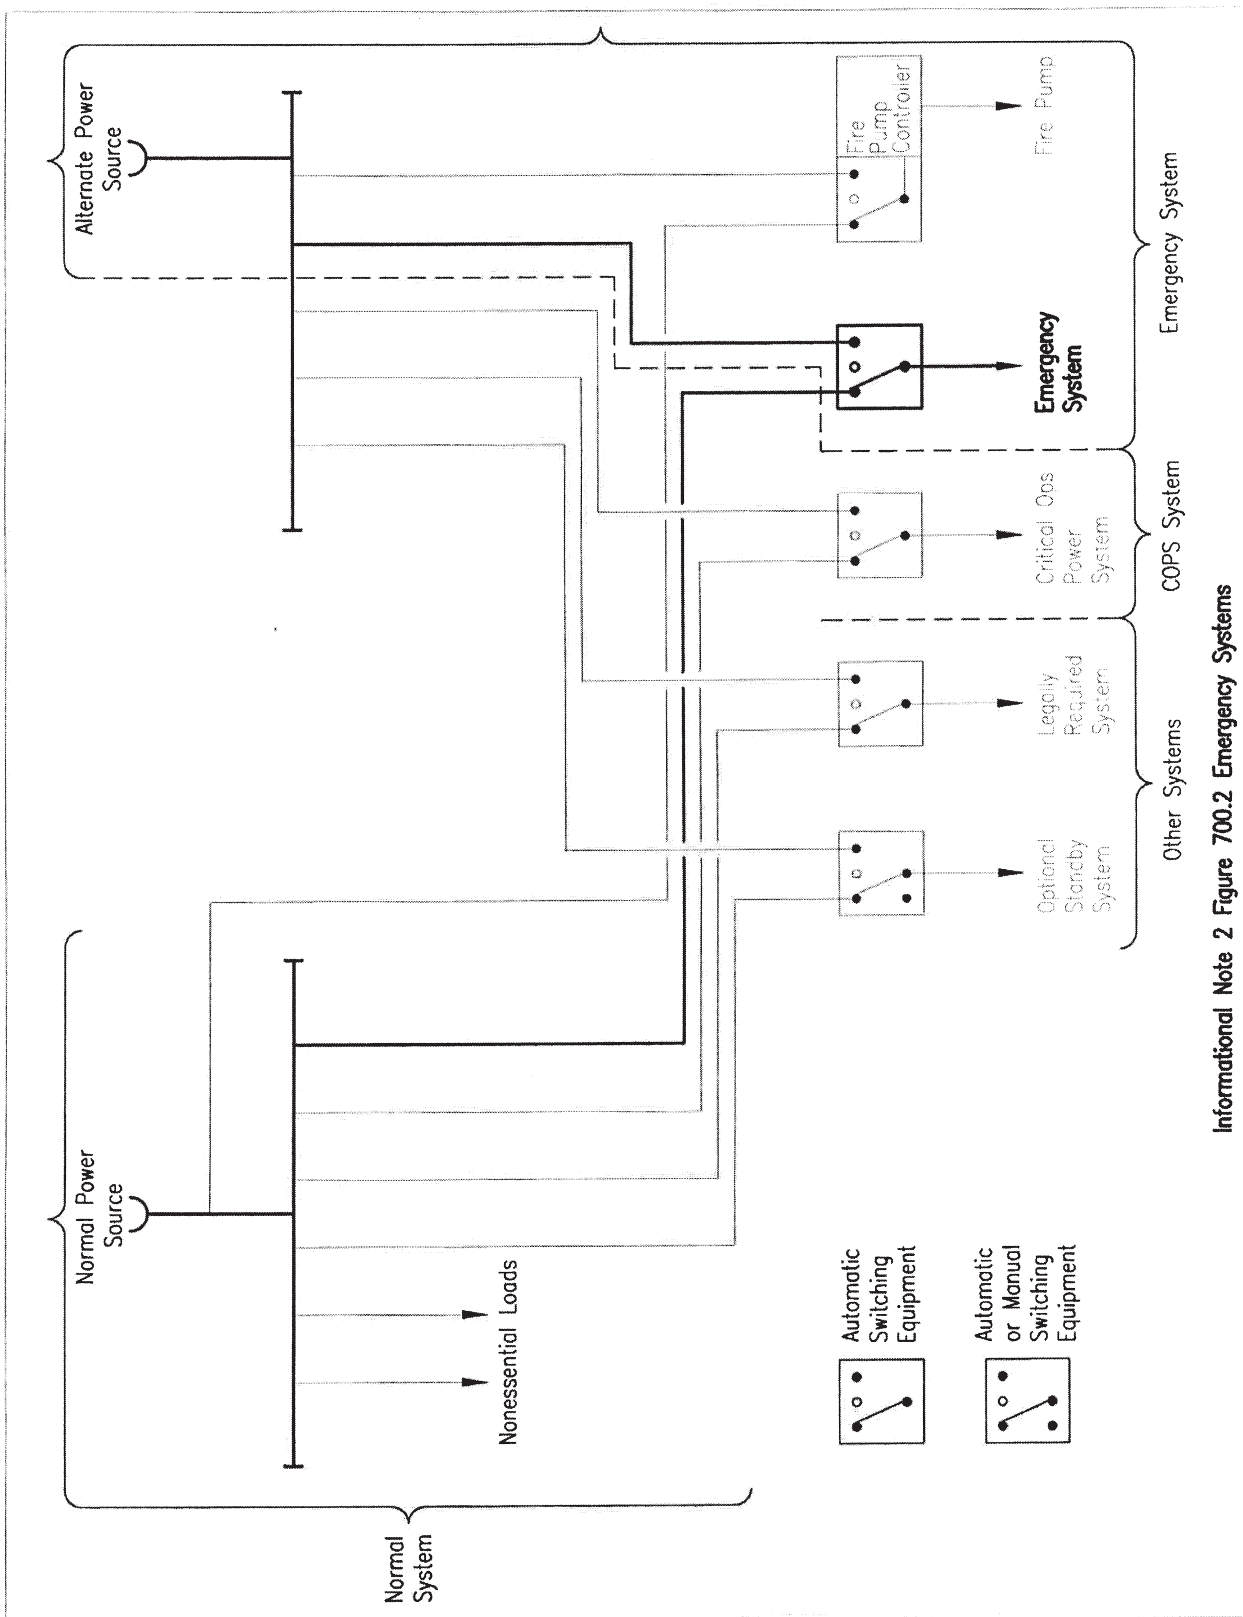
13-69 Log #766 NEC-P13 **Final Action: Accept**
(700.8 (New))

Submitter: Rob Redfoot, Eaton Corp.
Comment on Proposal No: 13-98
Recommendation: Add new text to read as follows:
<u>700.8 Surge Protection. A listed SPD shall be installed in or on all emergency systems switchboards and panelboards.</u>
Substantiation: The panel statement acknowledged that surges may result in failures but further substantiation of the type of SPD and level of protection was needed. UL 1449 3rd edition is the latest UL standard for SPD's and it defines four different types of surge protective devices and where each can be applied.

Type 1 - Before service disconnect
Type 2 - After service disconnect
Type 3 - At least 10 feet of conductor between service disconnect overcurrent device and and SPD
Type 4 - Component SPD (must be tested to the appropriate installation location where it will be installed.

The standard defined performance requirements for each of these different types of SPD's. Furthermore, IEEE C62.41 makes recommendations of size based on geographic location and incidents of lightning strikes. These are good guides and represent a significant amount of formal research that has been to define levels of protection.
Panel Meeting Action: Accept
Number Eligible to Vote: 21
Ballot Results: Affirmative: 20 Negative: 1

13-66 (Log #414) Figure 700.2



Informational Note 2 Figure 700.2 Emergency Systems

Explanation of Negative:

CARON, D.: The submitters substantiation does not cite any actual safety issues in the field due to a lack of SPD's, just anecdotal evidence that systems may be better if they are installed.

13-70 Log #1214 NEC-P13 **Final Action: Reject**
(700.9(B)(5))

Submitter: James S. Nasby, Skokie, IL
Comment on Proposal No: 13-99
Recommendation: Do NOT remove the option of using 2 in. of concrete. Eg., Do not delete said text.
Substantiation: 2" concrete requirement appears over a dozen times in NFPA 70 and has been as such for many editions. No problem or difficulty was offered for changing this requirement. No cost-benefit data was given. This is a very ornerous requirement. This would require 280% more concrete for a 3-1/2" conduit installation; plus twice the floor area. This would be even more horrendous on retrofit installations. While I did agree with increasing the requirement for wire protective systems from one hour to two hours, this requirement does not correlate with how much concrete is equivalent. This also invalidates almost all UL Listed wiring systems.
Panel Meeting Action: Reject
Panel Statement: Proposal 13-99 does not modify 700.10(D)(1)(5). See 13-75a (Log #CC1303).

(700.9(D)(1))

Submitter: Thomas Guida, TJG Services Inc.
Comment on Proposal No: 13-101
Recommendation: I support the Panel Action on this proposal.
Substantiation: None given.
Panel Meeting Action: Reject
Panel Statement: CMP 13 rejects this comment since it does not comply with the Regulations Governing Committee Projects 4.4.5(d). No substantiation was provided.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 21

13-72 Log #1473 NEC-P13 **Final Action: Reject**
(700.9(D)(1))

Submitter: John R. Kovacik, UL LLC
Comment on Proposal No: 13-101
Recommendation: Reject Proposal 13-101.
Substantiation: There were no incidents cited or problems identified that justify the removal of this requirement. The 2 in of concrete is a long-standing requirement that has a history and proven track record of providing adequate fire protection for conductors.

The added requirement that concrete or other material be listed to achieve a minimum fire rating is impractical for concrete. UL does not test concrete alone for a fire rating and such a program would be difficult if not impossible to develop based on the variables involved in preparation, finishing, curing, treating, etc.

The proponents of this proposal have argued that 2 in. of concrete does not equate to 2 hours of fire protection on the basis that the 2 in. concrete requirement was in the NFPA 20 Fire Pump Standard when the required fire rating for conductors was 1 hour, and the 2 in. concrete requirement was left unchanged when the fire rating for conductors was increased to 2 hours. The 2 in. of concrete has never been claimed to provide a specific time-sensitive fire rating or been considered to equate to a specific fire rating. It is an alternative method of protection for conductors and its removal from the NEC will cause a hardship in that it will force installers to use protection methods that may not be superior to 2 in. of concrete.
Panel Meeting Action: Reject
Panel Statement: See 13-75a (Log #CC1303).
Number Eligible to Vote: 21
Ballot Results: Affirmative: 18 Negative: 3
Explanation of Negative:

DEGNAN, J.: While temperature performance issues have been identified with 2" of concrete, it is not clear that they will be resolved with 4" concrete. If the panel changes the code they should be able to cite field performance data that substantiates that 2" of concrete has resulted in loss of life in a statistically significant number of building fires, and that this will be corrected by extension to 4" of concrete.

ODE, M.: See my statement on Comment 13-46.

SPINA, M.: See my statement on comment 13-46.

13-75 Log #415 NEC-P13 **Final Action: Reject**
(700.10(D))

Submitter: Daniel J. Caron, Bard, Rao + Athanas Consulting Engineers, LLC
Comment on Proposal No: 13-105
Recommendation: Revise text to read as follows:
(D) Fire Protection. Emergency systems shall meet the additional requirements in (D)(1) through (D)(3) ~~in assembly occupancies for not less than 1000 persons or in buildings above 23 m (75 ft) in height~~.
Substantiation: All emergency systems should be required to meet the requirements of (D)(1) through (D)(3). In the original substantiation provided by Mr. Guida, he states that "The need for fire protection of emergency system s is the same regardless of the occupancy classification." However, even after acceptance of his proposed revised text, the requirement only applies only to large places of assembly and high rise buildings. For instance, a large hospital that is only 4 floors (less than 75') would not be required to meet the requirements of (D)(l) through (D)(3).
Panel Meeting Action: Reject
Panel Statement: The existing text applies to assembly occupancies of not less than 1000 persons or buildings of greater than 75 ft in height. There wasn't any technical substantiation provided with the comment to justify applying these very specific fire protection techniques to all emergency feeder circuits and

equipment for all buildings. The removal of the quantity of persons and height thresholds should be given the opportunity for additional public review.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 16 Negative: 5
Explanation of Negative:
CARON, D.: CMP 13 missed an opportunity to expand upon accepted proposal 13-105, and include the requirements of 700.10(D) to all occupancies requiring emergency systems. Much discussion was had regarding the importance of 2 hour fire rated feeders, however, with 700.10(D) as written, 2 hour fire rated feeders are required on very few projects (high rise buildings and large places of assembly only)
I take exception to the Panel statement that this is new material. Please review my comment on Proposal 13-105 in the 2014 ROP. This is not new material.
LITTLE, L.: We are voting negative on the panel action to "Reject" comment 13-75. The submitter is correct, there is no practical reason to limit the fire protection requirements in 700.10(D) to assembly occupancies for not less than 1000 persons or in buildings above 75-feet in height. The submitter clearly provided adequate technical substantiation for this revision. Hospitals, schools, nursing homes, commercial structures and other occupancies may not contain areas for the assembly of 1000 persons. However, these occupancies may be extremely large without being taller than four of five stories in height. These occupancies should not be excluded from the fire protection requirements in 700.10(D).
NEESER, D.: This comment should have been accepted in addition to the deletion of occupancy types that was accepted at the ROP stage. The requirements for fire protection in emergency systems should not be based on the number of occupants or height of a building. The selection of 1000 persons or 75 ft in height should not determine when fire protection is required for emergency systems.
SPINA, M.: The requirements for fire protection in emergency systems should not be based on the occupancy capabilities or height of a building. A building with occupancy of less than 1000 persons or less than 75 ft in height should be provided with the same fire protection capabilities for emergency systems. The arbitrary selection of occupancy of 1000 persons or 75 ft in height has no bearing on when fire protection should be required for emergency systems.
WHITE, J.: We are voting "negative" on the committee action taken on 13-75. After consideration, we believe the submitter is correct in making the requirements of 700.10(D) mandatory for other types of facilities that may have assembly areas that will hold greater than 1,000 people or that may be less than 75 feet in height. As the submitter stated in his substantiation, many types of facilities, such as schools, hospitals and nursing homes may house hundreds of people, but not have an assembly area that holds 1,000 people.

13-75a Log #CC1303 NEC-P13 **Final Action: Accept**
(700.10(D)(1))

Submitter: Code-Making Panel 13,
Comment on Proposal No: 13-101
Recommendation: Revise the action on Proposal 13-101 as follows:
(1) Feeder-Circuit Wiring. Feeder-circuit wiring shall meet one of the following conditions:
(1) Be installed in spaces or areas that are fully protected by an approved automatic fire suppression system
(2) Be a listed electrical circuit protective system with a minimum 2-hour fire rating
Informational Note: UL guide information for electrical circuit protective systems (FHIT) contains information on proper installation requirements to maintain the fire rating.
~~(3) Be protected by a listed thermal barrier system for electrical system components with a minimum 2-hour fire rating~~
(~~4~~3) Be protected by a listed fire-rated assembly that has a minimum fire rating of 2 hours and contains only emergency
wiring circuits.
(4~~5~~) Be encased in a minimum ~~50~~ 100 mm (~~2~~ 4 in.) of concrete
(65) Be installed under not less than 50 mm (2 in.) of concrete on grade
Substantiation: The committee acknowledges that 2 inches of concrete is not sufficient to provide 2 hours of fire rating for areas other than a slab on grade. The committee continues to accept the 4 inches of concrete concept that was submitted during the 2011 cycle. The committee considers the 4 inch concept to be enforceable. The recommendation includes the action taken on Proposal 13-109 for clarity.
Panel Meeting Action: Accept
Number Eligible to Vote: 21
Ballot Results: Affirmative: 17 Negative: 4
Explanation of Negative:
CZARNECKI, N.: The allowance for 2" concrete encasement has been an acceptable method for providing protection for years in this section of the Code and no substantiation has been provided to show there is a problem with its use. Contrary to the substantiation in Proposal 13-68, Section 909.20.6.1 of the International Building code does allow control and power wiring to be encased in 2" of concrete as an alternative to the use of 2 hour rated cable, fire barriers, etc. The NEC has long allowed the use of 2" concrete as a viable alternative to other methods allowed and the 2011 NFPA Handbook describes the difference between the allowable methods in 695.6(A)(2)d), not necessarily their equivalency.
DEGNAN, J.: See my statement on comment 13-72.
ODE, M.: See my statement on Comment 13-46.
SPINA, M.: See my statement on comment 13-46.

13-76 Log #960 NEC-P13 **Final Action: Reject**
(700.10(D)(1))

Submitter: William A. Wolfe, Steel Tube Institute
Comment on Proposal No: 13-109
Recommendation: Reject this proposal and retain text from 20 II NEC.
Substantiation: This proposal removes the allowance for 2" of concrete which has for years been a recognized method of providing fire and mechanical protection for conductors. Sufficient substantiation for removing this long-held option was not provided. The submitter states that it is documented in the International Building Code (IBC) that 2 inches of concrete is not equivalency to 2-hr. fire protection. In fact, the 2012 IBC Section 909.20.6.1 (provided) allows control and power wiring to be encased in 2" of concrete as an alternative to the use of 2 hour rated cable fire barriers, etc. The BC does not require a "listed" concrete assembly.
The permission for concrete encasement should also be retained in the NEC as a viable alternative to the other methods listed. The NEC 2011 Handbook describes the difference between -not equivalency of - the other 2 methods allowed in 695.6(A)(2)(d): a 2·hour fire rating of an electrical circuit and a 2-hour fire-resistance rating of a structural member, such as a wall. In September 2012. UL removed several Electrical Circuit Protective Systems as allowed in 695.6(A)(2)(d)(3) from the UL Fire Resistive Directory.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject

13-77 Log #416 NEC-P13 **Final Action: Reject**
(700.12(B)(6), 701.12(B)(5), and 702.12)

Submitter: Daniel J. Caron, Bard, Rao + Athanas Consulting Engineers, LLC
Comment on Proposal No: 13-111
Recommendation: Add text to read as follows:
(6) Outdoor Generator Sets. Outdoor housed generator sets) shall be equipped with a disconnecting means in accordance with (6)(a) or (6)(b):
(a) A disconnecting means. in accordance with 445. 18, mounted on or within the generator enclosure and located within sight of the building or structure supplied.
(b) A disconnecting means, in accordance with 445.18. mounted on or within the generator enclosure and an additional disconnecting means. in accordance with 225.36 located where ungrounded conductors serve or pass through the building or structure supplied.
Exception: For installations under single management. where conditions of maintenance and super vision ensure that only qualified persons will monitor and service the installation and where documented safe switching procedures are established and maintained for disconnection. the generator set disconnecting means shall not be required to be located within sight of the building or structure served and an additional disconnecting means, in accordance with 225.36 located where ungrounded conductors serve or pass through the building or structure supplied shall not be required.
Substantiation: The Article should be rewritten for clarity.
Panel Meeting Action: Reject
Panel Statement: The proposed revision would significantly revise the requirement and is not editorial. No technical substantiation was provided.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 19 Negative: 2
Explanation of Negative:
BOX, K.: The committee rejects the proposal based upon the fact that "the revision would significantly revise the requirement." If the requirement as it is written is confusing, unclear and presents a potential safety hazard, the committee's basis for rejection is unwarranted. The recommendation does in fact add clarity to to article and should be revised.
CARON, D.: The proposed re-write of Proposal 13-111 does not change the requirement at all, but makes the requirement easier to understand.

13-78 Log #620 NEC-P13 **Final Action: Reject**
(700.12(F)(2)(3) Exception)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 13-116
Recommendation: Revise text to read as follows:
700.12 General Requirements.
(F) Unit Equipment.
(2) Installation of Unit Equipment.

(3) The branch circuit feeding the unit equipment shall be the same branch circuit as that serving the normal lighting in the area and connected ahead of any local switches.

Exception: In a separate and uninterrupted area supplied by a minimum of three normal lighting circuits that are not part of a multiwire branch circuit, a separate branch circuit for unit equipment shall be permitted if it originates from the same panelboard as that of the normal lighting circuits that are not part of a multiwire branch circuit and is ~~provided with a lock-on feature.~~ lockable in the closed position. **[ROP 13–116]**

Substantiation: Parallel the dominate "lockable" text:

110.25 Lockable Disconnecting Means. Where a disconnecting means is required to be *lockable open*, elsewhere in this *Code*, it shall be capable of being l*ocked in the open position*. The provisions for locking shall remain in place with or without the lock installed.

Panel Meeting Action: Reject

Panel Statement: The "lock-on feature" referred to in this exception is typically a device that is screwed tight to prevent inadvertent opening of the circuit.

Number Eligible to Vote: 21

Ballot Results: Affirmative: 21

13-79 Log #417 NEC-P13 **Final Action: Reject**
(700.20)

Submitter: Daniel J. Caron, Bard, Rao + Athanas Consulting Engineers, LLC

Comment on Proposal No: 13-119

Recommendation: Revise text to read as follows:

700.20 Switch Requirements.

(A) Arrangement. The switch or switches installed in emergency lighting circuits shall be arranged so that only authorized persons have control of emergency lighting.

Exception No. 1: Where two or more single-throw switches are connected in parallel to control a single circuit, at least one o/these switches shall be accessible only to authorized persons.

Exception No. 2: Additional switches that act only to put emergency lights into operation but not disconnect them shall be permissible.

(B) Series Connected or Three Way and Four Way Switches. Switches connected in series or 3- and 4-way switches shall not be used.

(C) Motion Sensors. Emergency lighting circuits shall be permitted to be switched by motion sensors, where all of the following conditions are met:

(1) Spacing between motion sensors is in accordance with manufacturer's instructions.

(2) Manual activation is not required to reenergize emergency lighting when the area is occupied.

(3) A non-adjustable time delay of 30 ~ minutes shall be required after the area is vacated prior to extinguishing of lighting for the area.

Exception to (C) (3): Motion sensors with lime delays shall be permitted, provided it is used in conjunction with an automatic load control relay that will automatically bypass the motion sensor and energize emergency lighting upon loss of normal power.

(4) Motion sensors shall not have a manual-off position.

Exception to 700.20: Exit signs shall not be permitted to be switched by any means.

Substantiation: Upon further reflection of the proposal, and commentary during the ROP, additional text has been added to alleviate some valid concerns.

Panel Meeting Action: Reject

Panel Statement: CMP-13 has rejected Proposal 13-119. See Comment 13-80.

Number Eligible to Vote: 21

Ballot Results: Affirmative: 20 Negative: 1

Explanation of Negative:

CARON, D.: Automatic load control relays (ALCR) are designed to turn emergency lights on during a normal power failure. There are many other types of "emergency:" situations, where the ALCR does not turn the lights on and motion sensors must operate solely by sensing occupancy, such as a fire alarm event, or other emergency situation where normal power is available. During these events, unoccupied areas are in darkness, and motion sensors alone turn the lights on when emergency or other personnel enter the area. There has been no evidence of motion sensors failing during these other types of emergency events.

13-80 Log #793 NEC-P13 **Final Action: Accept**
(700.20)

TCC Action: The Correlating Committee understands that the committee action is to reject proposal 13-119 in its entirety.

Submitter: Leon Hermans, LVS, Inc.

Comment on Proposal No: 13-119

Recommendation: Suggest rejecting Proposal 13-119 which would permit motion sensors to control emergency lighting circuits.

~~Motion Sensors It shall be permissible to control emergency lighting circuits with motion sensors, provided all of the following conditions are met:~~

~~(1) Spacing between motion sensors and installation is in accordance with manufacturer's instructions.~~

~~(2) Manual intervention is not required to reenergize emergency lighting when occupied.~~

~~(3) Areas must be vacant for 15 minutes continuously prior to extinguishing lighting.~~

Substantiation: The proposal should be rejected for the following reasons (detailed explanations follow summary):

1) Motion sensors are not fail-safe and may fail to illuminate lighting immediately even when a space is occupied. Only a 2 way transmitter/receiver design could be regarded as fail safe. Conditions such as fire and debris further degrade the performance of the motion sensors.

2) NFPA 101 Section 7.9.2.1 requires that "emergency illumination shall be provided for not less than 1-1/2 hours in the event of failure of normal lighting." The proposal would allow emergency lighting to be on for a period of only 15 minutes. NFPA 101 Section 7.9.2.2 details when emergency illumination is required and none of the requirements state that emergency lighting is required only in occupied areas.

3) The proposal does not solve any problem(s). The justification given is energy conservation: "Currently, most buildings with emergency generator backup for emergency lighting leave emergency lighting on 24/7/365."

This is inaccurate: NEC 700.2 defines Automatic Load Control Relays (ALCR's) which switch emergency lighting circuits, including wall switches, motion sensors, time clocks, and more. The ALCR's provide fail-safe ON operation, bypassing switching elements, during a power interruption. The proposed use of motion sensors without an ALCR would diminish the safety and reliability of the system. ALCR's have been widely accepted and used by industry for over 10 years.

sensor, blockage of the sensor, or an empty room, all of which will be interpreted as "LIGHTS OFF". The only fail-safe sensor would be a 2 way transmitter/receiver design such as a beam motion sensor, which is triggered when the received does not receive a signal from the transmitter (be it transmitter failure, or a person interrupting the beam by moving). For the purpose of emergency lighting, the first category of sensor should not be permitted because its operation is not fail-safe and will not guarantee that emergency lighting will illuminate when it is needed. The proposed motion sensor controlled emergency lighting system (in place of existing emergency lighting designs which come on automatically regardless of occupancy during a power interruption) would also degrade the ability of responders to perceive hazards in adjacent rooms and non-moving persons.

2) NFPA 101 Section 7.9.2.1 requires that emergency lighting stay on for a minimum of 90 minutes or until utility power is restored. The proposal would change these definitions to be "or for 15 minutes after a person is last detected." This is a major change to widely accepted life safety requirements (also used in IBC and UBC). This change should be considered in more detail to ensure consistent code requirements.

3) The proposal's justification.

"Currently, most buildings with emergency generator backup for emergency lighting leave emergency lighting on 24/7/365. In buildings that operate during set business hours and/or are vacant for significant periods of time (such as high rise commercial office buildings, out-patient facilities, etc.), this results in a substantial amount of wasted energy."

Does not recognize the wide use of ALCR's as defined in NEC 700.2. The same justification provided by the proposal was used to create ALCR's and led to their acceptance by the NEC. ALCR's can already be used with motion sensors, and other switching devices in compliance with all codes. ALCR's are also required to be tested and listed for use in emergency systems. Since the problem being solved by the proposal has already been addressed by the current edition of the NEC and by industry, this proposal would not offer any improvement from an energy conservation standpoint and would in fact diminish the safety of the emergency lighting system for the reasons discussed in 1) and 2).

Panel Meeting Action: Accept

Number Eligible to Vote: 21

Ballot Results: Affirmative: 20 Negative: 1

CARON, D.: See my Explanation of Negative vote on Comment 13-79.

13-81 Log #288 NEC-P13 **Final Action: Accept**
(700.24)

Submitter: Curtis Kasefang, Theatre Consultants Collaborative

Comment on Proposal No: 13-121

Recommendation: The following proposal was made by Steven Terry – I have suggested additional modifications (underlined).

700.24 (new), Directly Controlled Luminaires. Where emergency illumination is provided by one or more directly controlled luminaries that respond to an external control input to bypass normal control upon loss of normal power, such luminaires and external bypass controls shall be individually listed for use in emergency systems.

Substantiation: The code was written for externally dimmed and switched fixtures. Historically a listed transfer switch has been used to sense power loss and bypass dimming or switching to bring these devices to full. LED luminaries with onboard dimming capability are used widely at the moment. All have constant power input and are dimmed using serial or analog (0-10v) control schemes. In places of public assembly these are often used as emergency lights. To bring these devices to full in an emergency numerous unlisted schemes have been implemented. In code it is unclear as to the requirements for emergency switching of self dimming fixtures.

Philosophically be believe the intent is to have all intelligent devices in the emergency control signal chain listed for use in emergency systems. The initial proposal requires the fixture and its intelligent controls to have this listing. I am proposing that other devices in the signal chain also have that listing, such as devices that through serial communications or analog control sense power loss and tell the fixture to go to full. The resulting text when taken in combination with the existing text unambiguously requires that all devices that are required to bring a self dimming fixture to full are listed for this purpose, including the fixture itself.

Panel Meeting Action: Accept
Number Eligible to Vote: 21
Ballot Results: Affirmative: 21

13-82 Log #764 NEC-P13 **Final Action: Reject**
(700.26)

Submitter: Rob Redfoot, Eaton Corp.
Comment on Proposal No: 13-123
Recommendation: Revise text to read as follows:

700.26 Ground-Fault Protection of Equipment. The alternative source for emergency systems shall not be required to have ground-fault protection of equipment with automatic disconnecting means <u>and shall be selectively coordinated in accordance with 700.27</u>. Ground-fault indication of the emergency source shall be provided in accordance with 700.6(D).

Substantiation: The panel rejected this proposal based on argument that not having ground fault protection will help maintain power to emergency system. The problem is that most of these systems are solidly grounded systems. The purpose of low impedance ground is to provide a path for current to flow back to source at a level which will trip protective devices. Without ground fault protection there is very real possibility and many documented cases where the arcing fault current will not trip protective devices and could cause burn down of emergency equipment. As an example, with bonding impedance of.1 ohms, the fault current on 277V system would be only 2770 amps as a maximum. This would take a normal 1200A breakers several minutes to clear this fault without ground-fault protection. As mentioned above, there are many documented cases where emergency system has burned down because of low level ground faults. Reliability would be improved with the use of multi-level ground fault protection and zone interlocking to clear faults quickly and isolate them as close to fault point as possible. Attached is white paper on this subject.

Note: Supporting material is available for review at NFPA Headquarters.

Panel Meeting Action: Reject
Panel Statement: The added reference to 700.27 is unnecessary in 700.26 since emergency system overcurrent devices must already comply with selective coordination.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 21

13-83 Log #418 NEC-P13 **Final Action: Reject**
(700.27)

Submitter: Daniel J. Caron, Bard, Rao + Athanas Consulting Engineers, LLC
Comment on Proposal No: 13-124
Recommendation: Reconsider Proposal 13-124.
Substantiation: Although Panel 13 continues to support the action take in 2011 ROP Proposal 13-197, as stated in the Panel Statement, it is still clear that requirements on the normal system are outside the scope of Article 700 as stated by the Panel in 2011 and as clearly defined in Article 700.1 <u>"The provisions of this article apply to the electrical safety of the installation, operation, and maintenance of emergency systems</u> consisting of circuits and equipment intended to supply, distribute, and control electricity for illumination, power, or both, to required facilities <u>when the normal electrical supply or system is interrupted.</u>" (emphasis added)

Panel Meeting Action: Reject
Panel Statement: 700.1 clearly states that Article 700 has purview over the "electrical safety of the installation, operation, and maintenance of emergency systems consisting of circuits and equipment intended to supply, distribute, and control electricity for illumination, power, or both, to required facilities when the normal electrical supply or system is interrupted."

It is important to note that this section identifies the "circuits and equipment" covered in Article 700. It is the "circuits and equipment" that will be supplied by the alternate source "when the normal electrical supply or system is interrupted."

700.1 clearly states that Article 700 has purview over the "installation, operation, and maintenance" of these "circuits and equipment" that make up the emergency system. Article 700 has purview over both normal and emergency sources because they both supply "circuits and equipment" identified in 700.1

Number Eligible to Vote: 21
Ballot Results: Affirmative: 18 Negative: 3
Explanation of Negative:

BOX, K.: The "circuits and equipment" noted in the committee's response are shared circuits and equipment between the normal and emergency sources. 700.1 does not infer purview over the normal system. It clearly separates the normal system from the emergency system when the normal source is interrupted. The shared circuits are no longer energized by the normal source and are effectively disconnected from the normal source when the transfer switch is in the alternate source position.

CARON, D.: This Comment should have been accepted. The Panel Statement states, in part "Article 700 has purview over both normal and emergency sources because they both supply "circuits and equipment" identified in 700.1", however during the 2011 code Cycle, this same Panel made a different observation regarding Proposal 13-197, again, in part "The proposal for "(A) Normal System" covers devices in the normal source that are outside the scope of Article 700."

Although this Comment and Proposal 13-197 in the 2011 code cycle are completely different topics, Panel statements should be consistent for all proposal and comments. This Panel has to decide whether normal system circuits, equipment, devices, etc. are, or are not, in the scope of Article 700.

DEGNAN, J.: Anyone reading the chain of correspondence related to this comment, the original proposal, and the 2010 panel statements referenced in the proposal may be confused by what is or is not being stated by the panel and whether this does or does not constitute a change to the NEC.

The scope of Article 700, "Emergency Systems" is as defined in 700.1: the emergency system supplies, distributes and controls electrical power when the normal supply is interrupted. If the normal supply is interrupted the overcurrent devices on the normal side of the transfer switch are no longer in the circuit, are not part of the emergency system, and should not expect to be included with the requirements of 700.27.

The panel statement that Article 700 has purview over the normal source because the normal source supplies emergency circuits ignores the scope qualifier "when the normal electrical supply or system is interrupted" and should therefore be reevaluated.

A selectively coordinated emergency system is always available if the normal supply is interrupted from a utility failure or even if the normal side is interrupted because of a failure to selectively coordinate, hence requiring a selectively coordinated normal system results in a marginal gain in reliability. Those adopting the NEC may want to provide additional clarification statements if they require, or don't require some portion of the normal circuitry to be selectively coordinated. If they do require it, they must be specific as to whether that's one overcurrent protective device upstream from the transfer switch or all the way to the utility meter, which may be way upstream on a medium voltage distribution system. If the serving utility has fault currents in excess of 85000 amps it is also probable that selectively coordinating the normal side of an emergency system will mandate the use of fuses as overcurrent protective devices throughout the emergency system.

13-84 Log #419 NEC-P13 **Final Action: Reject**
(700.27)

Submitter: Daniel J. Caron, Bard, Rao + Athanas Consulting Engineers, LLC
Comment on Proposal No: 13-125
Recommendation: Reconsider Proposal 13 -125.
Substantiation: As stated in my explanation of my negative vote and in Ms. Little's comment on affirmative vote, Panel 13 in encouraged to seek a compromise between the Article 700.27 and NFPA 20 6.4.2.1.2.1. Without some relief to the strict interpretation, other special interests may seek to fine their own way to circumvent this provision. As is characterized by the many Proposals over the past few code cycles, this issue is not going away.

Panel Meeting Action: Reject
Panel Statement: No technical substantiation was provided.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 20 Negative: 1
Explanation of Negative:

CARON, D.: The Panel action should have been "Accept in Principal" and the Panel Statement should have been "See Panel Action and Statement on Comment 13-85"

13-85 Log #1433 NEC-P13 **Final Action: Accept in Part**
(700.27)

Submitter: Randy Hunter, Las Vegas, NV
Comment on Proposal No: 13-126
Recommendation: Revise text to read as follows:

700.27 Coordination.

Emergency system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices.

<u>Selective Coordination shall be selected by a licensed professional engineer or other qualified persons that are acceptable to the AHJ engaged primarily in the design, installation, or maintenance of electrical systems. The selection shall be documented and made available to those authorized to design, install, inspect, maintain, and operate the system.</u>

Exception: Selective coordination shall not be required between two overcurrent devices located in series if no loads are connected in parallel with the downstream device.

Substantiation: This proposal should have been accepted. The panel statement implies that the proposed language requires a licensed professional engineer only, but it does not. The original proposal clearly allows "or other qualified persons" to select the coordination. The qualification "acceptable to the AHJ" makes it clear that the AHJ has final say over who is qualified to choose selective coordination.

The last sentence in the panel substantiation stating that "… nor should the NEC get into licensing and stamping issues." is confusing, since other areas of the NEC (like 399.30 and 240.86(A)) require a licensed professional engineer. Certainly, emergency systems are important enough to justify requiring a qualified person, and being a licensed professional engineer is one way to demonstrate qualification.

Note that Panel 12 accepted similar language in Proposal 12-50 for 620.62.

Panel Meeting Action: Accept in Part

Revise the text to read as follows:

700.27 Selective **Coordination.** Emergency system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices.

Selective Coordination shall be selected by a licensed professional engineer or other qualified persons ~~that are acceptable to the AHJ~~ engaged primarily in the design, installation, or maintenance of electrical systems. The selection shall be documented and made available to those authorized to design, install, inspect, maintain, and operate the system.

Exception: Selective coordination shall not be required between two overcurrent devices located in series if no loads are connected in parallel with the downstream device.

Panel Statement: CMP-13 agrees with the substantiation that documentation as required in the revised wording will assist with the enforcement of the requirements for selective coordination. "Acceptable to the AHJ" is not necessary. CMP 13 now recognizes the need for this revision to assist the enforcement community with respect to this requirement.

Number Eligible to Vote: 21

Ballot Results: Affirmative: 20 Negative: 1

Explanation of Negative:

DEGNAN, J.: All states have laws that set thresholds for the type of electrical systems that require Professional Engineering, and emergency systems that protect safety and welfare are usually included within those thresholds. States may also adopt the NEC, however NEC statements regarding professional engineering can supplement state law, but not supplant it. If state law requires Professional Engineering the NEC's language of "other qualified persons" will not supplant the state's requirement. If the project has an emergency system that is outside of the state thresholds for professional engineering the language of "other qualified persons" is subjective, and no guidance is given as to what constitutes a "qualified person", which basically leaves the AHJ defenseless in any assessment of a person's qualifications. Accordingly the AHJ is in the same position with the "other qualified persons" language as they were before it was added into the code. For the most part this addition to the code won't accomplish much, and therefore is not worth adding.

Comment on Affirmative:

CARON, D.: The Panel is commended for finding a reasonable compromise to this requirement.

13-86 Log #1215 NEC-P13 **Final Action: Accept in Principle**
(700.100(D)(1)(5))

Submitter: James S. Nasby, Skokie, IL

Comment on Proposal No: 13-128

Recommendation: Do NOT remove the option of using 2 in. of concrete. E.g., Do not delete said text.

Substantiation: 2" concrete requirement appears over a dozen times in NFPA 70 and has been as such for many editions. No problem or difficulty was offered for changing this requirement. No cost-benefit data was given. This is a very ornerous requirement. This would require 280% more concrete for a 3 1/2" conduit installation; plus twice the floor area. This would be even more horrendous no retrofit installations. While I did agree with increasing the requirement for wire protective systems from one hour to tow hours, this requirement does not correlate with how much concrete is equivalent. This also invalidates almost all UL Listed wiring systems.

Panel Meeting Action: Accept in Principle

Panel Statement: See the action on 13-75a (Log #CC1303). CMP 13 does not agree with the submitter's substantiation.

13-87 Log #1474 NEC-P13 **Final Action: Reject**
(700.100(D)(1)(5))

Submitter: John R. Kovacik, UL LLC

Comment on Proposal No: 13-128

Recommendation: Reject Proposal 13-128.

Substantiation: There were no incidents cited or problems identified that justify the removal of this requirement. The 2 in of concrete is a long-standing requirement that has a history and proven track record of providing adequate fire protection for conductors.

The added requirement that concrete or other material be listed to achieve a minimum fire rating is impractical for concrete. UL does not test concrete alone for a fire rating and such a program would be difficult if not impossible to develop based on the variables involved in preparation, finishing, curing, treating, etc.

The proponents of this proposal have argued that 2 in. of concrete does not equate to 2 hours of fire protection on the basis that the 2 in. concrete requirement was in the NFPA 20 Fire Pump Standard when the required fire rating for conductors was 1 hour, and the 2 in. concrete requirement was left unchanged when the fire rating for conductors was increased to 2 hours. The 2 in. of concrete has never been claimed to provide a specific time-sensitive fire rating or been considered to equate to a specific fire rating. It is an alternative method of protection for conductors and its removal from the NEC will cause a hardship in that it will force installers to use protection methods that may not be superior to 2 in. of concrete.

13-89 Log #755 NEC-P13 **Final Action: Accept**
(701.5(C))

Submitter: James T. Dollard, Jr., IBEW Local 98

Comment on Proposal No: 13-132

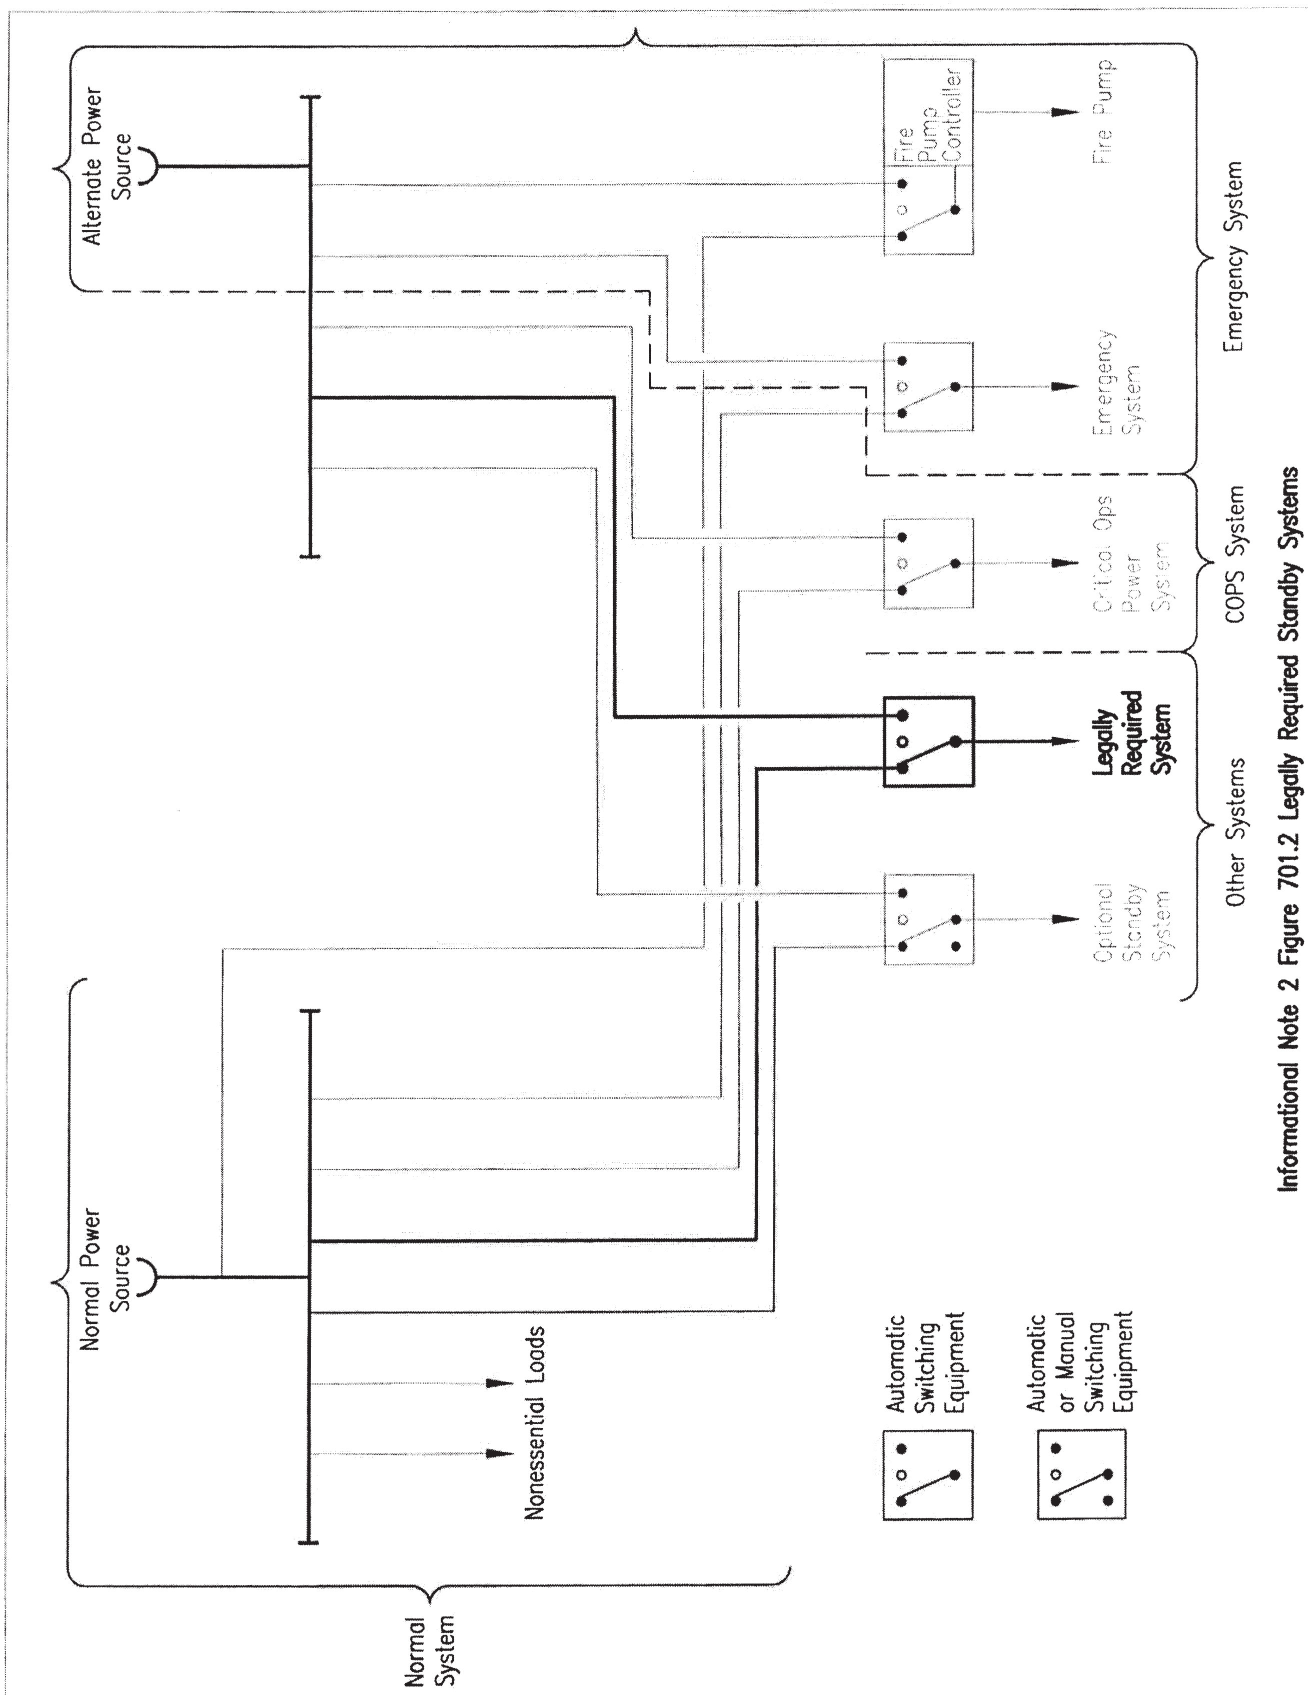
Recommendation: Continue to Accept.

Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. Section 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 and 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The

13-88 (Log #420) Figure 701.2



Informational Note 2 Figure 701.2 Legally Required Standby Systems

success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

Panel Meeting Action: Accept
Number Eligible to Vote: 21
Ballot Results: Affirmative: 20 Negative: 1
Explanation of Negative:
BROWN, J.: It is recognized that increasing voltage from 600 volts to 1000 volts may be applicable to specific installations. However, adequate technical substantiation has not been provided to support the change in this Article.

Revise 708.20(F)(5) as follows:
(5) Outdoor Generator Sets. Where an outdoor housed generator set is equipped with a readily accessible disconnecting means in accordance with 445.18, and the disconnecting means is located within sight of the building or structure supplied, an additional disconnecting means shall not be required where ungrounded conductors serve or pass through the building or structure. Where the generator supply conductors terminate at in a disconnecting means in or on a building or structure, the disconnecting means shall meet the requirements of 225.36.
Panel Statement: CMP-13 accepts the direction of the Correlating Committee to reconsider proposal 13-148 with regard to the action on proposal 13-172a. CMP-13 revises the action taken on proposal 13-172a for correlation and clarity.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 21

13-98 Log #1574 NEC-P13 **Final Action: Reject**
(702.11(C))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 13-149
Recommendation: Accept the proposal.
Substantiation: CMP 13 is to be commended for a remarkably thoughtful and complete panel statement, one of the best in this entire code cycle. The submitter would not pursue this further if it were not for the need for relief. Not only has UL 2201 required neutral bonding, that bonding must not be capable of field reversal. This means that the approach chosen by at least one manufacturer to provide for field bonding/unbonding along with detailed instructions as to when one or the other is appropriate will no longer be tenable. This will create a powerful incentive for untrained individuals, out of desperation, to open generator housings that should not be opened in order to make them work. The requirements in the proposal limit the amount of voltage drop on the neutral return path to a degree that will not pose other than extremely theoretical problems. The portion of the panel statement about a service reference point existing on the opposite side of the building is incorrect due to the distance limitations in the proposed (3) and (4). In addition, the requirement to mark the inlet with the need to unplug the generator after use further decreases the exposure.
Panel Meeting Action: Reject
Panel Statement: No additional technical substantiation has been provided. Transfer switches are readily available in multiple configurations providing the relief desired by the submitter and ensuring compliance with the NEC.
Number Eligible to Vote: 21
Ballot Results: Affirmative: 21

13-99 Log #1163 NEC-P13 **Final Action: Reject**
(702.12)

Submitter: Thomas A. Domitrovich, Eaton Corporation
Comment on Proposal No: 13-150
Recommendation: This proposal should have been accepted.
Substantiation: The panel rejected this proposal based on Section 445.18 of the code which requires a disconnecting means at or near a generator. However, the problem is that in many applications the disconnecting means required by 445.18 is out of the line of sight of remote inlets. When the generator is out of the line of sight from the inlet, the person who disconnects the leads at the inlet may not know whether or not the generator is on, or even that this inlet is supplied by a generator. The problem is that there is NO requirement for the disconnecting means to be at/near the inlet. Anyone can easily unplug the loads from the inlet while the generator is on. This change would ensure that disconnection is performed in a safe manner.
Panel Meeting Action: Reject
Panel Statement: CMP 13 rejects this comment since this may impact equipment not originally considered in the proposal. The submitter is encouraged to develop proposals in the next NEC cycle to incorporate this concept for the connection of portable generators to premises without regard to the type of system. Furthermore, any proposed text should address all levels of ampacity and types of equipment that may be impacted.

ARTICLE 705 — INTERCONNECTED ELECTRIC POWER PRODUCTION SOURCES

4-195 Log #88 NEC-P04 **Final Action: Accept**
(705.2)

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 4-375b
Recommendation: The Correlating Committee directs that the panel revise the mandatory text using "shall" in the definitions to nonmandatory text in accordance with 2.3.1.4 of the NFPA Manual of Style.
This action will be considered by as a public comment.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise proposed 705.2 text to read as follows:
705.2 Hybrid System. A system comprised of multiple power sources. These power sources could include photovoltaic, wind, micro-hydro generators, engine-driven generators, and others, but do not include electric power production and distribution network systems. Energy storage systems such as batteries, flywheels, or superconducting magnetic storage equipment do not constitute a power source for the purpose of this definition. The energy regenerated by an overhauling (descending) elevator do not constitute a power source for the purpose of this definition.
Panel Statement: The panel accepts the recommendation of the Correlating Committee. The word "shall" was change to "do" in two locations.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

4-196 Log #1035 NEC-P04 **Final Action: Accept**
(705.2)

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 4-375b
Recommendation: Accept the propose change, but relocate it to Article 100. Furthermore, delete the definition from 690.2.
Substantiation: Having two definitions of the same thing, located in two different articles, doesn't make sense. Moving it to Article 100 fixes the issue.
Panel Meeting Action: Accept
Relocate Hybrid System definition to Article 100.
Delete Hybrid System definition from 690.2.
Panel Statement: The panel accepts relocating the revised definition in Comment 4-195 of Hybrid System from 705.2 to Article 100. The panel accepts the deletion of the definition of hybrid system from 690.2 to comply with Section 2.2.2.1 of the NEC Style Manual.

(705.12)

Submitter: John C. Wiles, Southwest Technology Development Institute, New Mexico State University
Comment on Proposal No: 4-375a
Recommendation: Modify the ROP 4-375 language as follows:
(D) Utility-Interactive Inverters. The output of a utility interactive inverter shall be permitted to be connected to the load side of the service disconnecting means of the other source(s) at any distribution equipment on the premises. Where distribution equipment, including switchgear, switchboards, or panelboards, is fed simultaneously by a primary source(s) of electricity and one or more utility interactive inverters, and where this distribution equipment is capable of supplying multiple branch circuits or feeders or both, the interconnecting provisions for the utility interactive inverter(s) shall comply with (D)(1) through (D)(7).
(1) Dedicated Overcurrent and Disconnect. The source interconnection of ~~one or more~~ each inverter~~s~~ installed in one system shall be made at a dedicated circuit breaker or fusible disconnecting means.
(2) Bus or Conductor Ampere Rating. For all bus and feeder ampacity calculations, 125% of the inverter output circuit current shall be used. ~~In systems w~~ Where inverter output connections are made ~~at~~ to feeders, the calculations for load connections (taps), if any, shall use the rating of the existing overcurrent device in the circuit plus 125% of the inverter(s) rated output current as the overcurrent device protecting the conductors in the 240.21(B) calculations.
Where an inverter(s) is connected to an existing feeder, that feeder shall have an ampacity no less than the sum of the primary supply overcurrent device plus 125% of the inverter(s) rated output current.
Exception: Where the inverter(s) connection (s) and primary supply are at opposite ends of the feeder, the feeder shall have an ampacity no less than the larger of the primary supply overcurrent device or 125% of the rated output current of the inverter(s). And the feeder shall be marked at accessible point(s) every 3 meters (10 feet) with the following or equivalent wording:

WARNING:
MULTIPLE SOURCES OF POWER
DO NOT TAP

One of the methods in (a)-(d) shall be used to determine the ratings of busbars in panelboards:
(a) The sum of 125% of the inverter(s) output circuit current and the rating of the overcurrent device protecting the busbar shall not exceed the ampacity of the busbar.
Informational Note: This general rule assumes no limitation in the number of the loads or sources applied to a busbar or their locations.
(b) Where two or more sources, one utility and ~~the other an~~ one or more inverters, are located at opposite ends of a busbar that contains loads, the sum of 125% of the inverter(s) output circuit current and the rating of the overcurrent device protecting the busbar shall not exceed 120% the ampacity of the busbar. The busbar shall be sized at least for the loads connected in accordance with Article 220. A permanent warning label shall be applied to the distribution equipment adjacent to the backfed breaker from the inverter with the following or equivalent wording:

WARNING:
INVERTER OUTPUT CONNECTION,
DO NOT RELOCATE THIS OVERCURRENT DEVICE

The warning sign(s) or label (s) shall comply with 110.21(B).
Exception: Equipment with multiple ampacity busbars or center fed panelboards are not addressed by this provision.
(c) The sum of the ampere ratings of all overcurrent devices on panelboards, both load and supply devices, excluding the rating of the overcurrent device protecting the busbar, shall not exceed the ampacity of the busbar. The rating of the overcurrent device protecting the busbar shall not exceed the rating of the busbar. Permanent warning labels shall be applied to distribution equipment with the following or equivalent wording:

WARNING:
THIS EQUIPMENT FED BY MULTIPLE SOURCES.
TOTAL RATING OF ALL OVERCURRENT DEVICES,
EXCLUDING MAIN SUPPLY OVERCURRENT DEVICE,
SHALL NOT EXCEED AMPACITY OF BUSBAR.

The warning sign(s) or label(s) shall comply with 110.21(B).
(d) Connections shall be permitted on multiple ampacity busbars, or center fed panelboards where designed under engineering supervision that include fault studies and busbar load calculations.
(3) Marking. Equipment containing overcurrent devices in circuits supplying power to a busbar or conductor supplied from multiple sources shall be marked to indicate the presence of all sources.
(4) Suitable for Backfeed. Circuit breakers, if backfed, shall be suitable for such operation.
Informational Note: Fused disconnects, unless otherwise marked, are suitable for backfeeding.
(5) Fastening. Listed plug-in-type circuit breakers backfed from utility-interactive inverters that are listed and identified as interactive shall be permitted to omit the additional fastener normally required by 408.36(D) for such applications.
(6) Inverter Output Connection. The position of overcurrent devices supplying current to a conductor or busbar with respect to the position of the overcurrent devices connected to the utility source of supply shall be used to determine the calculated ampacity of the conductor or the rating of the panelboard bus bar in accordance with a, b and c.
(a) Where the overcurrent devices from inverter outputs supplying a panelboard are not located at the opposite end of the busbar from the utility input feeder or main overcurrent device location, the panelboard shall be rated not less than the sum of the ampere ratings of all overcurrent devices supplying it.

(b) In systems with panelboards connected in series, the rating of the first overcurrent device directly connected to the output of a utility-interactive inverter(s) shall be used in the calculations for all busbars and conductors where the circuits from the inverter supply sources are connected to the opposite end of the busbar or conductor from the circuit from the utility source of supply.
A permanent warning label shall be applied to the distribution equipment where backfed overcurrent devices may carry currents from the PV inverters with the following or equivalent wording:

WARNING
INVERTER OUTPUT CONNECTION
DO NOT RELOCATE THIS OVERCURRENT DEVICE

The warning sign(s) or label(s) shall comply with 110.21(B).
(c) The bus or conductor rating shall be sized not less than the loads connected in accordance with Article 220.
(7) Wire Harness and Exposed Cable Arc Fault Protection.
Utility interactive inverter(s) that have a wire harness or cable output circuit,

rated 240V, 30A or less, that is not installed within an enclosed raceway, shall be provided with listed AC AFCI protection.
Substantiation: (D)(1) As written, the text could (and will) be interpreted as allowing inverters to be paralleled on a single disconnect and OCPD and this could result in islanding and possible over loading of conductors under fault conditions. Only listed devices such as microinverters and ac PV modules have this allowance as part of the listing.
12(D)(2) The tap section was revised to clearly (hopefully) indicate that the material apples to load taps on feeders where inverters are on the circuit and does not apply to the inverter connections themselves.
The feeder section was added, because the ampacity of feeders with utility and PV inverter connections is not directly addressed anywhere. Connecting the output of a utility interactive inverter(s) through an OCPD/disconnect to the feeder inside a panel board is quite common in making load side connections. If an inverter is connected to the output of a breaker for a feeder, then that feeder may subject to the combined output of the breaker and the inverter if loads on the feeder are increased. The first paragraph addresses the general requirement for feeder protection. The exception brings common sense and engineering calculations into the equation, that is; where the supplies are at opposite ends of the feeders, then the maximum current that the feeder can see (at any point) is limited to the larger of the two sources. The warning is needed so that taps are not made and the tap rules corrupted when the second source is not known.
(2)(b). Covering the multiple inverter case. We should not have two conflicting ampacity requirements and the "at least" allows the conductors to be larger than load requirements when the inverters have high currents, but keeps the busbars sized to meet load requirements when there are no inverter currents.
(6) Revised for clarity. The language is pretty bad and has been for several cycles.
(6)(b) Revised to indicate that the only way to use the first OCPD device in the series panel calculations is where the OCPDs supplying each panel board or conductor are at the opposite ends of that panel board or conductor. If not, there is a potential for panel board or conductor overloading.
(6)(c) Added "not less than" to remove the conflicting double requirements on the ampacity calculation.
Panel Meeting Action: Reject
Panel Statement: Connections including taps do not require the summation of the output of the feeder breaker and the output of the inverter for ampacity calculations. See panel action on Comment 4-204.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

(705.12(D))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 9-181g
Recommendation: It was the action of the Correlating Committee that this proposal be referred to Code-Making Panel 4 for action in Article 705.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

4-200 Log #1575 NEC-P04 **Final Action: Reject**
(705.12(D))

Submitter: Frederic P. Hartwell, Hartwell Electrical Services, Inc.
Comment on Proposal No: 4-393
Recommendation: Accept the proposal.
Substantiation: The panel statement is incorrect with respect to the connection of unlisted power sources. Section 705.12(C) specifically allows sources over 100 kW, or medium voltage sources of any size, to be connected at any point provided there is the usual qualified maintenance and supervision. If such sources, particularly large utilization voltage cogenerations systems are connected at the nearest panelboard, the objections addressed for utility-interactive inverters should apply. This submitter vividly recalls wiring a 120 kW 480V cogeneration system as a back-feeding source into the nearest 480V panel. Absolutely no attention was paid to the size relative to the receiving bus and the position of the source breaker on the bus. The work was done in the 1980s, long before these concerns had surfaced. However, this source could be wired today exactly as it was in 1986 because the discrepancies between what is now 705.12(C) and 705.12(D) have never been addressed. The proposal should be accepted in some form so these wiring arrangements do not continue.
Panel Meeting Action: Reject
Panel Statement: Rather than move this information to utility interactive inverter in 705.12(D), a proposal should be submitted at the code cycle to revise 705.12(C) and to address the submitter's concern.
Requirements of 705.12(D) were specifically accepted because utility interactive inverter designs are tested and listed per UL-1741, which provides specific over/under voltage, over/under frequency, and loss of utility connection protection. Synchronous and induction generating systems require specific engineering supervision to design their interconnection, and are not restricted to the requirements of 705.12(D).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13 Negative: 1
Explanation of Negative:
ROGERS, J.: This comment and the related proposal should have been accepted. The submitter is correct that these systems are being installed and there needs to be a set of requirements to connect these systems in a safe manner. The language that has been submitted provides a clear set of enforceable installation requirements to connect these systems in the same manner as inverter type systems are connected.

4-201 Log #12 NEC-P04 **Final Action: Reject**
(705.12(D)(2))

Submitter: Abel Lampa, Innovative Engineering Inc.
Comment on Proposal No: N/A
Recommendation: Please add the following Text after the paragraph. Clarification:
If the existing Main Panel Board does not have a Main Circuit Breaker, then you can install a circuit breaker feeding the PV inverters which has a capacity equal to 125% of the capacity of the bus bar of the existing Panel Board, provided the total number of circuit breakers at the panel is not more than 5.
Substantiation: Some inspectors & electricians interpret it otherwise, when you connect a circuit breaker at the load side of the panel, which limit the capacity of the circuit breaker that will feed the PV inverters. I say, since there is no main breaker, the main breaker is 0, therefore I can install a circuit breaker that will feed the inverters equal to 125% of the capacity of the main busbar. The industry can save tons on money, if you clarify this.
Panel Meeting Action: Reject
Panel Statement: This comment does not comply with Section 4.4.5(b) of the NFPA Regulations Governing Committee Projects in that it does not identify the document, proposal number to which the comment is directed, and paragraph of the document to which the comment is directed.
See panel action on Comment 4-204. Adding this text would allow panelboards to be overloaded without proper protection.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 14

4-202 Log #871 NEC-P04 **Final Action: Reject**
(705.12(D)(2)(c))

Submitter: C. Douglas White, Center Point Energy / Rep. Edison Electric Institute/Electric Light & Power Group
Comment on Proposal No: 4-375a
Recommendation: The panel should have accepted in principle in part the panel proposal as follows:
Delete section 705.12(D)(2)(c) and re-number 705.12(D)(2)(d) as 705.12(D)(2)(c)
~~(c) The sum of the ampere ratings of all overcurrent devices on panelboards, both load and supply devices, excluding the rating of the overcurrent device protecting the busbar, shall not exceed the ampacity of the busbar. The rating of the overcurrent device protecting the busbar shall not exceed the rating of the busbar. Permanent warning labels shall be applied to distribution equipment with the following or equivalent wording:~~

~~WARNING:~~
~~THIS EQUIPMENT FED BY MULTIPLE SOURCES.~~
~~TOTAL RATING OF ALL OVERCURRENT DEVICES,~~
~~EXCLUDING MAIN SUPPLY OVERCURRENT DEVICE,~~
~~SHALL NOT EXCEED AMPACITY OF BUSBAR.~~

~~The warning sign(s) or label (s) shall comply with 110.21(B)~~.

~~(d)~~ (c) Connections shall be permitted on multiple ampacity busbars, or center fed panelboards where designed under engineering supervision that include fault studies and busbar load calculations.

Substantiation: The proposed 705.12(D)(2)(c) should be removed. The proposed text of this section relies on a field summation of load and source overcurrent device ratings and a warning sign to provide overload protection for an electrical panel. Overload protection should be inherently safe by design and not rely on varying field conditions and adherence to warning placards.

Panel Meeting Action: Reject

Panel Statement: It is possible to limit current on a busbar with the main breaker or by limiting the sum of the branch circuit breakers on the panel. Either method is valid. Historically supply of current only came from the utility supply. With utility interactive inverters current can be sourced on the load side and safely connected to distribution wiring. The sign is a reminder as to how current is limited.

Good practice for anyone adding a load to an electrical system whether supplied by PV or other sources mandates adherence to Chapter 2 of the NEC and load calculations should be considered prior to adding any loads.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13 Negative: 1

Explanation of Negative:

MCDANIEL, R.: The panel action should have been to Accept the comment in Principle and revise the text to limit this requirement to AC combiner panels, where multiple inverter ac output circuits are terminated. This requirement if applied to a service panel will be difficult to enforce. Service panels can be installed with up to 70 single pole overcurrent device spaces. Other articles in the NEC require dedicated branch circuits to specific load areas in 1 and 2 family residential dwellings, which require installation of many overcurrent devices. Many installations exist where the sum of all branch and feeder overcurrent device ratings in a panel exceed the panel's bus ampacity rating. A warning sign may not be sufficient to prohibit the end user from adding additional branch circuit overcurrent devices, such as extending a dedicated branch circuit to a new bathroom. An electrical panel's overcurrent protection should be inherent in the design and not rely on field summation of overcurrent device ratings and adherence to a sign that is not part of the panel's labeling from the manufacturer.

4-203 Log #1507 NEC-P04 **Final Action: Accept**
(705.12(D)(2)(b) Exception)

Submitter: William F. Brooks, Brooks Engineering

Comment on Proposal No: 4-375a

Recommendation: Delete 705.12(D)(2)(b) Exception as follows:

~~Exception: Equipment with multiple ampacity busbars or center fed panelboards are not addressed by this provision.~~

Substantiation: The TCC requested CMP4 to address the non-mandatory wording in the Exception. The most efficient way to address the non-mandatory wording is to remove it. The exception word is unnecessary since multiple ampacity busbars or center-fed panelboards are not addressed in this provision. However, they are addressed in 705.12(D)(2)(d). Removing the extraneous words of the Exception improve the readability of the section and does not alter the meaning or intent of the section in any way. The Exception was actually worded as an Informational Note and yet an Information Note is unnecessary here.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 14

4-204 Log #1603 NEC-P04 **Final Action: Accept in Principle**
(705.12(D)(2))

Submitter: William F. Brooks, Brooks Engineering

Comment on Proposal No: 4-375a

Recommendation: Revise text to read as follows:

(2) Bus or Conductor Ampere Rating. ~~For all bus and feeder ampacity calculations,~~ 125% of the inverter output circuit current shall be used in ampacity calculations for the following.

(1) Feeders. Where the inverter output connection is made to a feeder at a location other than the opposite end of the feeder from the primary source overcurrent device, that portion of the feeder on the load side of the inverter output connection shall be protected by one of the following:

a. feeder ampacity shall not be less than the sum of the primary source overcurrent device and 125% of the inverter output circuit current, or

b. an overcurrent device rated not greater than the ampacity of the feeder.

(2) Taps. In systems where inverter output connections are made at feeders, any ~~load~~ taps must be sized based on the sum of 125% of the inverter(s) output circuit current and the rating of the overcurrent device protecting the feeder conductors as calculated in 240.21(B).

(3) Busbars. One of the methods in (a)-(d) shall be used to determine the ratings of busbars in panelboards:

(no change in the remainder of 705.12(D)(2))

Substantiation: The panel proposal 4-375a, and the proposals on which it was based, neglected to provide direction on the proper methods to prevent overcurrent on feeders that have inverter output circuits connected to them. The panel proposal 4-375a did cover load taps and busbars. In order to clarify the enforcement of this section for AHJs and contractors, the three main areas were enumerated for clarity. The key concern is that the addition of a utility-interactive inverter supply presents a potential overload condition for the feeder and main lug only (MLO) panelboards on the load side of the inverter interconnection point. By making sure that the ampacity of the feeder is sufficient for both sources, or by installing an overcurrent device on the feeder on the load side of the inverter interconnection point, the feeder is protected. The busbar of the MLO panelboard can be protected by the overcurrent device installed at the interconnection point or by installing a main overcurrent device on the panelboard to prevent busbar overcurrent. The requirement to protect busbar overcurrent is already found in 705.12(D)(2)(3)(a).

The language for taps and busbars was retained unchanged except for one minor change related to taps. The word "load" was deleted to make it clear that any tap conductor, whether for loads or for an inverter output circuit, would be required to follow the tap rule when the tap rule sizing requirement exceeds the load of the tap or the supply of the inverter output circuit.

Explanatory diagrams have been provided to illustrate the concepts.

Note: Supporting Material is available for review at NFPA headquarters.

Panel Meeting Action: Accept in Principle

Revise wording of 705.12(D)(2) as follows:

(2) Bus or Conductor Ampere Rating. ~~For all bus and feeder ampacity calculations,~~ 125% of the inverter output circuit current shall be used in ampacity calculations for the following.

(1) Feeders. Where the inverter output connection is made to a feeder at a location other than the opposite end of the feeder from the primary source overcurrent device, that portion of the feeder on the load side of the inverter output connection shall be protected by one of the following:

(a) the feeder ampacity shall not be less than the sum of the primary source overcurrent device and 125% of the inverter output circuit current, or

(b) an overcurrent device on the load side of the inverter connection rated not greater than the ampacity of the feeder.

(2) Taps. In systems where inverter output connections are made at feeders, any ~~load~~ taps must be sized based on the sum of 125% of the inverter(s) output circuit current and the rating of the overcurrent device protecting the feeder conductors as calculated in 240.21(B).

(3) Busbars. One of the following methods ~~in (a)-(d)~~ shall be used to determine the ratings of busbars in panelboards:

(no change in the remainder of 705.12(D)(2))

Panel Statement: The word "the" was added in (2)(1)(a). The words "on the load side of the inverter connection" were added in (2)(1)(b).

The word "following" was added and the words "in (a)-(d)" were deleted in (3).

(705.12(D)(6))

Submitter: William F. Brooks, Brooks Engineering

Comment on Proposal No: 4-375a

Recommendation: Remove section erroneously retained by NFPA staff and renumber section accordingly:

~~(6) Inverter Output Connection. Unless the panelboard is rated not less than the~~

~~sum of the ampere ratings of all overcurrent devices supplying it, a connection in a panelboard shall be positioned at the opposite (load) end from the input feeder location or main circuit location. The bus or conductor rating shall be sized for the loads connected in accordance with Article 220. In systems with panelboards connected in series, the rating of the first overcurrent device directly connected to the output of a utility-interactive inverter(s) shall be used in the calculations for all busbars and conductors. A permanent warning label shall be applied to the distribution equipment with the following or equivalent wording:~~

~~WARNING~~
~~INVERTER OUTPUT CONNECTION~~
~~DO NOT RELOCATE THIS OVERCURRENT DEVICE~~
~~The warning sign(s) or label(s) shall comply with 110.21(B).~~

(~~7~~) (6) Wire Harness and Exposed Cable Arc Fault Protection. Utility interactive inverter(s) that have a wire harness or cable output circuit, rated 240V, 30A or less, that is not installed within an enclosed raceway, shall be provided with listed AC AFCI protection.

Substantiation: Panel proposal 4-375a refers to proposals 4-394, 4-396, and 4-401 as the template for 4-375a. In proposal 4-396, the existing 705.12(D)(7) was deleted and some of the content moved to 705.12(D)(2). Given the complexity of these changes, the staff inadvertently included the existing 705.12(D)(7) as the new 705.12(D)(6). 705.12(D) now includes duplicative language.

Panel Meeting Action: Accept

Panel Statement: This comment addresses an error in the ROP Draft.

Ballot Results: Affirmative: 14

4-207 Log #1384 NEC-P04 **Final Action: Reject**

(705.30 and 705.31 (New))

Submitter: Chad Kennedy, Schneider Electric

Comment on Proposal No: 4-410a

Recommendation: Revise text to read as follows:

705.30 Overcurrent Protection. Overcurrent protection for interconnected power production sources shall be provided in accordance with 750.30 (A) through (G).

(A) General. Conductors shall be protected in accordance with Article 240. Equipment and conductors connected to more than one electrical source shall have a sufficient number of overcurrent devices located so as to provide protection from all sources.

(B) Conductors Connected to Supply Side of Service Disconnecting Means. Where the point of connection to the service conductors is located inside of a building or structure, overcurrent protection for the interconnected power production source conductors shall be provided as close as practicable to the point where they connect to the service conductors. The overcurrent protection shall be permitted to be located inside or outside of the building or structure being supplied.

Informational Note: This overcurrent protection provides protection for the interconnected power production source conductors from short-circuit current introduced by the primary source(s) of electricity.

(C) ~~(A)~~ Solar Photovoltaic Systems. Solar photovoltaic systems shall be protected in accordance with Article 690.

(D) ~~(B)~~ Transformers. Overcurrent protection for a transformer with a source(s) on each side shall be provided in accordance with 450.3 by considering first one side of the transformer, then the other side of the transformer, as the primary.

(E) ~~(C)~~ Fuel Cell Systems. Fuel cell systems shall be protected in accordance with Article 692.

(F) ~~(D)~~ Utility-Interactive Inverters. Utility-interactive inverters shall be protected in accordance with 705.65.

(G) ~~(E)~~ Generators. Generators shall be protected in accordance with 705.130.

~~**705.31 Location of Overcurrent Protection.**~~ Where ~~Overcurrent protection for~~ electric power production source conductors, are ~~connected to the supply side of the service disconnecting means per 705.12(A)~~ and the connection is made inside the building, overcurrent protection ~~shall be located within 3m (10 ft) of~~ as close as practicable to ~~the point where the electric power production source conductors are connected to the service.~~

~~Informational Note: This overcurrent protection protects against short-circuit current supplied from the primary source(s) of electricity.~~

~~*Exception: Where the overcurrent protection for the power production source is located more than 3 m (10 ft) from the point of connection for the electric power production source to the service, cable limiters or current limited circuit breakers for each ungrounded conductor shall be installed at the point where the electric power production conductors are connected to the service.*~~

Substantiation: The provisions of this proposal should be restricted to installations where the connection is made inside the building. The NEC permits unlimited tap lengths in 240.21(B) and 240.21(C) for conductors outside of the building or structure where installed as a service per 230.6 and a disconnecting means is provided either outside or nearest the point of entrance of the conductors. Electric power production source connections ahead of the service disconnecting means located outside of the building or structure should not be required to have overcurrent protection within a specified distance.

In addition, where tap connections are made within large power equipment such as LV switchgear and switchboards the overcurrent protection location will exceed 10 ft of the connection. The requirements should treat such connections as service conductors in regards to the wiring methods and location of overcurrent protection rather than specify a distance constraint. The revised text also eliminates the need for an exception to the proposed requirement.

For clarity purposes, the proposed requirements should be grouped with existing overcurrent protection provisions in 705.30. The existing 705.30 text has not been revised but rather the first paragraph is now located in 705.30(A) and the existing 705.30(A) – 705.30(E) renumbered. The overcurrent protection requirements for supply side connections are located in 705.30(B).

Panel Meeting Action: Reject

Panel Statement: The supply side conductors are not considered a tap.

It is not the intent to limit the installation to only inside the building. CMP 4 intends that conductors connected to alternative energy systems ahead of the service main be protected when they exceed 10 feet from the connection point to limit the effects of fault currents that may be imposed upon them from the service.

Ballot Results: Affirmative: 14

4-209 Log #1509 NEC-P04 **Final Action: Accept in Principle**

(705.100)

Submitter: William F. Brooks, Brooks Engineering

Comment on Proposal No: 4-416

Recommendation: Revise language as follows:

705.100 Unbalanced Interconnections.

(A) Single Phase. Single-phase inverters for hybrid systems and ac modules in interactive hybrid systems shall ~~not~~ be connected to 3-phase power systems ~~unless the interconnected system is designed~~ so that ~~significant~~ unbalanced voltages in excess of 3% do not ~~cannot~~ result. For utility-interactive single-phase inverters, unbalanced voltages shall be prevented by the same methods used for single-phase loads on a 3-phase power system.

Substantiation: The code making panel was in error by not accepting proposal 4-416. The reason given was that sufficient substantiation was not provided. The substantiation was sufficient in that it outlined the problem and how the revised wording addressed the problem. AHJs are routinely misinterpreting this ambiguous language. Since the language is unclear, the common misconception is that the National Electrical Code is prohibiting single-phase inverters on three-phase systems. Since no criteria for acceptance is provided, this overly conservative interpretation is common. The wording in the existing 705.100 violates the style manual, which specifically prohibits unenforceable language such as is found in 705.100.

Quoting from the NEC Style Manual:

"3.2 Word Choices.

3.2.1 Unenforceable Terms. The NEC shall not contain references or requirements that are unenforceable or vague. The terms contained in Table 3.2.1 shall be reviewed in context, and, if the resulting requirement is unenforceable or vague, the term shall not be used." …"Significant".

The current language in 705.100(A) is unenforceable by any means other than prohibiting single-phase generators on 3-phase power systems altogether. This is due to the undefined nature of the term "significant unbalanced voltages." This undefined term is replaced with "unbalanced voltages in excess of 3% do not result." Single phase generators are routinely applied to 3-phase power systems successfully and without special phase voltage sensing equipment. This is accomplished with utility-interactive inverters by applying the well-understood methods used for single-phase loads for 3-phase systems. Single-phase loads are evenly distributed among the phases unless the single phase loads are not divisible by 3. In the event that a 3-phase circuit has extra single-phase loads, those loads are applied to the least loaded phases, therefore reducing imbalance rather than increasing imbalance. With utility-interactive single-phase generators, extra single-phase generators are applied to the most heavily loaded phases, reducing imbalance. Many jurisdictions have been prohibiting the use of single-phase utility-interactive generators on 3-phase systems thinking that these inverters had to be capable of sensing all three phases to prohibit imbalance. Since single-phase loads are not required to monitor all three phases and imbalance is prevented by design, utility-interactive inverters should follow the same, well-understood process. The only method to resolve an unbalanced voltage not caused by the utility system is to balance loads and generation on the building distribution system. Both single-phase load distribution and single-phase generator distribution can be effective means of mitigating unbalanced phase currents that contribute to unbalanced voltages.

Panel Meeting Action: Accept in Principle

Revise the recommended text to read as follows:

705.100 Unbalanced Interconnections.

(A) Single Phase. Single-phase inverters for hybrid systems and ac modules in interactive hybrid systems shall be connected to 3-phase power systems in order to limit unbalanced voltages to not more than 3 percent.

Informational Note: For utility-interactive single-phase inverters, unbalanced voltages can be minimized by the same methods that are used for single-phase loads on a 3-phase power system. See ANSI/C84.1 Electric Power Systems and Equipment - Voltage Calculations.

Panel Statement: The panel has moved the last proposed sentence to an informational note. The text was reworded for clarity. Additionally reference is made to ANSI/C84.1 as a method of calculation.

Submitter: William A. Wolfe, Steel Tube Institute

Comment on Proposal No: 13-167

Recommendation: Reject this proposal and retain the text in 2011 NEC.

Substantiation: This proposal removes the allowance for 2" of concrete which has for years been a recognized method of providing fire and mechanical protection for conductors. Sufficient substantiation for removing this long-held option was not provided. The submitter states that it is documented in the Intemational Building Code (IBC) that 2 inches of concrete is not equivalent to 2-hr. fire protection. In fact, the 2012 IBC Section 909.20.6.1 (provided) allows control and power wiring to be encased in 2" of concrete as an altemative to the use of 2 hour rated cable, fire barriers, etc. The IBC does not require a "listed" concrete assembly.

The permission for concrete encasement should also be retained in the NEC as a viable altemative to the other methods listed. The NEC 2011 Handbook describes the difference between - not equivalency of - the other 2 methods allowed in 695.6(A)(2)(d): a 2-hour fire rating of an electrical circuit and a 2-hour fire-resistance rating of a structural member, such as a wall. In September 2012, UL removed several Electrical Circuit Protective Systems as allowed in 695.6(A)(2)(d)(3) from the UL Fire Resistive Directory.

Note: Supporting material is available for review at NFPA Headquarters.

13-102a Log #CC1304 NEC-P13 **Final Action: Accept**
(708.10(C)(2))

Submitter: Code-Making Panel 13,

Comment on Proposal No: 13-167

Recommendation: Revise the action on Proposal 13-167 as follows:

(2) Fire Protection for Feeders. Feeders shall meet one of the following conditions:

(1) Be a listed electrical circuit protective system with a minimum 2-hour fire rating

Informational Note: UL guide information for electrical circuit protection systems (FHIT) contains information on
proper installation requirements to maintain the fire rating.

(2) Be protected by a listed fire-rated assembly that has a minimum fire rating of 2 hours

(3) Be encased in a minimum ~~50~~ <u>100</u> mm (~~2~~ <u>4</u> in.) of concrete

<u>(4) Be installed under not less than 50 mm (2 in.) of concrete on grade</u>

Substantiation: The committee acknowledges that 2 inches of concrete is not sufficient to provide 2 hours of fire rating for areas other than a slab on grade. The committee continues to accept the 4 inches of concrete concept that was submitted during the 2011 cycle. The committee considers the 4 inch concept to be enforceable.

Panel Meeting Action: Accept

Number Eligible to Vote: 21

Ballot Results: Affirmative: 17 Negative: 4

Explanation of Negative:

CZARNECKI, N.: The allowance for 2" concrete encasement has been an acceptable method for providing protection for years in this section of the Code and no substantiation has been provided to show there is a problem with its use. Contrary to the substantiation in Proposal 13-68, Section 909.20.6.1 of the International Building code does allow control and power wiring to be encased in 2" of concrete as an alternative to the use of 2 hour rated cable, fire barriers, etc. The NEC has long allowed the use of 2" concrete as a viable alternative to other methods allowed and the 2011 NFPA Handbook describes the difference between the allowable methods in 695.6(A)(2)d), not necessarily their equivalency.

DEGNAN, J.: See my statement on comment 13-72.

13-106 Log #1475 NEC-P13 **Final Action: Reject**
(708.10(C)(2)(3))

Submitter: John R. Kovacik, UL LLC
Comment on Proposal No: 13-168
Recommendation: Reject Proposal 13-168.
Substantiation: There were no incidents cited or problems identified that justify the removal of this requirement. The 2 in of concrete is a long-standing requirement that has a history and proven track record of providing adequate fire protection for conductors.
The added requirement that concrete or other material be listed to achieve a minimum fire rating is impractical for concrete. UL does not test concrete alone for a fire rating and such a program would be difficult if not impossible to develop based on the variables involved in preparation, finishing, curing, treating, etc.
The proponents of this proposal have argued that 2 in. of concrete does not equate to 2 hours of fire protection on the basis that the 2 in. concrete requirement was in the NFPA 20 Fire Pump Standard when the required fire rating for conductors was 1 hour, and the 2 in. concrete requirement was left unchanged when the fire rating for conductors was increased to 2 hours. The 2 in. of concrete has never been claimed to provide a specific time-sensitive fire rating or been considered to equate to a specific fire rating. It is an alternative method of protection for conductors and its removal from the NEC will cause a hardship in that it will force installers to use protection methods that may not be superior to 2 in. of concrete.

(708.52(B))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 13-174
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.
The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.
The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. Section 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 and 7 are special and serve only to modify or

supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

Panel Meeting Action: Accept

Number Eligible to Vote: 21

Ballot Results: Affirmative: 20 Negative: 1

Explanation of Negative:

BROWN, J.: It is recognized that increasing voltage from 600 volts to 1000 volts may be applicable to specific installations. However, adequate technical substantiation has not been provided to support the change in this Article.

13-110 Log #1436 NEC-P13 **Final Action: Accept in Part**
(708.54)

TCC Action: The Correlating Committee understands that the proposed revisions were intended to be made to 708.54.

Submitter: Randy Hunter, Las Vegas, NV

Comment on Proposal No: 13-176

Recommendation: Revise text to read as follows:

708.54 Coordination.

Critical operations power system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices. <u>Selective Coordination shall be selected by a licensed professional engineer or other qualified persons that are acceptable to the AHJ engaged primarily in the design, installation, or maintenance of electrical systems. The selection shall be documented and made available to those authorized to design, install, inspect, maintain, and operate the system.</u>

Revise text to read as follows:

Substantiation: This proposal should have been accepted. The panel statement implies that the proposed language requires a licensed professional engineer only, but it does not. The original proposal clearly allows "or other qualified persons" to select the coordination. The qualification "acceptable to the AHJ" makes it clear that the AHJ has final say over who is qualified to choose selective coordination.

The last sentence in the panel substantiation stating that "… nor should the NEC get into licensing and stamping issues." is confusing, since other areas of the NEC (like 399.30 and 240.86(A)) require a licensed professional engineer. Certainly, emergency systems are important enough to justify requiring a qualified person, and being a licensed professional engineer is one way to demonstrate qualification.

Note that Panel 12 accepted similar language in Proposal 12-50 for 620.62.

Panel Meeting Action: Accept in Part

Revise the text to read as follows:

700.27 <u>Selective</u> Coordination. Emergency system(s) overcurrent devices shall be selectively coordinated with all supply side overcurrent protective devices.

<u>Selective Coordination shall be selected by a licensed professional engineer or other qualified persons that are acceptable to the AHJ engaged primarily in the design, installation, or maintenance of electrical systems. The selection shall be documented and made available to those authorized to design, install, inspect, maintain, and operate the system.</u>

Exception: Selective coordination shall not be required between two overcurrent devices located in series if no loads are connected in parallel with the downstream device.

Panel Statement: CMP-13 agrees with the substantiation that documentation as required in the revised wording will assist with the enforcement of the requirements for selective coordination. "Acceptable to the AHJ" is not necessary. CMP 13 now recognizes the need for this revision to assist the enforcement community with respect to this requirement.

CARON, D.: See my Affirmative with Comment vote on Comment 13-85.

ARTICLE 725 — CLASS 1, CLASS 2, AND CLASS 3 REMOTE-CONTROL, SIGNALING, AND POWER-LIMITED CIRCUITS

3-40 Log #296 NEC-P03 **Final Action: Accept in Principle**
(725.2, 725.179, and 725.3)

TCC Action: See the Correlating Committee action on Comment 3-41 to hold proposed 725.3(M).

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.

Comment on Proposal No: 3-118

Recommendation: Revise the panel action on proposal 3-118 as follows:

Reject the definition of cable routing assembly recommended for 725.2.

Reject the changes recommended for 725.179 (listing requirements for cable routing assemblies).

<u>**725.3(M)**</u> (new) <u>**Cable Routing Assemblies.** The definition in 800.2, the applications in Table 800.154(c) and the installation rules in 800.110 and 800.113 shall apply to Article 725.</u>

Substantiation: Cable routing assemblies were introduced into the 2011 NEC. The definition, applications and installation rules for cable routing assemblies do not need to be repeated in every Article that has provisions for installing cables in cable routing assemblies.

The definition of cable routing assemblies is in 770.2. Proposal 16-23 recommended moving the definition to 800.2 so it would be in the same Article with the listing and application requirements. Panel 16 action on proposal 16-23 duplicated it in 800.2. We have submitted a comment delete the definition of cable routing assembly from 770.2 and have it in 800.2 only.

The listing requirements for cable routing assemblies are in 770.182 and 800.182. Panel 16 accepted proposal 16-81 which recommended deleting 770.182, which has listing requirements for cable routing assemblies and optical fiber raceways. The listing requirements for optical fiber raceways were no longer needed because panel 16 accepted proposals to replace optical fiber raceways with communications raceways and the listing requirements for cable routing assemblies in 770.182 were redundant. Acceptance of proposal 16-81 removed the redundancy.

The applications of cable routing assemblies are covered in Table 770.154(a). Panel 16 action on proposal 16-71 deleted the applications of cable routing assemblies from 770.154 including Table 770.154(a). Panel 16 action on proposal 16-131 established Table 800.154(c) which covers the applications of cable routing assemblies.

The definition, listing requirements, applications and installation rules for cable routing assemblies do not need to be repeated in multiple articles. Having them all in Article 800 is sufficient.

The Correlating Committee, in its actions on proposal 3-118 and 3-171, directed that the definition of cable routing assembly be located in a single Article of Chapter 8. The correlating committee also directed in it actions on proposals 16-37, 16-163 and 16-222 that the Panel 16 actions to establish references to the definition, applications and installation rules for cable routing assemblies in 770.3, 820.3 and 830.3 be correlated with Articles 725 and 760., Acceptance of this comment will bring the panel action into conformance with the Correlating Committee directives.

Panel Meeting Action: Accept in Principle

Panel Statement: Refer to the panel action and statement on Comment 3-41, which addresses the same issue.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 1

Ballot Not Returned: 1 Sepulveda, M.

Explanation of Negative:

STENE, S.: See the negative statement in Comment 3-41

Comment on Affirmative:

WALSH, R.: I believe the statement in the new text; "installation rules in 800.110 and 800.113 shall apply to Article 725", to be too general since it can be interpreted to include Class 1 circuits for installation in Cable Routing Assemblies. I submit that the comment should be evaluated by the Correlating Committee.

3-41 Log #711 NEC-P03 **Final Action: Hold**
(725.2)

TCC Action: The Correlating Committee directs that proposed 725.3(M) in this comment be reported as "Hold." The Correlating Committee action on Comment 3-2 changed the location of the definition of Cable Routing Assemblies to Article 100. The Correlating Committee rejects the definition of Cable Routing Assembly in 725.2. The installation requirements in 800.110 and 800.113 do not apply globally and negate some of the requirements in Article 725.
The Correlating Committee will appoint a task group to address installation issues regarding Cable Routing Assemblies throughout the Code.
The Correlating Committee notes that:
1) Only the revisions to 725.3(M) are being held
2) Accepts the revision of 725.179 (Introduction), 725.179(M), 725.179(N), and 725.179(O) as noted in Proposal 3-118
3) Reflect changes in the title of 725.179 by adding "Cable Routing Assemblies" and as a result of the action on Proposal 3-163a change the term "signaling raceways" to "communication raceways". The title to 725.179 will now read
"725.179. Listing and Marking of Class 2, Class 3, Type PLTC Cables, Communication Raceways, and Cable Routing Assemblies."
4) The remainder of the panel action for the comment stands with existing (L) becoming new (O) without any change.
Submitter: George Bish, Secure Watch Security
Comment on Proposal No: 3-118
Recommendation: Continue to Accept in Principle in Part with the following changes:
a. Reject the part to add a definition for "Cable Routing Assembly"
b. Accept the part to revise 725.133
c. Continue to Accept the part to revise 725.139 per original Panel Action
d. Reject the part to revise 725.179 (Introduction), 725.179(L), 725.1179(M), 725.179(N), and 725.179(O)
e. Add 725.3 (M) **Cable Routing Assemblies**. The definition in 800.2, the applications in Table 800.154(c), the listing requirements of 800.182 and the installation rules in 800.110 and 800.113 shall apply to Article 725
Substantiation: Rejecting the addition of a definition of "Cable Routing Assembly" to 725.2 is in keeping with the Correlating Committee Note to Proposal 3-118 to locate the definition in a single article of Chapter 8. See companion comment on Proposal 16-23 that not only relocates the definition to 800.2, but revises it as well.
The change to 725.133 should be accepted as it refers to 725.139 that now includes cable routing assemblies. For consistency, cable routing assemblies should be mentioned in the title of 725.133
Through the Panel Action of Panel 16 on Proposal 16-81, listing requirements for cable routing assemblies are contained in 800.182 and do not need to be repeated in 725. Locating cable routing assembly listing requirements in a single article is in keeping with the spirit of the Correlating Committee directive.
Now that the definition of Cable Routing Assembly is located in 800.2 and the listing requirements in 800.182 a new paragraph 725.3(M) is needed directing the reader to Article 800 for the appropriate information.
This is one of a group of comments developed by the CMP3/CMP16 Joint Task Group formed at the direction of the Correlating Committee to locate a correlated definition of Cable Routing Assemblies in a single Article of Chapter 8 for use in Article 725, 760, 770, and Chapter 8.
The Task Group members were:
George Bish, Chair, representing Satellite Broadcasting & Communication Association
Harry Ohde, representing IBEW
James Brunssen, representing Alliance for Telecommunications Industry Solutions
George Straniero, representing National Electrical Manufacturers Association
Robert Walsh, representing International Association of Electrical Inspectors
Wendell Whistler, representing Intertek Testing Services
Panel Meeting Action: Accept in Principle in Part
(1) Accept recommendation "a" through "c" and "e".
(2) Accept in principle in part recommendation "d": Correct the typographical error "725.1179(M)" to be "725.179(M)," and retain current 725.179(O) and renumber as appropriate.
(3) Revise the title of 725.179 to read: 725.179 Listing and Marking of Class 2, Class 3, Type PLTC Cables, and Signaling Raceways.
Panel Statement: (1) The panel accepts recommendation "e" contingent on the understanding that CMP 16 will accept the following joint (CMP 3 and CMP 16) task group recommendation for Comment 16-5:
Add a new definition in 800.2 to read as follows: "Cable Routing Assembly. A single channel or connected multiple channels, as well as associated fittings, forming a structural system that is used to support and route communications wires and cables, optical fiber cables, data cables associated with information technology and communications equipment, Class 2 and Class 3 cables."
Note that CMP 3 agrees with this basic definition, but has identified an oversight that should be corrected as shown below:
Add a new definition in 800.2 to read as follows: "Cable Routing Assembly. A single channel or connected multiple channels, as well as associated fittings, forming a structural system that is used to support and route communications wires and cables, optical fiber cables, data cables associated with information technology and communications equipment, Class 2 and Class 3 cables, and power-limited fire alarm cables."
The added phrase is currently permitted in Article 760 and should have been included in the task group work.
CMP 3 requests the correlating committee to review the actions of CMP 16 on Comment 16-5 to be sure that the intended correlation is provided consistent with CMP 3's understanding of the task group work.
(2) Changes are made to correct a typo. Also the panel rejects the removal of current 725.179(O) since the requirements for marking need to be retained.
(3) As a consequence of removal of cable routing assemblies from 725.179, the term needs to be removed from the title as well.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Sepulveda, M.
Explanation of Negative:
STENE, S.: The comment text as accepted would apply the application of Table 800.145(c), the listing requirements in 800.182 and the installation rules in 800.110 and 800.113 to all of Article 725, not just to cable routing assemblies within Article 725. This would permit this application for Class 1 circuits, as well as Class 2 and 3 applications and that was never the intent. In addition, the application, listing requirements, and installation requirements as referenced in this accepted text in Article 800 only applies to communications wiring, cables, and raceways, not Class 2 and Class 3 remote control, power limited applications and signaling systems, unless installed in accordance with 725.139(D) in the same cable as communications circuits. This comment should be rejected or held for next Code cycle since it would not be possible to fix it at this time. The Correlating Committee should also direct Panel 16 to locate this definition in Article 100 since it appears in more than one article and there is no technical or compelling reason to have the definition located in Article 800.
Comment on Affirmative:
KAHN, S.: See my Explanation of Affirmative with Comment on Comment no. 3-1.
WALSH, R.: I believe the statement in the new text; "installation rules in 800.110 and 800.113 shall apply to Article 725", to be too general since it can be interpreted to include Class 1 circuits for installation in Cable Routing Assemblies. I submit that the comment should be evaluated by the Correlating Committee.

3-42 Log #822 NEC-P03 **Final Action: Reject**
(725.2)

Submitter: David H. Kendall, Thomas & Betts Corporation
Comment on Proposal No: 3-118
Recommendation: Revise the definition of a Cable Routing Assembly to remove the word "conductors" and replace it with "circuits".
Substantiation: A Cable Routing Assembly is not a Wireway as defined in 376.2 and 378.2 and should not be treated as such. Cable Routing Assemblies are not permitted to route conductors. Wireways are listed for the routing and support of electrical conductors.
Panel Meeting Action: Reject
Panel Statement: The definition for Cable Routing Assembly has been deferred to Article 800 and the word "conductors" does not appear in the recommended definition.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Sepulveda, M.

3-43 Log #982 NEC-P03 **Final Action: Accept in Principle**
(725.2, 725.3, and 725.179)

TCC Action: See the Correlating Committee action on Comment 3-41 to hold part of the comment.
Submitter: Robert W. Jensen, dbi-Telecommunication Infrastructure Design
Comment on Proposal No: 3-118
Recommendation: Revise the panel action on proposal 3-118 as follows:
Reject the definition of cable routing assembly recommended for 725.2.
Reject the changes recommended for 725.179 (listing requirements for cable routing assemblies).
725.3(M) (new) **Cable Routing Assemblies.** The definition in 800.2, the applications in Table 800.154(c) and the installation rules in 800.110 and 800.113 shall apply to Article 725.
Substantiation: Cable routing assemblies were introduced into the 2011 NEC. The definition, applications and installation rules for cable routing assemblies do not need to be repeated in every Article that has provisions for installing cables in cable routing assemblies.
The definition of cable routing assemblies is in 770.2. Proposal 16-23 recommended moving the definition to 800.2 so it would be in the same Article with the listing and application requirements. Panel 16 action on proposal 16-23 duplicated it in 800.2. We have submitted a comment delete the definition of cable routing assembly from 770.2 and have it in 800.2 only.

The listing requirements for cable routing assemblies are in 770.182 and 800.182. Panel 16 accepted proposal 16-81 which recommended deleting 770.182, which has listing requirements for cable routing assemblies and optical fiber raceways. The listing requirements for optical fiber raceways were no longer needed because panel 16 accepted proposals to replace optical fiber raceways with communications raceways and the listing requirements for cable routing assemblies in 770.182 were redundant. Acceptance of proposal 16-81 removed the redundancy.

The applications of cable routing assemblies are covered in Table 770.154(a). Panel 16 action on proposal 16-71 deleted the applications of cable routing assemblies from 770.154 including Table 770.154(a). Panel 16 action on proposal 16-131 established Table 800.154(c) which covers the applications of cable routing assemblies.

The definition, listing requirements, applications and installation rules for cable routing assemblies do not need to be repeated in multiple articles. Having them all in Article 800 is sufficient.

The Correlating Committee, in its actions on proposal 3-118 and 3-171, directed that the definition of cable routing assembly be located in a single Article of Chapter 8. The correlating committee also directed in it actions on proposals 16-37, 16-163 and 16-222 that the Panel 16 actions to establish references to the definition, applications and installation rules for cable routing assemblies in 770.3, 820.3 and 830.3 be correlated with Articles 725 and 760., Acceptance of this comment will bring the panel action into conformance with the Correlating Committee directives.

Panel Meeting Action: Accept in Principle

Panel Statement: Refer to the panel action and statement for Comment 3-41 that addresses the same issue.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 12 Negative: 1

Ballot Not Returned: 1 Sepulveda, M.

Explanation of Negative:

STENE, S.: See the negative statement in Comment 3-41

Comment on Affirmative:

WALSH, R.: I believe the statement in the new text; "installation rules in 800.110 and 800.113 shall apply to Article 725", to be too general since it can be interpreted to include Class 1 circuits for installation in Cable Routing Assemblies. I submit that the comment should be evaluated by the Correlating Committee.

3-44 Log #460 NEC-P03 **Final Action: Reject**
(725.2.Class 2 Circuit and Informational Note (New))

Submitter: Marcelo M. Hirschler, GBH International

Comment on Proposal No: 3-119

Recommendation: Revise text to read as follows:

Class 2 Circuit. The portion of the wiring system between the load side of a Class 2 power source and the connected equipment. ~~Due to its power limitations, a Class 2 circuit considers safety from a fire initiation standpoint and provides acceptable protection from electric shock.~~

Informational Note: Due to its power limitations, a Class 2 circuit considers safety from a fire initiation standpoint and provides acceptable protection from electric shock.

Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains the defined term "Class 2 circuit" and the NEC manual of style does not permit the definition to contain the defined term. If CMP3 believes that this information is a requirement it should place it somewhere else in Article 725, for example as a new section 725.4 or a similar new location, since NEC definitions shall not contain requirements.

An example of an alternate approach is:

725.4 Class 2 and Class 3 circuits and power limitations.

725.4.1 Due to its power limitations, a Class 2 circuit considers safety from a fire initiation standpoint and provides acceptable protection from electric shock.

725.4.2 Due to its power limitations, a Class 3 circuit considers safety from a fire initiation standpoint. Since higher levels of voltage and current than for Class 2 are permitted, additional safeguards are specified to provide protection from an electric shock hazard that could be encountered.

The suggested section 725.4.2 is associated with the definition of class 3 circuits (proposal 3-120).

The NEC Manual of Style states as follows:

2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.

Panel Meeting Action: Reject

Panel Statement: The recommended changes do not provide any additional clarity and in fact, are detrimental to the application.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Sepulveda, M.

Comment on Affirmative:

STENE, S.: The definition is actually located in the first sentence and does not contain the phrase "Class 2 circuit" so it complies with the NEC Style Manual. The second sentence in the definition is a declarative sentence that Class 2 considers safety from a fire initiation standpoint and provides protection from shock.

3-45 Log #461 NEC-P03 **Final Action: Reject**
(725.2.Class 3 Circuit and Informational Note (New))

Submitter: Marcelo M. Hirschler, GBH International

Comment on Proposal No: 3-120

Recommendation: Revise text to read as follows:

Class 3 Circuit. The portion of the wiring system between the load side of a Class 3 power source and the connected equipment. ~~Due to its power limitations, a Class 3 circuit considers safety from a fire initiation standpoint. Since higher levels of voltage and current than for Class 2 are permitted, additional safeguards are specified to provide protection from an electric shock hazard that could be encountered.~~

Informational Note: Due to its power limitations, a Class 3 circuit considers safety from a fire initiation standpoint. Since higher levels of voltage and current than for Class 2 are permitted, additional safeguards are specified to provide protection from an electric shock hazard that could be encountered.

Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains the defined term "Class 3 circuit" and the NEC manual of style does not permit the definition to contain the defined term. If CMP3 believes that this information is a requirement it should place it somewhere else in Article 725, for example as a new section 725.4 or a similar new location, since NEC definitions shall not contain requirements.

An example of an alternate approach is:

725.4 Class 2 and Class 3 circuits and power limitations.

725.4.1 Due to its power limitations, a Class 2 circuit considers safety from a fire initiation standpoint and provides acceptable protection from electric shock.

725.4.2 Due to its power limitations, a Class 3 circuit considers safety from a fire initiation standpoint. Since higher levels of voltage and current than for Class 2 are permitted, additional safeguards are specified to provide protection from an electric shock hazard that could be encountered.

The suggested section 725.4.1 is associated with the definition of class 2 circuits (proposal 3-119).

The NEC Manual of Style states as follows:

2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.

Panel Meeting Action: Reject

Panel Statement: The recommended changes do not provide any additional clarity and in fact, are detrimental to the application.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Sepulveda, M.

Comment on Affirmative:

STENE, S.: The definition is actually located in the first sentence and does not contain the phrase "Class 3 circuit" so it complies with the NEC Style Manual. The second sentence in the definition is a declarative sentence that Class 3 considers safety from a fire initiation standpoint and provides additional protection from shock.

3-45a Log #CC300 NEC-P03 **Final Action: Accept**
(725.2.Power-Limited Tray Cable)

TCC Action: The Correlating Committee directs the acronym '"PLTC" be placed after the defined term and before the definition as follows: "Power-Limited Tray Cable (PLTC)" for consistency in accordance with the NEC Style Manual.

Submitter: Code-Making Panel 3,

Comment on Proposal No: 7-15

Recommendation: Add a new definition in 725.2 for Power-Limited Tray Cable to read as follows: Power-Limited Tray Cable. A factory assembly of two or more insulated conductors rated at 300 volts, with or without associated bare or insulated equipment grounding conductors, under a nonmetallic jacket.

Substantiation: The panel has modified the definition recommended in Proposal 7-15 to be consistent with that in 336.2 and has included the voltage rating for insulation as applied to Class 2 and 3 applications. The modification of the proposed new definition more appropriately applies to 725.179(E) for PLTC.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Sepulveda, M.

Comment on Affirmative:

STENE, S.: The acronym 'PLTC' should be placed after the defined term and before the definition as follows: "Power-Limited Tray Cable (PLTC)" for consistency in accordance with the NEC Style.

3-46 Log #41 NEC-P03 **Final Action: Accept**
(725.3(K) and (L))

TCC Action: The Correlating Committee directs that 725.3(L) be revised to read as follows: "Corrosive, Damp, or Wet Locations. Class 2 and Class 3 cables, installed in corrosive, damp, or wet locations, shall comply with the applicable requirements in 110.11, 300.5(B), 300.6, 300.9, and 310.10(G)."

This action modifies the text by adding "Class 2 and Class 3 cables," to distinguish what must comply with this subsection and adds "the applicable requirements in" before the references to make it clear that the cables do not have to comply with all of the requirements in those sections, only those requirements that apply to the specific application. This action ensures compliance with 3.4.2 and 3.4.3 in the NEC Style Manual.

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 3-122a
Recommendation: The Correlating Committee notes that 725.3(L) does not contain a requirement and is inconsistent in style.

Code-Making Panel 3 is directed to review this section for compliance with the NEC Style Manual.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

Modify Section 725.3 (L) to read: Corrosive, Damp, or Wet Locations. Where installed in corrosive, damp, or wet locations, installations shall comply with 110.11, 300.5(B), 300.6, 300.9, and 310.10(G).

Panel Statement: The panel accepts the Correlating Committee direction to review and has modified the requirement in (L) to be consistent with the NEC Style Manual.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Sepulveda, M.
Comment on Affirmative:

STENE, S.: Accept the Correlating Committee direction and modify the text by adding "Class 2 and Class 3 cables," to distinguish what must comply with this subsection and add "the applicable requirements in" before the references to make it clear that the cables do not have to comply with all of the requirements in those sections, only those requirements that apply to the specific application. The subsection should read as follows: "725.3(L): Corrosive, Damp, or Wet Locations. Class 2 and Class 3 cables, installed in corrosive, damp, or wet locations, shall comply with the applicable requirements in 110.11, 300.5(B), 300.6, 300.9, and 310.10(G). 110.11, 300.5(B), 300.6, 300.9, and 310.10(G)." The changes provided in new 725.3(L) ensures compliance with 3.4.2 and 3.4.3 in the NEC Style Manual as suggested by the NEC Correlating Committee.

3-47 Log #913 NEC-P03 **Final Action: Reject**
(725.3(K) Exception No. 1)

Submitter: Mark C. Wirfs, R & W Engineering, Inc.
Comment on Proposal No: 3-122a
Recommendation: Add text to read as follows:
Exception No. 1 <u>Air tubing, serving pneumatically operated equipment or devices and having a line pressure no greater than 125 psig, shall be permitted in a common raceway or cable tray with Class 2 or 3 circuit(s) wherein the low voltage wiring is functionally associated with the equipment or other related devices. Pneumatic air tubing shall have a minimum working pressure rating of 125 psig.</u>
Substantiation: The addition of the requirement to comply with 300.8 is a huge change from decades of NEC editions that has permitted specialized applications to exist. The substantiation by the panel is simply a statement of what the new language does. There is no <u>technical justification</u> of any kind to make this change and no problems or issues with the existing code text have been presented or demonstrated in any way. The substantiation text simply reiterates the text from 300.8, which in itself is not a technical basis.
I personally believe that coexisting with fluids is an issue even though this has never been reported to be a problem. We have electrical technology with 600-volt and higher systems where cables are integrally water-cooled, bus-bars are encapsulated in water, and we put capacitors and windings in permanent oil tanks. Coexistence with air is not an issue or technical problem. It seems basically logical to prohibit coexistence with fluid systems. The wiring in the world is surrounded by environmental air and coexistence with a tubing system with oil-free conditioned low pressure air has no technical problem that we can contemplate or foresee. Many years ago a pneumatically operated high-security locking system was developed for the corrections industry. This uses low pressure air to operate the locking mechanisms with low voltage (24VDC) circuits in lieu of higher powered electrical motor locks. This provides the same level of security while vastly reducing the energy requirements, wiring, and installation costs. Tens of Thousands of these locks have been installed throughout the United States with the air supply tubing and low-voltage wiring contained within the same raceway. There has not been a single reported incident of any issues with these systems operationally and they have provided for the latest in technology for securing inmates. Adding the full requirements of 300.8 will require separate piping/tubing systems for the air supply and will, most likely, require extensive added costs to detention facility construction and even return to motorized systems that have higher operating and installation costs.
At the end use point of the pneumatically locking assembly the wiring and air supply system coexist within the device! Why separate the supply system when the most likely source of an air leak is inside the lock assembly and this will still enter the low-voltage wiring raceway. <u>See attached exhibit of a locking device.</u>
We are proposing that you maintain the proposed additional requirements 300.8 but provide an appropriate exception for coexistence with air supply systems where they are functionally associated devices.
Also see our comment on proposal 3-154.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The addition of the reference to 300.8 was made to assure Article 725 cables and conductors correlated with the similar requirements in Article 760 as the applications are similar. Simply stating that the practice of installing tubing systems in raceways with wires and cables should be acceptable since it has always been done does not substantiate the assertion in the comment.

Special circumstances could allow the electrical inspector, based on 90.4 second paragraph where he or she is assured that safety would not be compromised, to accept an installation as stated in the Comment substantiation. There may be other circumstances, such as heat, cold, sharp parts, fittings or similar issues, that could preclude this installation from being accepted and should only be accepted on a case by case basis, not just generally in all cases.

Ballot Not Returned: 1 Sepulveda, M.
Explanation of Negative:

STENE, S.: See the negative statement in Comment 3-41

3-47a Log #CC304 NEC-P03 **Final Action: Hold**
(725.3(N) (New))

TCC Action: The Correlating Committee directs that this comment be reported as "Hold."

The Correlating Committee action on Comment 16-3 changed the location of the definition of Communication Raceways to Article 100. The installation requirements in 800.110 and 800.113 do not apply globally and negate some of the requirements in Article 725. The Correlating Committee will appoint a task group to address installation issues regarding Communication Raceways throughout the Code.

Submitter: Code-Making Panel 3,
Comment on Proposal No: 3-163a
Recommendation: Add new 725.3(N) to read as follows:
"(N) Communications Raceways. The definition in 800.2, the applications in Table 800.154(b), the listing requirements of 800.182 and the installation rules in 800.110 and 800.113 shall apply to Article 725."
Substantiation: The new paragraph is added to retain the reference to the information deleted from 725.179 regarding communications raceways. Refer to the panel action and statement on Comment 3-71.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Sepulveda, M.
Comment on Affirmative:

WALSH, R.: I believe the statement in the new text; "installation rules in 800.110 and 800.113 shall apply to Article 725", to be too general since it can be interpreted to include Class 1 circuits for installation in Cable Routing Assemblies. I submit that the comment should be evaluated by the Correlating Committee.

3-48 Log #298 NEC-P03 **Final Action: Accept**
(725.24)

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 3-126
Recommendation: Continue to reject the proposal.
Substantiation: The submitter is trying to apply a uniform set of installation rules to power, and power-limited circuit cables without considering the inherent safety features of power-limited circuits.
Panel Meeting Action: Accept
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Sepulveda, M.

3-49 Log #710 NEC-P03 **Final Action: Accept**
(725.24)

Submitter: George Bish, Secure Watch Security
Comment on Proposal No: 3-125
Recommendation: Continue to Accept in Principle.
Substantiation: The Task Group understands that the Panel Action to Accept in Principle refers to the Panel Action on Proposal 3-86 and that the listing of cable ties for use in other spaces used for environmental air is covered by reference to 300.22(C)(1) in 725.3(C)

Continued Panel Action to Accept in Principle is in keeping with the Correlating Committee's directive to correlate requirements addressing the listing of cable ties across Article 300, 770, 800, 820 and 830.

This is one of a group of comments developed by the CMP3/CMP16 Joint Task Group formed at the direction of the Correlating Committee to correlate the requirements of Cable Ties in Articles 300, 770, 800, 820 and 830

The Task Group members were:

George Bish, Chair, representing Satellite Broadcasting & Communication Association

Harry Ohde, representing IBEW

James Brunssen, representing Alliance for Telecommunications Industry Solutions

George Straniero, representing National Electrical Manufacturers Association

Robert Walsh, representing International Association of Electrical Inspectors

Wendell Whistler, representing Intertek Testing Services

3-50 Log #654 NEC-P03 **Final Action: Accept**
(725.48(B)(4)(2))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 3-136
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task group to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

(725.121, 725.179, 727.6, 760.176, and 760.179, Informational Note)

TCC Action: The format and language used in this code follows guidelines established by NFPA and published in the NEC Style Manual.
Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 3-141
Recommendation: The Correlating Committee directs that the action on this proposal be reconsidered and accepted without the revision date in parenthesis to comply with the NEC Style Manual regarding referencing other standards in Informational notes and Annex A.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise the references to the standards listed as follows:
UL 60950-1 2011
UL 1666 2012
UL 1685 2010
UL 1581 2011
UL 2196 2012
Panel Statement: The panel recognizes that the Correlating Committee, in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects, does indeed have the responsibility to direct Code-Making Panels to comply with the NEC Style Manual.
The panel also recognizes that the NEC Style Manual states:
"4.2 References to Other Standards. References to other standards shall not be in mandatory Code text. References to product standards shall be in an informative annex. References to other Standards shall be in the Informational Notes."
The entire section for references to other standards does not preclude the inclusion of specific revisions as shown in the previous panel action for Proposal 3-141.
The panel recommends that the practice of including the revision dates as originally proposed by Panel 3 be reviewed by a task group appointed by the Correlating Committee to develop a comprehensive position for the 2017 NEC cycle.

3-54 Log #578 NEC-P03 **Final Action: Hold**
(725.121(A)(4) and Informational Note)

Submitter: Thomas M. Burke, UL LLC
Comment on Proposal No: 3-141
Recommendation: Revise Section 725.121(A)(4) to reflect publication of UL 62368-1 in February 2012:
(4) Listed <u>audio/video,</u> information (computer) <u>and communication technology</u> equipment limited-power circuits.
Informational Note: One way to determine applicable requirements for listing of information technology (computer) equipment is to refer to UL 60950-1-2007 (Rev: 2011), *Standard for Safety of Information Technology Equipment*. <u>Another way to determine applicable requirements for listing of audio/video, information and communication technology equipment is to refer to UL 62368-1-2012, *Standard for Safety of Audio/Video, Information and Communication Technology Equipment.*</u> Typically such circuits are used to interconnect such equipment for the purpose of exchanging information (data).
Substantiation: This is one in a series of comments to update NFPA 70 to add a reference to newly published UL 62368-1.
ANSI/UL 62368-1, Audio/video, information and communication technology equipment – Part 1: Safety requirements, was published on February 17, 2012. This new standard will eventually replace (later this decade) both, UL 60065, Audio, Video, and Similar Electronic Apparatus-Safety Requirements, and UL 60950-1, Information Technology Equipment Safety - Part 1: General Requirements. In the meantime, multiple references to UL 60950-1 in the body of the Code should be supplemented by a reference to UL 62368-1 since similar equipment complying with, and Listed to both standards will be installed per the Code. In fact, equipment already is being Listed to UL 62368-1. The requirements for limited power sources are the same in both standards.
Panel Meeting Action: Hold
Panel Statement: This comment introduces new material and the recommended revision has not yet been reviewed by the panel for applicability. The panel, therefore, recommends that this comment be held for the next NEC revision cycle.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Sepulveda, M.
Comment on Affirmative:
STENE, S.: The Correlating Committee should review the actions taken on Comments 1-111, 12-54, 12-57, 12-63, 16-64 and 16-116 and include the reference to UL 62638-1 in the informational note to 725.121(A)(4).

3-55 Log #1443 NEC-P03 **Final Action: Reject**
(725.122)

Submitter: Mike Weitzel, Richland, WA
Comment on Proposal No: 3-124
Recommendation: Add text to read as follows:
<u>**Non-Safety Control Devices.** Devices, other than cables and raceways, operating at Less than 50-volts, and current limited to100-Volt amperes maximum and installed in industrial facilities, where qualified persons perform installation and maintenance, shall not be required to be listed.</u>
<u>*Exception: Non-Safety Control Devices installed in the following locations shall be listed:*</u>
<u>1) Wet Locations</u>
<u>2) Hazardous Locations</u>
Informational Note: Power supplies must meet the requirements of 725.121 (A) and (B).

Substantiation: I agree that the power supplies should require listing by an OSHA-approved NRTL. And, I understand and agree with Panel 3's concerns with the installations over 100 VA.

What I am trying to target is the little 0 to 5 volt DC, or 24 volt AC devices such as a pressure transmitter or transducer, which operates at minute amounts of power and is not a shock or fire hazard. There are some regulatory personnel who want to take this issue to the extreme and require listing of these types of products, even when installed in a non-classified, non-hazardous location.

Many times, for the nuclear industry, there are no listed products available. In that case, it is either complete a mountain of paperwork for each little device to justify an AHJ approval, or hire an NRTL to field evaluate these little devices, which seems excessive.

Panel Meeting Action: Reject

Panel Statement: The suggested text of "less than 50 volts and current limited to 100 volt-amperes" would permit unlisted power supplies with up to 2 amps of current without regard to the available peak current as limited by the Imax values in Table 11(A) and (B) to not more than 8 amperes. By not restricting the available fault peak current of listing in accordance with the restrictions in Tables 11(A) and (B), the peak current could cause a person to be subjected to a injurious or fatal shock or could initiate a fire.

(725.133 and 725.135 (New))

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.

Comment on Proposal No: 3-144a

Recommendation: Revise text to read as follows:

725.133 Installation of Conductors and Equipment in Cables, Compartments, Cable Trays, Enclosures, Manholes, Outlet Boxes, Device Boxes, ~~and~~ Raceways and Cable Routing Assemblies for Class 2 and Class 3 Circuits. Conductors and equipment for Class 2 and Class 3 circuits shall be installed in accordance with 725.135 ~~725.136~~ through 725.143.

725.135 Installation of Class 2, Class 3 and PLTC Cables. Installation of Class 2, Class 3 and PLTC cables shall comply with 725.135(A) through (L).

(A) Listing. Class 2, Class 3 and PLTC cables installed in buildings shall be listed.

(B) Other Spaces Used for Environmental Air (Plenums). The following cables shall be permitted in other spaces used for environmental air as described in 300.22(C):

(1) Types CL2P and CL3P cables

(2) Types CL2P and CL3P cables installed in plenum communications raceways

(3) Types CL2P and CL3P cables and plenum communications raceways supported by open metallic cable trays or cable tray systems

(4) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3, CL2X, CL3X and PLTC cables installed in raceways that are installed in compliance with 300.22(C)

(5) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3, CL2X, CL3X and PLTC cables supported by solid bottom metal cable trays with solid metal covers in other spaces used for environmental air (plenums) as described in 300.22(C).

(6) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3, CL2X, CL3X and PLTC cables installed in plenum communications raceways, riser communications raceways and general-purpose communications raceways supported by solid bottom metal cable trays with solid metal covers in other spaces used for environmental air (plenums) as described in 300.22(C)

(C) Risers — Cables in Vertical Runs. The following cables shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft:

(1) Types CL2P, CL3P, CL2R and CL3R cables

(2) Types CL2P, CL3P, CL2R and CL3R cables installed in:

a. Plenum communications raceways

b. Plenum cable routing assemblies

c. Riser communications raceways

d. Riser cable routing assemblies

Informational Note: See 300.21 for firestop requirements for floor penetrations.

(D) Risers — Cables in Metal Raceways. The following cables shall be permitted in metal raceways in a riser having firestops at each floor:

(1) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3, CL2X, CL3X and PLTC cables

(2) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3, CL2X, CL3X and PLTC cables installed in:

a. Plenum communications raceways

b. Riser communications raceways

c. General-purpose communications raceways

Informational Note: See 300.21 for firestop requirements for floor penetrations.

(E) Risers — Cables Fireproof Shafts. The following shall be permitted to be installed in fireproof riser shafts having firestops at each floor:

(1) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3, CL2X, CL3X and PLTC cables

(2) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables installed in:

a. Plenum communications raceways

b. Plenum cable routing assemblies

c. Riser communications raceways

d. Riser cable routing assemblies

e. General-purpose communications raceways

f. General-purpose cable routing assemblies

Informational Note: See 300.21 for firestop requirements for floor penetrations.

(F) Risers — One- and Two-Family Dwellings. The following cables shall be permitted in one- and two-family dwellings:

(1) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables

(2) Type CL2X and CL3X cables less than 6 mm (0.25 in.) in diameter

(3) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables installed in:

a. Plenum communications raceways

b. Plenum cable routing assemblies

c. Riser communications raceways

d. Riser cable routing assemblies

e. General-purpose communications raceways

f. General-purpose cable routing assemblies

(G) Cable Trays. Cables installed in cable trays outdoors shall be Type PLTC. The following cables and shall be permitted to be supported by cable trays in buildings:

(1) Types CM CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables

(2) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables installed in:

a. Plenum communications raceways

b. Riser communications raceways

c. General-purpose communications raceways

(H) Cross-Connect Arrays. The following cables shall be permitted to be installed in cross-connect arrays:

(1) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables

(2) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables installed in:

a. Plenum communications raceways

b. Plenum cable routing assemblies

c. Riser communications raceways

d. Riser cable routing assemblies

e. General-purpose communications raceways

f. General-purpose cable routing assemblies

(I) Industrial Establishments. In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type PLTC cable shall be permitted in accordance with either (1) or (2):

(1) Where the cable is not subject to physical damage, Type PLTC cable that complies with the crush and impact requirements of Type MC cable and is identified as PLTC-ER for such use shall be permitted to be exposed between the cable tray and the utilization equipment or device. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be supported and secured at intervals not exceeding 1.8 m (6 ft).

(2) Type PLTC cable, with a metallic sheath or armor in accordance with 725.179(E), shall be permitted to be installed exposed. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be secured at intervals not exceeding 1.8 m (6 ft).

(J) Other Building Locations. The following wires, cables shall be permitted to be installed in building locations other than the locations covered in 725.135(B) through (I):

(1) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables

(2) A maximum of 3 m (10 ft) of exposed Type CL2X in nonconcealed spaces

(3) A maximum of 3 m (10 ft) of exposed Type CL3X in nonconcealed spaces

(4) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables installed in:

a. Plenum communications raceways

b. Plenum cable routing assemblies

c. Riser communications raceways

d. Riser cable routing assemblies

e. General-purpose communications raceways

f. General-purpose cable routing assemblies

(5) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3, CL2X, CL3X and PLTC cables installed in raceways recognized in Chapter 3

(6) Type CMUC undercarpet communications wires and cables installed under carpet

(K) Multifamily Dwellings. The following wires and cables shall be permitted to be installed in multifamily dwellings in locations other than the locations covered in 725.135(B) through (I):

(1) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables

(2) Type CL2X less than 6 mm (0.25 in.) in diameter in nonconcealed spaces

(3) Type CL3X less than 6 mm (0.25 in.) in diameter in nonconcealed spaces

(4) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables installed in:

a. Plenum communications raceways

b. Plenum cable routing assemblies

c. Riser communications raceways

d. Riser cable routing assemblies

e. General-purpose communications raceways

f. General-purpose cable routing assemblies

(5) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3, CL2X, CL3X and PLTC cables installed in raceways recognized in Chapter 3

(6) Type CMUC undercarpet communications wires and cables installed under carpet

(L) One- and Two-Family Dwellings. The following wires and cables shall be permitted to be installed in one- and two-family dwellings in locations other

than the locations covered in 725.135 (B) through (I):
(1) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables
(2) Type CL2X less than 6 mm (0.25 in.) in diameter
(3) Type CL3X less than 6 mm (0.25 in.) in diameter
(4) Communications wires and Types CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables installed in:
a. Plenum communications raceways
b. Plenum cable routing assemblies
c. Riser communications raceways
d. Riser cable routing assemblies
e. General-purpose communications raceways
f. General-purpose cable routing assemblies
(5) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3, CL2X, CL3X and PLTC cables installed in raceways recognized in Chapter 3
(6) Type CMUC undercarpet communications wires and cables installed under carpet

Substantiation: Proposals 3-144a and 3-154a were submitted as a package.

Proposal 3-154a deals with 725.154, *Applications of Listed Class 2, Class 3, and PLTC Cables*. Notwithstanding the title of 725.154, it contains a mixture of applications and installation rules. The primary objectives of proposals 3-144a and 3-154a are to separate the installation rules from the applications and to express the applications as simply as possible by using a table. If this concept is accepted in Articles 725 (proposals 3-144a & 3-154a) and 760 (proposals 3-197 & 3-202), then the cable applications and installation sections will be editorially consistent with Articles 770, 800, 820 and 830.

CMP-3 accepted 3-154a in principle in part by correcting the errors in the proposed Table 725.154 (accept in principle) and retaining the text in 725.154. Table 725.154 clearly prohibits the installation of plenum cable routing assemblies in plenums; permitting them to be used only in place of riser and general-purpose cable routing assemblies.

We also submitted proposal 3-156 as alternate to splitting 725.154 into an applications and installation parts; it just recommended changing the text of 725.154 to permit the use of cable routing assemblies and the use of communications raceways as an alternate to signaling raceways.

Instead of retaining signaling raceways and permitting communications to be used in place of them the panel action on proposal 3-156 consolidated the number of redundant raceways by eliminating signaling raceways and replaced them with communications raceways; This is a welcome simplification.

However the text accepted by the panel in its action on proposal 3-156 has several serious conflicts and omissions:

725.154(A) permits the installation of plenum cable routing assemblies in plenums (other space used for environmental air) which conflicts with Table 725.154.

725.154(A) only permits the installation of Types CL2P and CL3P cables in plenum communications raceways that are installed in plenums, which conflicts with 770.113(C), 800.113(C), 820.113(C) and 830.113(C) which permit the installation of optical fiber, communications, CATV and network-powered communications plenum cables in plenum communications raceways that are installed in plenums.

725.154(B) only permits the installation of Types CL2R, CL3R, CL2P and CL3P cables in riser and plenum communications raceways that are installed in risers, which conflicts with 770.113(D), 800.113(D), 820.113(D) and 830.113(D) which permit the installation of optical fiber, communications, CATV and network-powered communications riser and plenum cables in riser communications raceways that are installed in risers.

Whereas 725.154(B) is overly restrictive in the cables permitted to be installed in plenum and riser raceways, it has no restrictions on the cables that are permitted to be installed in cable routing assemblies, opening up the possibility of a general-purpose cable (CL2 or CL3) being installed in a riser cable routing assembly in a riser application.

The solution to fixing the text accepted in action on 3-156 is to take three actions, 1) accept the text recommended in this comment for 725.135(new) which contains all the installation requirements, 2) and to also accept our companion comment on proposal 3-154a for 725.154 and 3) changing the action proposal 3-156 to accept in principle with reference to the acceptance of this comment on proposal 3-144a and our comment on proposal 3-154a.

Proposal 3-144a included a recommendation for wiring in ducts specifically fabricated for environmental air. This comment has deletes that section in order to correlate with panel action on proposal 3-82 which prohibited wiring in ducts specifically fabricated for environmental air.

Proposal 3-144a was not correlated with (couldn't anticipate the panel action) action on proposal 3-160 which required cables penetrating one or more floors to be riser or plenum rated. The comment recommends text for 725.135(C) that correlates with the panel action on proposal 3-160. The text accepted by CMP 3 on proposals 3-159 and 3-160 used the phrase "penetrating from floor to floor" instead of "penetrating one or more floors" as recommended by the submitters. The correlating committee directed that the CMP 3 action be correlated with CMP 16 existing text. CMP 16 uses "penetrating one or more floors" in 770.113(D), 800.113(D), 820.113(D) and 830.113(D). Since there were no proposals to change "penetrating one or more floors", the only way to correlate is to use "penetrating one or more floors" in CMP 3 text for Articles 725 and 760. If this comment and its companion comment on proposal 3-154a are accepted, the action on proposal 3-160 should be changed to accept in principle with reference to the acceptance of this comment on proposal 3-144a and our comment on proposal 3-154a.

Proposal 3-144a included installation requirements for signaling raceways. The recommended text for this comment has eliminated all mention of signaling raceways and replaced signaling raceways with communications raceways to collate with the panel action on proposal 3-156. It provides installation requirements for the installation of class 2, class 3 and PLTC cables in communications raceways and in cable routing assemblies. It does not cover the installation of communications raceways or cable routing assemblies because that would be redundant.

Proposal 3-144a included a sub-section on distributing frames and cross-connect arrays that has been changed in this comment to just cross-connect arrays to correlate with panel action of Table 725.154 in proposal 3-154a and the existing text in 725.154(F).

Panel Meeting Action: Accept in Principle
Panel Statement: Refer to the panel action and statement on Comment 3-57, which addresses the same issues.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Sepulveda, M.

3-57 Log #983 NEC-P03 **Final Action: Accept in Principle**
(725.133 and 725.135 (New))

Submitter: Robert W. Jensen, dbi-Telecommunication Infrastructure Design
Comment on Proposal No: 3-144a
Recommendation: Revise text to read as follows:

725.133 Installation of Conductors and Equipment in Cables, Compartments, Cable Trays, Enclosures, Manholes, Outlet Boxes, Device Boxes, ~~and~~ Raceways and Cable Routing Assemblies for Class 2 and Class 3 Circuits. Conductors and equipment for Class 2 and Class 3 circuits shall be installed in accordance with 725.135 ~~725.136~~ through 725.143.

725.135 Installation of Class 2, Class 3 and PLTC Cables. Installation of Class 2, Class 3 and PLTC cables shall comply with 725.135(A) through (M).

(A) Listing. Class 2, Class 3 and PLTC cables installed in buildings shall be listed.

(B) Fabricated Ducts Used for Environmental Air. The following wires and cables shall be permitted in ducts used for environmental air as described in 300.22(B) if they are directly associated with the air distribution system:
(1) Up to 1.22 m (4 ft) of Type CL2P and CL3P cables
(2) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3, CL2X, CL3X and PLTC cables and installed in raceways that are installed in compliance with 300.22(B)
Informational Note: For information on fire protection of wiring installed in fabricated ducts see 4.3.4.1 and 4.3.11.3.3 in NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilating Systems*.

(C) Other Spaces Used for Environmental Air (Plenums). The following cables shall be permitted in other spaces used for environmental air as described in 300.22(C):
(1) Types CL2P and CL3P cables
(2) Types CL2P and CL3P cables installed in plenum communications raceways
(3) Types CL2P and CL3P cables and plenum communications raceways supported by open metallic cable trays or cable tray systems
(4) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3, CL2X, CL3X and PLTC cables installed in raceways that are installed in compliance with 300.22(C)
(5) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3, CL2X, CL3X and PLTC cables supported by solid bottom metal cable trays with solid metal covers in other spaces used for environmental air (plenums) as described in 300.22(C).
(6) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3, CL2X, CL3X and PLTC cables installed in plenum communications raceways, riser communications raceways and general-purpose communications raceways supported by solid bottom metal cable trays with solid metal covers in other spaces used for environmental air (plenums) as described in 300.22(C)

(D) Risers — Cables in Vertical Runs. The following cables shall be permitted in vertical runs penetrating from floor to floor and in vertical runs in a shaft:
(1) Types CL2P, CL3P, CL2R and CL3R cables
(2) Types CL2P, CL3P, CL2R and CL3R cables installed in:
a. Plenum communications raceways
b. Plenum cable routing assemblies
c. Riser communications raceways
d. Riser cable routing assemblies
Informational Note: See 300.21 for firestop requirements for floor penetrations.

(E) Risers — Cables in Metal Raceways. The following cables shall be permitted in metal raceways in a riser having firestops at each floor:
(1) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3, CL2X, CL3X and PLTC cables
(2) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3, CL2X, CL3X and PLTC cables installed in:
a. Plenum communications raceways
b. Riser communications raceways
c. General-purpose communications raceways
Informational Note: See 300.21 for firestop requirements for floor penetrations.

(F) Risers — Cables Fireproof Shafts. The following shall be permitted to be installed in fireproof riser shafts having firestops at each floor:
(1) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3, CL2X, CL3X and PLTC cables

(2) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables installed in:
a. Plenum communications raceways
b. Plenum cable routing assemblies
c. Riser communications raceways
d. Riser cable routing assemblies
e. General-purpose communications raceways
f. General-purpose cable routing assemblies
Informational Note: See 300.21 for firestop requirements for floor penetrations.
(G) Risers — One- and Two-Family Dwellings. The following cables shall be permitted in one- and two-family dwellings:
(1) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables
(2) Type CL2X and CL3X cables less than 6 mm (0.25 in.) in diameter
(3) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables installed in:
a. Plenum communications raceways
b. Plenum cable routing assemblies
c. Riser communications raceways
d. Riser cable routing assemblies
e. General-purpose communications raceways
f. General-purpose cable routing assemblies
(H) Cable Trays. Cables installed in cable trays outdoors shall be Type PLTC. The following cables and shall be permitted to be supported by cable trays in buildings:
(1) Types CM CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables
(2) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables installed in:
a. Plenum communications raceways
b. Riser communications raceways
c. General-purpose communications raceways
(I) Cross-Connect Arrays. The following cables shall be permitted to be installed in cross-connect arrays:
(1) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables
(2) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables installed in:
a. Plenum communications raceways
b. Plenum cable routing assemblies
c. Riser communications raceways
d. Riser cable routing assemblies
e. General-purpose communications raceways
f. General-purpose cable routing assemblies
(J) Industrial Establishments. In industrial establishments where the conditions of maintenance and supervision ensure that only qualified persons service the installation, Type PLTC cable shall be permitted in accordance with either (1) or (2):
(1) Where the cable is not subject to physical damage, Type PLTC cable that complies with the crush and impact requirements of Type MC cable and is identified as PLTC-ER for such use shall be permitted to be exposed between the cable tray and the utilization equipment or device. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be supported and secured at intervals not exceeding 1.8 m (6 ft).
(2) Type PLTC cable, with a metallic sheath or armor in accordance with 725.179(E), shall be permitted to be installed exposed. The cable shall be continuously supported and protected against physical damage using mechanical protection such as dedicated struts, angles, or channels. The cable shall be secured at intervals not exceeding 1.8 m (6 ft).
(K) Other Building Locations. The following wires, cables shall be permitted to be installed in building locations other than the locations covered in 725.135(B) through (I):
(1) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables
(2) A maximum of 3 m (10 ft) of exposed Type CL2X in nonconcealed spaces
(3) A maximum of 3 m (10 ft) of exposed Type CL3X in nonconcealed spaces
(4) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables installed in:
a. Plenum communications raceways
b. Plenum cable routing assemblies
c. Riser communications raceways
d. Riser cable routing assemblies
e. General-purpose communications raceways
f. General-purpose cable routing assemblies
(5) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3, CL2X, CL3X and PLTC cables installed in raceways recognized in Chapter 3
(6) Type CMUC undercarpet communications wires and cables installed under carpet
(L) Multifamily Dwellings. The following wires and cables shall be permitted to be installed in multifamily dwellings in locations other than the locations covered in 725.135(B) through (I):
(1) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables
(2) Type CL2X less than 6 mm (0.25 in.) in diameter in nonconcealed spaces
(3) Type CL3X less than 6 mm (0.25 in.) in diameter in nonconcealed spaces
(4) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables installed in:
a. Plenum communications raceways
b. Plenum cable routing assemblies
c. Riser communications raceways
d. Riser cable routing assemblies
e. General-purpose communications raceways
f. General-purpose cable routing assemblies
(5) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3, CL2X, CL3X and PLTC cables installed in raceways recognized in Chapter 3
(6) Type CMUC undercarpet communications wires and cables installed under carpet
(M) One- and Two-Family Dwellings. The following wires and cables shall be permitted to be installed in one- and two-family dwellings in locations other than the locations covered in 725.135 (B) through (I):
(1) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables
(2) Type CL2X less than 6 mm (0.25 in.) in diameter
(3) Type CL3X less than 6 mm (0.25 in.) in diameter
(4) Communications wires and Types CL2P, CL3P, CL2R, CL3R, CL2, CL3 and PLTC cables installed in:
a. Plenum communications raceways
b. Plenum cable routing assemblies
c. Riser communications raceways
d. Riser cable routing assemblies
e. General-purpose communications raceways
f. General-purpose cable routing assemblies
(5) Types CL2P, CL3P, CL2R, CL3R, CL2, CL3, CL2X, CL3X and PLTC cables installed in raceways recognized in Chapter 3
(6) Type CMUC undercarpet communications wires and cables installed under carpet

Substantiation: Proposals 3-144a and 3-154a were submitted as a package.

Proposal 3-154a deals with 725.154, *Applications of Listed Class 2, Class 3, and PLTC Cables*. Notwithstanding the title of 725.154, it contains a mixture of applications and installation rules. The primary objectives of proposals 3-144a and 3-154a are to separate the installation rules from the applications and to express the applications as simply as possible by using a table. If this concept is accepted in Articles 725 (proposals 3-144a & 3-154a) and 760 (proposals 3-197 & 3-202), then the cable applications and installation sections will be editorially consistent with Articles 770, 800, 820 and 830.

CMP-3 accepted 3-154a in principle in part by correcting the errors in the proposed Table 725.154 (accept in principle) and retaining the text in 725.154. Table 725.154 clearly prohibits the installation of plenum cable routing assemblies in plenums; permitting them to be used only in place of riser and general-purpose cable routing assemblies.

Instead of retaining signaling raceways and permitting communications to be used in place of them the panel action on proposal 3-156 consolidated the number of redundant raceways by eliminating signaling raceways and replaced them with communications raceways; This is a welcome simplification.

However the text accepted by the panel in its action on proposal 3-156 has several serious conflicts and omissions:

725.154(A) permits the installation of plenum cable routing assemblies in plenums (other space used for environmental air) which conflicts with Table 725.154.

725.154(A) only permits the installation of Types CL2P and CL3P cables in plenum communications raceways that are installed in plenums, which conflicts with 770.113(C), 800.113(C), 820.113(C) and 830.113(C) which permit the installation of optical fiber, communications, CATV and network-powered communications plenum cables in plenum communications raceways that are installed in plenums.

725.154(B) only permits the installation of Types CL2R, CL3R, CL2P and CL3P cables in riser and plenum communications raceways that are installed in risers, which conflicts with 770.113(D), 800.113(D), 820.113(D) and 830.113(D) which permit the installation of optical fiber, communications, CATV and network-powered communications riser and plenum cables in riser communications raceways that are installed in risers.

Whereas 725.154(B) is overly restrictive in the cables permitted to be installed in plenum and riser raceways, it has no restrictions on the cables that are permitted to be installed in cable routing assemblies, opening up the possibility of a general-purpose cable (CL2 or CL3) being installed in a riser cable routing assembly in a riser application.

The solution to fixing the text accepted in action on 3-156 is to take three actions, 1) accept the text recommended in this comment for 725.135(new) which contains all the installation requirements, 2) and to also accept our companion comment on proposal 3-154a for 725.154 and 3) changing the action proposal 3-156 to accept in principle with reference to the acceptance of this comment on proposal 3-144a and our comment on proposal 3-154a.

Proposal 3-144a was not correlated with (couldn't anticipate the panel action) action on proposal 3-160 which required cables penetrating one or more floors to be riser or plenum rated. The comment recommends text for 725.135(C) that correlates with the panel action on proposal 3-160.

Proposal 3-144a included installation requirements for signaling raceways. The recommended text for this comment has eliminated all mention of signaling raceways and replaced signaling raceways with communications raceways to collate with the panel action on proposal 3-156. It provides installation requirements for the installation of class 2, class 3 and PLTC cables in communications raceways and in cable routing assemblies. It does not cover the installation of communications raceways or cable routing assemblies because that would be redundant.

Proposal 3-144a included a sub-section on distributing frames and cross-connect arrays that has been changed in this comment to just cross-connect arrays to correlate with panel action of Table 725.154 in proposal 3-154a and the existing text in 725.154(F).

Panel Meeting Action: Accept in Principle

The panel accepts the comment with the following modifications:

(1) Modify (B)(1) to read: (1) Type CL2P and CL3P cables in lengths as

short as practicable to perform the required function

(2) Modify the charging sentence of (D) as follows:

(D) Risers — Cables in Vertical Runs. The following cables shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft: (remainder unchanged)

(3) Modify the charging sentence of (F) to read: (F) Risers — Cables in Fireproof Shafts. (remainder unchanged)

Panel Statement: The panel recognizes the requirements of NFPA 90A and modified (B)(1) to clarify the need to be consistent with NFPA 90A section 4.3.4.3.

The panel modified (D) to align with the Correlating Committee direction and the joint (CMP 3 and CMP 16) task group conclusions.

The panel also corrected the typographical error in (F) by inserting "in" for clarity.

3-58 Log #297 NEC-P03 **Final Action: Accept**
(725.139)

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 3-118
Recommendation: Continue to accept proposals 3-152 and 3-153 in principle based on the acceptance of the recommended text in proposal 3-118 for 725.139.
Substantiation: I submitted proposal 3-152 to permit the installation of Class 2 and Class 3 cables along with optical fiber and communications cables in cable routing assemblies. The recommended text in proposals 3-152 and 3-152 and the text accepted for 725.139 in proposal 3-118 are identical.

CMP-3 action on these proposals will facilitate the use of cable routing assemblies in data centers where they are used to support and manage large installations of data cables.

Thank you. Y'all done good.

Panel Meeting Action: Accept

(725.140 (New))

Submitter: Mark C. Wirfs, R & W Engineering, Inc.
Comment on Proposal No: 3-154
Recommendation: Accept the original wording in the proposal.
Substantiation: Article 760 is not a valid reference or technical justification. The reference to 300.8 has not been 'missing' but was done purposefully and there has been no evidence to indicate otherwise for decades. Fill calculations can be simply done by treating the tubing size as a conductor of the same dimensions and this has been done for many years in the corrections industry. See substantiation in comment of proposal 3-122a.
Panel Meeting Action: Reject
Panel Statement: The panel maintains its position that the recommended change does not support the purpose of the Code to maintain a separate electrical system.

Comment on Proposal No: 3-154a
Recommendation: Revise the panel action on proposal 3-154a as follows:
Delete 725.154(A) through (F)

725.154 Applications of Listed Class 2, Class 3 and PLTC Cables. Class 2, Class 3 and PLTC cables shall comply with any of the requirements described in 725.154(A) through (C ~~I~~) and as indicated in Table 725.154.

See Table 725.154 on Page 416

(A ~~G~~) Class 2 and Class 3 Cable Substitutions. The substitutions for Class 2 and Class 3 cables listed in Table 725.154(A ~~G~~) and illustrated in Figure 725.154(A ~~G~~) shall be permitted. Where substitute cables are installed, the wiring requirements of Article 725, Parts I and III, shall apply.

Informational Note: For information on Types CMP, CMR, CM, and CMX, see 800.179.

Renumber existing Table 725.154(G) to 725.154(A).

Renumber existing Figure 725.154(G) to Figure 725.154(A).

(B ~~H~~) Class 2, Class 3, PLTC Circuit Integrity (CI) Cable or Electrical Circuit Protective System. Circuit integrity (CI) cable or a listed electrical circuit protective system shall be permitted for use in remote control, signaling, or power-limited systems that supply critical circuits to ensure survivability for continued circuit operation for a specified time under fire conditions.

(C ~~I~~) Thermocouple Circuits. Conductors in Type PLTC cables used for Class 2 thermocouple circuits shall be permitted to be any of the materials used for thermocouple extension wire.

In Table 396.10(A) Cable Types in the column labeled "Section" make the following change:

~~725.154(C) and~~ 725.179(E)

In 600.33(A) and 600.33(A)(2) make the following change:

Table 725.154(A ~~G~~)

In 640.3(C) Informational Note, make the following change:

Table 725.154 ~~(C)~~

In 725.3(C) exception make the following change:

Exception: As permitted in Table 725.154 ~~(A)~~.

In 645.3(B) make the following changes:

(B) Plenums. The provisions of ~~Sections~~ 300.22(C)(1), 725.135(B) ~~725.154(A),~~ 760.53(B)(2), 760.135(B) ~~760.154(A),~~ 770.113(C), 800.113(C), and 820.113(C) and Tables 725.154, 760.154, 770.154(A), 800.154(A) and 820.154(A) shall apply to wiring and cabling in a plenum (other space used for environmental air) above an information technology equipment room.

In 645.32 (645.10(B) renumbered by CMP-12 action on proposal 12-109)

645.32 Under Raised Floors in a Critical Operations Data system. Signal wiring under a raised floor in a critical operations data system shall be in compliance with 300.22(C), 725.135(B) and Table 725.154 ~~(A),~~ 770.113(C) and Table 770.154(a), 800.113(C) and Table 800.154(a), or 820.113(C) and Table 820.154(a).

Substantiation: Proposals 3-144a and 3-154a were submitted as a package. Proposal 3-154a deals with 725.154, Applications of Listed Class 2, Class 3, and PLTC Cables. Notwithstanding the title of 725.154, it contains a mixture of applications and installation rules. The primary objectives of proposals 3-144a and 3-154a are to separate the installation rules from the applications and to express the applications as simply as possible by using a table. If this concept is accepted in Articles 725 (proposals 3-144a & 3-154a) and 760 (proposals 3-197 & 3-202), then the cable applications and installation sections will be editorially consistent with Articles 770, 800, 820 and 830.

CMP-3 accepted 3-154a in principle in part by correcting the errors in the proposed Table 725.154 (accept in principle) and retaining the text in 725.154. Table 725.154 clearly prohibits the installation of plenum cable routing assemblies in plenums; permitting them to be used only in place of riser and general-purpose cable routing assemblies.

We also submitted proposal 3-156 as alternate to splitting 725.154 into an applications and installation parts; it just recommended changing the text of 725.154 to permit the use of cable routing assemblies and the use of communications raceways as an alternate to signaling raceways. Instead of retaining signaling raceways and permitting communications to be used in place of them the panel consolidated the number of redundant raceways and eliminated signaling raceways and replaced them with communications raceways; that's a welcome simplification. However the text accepted by the panel in its action on proposal 3-156 has several serious conflicts and omissions:

725.154(A) permits the installation of plenum cable routing assemblies in plenums (other space used for environmental air) which conflicts with Table 725.154.

725.154(A) only permits the installation of Types CL2P and CL3P cables in plenum communications raceways, which conflicts with 770.113(C), 800.113(C), 820.113(C) and 830.113(C) which permit the installation of optical fiber, communications, CATV and network-powered communications plenum cables in plenum communications raceways.

725.154(B) only permits the installation of Types CL2R, CL3R, CL2P and CL3P cables in rider and plenum communications raceways, which conflicts with 770.113(D), 800.113(D), 820.113(D) and 830.113(D) which permit the installation of optical fiber, communications, CATV and network-powered communications riser and plenum cables in riser cables communications raceways.

Whereas 725.154(B) is overly restrictive in the cables permitted to be installed in plenum and riser raceways, it has no restrictions on the cables that are permitted to be installed in cable routing assemblies opening up the possibility of a general-purpose cable (CL2 or CL3) being installed in a riser cable routing assembly in a riser application.

The solution to fixing the text accepted in action on 3-156 is to accept this comment and to also accept the companion comment on proposal 3-154a which also deals with 725.154. If these two actions are taken we recommend changing the action on 3-156 to "accept in principle" with reference to the panel action on this comment.

Note that a change has been made in Table 725.154 to correlate with the panel action on proposal 3-82 which rejected the use of any plenum cable in a duct specifically fabricated for environmental air.

Part of the panel statement was "The panel rejects the remainder of the proposal because deletion of the text and subsections would create a disparity with other articles that reference specific subsections of 725.154." The comment includes correlating renumbering (or re-lettering) of the affected references throughout the code. The recommended changes to 645.3 correlate with CMP-12 action on proposal 12-109.

Table 725.154
Applications of Listed Class 2, Class 3 and PLTC Cables in Buildings

Applications		**Wire and Cable Type**					
		CL2P & CL3P	CL2R & CL3R	CL2 & CL3	CL2X & CL3X	CMUC	PLTC
In Fabricated Ducts as Described in 300.22(B)	In fabricated ducts	N	N	N	N	N	N
	In metal raceway that complies with 300.22(B)	Y*	Y*	Y*	Y*	N	Y*
In Other Spaces Used for Environmental Air as Described in 300.22(C)	In other spaces used for environmental air	Y*	N	N	N	N	N
	In metal raceway that complies with 300.22(C)	Y*	Y*	Y*	Y*	N	Y*
	In plenum communications raceways	Y*	N	N	N	N	N
	In plenum cable routing assemblies	NOT PERMITTED					
	Supported by open metal cable trays	Y*	N	N	N	N	N
	Supported by solid bottom metal cable trays with solid metal covers	Y*	Y*	Y*	Y*	N	N
In Risers	In vertical runs	Y*	Y*	N	N	N	N
	In metal raceways	Y*	Y*	Y*	Y*	N	Y*
	In fireproof shafts	Y*	Y*	Y*	Y*	N	Y*
	In plenum communications raceways	Y*	Y*	N	N	N	N
	In plenum cable routing assemblies	Y*	Y*	N	N	N	N
	In riser communications raceways	Y*	Y*	N	N	N	N
	In riser cable routing assemblies	Y*	Y*	N	N	N	N
	In one- and two-family dwellings	Y*	Y*	Y*	Y*	N	Y*
Within Buildings in Other Than Air-Handling Spaces and Risers	General	Y*	Y*	Y*	Y*	N	Y*
	In one- and two-family dwellings	Y*	Y*	Y*	Y*	Y*	Y*
	In multifamily dwellings	Y*	Y*	Y*	Y*	Y*	Y*
	In nonconcealed spaces	Y*	Y*	Y*	Y*	Y*	Y*
	Supported by cable trays	Y*	Y*	Y*	N	N	Y*
	Under carpet	N	N	N	N	Y*	N
	In cross-connect arrays	Y*	Y*	Y*	N	N	Y*
	In any raceway recognized in Chapter 3	Y*	Y*	Y*	Y*	N	Y*
	In plenum communications raceways	Y*	Y*	Y*	N	N	Y*
	In plenum cable routing assemblies	Y*	Y*	Y*	N	N	Y*
	In riser communications raceways	Y*	Y*	Y*	N	N	Y*
	In riser cable routing assemblies	Y*	Y*	Y*	N	N	Y*
	In general-purpose communications raceways	Y*	Y*	Y*	N	N	Y*
	In general-purpose cable routing assemblies	Y*	Y*	Y*	N	N	Y*

Note: An ‘N’ in the table indicates that the cable type shall not be permitted to be installed in the application. A ‘Y*’ indicates that the cable shall be permitted to be installed in the application, subject to the limitations described in 725.130 through 725.143.

We are submitting correlating comments on proposals 7-76 [Table 396.19(A)], 18-124 (600.33) and 12-109 (Article 645) to revise the references to Article 725.

Ballot Not Returned: 1 Sepulveda, M.

3-61 Log #301 NEC-P03 **Final Action: Accept in Principle**
(725.154)

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.

Comment on Proposal No: 3-156

Recommendation: Revise the panel action on proposal 3-154a as follows:

Continue to accept proposal 3-156 in principle but change the panel action to "See panel action on comments 3-xx and 3-yy", where comment 3-xx is the comment I submitted in proposal 3-144a and 3-yy in the comment that I submitted on proposal 3-154a.

Substantiation: Proposals 3-144a and 3-154a were submitted as a package. Proposal 3-154a deals with 725.154, *Applications of Listed Class 2, Class 3, and PLTC Cables*. Notwithstanding the title of 725.154, it contains a mixture of applications and installation rules. The primary objectives of proposals 3-144a and 3-154a are to separate the installation rules from the applications and to express the applications as simply as possible by using a table. If this concept is accepted in Articles 725 (proposals 3-144a & 3-154a) and 760 (proposals 3-197 & 3-202), then the cable applications and installation sections will be editorially consistent with Articles 770, 800, 820 and 830.

CMP-3 accepted 3-154a in principle in part by correcting the errors in the proposed Table 725.154 (accept in principle) and retaining the text in 725.154. Table 725.154 clearly prohibits the installation of plenum cable routing assemblies in plenums; permitting them to be used only in place of riser and general-purpose cable routing assemblies.

We also submitted proposal 3-156 as alternate to splitting 725.154 into an applications and installation parts; it just recommended changing the text of 725.154 to permit the use of cable routing assemblies and the use of communications raceways as an alternate to signaling raceways. Instead of retaining signaling raceways and permitting communications to be used in place of them the panel consolidated the number of redundant raceways and eliminated signaling raceways and replaced them with communications raceways; that's a welcome simplification. However the text accepted by the panel in its action on proposal 3-156 has several serious conflicts and omissions:

725.154(A) permits the installation of plenum cable routing assemblies in plenums (other space used for environmental air) which conflicts with Table 725.154.

725.154(A) only permits the installation of Types CL2P and CL3P cables in plenum communications raceways, which conflicts with 770.113(C), 800.113(C), 820.113(C) and 830.113(C) which permit the installation of optical fiber, communications, CATV and network-powered communications plenum cables in plenum communications raceways.

725.154(B) only permits the installation of Types CL2R, CL3R, CL2P and CL3P cables in rider and plenum communications raceways, which conflicts with 770.113(D), 800.113(D), 820.113(D) and 830.113(D) which permit the installation of optical fiber, communications, CATV and network-powered communications riser and plenum cables in riser cables communications raceways.

Whereas 725.154(B) is overly restrictive in the cables permitted to be installed in plenum and riser raceways, it has no restrictions on the cables that are permitted to be installed in cable routing assemblies opening up the possibility of a general-purpose cable (CL2 or CL3) being installed in a riser cable routing assembly in a riser application.

The solution to fixing the text accepted in action on 3-156 is to accept my comments on proposals 3-144a and proposal 3-154a. If these two actions are taken we recommend changing the action on 3-156 to "accept in principle" with reference to the panel action on my comments on proposals 3-144a and proposal 3-154a.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement for Comments 3-57 and 3-63 which meets the intent of the submitter.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Sepulveda, M.

3-62 Log #879 NEC-P03 **Final Action: Accept**
(725.154)

Submitter: Terry Peters, The Society of the Plastics Industry

Comment on Proposal No: 3-155

Recommendation: Continue to reject proposal 3-155.

Substantiation: The submitter's recommendation to prohibit the installation of plenum cables in plenum raceways is absurd. Plenum raceways are designed to be used with plenum cables. The Society of the Plastics Industry supports the panel action to reject this proposal.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Sepulveda, M.

3-63 Log #984 NEC-P03 **Final Action: Accept in Principle in Part**
(725.154)

TCC Action: The Correlating Committee understands the Panel Meeting Action should have stated that the "panel accepts the proposal with the modifications below." The panel accepted the deletion of 725.154(A) thru (F) and the relettering of the remaining sections in addition to the changes noted in the Panel Meeting Action.

Submitter: Robert W. Jensen, dbi-Telecommunication Infrastructure Design

Comment on Proposal No: 3-154a

Recommendation: Revise the panel action on proposal 3-154a as follows:

Delete 725.154(A) through (F)

725.154 Applications of Listed Class 2, Class 3 and PLTC Cables. Class 2, Class 3 and PLTC cables shall comply with any of the requirements described in 725.154(A) through (C ~~I~~) and as indicated in Table 725.154.

Insert Table 725.154

See Table 725.154 on Page 418

(A ~~G~~) Class 2 and Class 3 Cable Substitutions. The substitutions for Class 2 and Class 3 cables listed in Table 725.154(A ~~G~~) and illustrated in Figure 725.154(A ~~G~~) shall be permitted. Where substitute cables are installed, the wiring requirements of Article 725, Parts I and III, shall apply.

Informational Note: For information on Types CMP, CMR, CM, and CMX, see 800.179.

Renumber existing Table 725.54(G) to 725.154(A).

Insert Table 725.154(A) Cable Substitutions (not submitted)

Renumber existing Figure 725.154(G) to Figure 725.154(A).

Insert Figure 725.154(A) Cable Substitution Hierarchy (not submitted)

(B ~~H~~) Class 2, Class 3, PLTC Circuit Integrity (CI) Cable or Electrical Circuit Protective System. Circuit integrity (CI) cable or a listed electrical circuit protective system shall be permitted for use in remote control, signaling, or power-limited systems that supply critical circuits to ensure survivability for continued circuit operation for a specified time under fire conditions.

(C ~~I~~) Thermocouple Circuits. Conductors in Type PLTC cables used for Class 2 thermocouple circuits shall be permitted to be any of the materials used for thermocouple extension wire.

In Table 396.10(A) Cable Types in the column labeled "Section" make the following change:

~~725.154(C) and~~ 725.179(E)

In 600.33(A) and 600.33(A)(2) make the following change:

Table 725.154(A ~~G~~)

In 640.3(C) Informational Note, make the following change:

Table 725.154 ~~(C)~~

In 725.3(C) exception make the following change:

Exception: As permitted in Table 725.154 ~~(A)~~.

In 645.3(B) make the following changes:

(B) Plenums. The provisions of ~~Sections~~ 300.22(C)(1), 725.135(B) ~~725.154(A),~~ 760.53(B)(2), 760.135(B) ~~760.154(A),~~ 770.113(C), 800.113(C), and 820.113(C) and Tables 725.154, 760.154, 770.154(A), 800.154(A) and 820.154(A) shall apply to wiring and cabling in a plenum (other space used for environmental air) above an information technology equipment room.

In 645.32 (645.10(B) renumbered by CMP-12 action on proposal 12-109)

645.32 Under Raised Floors in a Critical Operations Data system. Signal wiring under a raised floor in a critical operations data system shall be in compliance with 300.22(C), 725.135(B) and Table 725.154 ~~(A),~~ 770.113(C) and Table 770.154(a), 800.113(C) and Table 800.154(a), or 820.113(C) and Table 820.154(a).

Substantiation: Proposals 3-144a and 3-154a were submitted as a package. Proposal 3-154a deals with 725.154, Applications of Listed Class 2, Class 3, and PLTC Cables. Notwithstanding the title of 725.154, it contains a mixture of applications and installation rules. The primary objectives of proposals 3-144a and 3-154a are to separate the installation rules from the applications and to express the applications as simply as possible by using a table. If this concept is accepted in Articles 725 (proposals 3-144a & 3-154a) and 760 (proposals 3-197 & 3-202), then the cable applications and installation sections will be editorially consistent with Articles 770, 800, 820 and 830.

CMP-3 accepted 3-154a in principle in part by correcting the errors in the proposed Table 725.154 (accept in principle) and retaining the text in 725.154. Table 725.154 clearly prohibits the installation of plenum cable routing assemblies in plenums; permitting them to be used only in place of riser and general-purpose cable routing assemblies.

The text accepted by the panel in its action on proposal 3-156 has several serious conflicts and omissions:

725.154(A) permits the installation of plenum cable routing assemblies in plenums (other space used for environmental air) which conflicts with Table 725.154.

Table 725.154 Applications of Listed Class 2, Class 3 and PLTC Cables in Buildings							
Applications		**Wire and Cable Type**					
		CL2P & CL3P	CL2R & CL3R	CL2 & CL3	CL2X & CL3X	CMUC	PLTC
In Fabricated Ducts as Described in 300.22(B)	In fabricated ducts	Y*	N	N	N	N	N
	In metal raceway that complies with 300.22(B)	Y*	Y*	Y*	Y*	N	Y*
In Other Spaces Used for Environmental Air as Described in 300.22(C)	In other spaces used for environmental air	Y*	N	N	N	N	N
	In metal raceway that complies with 300.22(C)	Y*	Y*	Y*	Y*	N	Y*
	In plenum communications raceways	Y*	N	N	N	N	N
	In plenum cable routing assemblies	NOT PERMITTED					
	Supported by open metal cable trays	Y*	N	N	N	N	N
	Supported by solid bottom metal cable trays with solid metal covers	Y*	Y*	Y*	Y*	N	N
In Risers	In vertical runs	Y*	Y*	N	N	N	N
	In metal raceways	Y*	Y*	Y*	Y*	N	Y*
	In fireproof shafts	Y*	Y*	Y*	Y*	N	Y*
	In plenum communications raceways	Y*	Y*	N	N	N	N
	In plenum cable routing assemblies	Y*	Y*	N	N	N	N
	In riser communications raceways	Y*	Y*	N	N	N	N
	In riser cable routing assemblies	Y*	Y*	N	N	N	N
	In one- and two-family dwellings	Y*	Y*	Y*	Y*	N	Y*
Within Buildings in Other Than Air-Handling Spaces and Risers	General	Y*	Y*	Y*	Y*	N	Y*
	In one- and two-family dwellings	Y*	Y*	Y*	Y*	Y*	Y*
	In multifamily dwellings	Y*	Y*	Y*	Y*	Y*	Y*
	In nonconcealed spaces	Y*	Y*	Y*	Y*	Y*	Y*
	Supported by cable trays	Y*	Y*	Y*	N	N	Y*
	Under carpet	N	N	N	N	Y*	N
	In cross-connect arrays	Y*	Y*	Y*	N	N	Y*
	In any raceway recognized in Chapter 3	Y*	Y*	Y*	Y*	N	Y*
	In plenum communications raceways	Y*	Y*	Y*	N	N	Y*
	In plenum cable routing assemblies	Y*	Y*	Y*	N	N	Y*
	In riser communications raceways	Y*	Y*	Y*	N	N	Y*
	In riser cable routing assemblies	Y*	Y*	Y*	N	N	Y*
	In general-purpose communications raceways	Y*	Y*	Y*	N	N	Y*
	In general-purpose cable routing assemblies	Y*	Y*	Y*	N	N	Y*
Note: An ‘N’ in the table indicates that the cable type shall not be permitted to be installed in the application. A ‘Y*’ indicates that the cable shall be permitted to be installed in the application, subject to the limitations described in 725.130 through 725.143.							

725.154(A) only permits the installation of Types CL2P and CL3P cables in plenum communications raceways, which conflicts with 770.113(C), 800.113(C), 820.113(C) and 830.113(C) which permit the installation of optical fiber, communications, CATV and network-powered communications plenum cables in plenum communications raceways.

725.154(B) only permits the installation of Types CL2R, CL3R, CL2P and CL3P cables in rider and plenum communications raceways, which conflicts with 770.113(D), 800.113(D), 820.113(D) and 830.113(D) which permit the installation of optical fiber, communications, CATV and network-powered communications riser and plenum cables in riser cables communications raceways.

Whereas 725.154(B) is overly restrictive in the cables permitted to be installed in plenum and riser raceways, it has no restrictions on the cables that are permitted to be installed in cable routing assemblies opening up the possibility of a general-purpose cable (CL2 or CL3) being installed in a riser cable routing assembly in a riser application.

The solution to fixing the text accepted in action on 3-156 is to accept this comment and to also accept the companion comment on proposal 3-154a which also deals with 725.154. If these two actions are taken we recommend changing the action on 3-156 to “accept in principle” with reference to the panel action on this comment.

Part of the panel statement was “The panel rejects the remainder of the proposal because deletion of the text and subsections would create a disparity with other articles that reference specific subsections of 725.154.” The comment includes correlating renumbering (or re-lettering) of the affected references throughout the code. The recommended changes to 645.3 correlate with CMP-12 action on proposal 12-109.

Panel Meeting Action: Accept in Principle in Part

The panel accepts the proposed recommendation modified below:

In new Table 725.154, correct the last line in the section “In Other Spaces Used for Environmental Air as Described in 300.22(C)” for PLTC to read “Y*”.

The panel rejects the changes to Table 396.10(A); 600.33(A) and 600.33(A)(2); 640.3(C); 645.3(B); and 645.32

Panel Statement: The panel corrected the application of PLTC in Table 725.154 to allow PLTC to be supported by solid bottom metal cable trays with solid metal covers in other spaces for environmental air.

The rejected parts of the comment are based on the fact that they are outside the scope of the panel.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Sepulveda, M.

Comment on Affirmative:

STENE, S.: The Panel Meeting Action should have stated that the ‘panel accepts the proposal with the modifications below’. The panel accepted the deletion of 725.154(A) thru (F) and the relettering of the remaining sections in addition to the changes noted in the Panel Meeting Action.

3-64 Log #1364 NEC-P03 **Final Action: Reject**
(Table 725.154)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Comment on Proposal No: 3-154a

Recommendation: Delete plenum cable routing assemblies from the second column of Table 725.154.

Substantiation: Cable Routing assemblies are not permitted in Plenums or other spaces used for environmental air by either the NEC or by NFPA 90A that has jurisdiction over wiring in air handling plenum spaces. Inclusion of plenum cable routing assemblies is misleading and could cause it to be used where it is not permitted. Companion comment on proposal 3-118 proposes an Informational Note that would permit the substitution of plenum cable routing assemblies for Riser cable routing assemblies

Panel Meeting Action: Reject

Panel Statement: The panel asserts that the table, as presented, states very clearly where the plenum rated cable routing assemblies are allowed to be installed.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Sepulveda, M.

3-65 Log #880 NEC-P03 **Final Action: Accept**
(725.154(A))

Submitter: Terry Peters, The Society of the Plastics Industry

Comment on Proposal No: 3-157

Recommendation: Continue to reject proposal 3-157.

Substantiation: The Society of the Plastics Industry agrees that the recommended text is contradictory and supports the panel action to reject this proposal.

Panel Meeting Action: Accept

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Sepulveda, M.

3-66 Log #905 NEC-P03 **Final Action: Accept in Principle**
(725.154(A))

Submitter: Marcelo M. Hirschler, GBH International

Comment on Proposal No: 3-156

Recommendation: Revise text to read as follows:

725.154 Applications of Listed Class 2, Class 3, and PLTC Cables. Class 2, Class 3, and PLTC cables shall comply with any of the requirements described in 725.154 (A) through (I).

(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CL2P or CL3P. Listed wires and cables installed in compliance with 300.22 shall be permitted. Listed plenum communications raceways ~~and listed plenum cable routing assemblies~~ shall be permitted to be installed in other spaces used for environmental air as described in 300.22(C). Only Types CL2P or CL3P cables shall be permitted to be installed in these plenum communications raceways.

Substantiation: This section contains a mistake in that it allows plenum cable routing assemblies” into plenums. This is inconsistent with NFPA 90A, with the table 725.154 and with the requirements in articles 760, 770, 800, 820 and 830.

Plenum cable routing assemblies are permitted to be listed and are permitted to be used in risers, cable trays and so on but are not permitted to be used in plenums.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement for Comment 3-63, which meets the intent of the submitter.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Sepulveda, M.

3-67 Log #1365 NEC-P03 **Final Action: Accept in Principle**
(725.154(A))

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Comment on Proposal No: 3-156

Recommendation: Delete the proposed permitted use of Listed plenum cable routing assemblies in plenums in 725.154(A):

(A) Plenums. Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type CL2P or CL3P. Listed wires and cables installed in compliance with 300.22 shall be permitted. Listed plenum communications raceways ~~and listed plenum cable routing assemblies~~ shall be permitted to be installed in other spaces used for environmental air as described in 300.22(C). Only Types CL2P or CL3P cables shall be permitted to be installed in these plenum communications raceways.

Substantiation: The text in 725.154 accepted by the panel permits plenum rated cable routing assemblies to be installed in other spaces used for environmental air as described in 300.22(C). Cable Routing assemblies are not permitted in other spaces used for environmental air by either the NEC or by NFPA 90A that has jurisdiction over wiring in air handling plenum spaces.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement for Comment 3-63 which meets the intent of the submitter.

Number Eligible to Vote: 14

(725.154(B)(1))

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.

Comment on Proposal No: 3-160

Recommendation: Revise the panel action on proposal 3-154a as follows:

Continue to accept proposal 3-156 in principle but change the panel action to “See panel action on comments 3-xx and 3-yy”, where comment 3-xx is the comment I submitted in proposal 3-144a and 3-yy in the comment that I submitted on proposal 3-154a.

Substantiation: This is a companion comment to our comments on proposals 3-144a and 3-154a. Our comment on proposal 3-144a has text to correlate with the panel action on proposal 3-160.

If the panel accepts our comments on proposals 3-144a and 3-154a, the action on this proposal should be changed to accept in principle with references to the actions on our comments on 3-144a and 3-154a.

Panel Meeting Action: Accept in Principle

Panel Statement: See panel action and statement for Comments 3-57 and 3-63 which meets the intent of the submitter.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Sepulveda, M.

3-69 Log #707 NEC-P03 **Final Action: Accept in Principle in Part**
(725.154(B)(1))

Submitter: George Bish, Secure Watch Security
Comment on Proposal No: 3-160
Recommendation: Continue to "Accept in Principle".
Revise Panel Statement to: "See Panel Action and Panel Statement on Proposal 3-159."
Substantiation: It is the recommendation of the Task Group to correlate with the current language used in Chapter 8, Sections 800.113(D), 820.113(D) and 830.113(D), as well as 770.113(D). The Acceptance in Principle of Proposal 3-160 with reference to the Panel Action and Panel Statement on Proposal 3-159 as recommended by the Task Group will accomplish this. This action will fulfill the Correlating Committee's request to correlate the phrase "penetrating one or more floors" and "from floor to floor" in Proposals 3-159, 3-192, 3-193, 3-205 and 3-206
This is one of a group of comments developed by the CMP3/CMP16 Joint Task Group formed at the direction of the Correlating Committee to address the correlation of the term "floor to floor" vs. "more than one floor"
The Task Group members were:
George Bish, Chair, representing Satellite Broadcasting & Communication Association
Harry Ohde, representing IBEW
James Brunssen, representing Alliance for Telecommunications Industry Solutions
George Straniero, representing National Electrical Manufacturers Association
Robert Walsh, representing International Association of Electrical Inspectors
Wendell Whistler, representing Intertek Testing Services
Panel Meeting Action: Accept in Principle in Part
Revise the panel action on Proposal 3-160 to read as follows:
(1) Cables installed in vertical runs and penetrating one or more floors or cables installed in vertical runs in a shaft, shall be Type CL2R or CL3R. Floor penetrations requiring Type CL2R or CL3R shall contain only cables suitable for riser or plenum use. Listed riser signaling raceways and listed plenum signaling raceways shall be permitted to be installed in vertical riser runs in a shaft from floor to floor.
Only Type CL2R, CL3R, CL2P, or CL3P cables shall be permitted to be installed in these raceways.
Reject the recommendation to "Revise panel statement to "See panel action and panel statement on Proposal 3-159".
Panel Statement: The changes made by the panel to 725.154(B)(1) meet the intent of the submitter.
The panel cannot revise the panel statement in the ROP as suggested in the recommendation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Sepulveda, M.

3-70 Log #709 NEC-P03 **Final Action: Accept in Principle**
(725.154(B)(1))

Submitter: George Bish, Secure Watch Security
Comment on Proposal No: 3-159
Recommendation: Revise Panel Action to Accept Proposal 3-159.
Substantiation: It is the recommendation of the Task Group to Accept this proposal as this will correlate with the language used in Chapter 8, Sections 800.113(D), 820.113(D) and 830.113(D), as well as 770.113(D). This action will fulfill the TCC's request to correlate the phrase "penetrating one or more floors" and "from floor to floor" in Proposals 3-159, 3-192, 3-193, 3-205, and 3-206. The Task Group realizes that there are other sections of Articles 770 and Chapter 8 where this phrase is not consistent and recommends that a Task Group be appointed to work on the complete correlation for the 2017 edition
This is one of a group of comments developed by the CMP3/CMP16 Joint Task Group formed at the direction of the Correlating Committee to address the correlation of the term "floor to floor" vs. "more than one floor"
The Task Group members were:
George Bish, Chair, representing Satellite Broadcasting & Communication Association
Harry Ohde, representing IBEW
James Brunssen, representing Alliance for Telecommunications Industry Solutions
George Straniero, representing National Electrical Manufacturers Association
Robert Walsh, representing International Association of Electrical Inspectors
Wendell Whistler, representing Intertek Testing Services
Panel Meeting Action: Accept in Principle

Ballot Not Returned: 1 Sepulveda, M.

3-71 Log #303 NEC-P03 **Final Action: Accept in Principle**
(725.179)

TCC Action: See the Correlating Committee action on Comment 3-41 which revises the introductory paragraph and title of 725.179.
Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 3-163a
Recommendation: Delete 725.179(I), 725.179(J) and 725.179(K).
Renumber 725.179(L) to 725.179(I).
In the introductory paragraph of 725.179, change 725.179(L) to 725.179(I).
Substantiation: The panel deleted signaling raceways and replaced them with communications raceways. The listing requirements for communications raceways are in 800.182. There is no need to have redundant listing requirements in multiple Articles. Having the listing requirements for communications raceways in 800.182 is sufficient.
Panel Meeting Action: Accept in Principle
The panel accepts the recommendation except as modified below:
(1) Revise the introductory paragraph to reflect the deleted paragraphs.
(2) Change the title to read: 725.179 Listing and Marking of Class 2, Class 3, and Type PLTC Cables.
Panel Statement: With the deletion of "communications raceways" from 725.179, the title needed to be changed.
The information related to communications raceways contained in the deleted material is addressed in the action on 3-47a (Log #CC304).
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Sepulveda, M.

3-72 Log #985 NEC-P03 **Final Action: Accept in Principle**
(725.179)

Submitter: Robert W. Jensen, dbi-Telecommunication Infrastructure Design
Comment on Proposal No: 3-163a
Recommendation: Delete 725.179(I), 725.179(J) and 725.179(K).
Renumber 725.179(L) to 725.179(I).
In the introductory paragraph of 725.179, change 725.179(L) to 725.179(I).
Substantiation: The panel deleted signaling raceways and replaced them with communications raceways. The listing requirements for communications raceways are in 800.182. There is no need to have redundant listing requirements in multiple Articles. Having the listing requirements for communications raceways in 800.182 is sufficient.
Panel Meeting Action: Accept in Principle
Panel Statement: Refer to the panel action and statement on Comment 3-71 which addresses the same changes.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Sepulveda, M.

3-73 Log #1366 NEC-P03 **Final Action: Reject**
(725.179)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)
Comment on Proposal No: 3-118
Recommendation: Delete the proposed new 725.179(L), re-letter proposed new 725.179(M) as (L) and add an Informational Note following it as follows:
<u>Informational Note: Cable routing assemblies that exhibit a maximum peak optical density of 0.5 or less, an average optical density of 0.15 or less, and a maximum flame spread distance of 1.52 m (5 ft) or less when tested in accordance with the plenum test in UL 2024 Signaling, Optical Fiber and Communications Raceways and Cable Routing Assemblies are considered suitable wherever cable routing assemblies that pass the requirements of the test for flame propagation (riser) in UL 2024 Signaling, Optical Fiber and Communications Raceways and Cable Routing Assemblies are required.</u>
Substantiation: Proposed new 725.179(L) includes requirements for a plenum rated cable routing assembly where there is no corresponding application for the product. While it is permitted as a substitute for the riser and lower rated Cable Routing assemblies, its use in plenums is not permitted by the NEC or by NFPA 90A that has jurisdiction over wiring in air handling plenum spaces. An Informational Note after the requirements for Riser cable routing assemblies would be appropriate in place of the proposed requirement.
Panel Meeting Action: Reject
Panel Statement: See the panel statement for Comment 3-64 which addresses the subject of where cable routing assemblies are permitted to be used. The informational note is not needed.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Sepulveda, M.

3-74 Log #708 NEC-P03 **Final Action: Accept in Principle in Part**
(725.179(F))

Submitter: George Bish, Secure Watch Security
Comment on Proposal No: 3-165
Recommendation: Continue to Accept in Principle with the following changes
725.179(F)(1) "Circuit integrity (-CI) cables used in raceways shall ~~only~~ be ~~permitted to be installed in a raceway where specifically~~ listed and marked as part of an Electrical Circuit Protective System as covered in (F)(2)"
725.179(F)(2) "printed on the outer jacket of the cable and ~~shall be~~ installed"
725.179(F)(2) Informational Note 1 "UL 2196-200~~2~~1"
725.179(F)(2) Informational Note 2 "~~UL guide~~ The listing organization provides information for Electrical Circuit Protective Systems (FHIT) ~~contains information on proper~~ including installation requirements to maintain the fire rating."
Substantiation: The recommended changes to 725.179(F)(1) and (F)(2) will correlate these sections with 770.179(E)(1) & (E)(2) and 800.179(G)(1) & (G)(2) as contained in companion comments to Proposals 16-26a and 16-85a and similar changes recommended in companion comments to Proposals 3-208 and 3-210.
The correct date is provided for UL 2196 in Informational Note No 1. Informational note No 2 is revised to indicate that the listing organization provides information, including installation requirements for FHIT systems.
This is one of a group of comments developed by the CMP3/CMP16 Joint Task Group formed at the direction of the Correlating Committee to correlate the Panel Action on Proposals 16-26a, 16-79, 16-85a, 16-137, 3-165, 3-208, and 3-210
The Task Group members were:
George Bish, Chair, representing Satellite Broadcasting & Communication Association
Harry Ohde, representing IBEW
James Brunssen, representing Alliance for Telecommunications Industry Solutions
George Straniero, representing National Electrical Manufacturers Association
Robert Walsh, representing International Association of Electrical Inspectors
Wendell Whistler, representing Intertek Testing Services
Panel Meeting Action: Accept in Principle in Part
Accept the recommendation: 725.179(F)(2) printed on the outer jacket of the cable and ~~shall be~~ installed, and reject the remaining recommendations.
Modify 725.179(F)(2) Informational Note 1 to read:
One method of defining circuit integrity (CI) cable or an Electrical Circuit Protective System is by establishing a minimum 2-hour fire resistive rating when tested in accordance with UL 2196-2012, Standard for Tests of Fire Resistive Cables.
Panel Statement: The panel asserts that the original language of 725.179(F)(1) should remain.
The panel agrees that the second "shall be" should be removed in 725.179(F)(2)
The reference to UL 2196 in 725.179(F)(2) Informational Note 1 was modified to reflect the current revision of the standard.
There is no need to modify 725.179(F)(2) Informational Note 2.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Sepulveda, M.

3-75 Log #1182 NEC-P03 **Final Action: Accept in Principle**
(725.179(F)(2), Informational Note 1)

Submitter: Susan L. Stene, UL LLC
Comment on Proposal No: 3-141
Recommendation: Revise text to read as follows:
(F) Circuit Integrity (CI) Cable or Electrical Circuit Protective System. Cables that are used for survivability of critical circuits under fire conditions shall meet either (F)(1) or (F)(2) as follows (1) Circuit Integrity (CI) Cables. Circuit Integrity (CI) cables, specified in 725.154(A), (B), (D)(1), and (E), and used for survivability of critical circuits shall have the additional classification using the suffix "-CI". Circuit integrity (CI) cables shall only be permitted to be installed in a raceway where specifically listed and marked as part of an electrical circuit protective system as covered in (F)(2).
(2) Electrical Circuit Protective System. Cables, specified in 725.154(A), (B), (D)(1), (E) and (F)(1) that are part of an electrical circuit protective system, shall be identified with the protective system number and hourly rating printed on the outer jacket of the cable and shall be in- stalled in accordance with the listing of the protective system.
Informational Note No. 1: One method of defining circuit integrity (CI) cable or an Electrical Circuit Protective System is by establishing a minimum 2-hour fire resistive rating when tested in accordance with UL 2196-~~2001~~ (2012), Standard for Tests of Fire Resistive Cables.
Informational Note No. 2: UL guide information for electrical circuit protective systems (FHIT) contains information on proper installation.
Substantiation: UL 2196, the Standard for Tests for Fire Resistive Cables was revised in 2012. References to UL Standards in the NEC should reflect the current edition.
Panel Meeting Action: Accept in Principle
Revise the date as shown in the recommendation but remove the parentheses.
Panel Statement: The removal of the parentheses is needed to comply with the manual of style. Also refer to the panel statement in Comment 3-53 for further explanation.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13

ARTICLE 728—FIRE RESISTIVE CABLE SYSTEMS (PROPOSED)

3-76 Log #554 NEC-P03 **Final Action: Reject**
(728 (New))

Submitter: Richard E. Loyd, Sun Lakes, AZ
Comment on Proposal No: 3-170
Recommendation: Reject this proposal.
Substantiation: Effective 09-12-12 UL issued Interim Guidelines for testing CI cables and Fire-Resistive cables that are part of the Electrical Circuit Protective Systems covered in this new Article. UL will be reviewing the requirements for these systems which will very likely lead to changes in the standard and in installation requirements for these systems.
The substantiation provided by the submitter is to inform the installers details including specific materials that must be used in association with CI cable. It is likely all these specifics will be changed by this UL action. Until that work is completed, this proposal should be rejected.
Panel Meeting Action: Reject
Panel Statement: While listed fire rated cable is currently undergoing scrutiny, an interim listing program exists that will allow the use of this article. Article 728, developed from the actions on Proposal 3-170 and Comments 3-79, 3-80, 3-81, 3-83, 3-88, Comment 3-83a (Log #CC302), 3-83b (Log #CC303), and 3-47a (Log #CC304) contains generic requirements which should allow for flexibility for the installation of these systems.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-77 Log #955 NEC-P03 **Final Action: Reject**
(728 (New))

Submitter: William A. Wolfe, Steel Tube Institute
Comment on Proposal No: 3-170
Recommendation: Reject this proposal.
Substantiation: Effective 09-12-12 ULpulled the listings on many of these systems and cables and issued Interim Guidelines for testing CI cables and Fire-Resistive cables that are part of the Electrical Circuit Protective Systems covered in this new Article. The Standards Technical Panel (STP) for UL 2196 Fire Resistive Cables has been expanded and will be charged with reviewing the requirements for these systems which will very likely lead to changes in the standard and in the requirements for these systems. Until that work is completed, this proposal should be rejected.
Panel Meeting Action: Reject
Panel Statement: Refer to the panel action and statement on Comment 3-76, which addresses the same issue.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-78 Log #968 NEC-P03 **Final Action: Reject**
(728)

Submitter: Edward Walton, WC Services
Comment on Proposal No: 3-170
Recommendation: Delete entire article.
Substantiation: As a manufacturer of fire resistive cable systems, we (and the installer) must follow the detailed requirements in our specific Electrical Circuit Protective System, the FHIT.GuideInfo provided by UL, code requirements as they appear in other articles and our own manufacturers instructions for each specific cable product. Many of our qualified installation requirements (and future qualified products) are (would be) in conflict with this article. This article does not provide any new material and conflicts with existing code articles (article 760, conduit support spacing; article 708, use of rigid conduit; etc). Finally, the updating of specific requirements in this article would not be practical on a three year cycle. I suggest this is good annex material.
Panel Meeting Action: Reject
Panel Statement: Refer to the panel action and statement on Comment 3-76, which addresses the same issue.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-79 Log #792 NEC-P03 **Final Action: Accept in Principle**
(728.4, 728.5)

TCC Action: The Correlating Committee directs that commas be added editorially after "system" in two places in 728.4 and after "room" in 728.5 as follows:
"728.4 General. Fire resistive cables, fire resistive conductors and components shall be tested and listed as a complete system, shall be designated for use in a specific fire rated system, and shall not be interchangeable between systems. Fire resistive cables, conductors and components shall be approved.
728.5 Installations. Fire resistive cable systems installed outside the fire-rated rooms that they serve, such as the electrical room or the fire pump room, shall comply with the following requirements and all other installation instructions provided in the listing."
Submitter: Thomas Guida, TJG Services Inc.
Comment on Proposal No: 3-170
Recommendation: Revise text to read as follows:
728.4 General. Fire resistive cables, fire resistive conductors and components shall be tested and listed as a complete system. The cables, conductors and components shall be designated for use in a specific fire rated system and shall not be interchangeable between systems. Fire resistive cables, conductors and components shall be suitable for use with the wiring methods in this code ~~Chapter 3~~ as applicable.
728.5 Installations.
Fire resistive cable systems installed outside the fire-rated rooms that they serve, such as the electrical room or the fire pump room shall comply with the following requirements and all other installation instructions provided in the listing.
(A) Mounting surface. The fire resistive cable system shall be fastened to a concrete or masonry wall or a concrete floor-ceiling assembly or other surfaces described in the installation instructions provided in the listing. The fire rating of the wall or floor-ceiling assembly upon which the electrical circuit protective system is mounted shall be equal to or greater than the rating of the fire resistive cable system.
Substantiation: These revisions to the text better define where these systems are used.
Panel Meeting Action: Accept in Principle
Revise text to read as follows:
728.4 General. Fire resistive cables, fire resistive conductors and components shall be tested and listed as a complete system. ~~The cables, conductors and components shall be~~ designated for use in a specific fire rated system and shall not be interchangeable between systems. Fire resistive cables, conductors and components shall be approved. ~~suitable for use with the wiring methods in Chapter 3 as applicable.~~
728.5 Installations.
Fire resistive cable systems installed outside the fire-rated rooms that they serve, such as the electrical room or the fire pump room shall comply with the following requirements and all other installation instructions provided in the listing.
(A) Mounting. ~~**surface.**~~ The fire resistive cable system shall be secured to the building structure in accordance with the listing and manufacturer's installation instructions. ~~fastened to a concrete or masonry wall or a concrete floor-ceiling assembly.~~ The fire rating of the wall or floor-ceiling assembly upon which the electrical circuit protective system is mounted shall be equal to or greater than the rating of the fire resistive cable system.
Panel Statement: The panel made changes to clarify the requirements for installation of fire resistive cable systems.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-80 Log #1184 NEC-P03 **Final Action: Accept**
(728.4 (New))

Submitter: Susan L. Stene, UL LLC
Comment on Proposal No: 3-170
Recommendation: Revise text to read as follows:
728.4 General. Fire resistive cables, fire resistive conductors and components shall be tested and listed as a complete system. The cables, conductors and components shall be designated for use in a specific fire rated system and shall not be interchangeable between systems. Fire resistive cables, conductors and components shall be suitable for use with the wiring methods in Chapter 3 as applicable.
Informational Note No. 1: One method of defining the fire rating is by testing the system in accordance with UL 2196-~~2006~~ 2012, Standard for Tests of Fire Resistive Cables.
Informational Note No. 2: Fire resistive cable systems are considered part of an Electrical Circuit Protective System.
Substantiation: UL 2196, the Standard for Tests for Fire Resistive Cables was revised in 2012. References to UL Standards in the NEC should reflect the current edition.
Panel Meeting Action: Accept
Panel Statement: Also see panel action and statement for Comment 3-53 for an explanation.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-81 Log #1107 NEC-P03 **Final Action: Accept in Principle**
(728.5(B))

Submitter: Edward Walton, WC Services
Comment on Proposal No: 3-170
Recommendation: Revise text to read as follows:
(B) Supports. ~~Fire resistive cabling systems shall be supported with steel support hardware, such as steel struts, clamps, straps or fasteners.~~ The fire resistive system shall be supported in accordance with the manufacturer's listing. ~~and, if not specified, at intervals not to exceed 1.5 m (5 ft).~~ At termination points, the fire resistive system shall be supported within 610 mm (24 in.) of each junction box, pull point, or enclosure.
Informational Note: The supports are an important part of the systems and each individual system may have specific support requirements. These supports are critical and must survive under fire condition to ensure the survivability of the system.
Substantiation: Limiting supports to "steel" would eliminate other qualified components that are not steel. A qualified example from FHIT.25 is approved "reinforced thermosetting resin conduit (RTRC)." This non corrosive conduit system is qualified to UL 2196 and important to transit, underground and chemical plant applications.
Panel Meeting Action: Accept in Principle
Modify the recommendation as follows:
(B) Supports. ~~Fire resistive cabling systems shall be supported with steel support hardware, such as steel struts, clamps, straps or fasteners.~~ The fire resistive system shall be supported in accordance with the listing and the manufacturer's installation instructions ~~listing~~. ~~and, if not specified, at intervals not to exceed 1.5 m (5 ft). At termination points, the fire resistive system shall be supported within 610 mm (24 in.) of each junction box, pull point, or enclosure.~~
Informational Note: The supports are critical for survivability of the system. Each system will have its specific support requirements. ~~The supports are an important part of the systems and each individual system may have specific support requirements. These supports are critical and must survive under fire condition. to ensure the survivability of the system.~~
Panel Statement: The panel has revised the text for clarity and to be consistent with the changes made in Comment 3-79. The last sentence of the requirement is deleted because these type provisions would be addressed in the listing and manufacturer's installation instructions.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-82 Log #1185 NEC-P03 **Final Action: Accept in Principle**
(728.5(B))

Submitter: Susan L. Stene, UL LLC
Comment on Proposal No: 3-170
Recommendation: Revise text to read as follows:
(B) Supports. Fire resistive cabling systems shall be supported with steel support hardware, such as steel struts, clamps, straps or fasteners. The fire resistive system shall be supported in accordance with the manufacturer's listing ~~and, if not specified, at intervals not to exceed 1.5 m (5 ft)~~. At termination points, the fire resistive system shall be supported within 610 mm (24 in.) of each junction box, pull point, or enclosure.
Substantiation: All listed Fire Resistive Cabling systems are tested using the support distance specified in the manufacturer's instructions. Therefore, there should be no system where the support length is unspecified.
Panel Meeting Action: Accept in Principle
Panel Statement: Refer to the panel action and statement on Comment 3-81, which addresses the same issue.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

(728.5(F) (G), and (H))

Submitter: Code-Making Panel 3,
Comment on Proposal No: 3-170
Recommendation: Revise 728.5(F),(G) and (H) as follows:
(F) Pulling Lubricants. Fire resistive cable systems, installed in a raceway shall only use pulling lubricants listed ~~for~~ as part of the fire resistive cable system~~s~~.
(G) Vertical Supports. Cables and conductors installed in vertical raceways shall be supported in accordance with the listing ~~300.19(B). The cable supports shall be steel and shall be identified in the~~ of the fire resistive cable system.
(H) Splices. Only splices that are part of the listing for the fire resistive cable system shall be used. Splices shall have manufacturer's installation instructions. ~~Splices shall be specific for each cable manufacturer.~~
Substantiation: The panel has revised the text for clarity and to be consistent with the changes made in Comment 3-79, 3-81 and Log CC 302.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-84 Log #1109 NEC-P03 **Final Action: Reject**
(728.5(F))

Submitter: Edward Walton, WC Services
Comment on Proposal No: 3-170
Recommendation: Delete and renumber
~~**(F) Pulling Lubricants.** Fire resistive systems, installed in a raceway shall only use pulling lubricants listed for fire resistive systems.~~
Substantiation: There are no provisions within the UL 2196 Standard for the installation or testing of cable lubricants during the fire test. There are no lubricants listed for use with "fire resistive systems". Lubricants are listed per UL Subject 267, "Outline of Investigation for Wire-Pulling Compounds." They are tested for compatibility with the cable jacket using IEEE 1210, "Standard Tests for Determining Compatibility of Cable-Pulling Lubricants with Wire and Cable" which demonstrates there are no short or long term effects on the cable jacket properties. Manufacturers recommend lubricants that meet these criteria.
Panel Meeting Action: Reject
Panel Statement: Pulling lubricants need to be addressed as part of the fire resistive system.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

3-85 Log #1110 NEC-P03 **Final Action: Reject**
(728.120)

Submitter: Edward Walton, WC Services
Comment on Proposal No: 3-170
Recommendation: Delete entire Paragraph
~~728.120 Marking. In addition to the marking required in 310.120, system cables and conductors shall be surface marked with the suffix "–FRR" (Fire Resistive Rating), along with the circuit integrity duration in hours and with the system identifier.~~
Substantiation: UL standards and follow up procedures specify marking requirements for listed and classified systems (including marking required in 310.120). Example " XX AWG RHW-2 600V (UL) R19359 CLASSIFIED 2 HOUR FIRE RATING (SYS #25)". In some cases 728.120 duplicates existing requirements or directly conflicts with current requirements (-CI listed products must be rated for two hours, see NEC articles 725, 760 and 800). System identifier is not defined. The suffix "–FRR" (Fire Resistive Rating) does not add any additional information.
Panel Meeting Action: Reject
Panel Statement: The provisions of 310.120(D) permits the conductors to be marked in this manner.
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ARTICLE 760 — FIRE ALARM SYSTEMS

3-86 Log #304 NEC-P03 **Final Action: Accept in Principle**
(760.2 and 760.3)

TCC Action: See Correlating Committee action on Comment 3-88.
Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 3-171
Recommendation: Revise the panel action on proposal 3-171 as follows:
Reject the definition of cable routing assembly recommended for 760.2.
760.3(L) (new) **Cable Routing Assemblies.** The definition in 800.2, the applications in Table 800.154(c) and the installation rules in 800.110 and 800.113 shall apply to Article 760.
Substantiation: Cable routing assemblies were introduced into the 2011 NEC. The definition, applications and installation rules for cable routing assemblies do not need to be repeated in every Article that has provisions for installing cables in cable routing assemblies.
The definition of cable routing assemblies is in 770.2. Proposal 16-23 recommended moving the definition to 800.2 so it would be in the same Article with the listing and application requirements. Panel 16 action on proposal 16-23 duplicated it in 800.2. We have submitted a comment to delete the definition of cable routing assembly from 770.2 and have it in 800.2 only.
The definition, listing requirements, applications and installation rules for cable routing assemblies do not need to be repeated in multiple articles. Having them all in Article 800 is sufficient.
The Correlating Committee, in its actions on proposal 3-118 and 3-171, directed that the definition of cable routing assembly be located in a single Article of Chapter 8. The correlating committee also directed in it actions on proposals 16-37, 16-163 and 16-222 that the Panel 16 actions to establish references to the definition, applications and installation rules for cable routing assemblies in 770.3, 820.3 and 830.3 be correlated with Articles 725 and 760., Acceptance of this comment will bring the panel action into conformance with the Correlating Committee directives.
Panel Meeting Action: Accept in Principle
Panel Statement: Refer to the panel action and statement on Comment 3-88.
With the removal of the definition of Cable Routing Assembly from Article 760, the panel agrees that the pointer to Article 800 needs to be in included for the information regarding the cable routing assembly.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 12 Negative: 1
Ballot Not Returned: 1 Sepulveda, M.
Explanation of Negative:
STENE, S.: The comment text as accepted would apply the application of Table 800.145(c), the listing requirements in 800.182 and the installation rules in 800.110 and 800.113 to all of Article 760, not just to cable routing assemblies within Article 760. This would permit this application for non-power-limited fire alarm circuits, as well as power-limited fire alarm circuit applications and that was never the intent. In addition, the application, listing requirements, and installation requirements as referenced in this accepted text in Article 800 only applies to communications wiring, cables, and raceways, not power-limited fire alarm circuits. This comment should be rejected or held for next Code cycle since it would not be possible to fix it at this time. The Correlating Committee should direct Panel 16 to locate this definition in Article 100 since it appears in more than one article and there is no technical or compelling reason to have the definition located in Article 800.
Comment on Affirmative:
WALSH, R.: I believe the statement in the new text; "installation rules in 800.110 and 800.113 shall apply to Article 70", to be too general since it can be interpreted to include NPLFA circuits and not just to the installation of Cable Routing Assemblies. I submit that the comment should be evaluated by the Correlating

3-87 Log #705 NEC-P03 **Final Action: Accept in Principle**
(760.2)

TCC Action: See Correlating Committee action on Comment 3-88.
Submitter: George Bish, Secure Watch Security
Comment on Proposal No: 3-171
Recommendation: Continue to Accept in Principle in Part with the following changes:
a. Reject the part to add a definition for "Cable Routing Assembly"
b. Add 760.3 (L) **Cable Routing Assembly**. The definition in 800.2, the applications in Table 800.154(c), the listing requirements of 800.182 and the installation rules in 800.110 and 800.113 shall apply to Article 760.
Substantiation: Rejecting the addition of a definition of "Cable Routing Assembly" to 760.2 is in keeping with the Correlating Committee Note to Proposal 3-171 to locate the definition in a single article of Chapter 8. See companion comment on Proposal 16-23 that not only relocates the definition to 800.2, but revises it as well.
Now that the definition of Cable Routing Assembly is located in 800.2 and the listing requirements in 800.182 a new paragraph 760.3(L) is needed directing the reader to Article 800 for the appropriate information.

This is one of a group of comments developed by the CMP3/CMP16 Joint Task Group formed at the direction of the Correlating Committee to locate a correlated definition of Cable Routing Assembly in a single Article of Chapter 8 for use in Article 725, 760, 770, and Chapter 8.

The Task Group members were:

George Bish, Chair, representing Satellite Broadcasting & Communication Association

Harry Ohde, representing IBEW

James Brunssen, representing Alliance for Telecommunications Industry Solutions

George Straniero, representing National Electrical Manufacturers Association

Robert Walsh, representing International Association of Electrical Inspectors

Wendell Whistler, representing Intertek Testing Services

Panel Meeting Action: Accept in Principle

Panel Statement: Refer to the panel action and statement on Comment 3-86, which addresses the same issue.

Ballot Results: Affirmative: 12 Negative: 1

Ballot Not Returned: 1 Sepulveda, M.

Explanation of Negative:

STENE, S.: See the negative statement in Comment 3-86

Comment on Affirmative:

WALSH, R.: I believe the statement in the new text; "installation rules in 800.110 and 800.113 shall apply to Article 70", to be too general since it can be interpreted to include NPLFA circuits and not just to the installation of Cable Routing Assemblies. I submit that the comment should be evaluated by the Correlating

---

3-88 Log #986 NEC-P03 **Final Action: Hold**
(760.2 and 760.3)

TCC Action: The Correlating Committee directs that the proposed 760.3(L) in this comment be reported as "Hold."

The Correlating Committee action on Comment 16-5 changed the location of the definition of Cable Routing Assemblies to Article 100. The installation requirements in 800.110 and 800.113 do not apply globally and negate some of the requirements in Article 760. The Correlating Committee will appoint a task group to address installation issues regarding Cable Routing Assemblies throughout the Code.

The Correlating Committee notes that only the revisions to 760.3(L) are being held.

Submitter: Robert W. Jensen, dbi-Telecommunication Infrastructure Design

Comment on Proposal No: 3-171

Recommendation: Revise the panel action on proposal 3-171 as follows:

Reject the definition of cable routing assembly recommended for 760.2.

<u>**760.3(L)**</u> (new) <u>**Cable Routing Assemblies.** The definition in 800.2, the applications in Table 800.154(c) and the installation rules in 800.110 and 800.113 shall apply to Article 760.</u>

Substantiation: Cable routing assemblies were introduced into the 2011 NEC. The definition, applications and installation rules for cable routing assemblies do not need to be repeated in every Article that has provisions for installing cables in cable routing assemblies.

The definition of cable routing assemblies is in 770.2. Proposal 16-23 recommended moving the definition to 800.2 so it would be in the same Article with the listing and application requirements. Panel 16 action on proposal 16-23 duplicated it in 800.2. We have submitted a comment to delete the definition of cable routing assembly from 770.2 and have it in 800.2 only.

The definition, listing requirements, applications and installation rules for cable routing assemblies do not need to be repeated in multiple articles. Having them all in Article 800 is sufficient.

The Correlating Committee, in its actions on proposal 3-118 and 3-171, directed that the definition of cable routing assembly be located in a single Article of Chapter 8. The correlating committee also directed in it actions on proposals 16-37, 16-163 and 16-222 that the Panel 16 actions to establish references to the definition, applications and installation rules for cable routing assemblies in 770.3, 820.3 and 830.3 be correlated with Articles 725 and 760., Acceptance of this comment will bring the panel action into conformance with the Correlating Committee directives.

Panel Meeting Action: Accept

Panel Statement: The panel accepts the recommendation contingent on the understanding that CMP 16 will accept the following joint (CMP 3 and CMP 16) task group recommendation for Comment 16-5:

Add a new definition in 800.2 to read as follows: "Cable Routing Assembly. A single channel or connected multiple channels, as well as associated fittings, forming a structural system that is used to support and route communications wires and cables, optical fiber cables, data cables associated with information technology and communications equipment, Class 2 and Class 3 cables."

Note that CMP 3 agrees with this basic definition, but has identified an oversight that should be corrected as shown below:

Add a new definition in 800.2 to read as follows: "Cable Routing Assembly. A single channel or connected multiple channels, as well as associated fittings, forming a structural system that is used to support and route communications wires and cables, optical fiber cables, data cables associated with information technology and communications equipment, Class 2 and Class 3 cables<u>, and power-limited fire alarm cables</u>."

The added phrase is currently permitted in Article 760 and should have been included in the task group work.

CMP 3 requests the correlating committee to review the actions of CMP 16 on Comment 16-5 to be sure that the intended correlation is provided consistent with CMP 3's understanding of the task group work.

Number Eligible to Vote: 14

WALSH, R.: I believe the statement in the new text; "installation rules in 800.110 and 800.113 shall apply to Article 70", to be too general since it can be interpreted to include NPLFA circuits and not just to the installation of Cable Routing Assemblies. I submit that the comment should be evaluated by the Correlating

---

3-89 Log #1265 NEC-P03 **Final Action: Reject**
(760.2.Cable Routing Assembly)

Submitter: David H. Kendall, Thomas & Betts Corporation

Comment on Proposal No: 3-171

Recommendation: Revise the definition of a Cable Routing Assembly to remove the word " conductors" and replace it with "circuits·.

Substantiation: A Cable Routing Assembly is not a Wireway as defined in 376.2 and 378.2 and should not be treated as such. Cable Routing Assemblies are not permitted to route conductors. Wireways are listed for the routing and support of electrical conductors,

Panel Meeting Action: Reject

Panel Statement: The definition for Cable Routing Assembly has been deferred to Article 800 and the word "conductors" does not appear in the recommended definition. Also refer to the panel action and statement on Comment 3-88.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Sepulveda, M.

3-90 Log #462 NEC-P03 **Final Action: Reject**
(760.2.Fire Alarm Circuit)

Submitter: Marcelo M. Hirschler, GBH International

Comment on Proposal No: 3-172

Recommendation: Revise text to read as follows:

Fire Alarm Circuit. The portion of the wiring system between the load side of the overcurrent device or the power-limited supply and the connected equipment of all circuits powered and controlled by the fire alarm system. ~~Fire alarm circuits are classified as either non–power-limited or power-limited.~~ <u>**Informational Note:** Fire alarm circuits are classified as either non–power-limited or power-limited.</u>

Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains the defined term "Fire alarm circuit" and the NEC manual of style does not permit the definition to contain the defined term. If CMP3 believes that this information is a requirement it should place it somewhere else in Article 760, for example as a new section 760.4 or a similar new location, since NEC definitions shall not contain requirements.

An example of an alternate approach is:

<u>**760.4 Fire alarm circuits and power limitations**.</u>

<u>**760.4.1** Fire alarm circuits are classified as either non–power-limited or power-limited.</u>

The NEC Manual of Style states as follows:

2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.

Panel Meeting Action: Reject

Panel Statement: The recommended changes do not provide any additional clarity and in fact, are detrimental to the application.

3-91 Log #282 NEC-P03 **Final Action: Accept**
(760.4 (New))

Submitter: Code-Making Panel 9,

Comment on Proposal No: 3-174

Recommendation: The panel should continue to reject this proposal to correlate with the panel action on Proposal 9-38.

Substantiation: The 35% parameter has not been substantiated. This provision [314.16(B)(4)] in concert with 314.24, which was as modified in the 2011 NEC based on actual device sizing measurements, will provide enough volume for all but the most unusual cases, which can be addressed by the AHJ using the parent language of the section as cited in the substantiation. The mathematical analysis presented fails completely because the volume provisions of this section were never intended to directly correlate with the occluded volume of the component. For example, an 11-inch wire and a 6-inch wire have the same volume allowance, as is the case with a crow foot and a hickey, as is with the case of an NM cable clamp compared to a MC or AC cable clamp. Each of these examples has significantly differing relative sizes. This has been the case since the principle of sizing boxes based on volume allowances for the contained wiring entered the NEC in the 1933 edition. CMP 9 made a major revision to require a double allowance for device fill in the 1990 edition. However inexact, the procedure works, and CMP 9 would need to see compelling substantiation that a code-compliant installation, performed by qualified persons adhering to sound workmanship, could be expected to constitute a hazard in even a small (but not infinitesimal) minority of cases.

3-94 Log #706 NEC-P03 **Final Action: Accept in Principle**
(760.24)

Submitter: George Bish, Secure Watch Security
Comment on Proposal No: 3-176
Recommendation: Revise Panel Action to Accept in Principle.
Substantiation: Revising the Panel Action to "Accept in Principle" will correlate with the Panel Action on Proposals 3-125 and 3-86. Based upon the Panel Statement, the revised Panel Action to Accept in Principle refers to the Panel Action on Proposal 3-86 and listing of cable ties for use in other spaces used for environmental air is covered by reference to 300.22(C)(1) in 760.3(B)

The revised Panel Action to Accept in Principle is in keeping with the Correlating Committee's directive to correlate requirements addressing the listing of cable ties across Article 300, 770, 800, 820 and 830.

This is one of a group of comments developed by the CMP3/CMP16 Joint Task Group formed at the direction of the Correlating Committee to correlate the requirements of Cable Ties in Articles 300, 770, 800, 820 and 830.

The Task Group members were:

George Bish, Chair, representing Satellite Broadcasting & Communication Association

Harry Ohde, representing IBEW

James Brunssen, representing Alliance for Telecommunications Industry Solutions

George Straniero, representing National Electrical Manufacturers Association

Robert Walsh, representing International Association of Electrical Inspectors

Wendell Whistler, representing Intertek Testing Services

Panel Meeting Action: Accept in Principle
Panel Statement: The panel accepts the need to correlate the overall subject of Proposals 3-86, 3-125 and 3-176, but rejects the revision to the previous panel statement. Section 760.3(B) refers to 300.22 for wiring methods. The panel accepted the addition of cable ties into 300.22(C)(1) by action on Proposal 3-86.

3-95 Log #657 NEC-P03 **Final Action: Accept**
(760.49(B))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 3-182
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task group to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

Panel Meeting Action: Accept

3-96 Log #528 NEC-P03 **Final Action: Hold**
(760.51(B))

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 3-183
Recommendation: Revise text to read as follows:
760.51 Number of Conductors in Cable Trays and Raceways, and Ampacity Adjustment Factors.
(B) Power-Supply Conductors and NPLFA Circuit Conductors. Where power-supply conductors and nonpower-limited fire alarm circuit conductors are permitted in a raceway in accordance with 760.48, the number of conductors shall be determined in accordance with 300.17. The ampacity

adjustment factors given in 310.15(B)(3)(a) shall apply as follows: [ROP 3–183]
(1) To all conductors where ~~the~~ any fire alarm circuit conductors carry continuous loads in excess of 10 percent of the ampacity of each conductor ~~and where the total number of conductors is more than three~~
(2) To the power-supply conductors only, where none of the fire alarm circuit conductors ~~do not~~ carry continuous loads in excess of 10 percent of the ampacity of each conductor ~~and where the number of power-supply conductors is more than three~~
Substantiation: The requirement for 10% or over current is not clear in either (1) or (2) as to whether it applies to some or all of the conductors.
The requirement for 3 or more conductors is unnecessary since there is no derating – for count – for 3 or less.
Panel Meeting Action: Hold
Panel Statement: Hold the comment. This comment presents new material which cannot be introduced at this point in this cycle. Proposal 3-183 did not modify 760.51(B)(1) and (2).

(760.121(B))

Submitter: Ron B. Chilton, Rep. NC Code Clearing Committee
Comment on Proposal No: 3-175
Recommendation: This Proposal should have been "Accepted" to correlate with the current NFPA 72.
Substantiation: For dwellings the International Residential Code allows both a smoke alarm system and a fire alarm system with no provision prohibiting AFCI protection, and must be provided with a battery-backed or secondary source, which NFPA 72 requires also. Section 760.121(B) is being incorrectly interpreted to prohibit AFCI on a circuit providing power to 120-volt smoke alarm devices that are not part of a central fire alarm system in dwellings, and not an NFPA 72 system. If NFPA 72 still does not prohibit AFCI for protection of the branch circuit, for those specific fire alarm systems, then Section 760.121(B) of NFPA 70 should not.
If the fire alarm panel for a dwelling is installed in one of those areas requiring AFCI protection per Section 210.12(A) then you would violate either that Section or Section 760.121(B), or you must install it in the kitchen, laundry, bathroom, attic, basement, crawl space, garage, or another area not requiring AFCI. The NEC should not reflect an implication of conflict in this issue, the Code Making Panel should have deleted the AFCI reference and allowed the Technical Committee Task Group on Intercoordination to confirm a resolution agreeable to both NFPA Groups. Currently the 2010 NFPA 72 document permits it and there is no guarantee those Committee would see the need to prohibit AFCI as it has been a factor to consider since the 2002 NEC.
Panel Meeting Action: Reject
Panel Statement: The main concern of the panel is that unattended systems may trip off which would leave a facility unprotected for an indeterminate period of time until it became known to the responsible party. Whether to have AFCI and GFCI protection on fire alarm panels was discussed in both the 2008 and 2011 code cycles with the pros and cons discussed for quite some time. The panel agreed to exclude these protection devices from the power circuits for the following reason:
Connecting a fire alarm system (not a single or multiple station smoke alarm which is a self-contained device) to an AFCI device may create a life safety situation. Where the fire alarm panel has a generator standby power system with 4 hours of battery standby power or the system has 24 hours of battery standby power, loss of the power source to the fire alarm panel by tripping an AFCI device could very well result in loss of fire alarm protection with loss of the early fire warning system and potential loss of life. This provision does not apply to single station or multiple station smoke alarm devices with battery backup since these devices have batteries that will provide power for power for extended time but low battery charge will cause the smoke alarm to chirp, indicating low battery.
The panel recommends submission of this issue to the NFPA Fire Research Foundation for consideration as a possible study on the issue of AFCI and GFCI protection of the branch circuit supplying the fire alarm system.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Sepulveda, M.
Comment on Affirmative:
CLARY, S.: The NFPA 70 Correlating Committee should communicate with the NFPA 72® Correlating Committee so as to discuss and rectify the conflict between these two Codes. Both 70 and 72 state that one is to consult the other for additional requirements The two need to be in agreement in regards to the use or non use of AFCI protected branch circuits.
AFAA also supports the proposal for the NFPA Fire Protection Research Foundation to study this issue.

3-100 Log #307 NEC-P03 **Final Action: Accept in Principle**
(760.133 and 760.135 (New))

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 3-197
Recommendation: Revise and add new text to read as follows:
760.133 Installation of Conductors and Equipment in Cables, Compartments, Cable Trays, Enclosures, Manholes, Outlet Boxes, Device Boxes, and Raceways for Power-Limited Circuits. Conductors and equipment for power-limited fire alarm circuits shall be installed in accordance

with ~~760.136~~ 760.135 through 760.143.

760.135 (new) Installation of PLFA Cables In Buildings. Installation of power-limited fire alarm cables in buildings shall comply with 760.135(A) through (J).

(A) Listing. PLFA cables installed in buildings shall be listed.

(B) Other Spaces Used For Environmental Air (Plenums). The following cables shall be permitted in other spaces used for environmental air as described in 300.22(C):

(1) Type FPLP cables
(2) Type FPLP cables installed in plenum communications raceways
(3) Type FPLP and FPLP-CI cables supported by open metallic cable trays or cable tray systems
(4) Types FPLP, FPLR and FPL cables installed in raceways that are installed in compliance with 300.22(C)
(5) Types FPLP, FPLR and FPL cables supported by solid bottom metal cable trays with solid metal covers in other spaces used for environmental air (plenums) as described in 300.22(C)
(6) Types FPLP, FPLR and FPL cables installed in plenum communications raceways, riser communications raceways or general-purpose communications raceways supported by solid bottom metal cable trays with solid metal covers in other spaces used for environmental air (plenums) as described in 300.22(C)

(C) Risers — Cables in Vertical Runs. The following cables shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft:

(1) Types FPLP and FPLR cables
(2) Types FPLP and FPLR cables installed in:
a. Plenum communications raceways
b. Plenum cable routing assemblies
c. Riser communications raceway
d. Riser cable routing assemblies

Informational Note: See 300.21 for firestop requirements for floor penetrations.

(D) Risers — Cables in Metal Raceways. The following cables shall be permitted in metal raceways in a riser having firestops at each floor:

(1) Types FPLP, FPLR and FPL cables
(2) Types FPLP, FPLR and FPL cables installed in:
a. Plenum communications raceways
b. Riser communications raceways
c. General-purpose communications raceways

Informational Note: See 300.21 for firestop requirements for floor penetrations.

(E) Risers — Cables in Fireproof Shafts. The following cables shall be permitted to be installed in fireproof riser shafts having firestops at each floor:

(1) Types FPLP, FPLR and FPL cables
(2) Types FPLP, FPLR and FPL cables installed in:
a. Plenum communications raceways
b. Plenum cable routing assemblies
c. Riser communications raceways
d. Riser cable routing assemblies
e. General-purpose communications raceways
f. General-purpose cable routing assemblies

Informational Note: See 300.21 for firestop requirements for floor penetrations.

(H) Risers — One- and Two-Family Dwellings. The following cables shall be permitted in one- and two-family dwellings:

(1) Types FPLP, FPLR FPL cables
(2) Types FPLP, FPLR and FPL cables installed in:
a. Plenum communications raceways
b. Plenum cable routing assemblies
c. Riser communications raceways
d. Riser cable routing assemblies
e. General-purpose communications raceways
f. General-purpose cable routing assemblies

(I) Other Building Locations. The following cables shall be permitted to be installed in building locations other than the locations covered in 770.113(B) through (H):

(1) Types FPLP, FPLR and FPL cables
(2) Types FPLP, FPLR and FPL cables installed in:
a. Plenum communications raceways
b. Plenum cable routing assemblies
c. Riser communications raceways
d. Riser cable routing assemblies
e. General-purpose communications raceways
f. General-purpose cable routing assemblies
(3) Types FPLP, FPLR and FPL cables installed in a raceway of a type recognized in Chapter 3

(L) Nonconcealed Spaces. Cables specified in Chapter 3 and meeting the requirements of 760.179 (A) and (B) shall be permitted to be installed in nonconcealed spaces where the exposed length of cable does not exceed 3 m (10 ft).

(M) Portable Fire Alarm System. A portable fire alarm system provided to protect a stage or set when not in use shall be permitted to use wiring methods in accordance with 530.12.

Substantiation: Proposals 3-197 and 3-202 were submitted as a package. Proposal 3-202 deals with 760.154, *Applications of Listed PLFA Cables*. Notwithstanding the title of 760.154, it contains a mixture of applications and installation rules. The primary objectives of proposals 3-197 and 3-202 are to separate the installation rules from the applications and to express the applications as simply as possible by using a table. If this concept is accepted in Articles 725 (proposals 3-144a & 3-154a) and 760 (proposals 3-197 & 3-202), then the cable applications and installation sections will be editorially consistent with Articles 770, 800, 820 and 830.

CMP-3 accepted 3-202 in principle in part by correcting the errors in the proposed Table 760.154 (accept in principle) and retaining the text in 760.154. Table 760.154 clearly prohibits the installation of plenum cable routing assemblies in plenums; permitting them to be used only in place of riser and general-purpose cable routing assemblies.

Proposal 3-197 was not correlated with (couldn't anticipate the panel action) the action on proposal 3-206 which required cables penetrating one or more floors to be riser or plenum rated. The comment recommends text for 760.135(C) that correlates with the panel action on proposal 3-206. The text accepted by CMP 3 on proposals 3-205 and 3-206 used the phrase "penetrating from floor to floor" instead of "penetrating one or more floors" as recommended by the submitters. The correlating committee directed that the CMP 3 action be correlated with CMP 16 existing text. CMP 16 uses "penetrating one or more floors" in 770.113(D), 800.113(D), 820.113(D) and 830.113(D). Since there were no proposals to change "penetrating one or more floors", the only way to correlate is to use "penetrating one or more floors" in CMP 3 text for Articles 725 and 760. If this comment and its companion comment on proposal 3-202 are accepted, the action on proposals 3-205 and 3-206 should be changed to accept in principle with reference to the acceptance of this comment on proposal 3-197 and our comment on proposal 3-202.

Proposal 3-197 included a recommendation for wiring in ducts specifically fabricated for environmental air. This comment has deletes that section in order to correlate with panel action on proposal 3-82 which prohibited wiring in ducts specifically fabricated for environmental air.

Panel Meeting Action: Accept in Principle

Panel Statement: Refer to panel action and statement for Comment 3-101 which meets the intent of the submitter.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Sepulveda, M.

3-101 Log #987 NEC-P03 **Final Action: Accept in Principle**
(760.133 and 760.135 (New))

Submitter: Robert W. Jensen, dbi-Telecommunication Infrastructure Design

Comment on Proposal No: 3-197

Recommendation: Revise text to read as follows:

760.133 Installation of Conductors and Equipment in Cables, Compartments, Cable Trays, Enclosures, Manholes, Outlet Boxes, Device Boxes, and Raceways for Power-Limited Circuits. Conductors and equipment for power-limited fire alarm circuits shall be installed in accordance with ~~760.136~~ 760.135 through 760.143.

760.135 (new) Installation of PLFA Cables In Buildings. Installation of power-limited fire alarm cables in buildings shall comply with 760.135(A) through (J).

(A) Listing. PLFA cables installed in buildings shall be listed.

(B) Fabricated Ducts Used for Environmental Air. The following cables shall be permitted in ducts, as described in 300.22(B) if they are directly associated with the air distribution system:

(1) Up to 1.22 m (4 ft) of Types FPLP and FPLP-CI cables
(2) Types FPLP, FPLP-CI, FPLR, FPLR-CI, FPL and FPL-CI cables installed in raceways that are installed in compliance with 300.22(B)

Informational Note: For information on fire protection of wiring installed in fabricated ducts see 4.3.4.1 and 4.3.11.3.3 in NFPA 90A-2012, *Standard for the Installation of Air-Conditioning and Ventilating Systems*.

(C) Other Spaces Used For Environmental Air (Plenums). The following cables shall be permitted in other spaces used for environmental air as described in 300.22(C):

(1) Type FPLP cables
(2) Type FPLP cables installed in plenum communications raceways
(3) Type FPLP and FPLP-CI cables supported by open metallic cable trays or cable tray systems
(4) Types FPLP, FPLR and FPL cables installed in raceways that are installed in compliance with 300.22(C)
(5) Types FPLP, FPLR and FPL cables supported by solid bottom metal cable trays with solid metal covers in other spaces used for environmental air (plenums) as described in 300.22(C)
(6) Types FPLP, FPLR and FPL cables installed in plenum communications raceways, riser communications raceways or general-purpose communications raceways supported by solid bottom metal cable trays with solid metal covers in other spaces used for environmental air (plenums) as described in 300.22(C)

(D) Risers — Cables in Vertical Runs. The following cables shall be permitted in vertical runs penetrating from floor to floor and in vertical runs in a shaft:

(1) Types FPLP and FPLR cables
(2) Types FPLP and FPLR cables installed in:
a. Plenum communications raceways
b. Plenum cable routing assemblies
c. Riser communications raceway
d. Riser cable routing assemblies

Informational Note: See 300.21 for firestop requirements for floor penetrations.
(E) Risers — Cables in Metal Raceways. The following cables shall be permitted in metal raceways in a riser having firestops at each floor:
(1) Types FPLP, FPLR and FPL cables
(2) Types FPLP, FPLR and FPL cables installed in:
a. Plenum communications raceways
b. Riser communications raceways
c. General-purpose communications raceways
Informational Note: See 300.21 for firestop requirements for floor penetrations.
(F) Risers — Cables in Fireproof Shafts. The following cables shall be permitted to be installed in fireproof riser shafts having firestops at each floor:
(1) Types FPLP, FPLR and FPL cables
(2) Types FPLP, FPLR and FPL cables installed in:
a. Plenum communications raceways
b. Plenum cable routing assemblies
c. Riser communications raceways
d. Riser cable routing assemblies
e. General-purpose communications raceways
f. General-purpose cable routing assemblies
Informational Note: See 300.21 for firestop requirements for floor penetrations.
(G) Risers — One- and Two-Family Dwellings. The following cables shall be permitted in one- and two-family dwellings:
(1) Types FPLP, FPLR FPL cables
(2) Types FPLP, FPLR and FPL cables installed in:
a. Plenum communications raceways
b. Plenum cable routing assemblies
c. Riser communications raceways
d. Riser cable routing assemblies
e. General-purpose communications raceways
f. General-purpose cable routing assemblies
(H) Other Building Locations. The following cables shall be permitted to be installed in building locations other than the locations covered in 770.113(B) through (H):
(1) Types FPLP, FPLR and FPL cables
(2) Types FPLP, FPLR and FPL cables installed in:
a. Plenum communications raceways
b. Plenum cable routing assemblies
c. Riser communications raceways
d. Riser cable routing assemblies
e. General-purpose communications raceways
f. General-purpose cable routing assemblies
(3) Types FPLP, FPLR and FPL cables installed in a raceway of a type recognized in Chapter 3
(I) Nonconcealed Spaces. Cables specified in Chapter 3 and meeting the requirements of 760.179 (A) and (B) shall be permitted to be installed in nonconcealed spaces where the exposed length of cable does not exceed 3 m (10 ft).
(J) Portable Fire Alarm System. A portable fire alarm system provided to protect a stage or set when not in use shall be permitted to use wiring methods in accordance with 530.12.

Substantiation: Proposals 3-197 and 3-202 were submitted as a package. Proposal 3-202 deals with 760.154, Applications of Listed PLFA Cables. Notwithstanding the title of 760.154, it contains a mixture of applications and installation rules. The primary objectives of proposals 3-197 and 3-202 are to separate the installation rules from the applications and to express the applications as simply as possible by using a table. If this concept is accepted in Articles 725 (proposals 3-144a & 3-154a) and 760 (proposals 3-197 & 3-202), then the cable applications and installation sections will be editorially consistent with Articles 770, 800, 820 and 830.

CMP-3 accepted 3-202 in principle in part by correcting the errors in the proposed Table 760.154 (accept in principle) and retaining the text in 760.154. Table 760.154 clearly prohibits the installation of plenum cable routing assemblies in plenums; permitting them to be used only in place of riser and general-purpose cable routing assemblies.

Proposal 3-197 was not correlated with (couldn't anticipate the panel action) the action on proposal 3-206 which required cables penetrating one or more floors to be riser or plenum rated. The comment recommends text for 760.135(C) that correlates with the panel action on proposal 3-206. If this comment and its companion comment on proposal 3-202 are accepted, the action on proposals 3-205 and 3-206 should be changed to accept in principle with reference to the acceptance of this comment on proposal 3-197 and our comment on proposal 3-202.

Panel Meeting Action: Accept in Principle
The panel accepts the comment with the following modifications:
(1) Modify (B)(1) to read: "(1) Types FPLP and FPLP-CI cables in lengths as short as practicable to perform the required function"
(2) Modify (D) to read as follows:
(D) Risers — Cables in Vertical Runs. The following cables shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft: (remainder unchanged.)

Panel Statement: The panel recognizes the requirements of NFPA 90A and modified (B)(1) to clarify the need to be consistent with NFPA 90A section 4.3.4.3.

The panel modified (D) to align with the correlating committee direction and the joint (CMP 3 and CMP 16) task team conclusions.

Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Sepulveda, M.

3-102 Log #305 NEC-P03 **Final Action: Accept**
(760.139)

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 3-171
Recommendation: Continue to accept proposals 3-200 and 3-201 in principle based on the acceptance of the recommended text in proposal 3-171 for 760.139.
Substantiation: I submitted proposal 3-200 to permit the installation of power-limited fire alarm cables along with Class 2 and Class 3, optical fiber and communications cables in cable routing assemblies. The recommended text in proposals 3-200 and 3-211 and the text accepted for 760.139 in proposal 3-171 are identical.

CMP-3 action on these proposals will facilitate the use of cable routing assemblies in data centers where they are used to support and manage large installations of data cables.

Thank you. Y'all done good.

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 3-202
Recommendation: Revise 760.154 as follows:

760.154 Applications of Listed PLFA Cables. PLFA cables shall comply with the requirements described in ~~either 760.154(A), (B), or (C)~~ Table 760.154, or where cable substitutions are made as shown in 760.154(A ~~D~~). Where substitute cables are installed, the wiring requirements of Article 760, Parts I and III, shall apply. Types FPLP-CI, FPLR-CI and FPL-CI cables shall be permitted to be installed to provide 2-hour circuit integrity rated cables.

See Table 760.154 on Page 429

~~**(A) Plenum.** Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type FPLP. Types FPLP, FPLR, and FPL cables installed in compliance with 300.22 shall be permitted. Type FPLP-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.~~
~~**(B) Riser.** Cables installed in risers shall be as described in either (1), (2), or (3):~~
~~(1) Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type FPLR. Floor penetrations requiring Type FPLR shall contain only cables suitable for riser or plenum use. Type FPLR-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.~~
~~(2) Other cables shall be installed in metal raceways or located in a fireproof shaft having firestops at each floor.~~
~~(3) Type FPL cable shall be permitted in one- and two-family dwellings.~~
~~Informational Note: See **300.21** for firestop requirements for floor penetrations.~~
~~**(C) Other Wiring Within Buildings.** Cables installed in building locations other than those covered in **760.154(A)** or (B) shall be as described in either (C)(1), (C)(2), (C)(3), or (C)(4). Type FPL-CI cable shall be permitted to be installed as described in either (C)(1), (C)(2), (C)(3), or (C)(4) to provide a 2-hour circuit integrity rated cable.~~
~~**(1) General.** Type FPL shall be permitted.~~
~~**(2) In Raceways.** Cables shall be permitted to be installed in raceways.~~
~~**(3) Nonconcealed Spaces.** Cables specified in Chapter **3** and meeting the requirements of 760.179 **(A)** and (B) shall be permitted to be installed in nonconcealed spaces where the exposed length of cable does not exceed 3 m (10 ft).~~
~~**(4) Portable Fire Alarm System.** A portable fire alarm system provided to protect a stage or set when not in use shall be permitted to use wiring methods in accordance with 530.12.~~
(A ~~D~~) Fire Alarm Cable Substitutions. The substitutions for fire alarm cables listed in Table 760.154(A~~D~~) and illustrated in Figure 760.154(A ~~D~~) shall be permitted. Where substitute cables are installed, the wiring requirements of Article 760, Parts I and III, shall apply.
Informational Note: For information on communications cables (CMP, CMR, CMG, CM), see 800.179.
Renumber (re-letter) Figure 760.154(D) to 760.154(A). Delete the column "References" in Table 760.154(D) and renumber (re-letter) Table 760.154(D) to 760.154(A).

Insert Table 760.154(A) and Figure 760.154(A) here. (no changes, not submitted)

In 645.3(B) make the following changes:
(B) Plenums. The provisions of ~~Sections~~ 300.22(C)(1), 725.135(B) ~~725.154(A)~~, 760.53(B)(2), 760.135(B) ~~760.154(A)~~, 770.113(C), 800.113(C),

Table 760.154
Applications of Listed PLFA Cables in Buildings

Applications		**Cable Type**		
		FPLP	FPLR	FPL
In Fabricated Ducts as Described in 300.22(B)	In fabricated ducts	N	N	N
	In metal raceway that complies with 300.22(B)	Y*	Y*	Y*
In Other Spaces Used for Environmental Air as Described in 300.22(C)	In other spaces used for environmental air	Y*	N	N
	In metal raceway that complies with 300.22(C)	Y*	Y*	Y*
	In plenum communications raceways	Y*	N	N

	In general-purpose cable routing assemblies	Y*	Y*	Y*

and 820.113(C) and Tables 725.154, 760.154, 770.154(A), 800.154(A) and 820.154(A) shall apply to wiring and cabling in a plenum (other space used for environmental air) above an information technology equipment room.

In 760.3(B) Exception, make the following change:

Exception: As permitted in 760.53(B)(1) and (B)(2) and Table 760.154 ~~(A).~~

Substantiation: Proposals 3-144a and 3-154a were submitted as a package. Proposal 3-154a deals with 725.154, *Applications of Listed Class 2, Class 3, and PLTC Cables*. Notwithstanding the title of 725.154, it contains a mixture of applications and installation rules. The primary objectives of proposals 3-144a and 3-154a are to separate the installation rules from the applications and to express the applications as simply as possible by using a table. If this concept is accepted in Articles 725 (proposals 3-144a & 3-154a) and 760 (proposals 3-197 & 3-202), then the cable applications and installation sections will be editorially consistent with Articles 770, 800, 820 and 830.

Note that a change has been made in Table 760.154 to correlate with the panel action on proposal 3-82 which rejected the use of any plenum cable in a duct specifically fabricated for environmental air.

Panel Meeting Action: Accept in Principle

Panel Statement: Refer to the panel action in comment 3-104. The primary difference between the two comments are differences in the table. The panel does not want to eliminate the use of FPLP in fabricated ducts as described in 300.22(B).

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Sepulveda, M.

3-104 Log #988 NEC-P03 **Final Action: Accept in Part**
(760.154)

Submitter: Robert W. Jensen, dbi-Telecommunication Infrastructure Design

Comment on Proposal No: 3-202

Recommendation: Revise 760.154 as follows:

760.154 Applications of Listed PLFA Cables. PLFA cables shall comply with the requirements described in ~~either 760.154(A), (B), or (C)~~ Table 760.154, or where cable substitutions are made as shown in 760.154(A ~~D~~). Where substitute cables are installed, the wiring requirements of Article 760, Parts I and III, shall apply. Types FPLP-CI, FPLR-CI and FPL-CI cables shall be permitted to be installed to provide 2-hour circuit integrity rated cables.

*****Insert Table 760.154 Here*****

~~**(A) Plenum.** Cables installed in ducts, plenums, and other spaces used for environmental air shall be Type FPLP. Types FPLP, FPLR, and FPL cables installed in compliance with 300.22 shall be permitted. Type FPLP-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.~~

~~**(B) Riser.** Cables installed in risers shall be as described in either (1), (2), or (3):~~

~~(1) Cables installed in vertical runs and penetrating more than one floor, or cables installed in vertical runs in a shaft, shall be Type FPLR. Floor penetrations requiring Type FPLR shall contain only cables suitable for riser or plenum use. Type FPLR-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.~~

~~(2) Other cables shall be installed in metal raceways or located in a fireproof shaft having firestops at each floor.~~

~~(3) Type FPL cable shall be permitted in one- and two-family dwellings.~~

~~Informational Note: See **300.21** for firestop requirements for floor penetrations.~~

~~**(C) Other Wiring Within Buildings.** Cables installed in building locations other than those covered in **760.154(A)** or (B) shall be as described in either (C)(1), (C)(2), (C)(3), or (C)(4). Type FPL-CI cable shall be permitted to be installed as described in either (C)(1), (C)(2), (C)(3), or (C)(4) to provide a 2-hour circuit integrity rated cable.~~

~~**(1) General.** Type FPL shall be permitted.~~

~~**(2) In Raceways.** Cables shall be permitted to be installed in raceways.~~

~~**(3) Nonconcealed Spaces.** Cables specified in Chapter **3** and meeting the requirements of 760.179 **(A)** and (B) shall be permitted to be installed in nonconcealed spaces where the exposed length of cable does not exceed 3 m (10 ft).~~

~~**(4) Portable Fire Alarm System.** A portable fire alarm system provided to protect a stage or set when not in use shall be permitted to use wiring methods in accordance with 530.12.~~

(A ~~D~~) Fire Alarm Cable Substitutions. The substitutions for fire alarm cables listed in Table 760.154(A~~D~~) and illustrated in Figure 760.154(A ~~D~~) shall be permitted. Where substitute cables are installed, the wiring requirements of Article 760, Parts I and III, shall apply.

Informational Note: For information on communications cables (CMP, CMR, CMG, CM), see 800.179.

Renumber (re-letter) Figure 760.154(D) to 760.154(A). Delete the column "References" in Table 760.154(D) and renumber (re-letter) Table 760.154(D) to 760.154(A).

Insert Table 760.154(A) and Figure 760.154(A) here. (Not submitted)

In 645.3(B) make the following changes:

(B) Plenums. The provisions of ~~Sections~~ 300.22(C)(1), 725.135(B) ~~725.154(A),~~ 760.53(B)(2), 760.135(B) ~~760.154(A),~~ 770.113(C), 800.113(C), and 820.113(C) and Tables 725.154, 760.154, 770.154(A), 800.154(A) and 820.154(A) shall apply to wiring and cabling in a plenum (other space used for environmental air) above an information technology equipment room.

In 760.3(B) Exception, make the following change:

Exception: As permitted in 760.53(B)(1) and (B)(2) and Table 760.154 ~~(A).~~

Substantiation: Proposals 3-144a and 3-154a were submitted as a package. Proposal 3-154a deals with 725.154, Applications of Listed Class 2, Class 3, and PLTC Cables. Notwithstanding the title of 725.154, it contains a mixture of applications and installation rules. The primary objectives of proposals 3-144a and 3-154a are to separate the installation rules from the applications and to express the applications as simply as possible by using a table. If this concept is accepted in Articles 725 (proposals 3-144a & 3-154a) and 760 (proposals 3-197 & 3-202), then the cable applications and installation sections will be editorially consistent with Articles 770, 800, 820 and 830.

Panel Meeting Action: Accept in Part

Reject the proposed changes to 645.3(B).

The balance of the recommendation is accepted.

Panel Statement: The panel rejects the part of the comment that is outside the scope of the panel.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Sepulveda, M.

3-105 Log #1367 NEC-P03 **Final Action: Reject**
(Table 760.154)

Submitter: Vince Baclawski, National Electrical Manufacturers Association (NEMA)

Comment on Proposal No: 3-202

Recommendation: Delete plenum cable routing assemblies from the second column of Table 760.154.

Substantiation: Cable Routing assemblies are not permitted in Plenums or other spaces used for environmental air by either the NEC or by NFPA 90A that has jurisdiction over wiring in air handling plenum spaces. Inclusion of plenum cable routing assemblies is misleading and could cause it to be used where it is not permitted.

Panel Meeting Action: Reject

Panel Statement: The panel asserts that the table, as presented, states very clearly where the plenum rated cable routing assemblies are allowed to be installed.

Number Eligible to Vote: 14

Ballot Results: Affirmative: 13

Ballot Not Returned: 1 Sepulveda, M.

3-106 Log #697 NEC-P03 **Final Action: Accept in Principle in Part**
(760.154(B)(1))

Submitter: George Bish, Secure Watch Security

Comment on Proposal No: 3-206

Recommendation: Continue to "Accept in Principle".

Revise Panel Statement to: "See Panel Action and Panel Statement on Proposal 3-205."

Substantiation: It is the recommendation of the Task Group to correlate with the current language used in Chapter 8, Sections 800.113(D), 820.113(D) and 830.113(D), as well as 770.113(D). The Acceptance in Principle of Proposal 3-206 with reference to the Panel Action and Panel Statement on Proposal 3-205 as recommended by the Task Group will accomplish this. This action will fulfill the Correlating Committee's request to correlate the phrase "penetrating one or more floors" and "from floor to floor" in Proposals 3-159, 3-192, 3-193, 3-205, and 3-206.

This is one of a group of comments developed by the CMP3/CMP16 Joint Task Group formed at the direction of the Correlating Committee to address the correlation of the term "floor to floor" vs. "more than one floor"

The Task Group members were:

George Bish, Chair, representing Satellite Broadcasting & Communication Association

Harry Ohde, representing IBEW

James Brunssen, representing Alliance for Telecommunications Industry Solutions

George Straniero, representing National Electrical Manufacturers Association

Robert Walsh, representing International Association of Electrical Inspectors

Wendell Whistler, representing Intertek Testing Services

Panel Meeting Action: Accept in Principle in Part

Revise panel action on Proposal 3-206 to read as follows:

(1) Cables installed in vertical runs and penetrating one or more floors, or cables installed in vertical runs in a shaft, shall be Type FPLR. Floor penetrations requiring Type FPLR shall contain only cables suitable for riser or plenum use. Type FPLR-CI cable shall be permitted to be installed to provide a 2-hour circuit integrity rated cable.

Panel Statement: The changes made by the panel to 760.154(B)(1) meet the intent of the submitter.

The panel cannot revise the panel statement in the ROP as suggested in the recommendation.

3-104 (Log #988)

Table 760.154 Applications of Listed PLFA Cables in Buildings

Applications		**Cable Type**		
		FPLP	FPLR	FPL
In Fabricated Ducts as Described in 300.22(B)	In fabricated ducts	Y*	N	N
	In metal raceway that complies with 300.22(B)	Y*	Y*	Y*
In Other Spaces Used for Environmental Air as Described in 300.22(C)	In other spaces used for environmental air	Y*	N	N
	In metal raceway that complies with 300.22(C)	Y*	Y*	Y*
	In plenum communications raceways	Y*	N	N
	In plenum cable routing assemblies	NOT PERMITTED		
	Supported by open metal cable trays	Y*	N	N
	Supported by solid bottom metal cable trays with solid metal covers	Y*	Y*	Y*
In Risers	In vertical runs	Y*	Y*	N
	In metal raceways	Y*	Y*	Y*
	In fireproof shafts	Y*	Y*	Y*
	In plenum communications raceways	Y*	Y*	N
	In plenum cable routing assemblies	Y*	Y*	N
	In riser communications raceways	Y*	Y*	N
	In riser cable routing assemblies	Y*	Y*	N
	In one- and two-family dwellings	Y*	Y*	Y*
Within Buildings in other than Air-Handling Spaces and Risers	General	Y*	Y*	Y*
	Supported by cable trays	Y*	Y*	Y*
	In cross connect arrays	Y*	Y*	Y*
	In any raceway recognized in Chapter 3	Y*	Y*	Y*
	In plenum communications raceways	Y*	Y*	Y*
	In plenum cable routing assemblies	Y*	Y*	Y*
	In riser communications raceways	Y*	Y*	Y*
	In riser cable routing assemblies	Y*	Y*	Y*
	In general-purpose communications raceways	Y*	Y*	Y*
	In general-purpose cable routing assemblies	Y*	Y*	Y*

Note: An 'N' in the table indicates that the cable type shall not be permitted to be installed in the application. A 'Y*' indicates that the cable shall be permitted to be installed in the application, subject to the limitations described in 760.130 through 760.145.

3-107 Log #704 NEC-P03 **Final Action: Accept in Principle**
(760.154(B)(1))

Submitter: George Bish, Secure Watch Security
Comment on Proposal No: 3-205
Recommendation: Revise Panel Action to Accept Proposal 3-205.
Substantiation: It is the recommendation of the Task Group to Accept this proposal as this will correlate with the language used in Chapter 8, Sections 800.113(D), 820.113(D) and 830.113(D), as well as 770.113(D). This action will fulfill the TCC's request to correlate the phrase "penetrating one or more floors" and "from floor to floor" in Proposals 3-159, 3-192, 3-193, 3-205, and 3-206. The Task Group realizes that there are other sections of Articles 770 and Chapter 8 where this phrase is not consistent and recommends that a Task Group be appointed to work on the complete correlation for the 2017 edition

This is one of a group of comments developed by the CMP3/CMP16 Joint Task Group formed at the direction of the Correlating Committee to address the correlation of the term "floor to floor" vs. "more than one floor"

The Task Group members were:

George Bish, Chair, representing Satellite Broadcasting & Communication Association

Harry Ohde, representing IBEW

James Brunssen, representing Alliance for Telecommunications Industry Solutions

George Straniero, representing National Electrical Manufacturers Association

Robert Walsh, representing International Association of Electrical Inspectors

Wendell Whistler, representing Intertek Testing Services

Panel Meeting Action: Accept in Principle
Panel Statement: Refer to the panel action and statement in Comment 3-106, which meets the intent of the submitter.
Number Eligible to Vote: 14
Ballot Results: Affirmative: 13
Ballot Not Returned: 1 Sepulveda, M.

3-108 Log #658 NEC-P03 **Final Action: Accept**
(760.176(B))

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 3-207
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task group to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 & 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity. The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

Panel Meeting Action: Accept

(760.176(F), Informational Note 2)

Submitter: Susan L. Stene, UL LLC
Comment on Proposal No: 3-141
Recommendation: Revise text to read as follows:

(F) Fire Alarm Circuit Integrity (CI) Cable or Electrical Circuit Protective System. Cables that are used for survivability of critical circuits under fire conditions shall meet either (F)(1) or (F)(2) as follows:

(1) Circuit Integrity (CI) Cables. Circuit Integrity (CI) cables, specified in 760.176(C), (D), and (E), and used for survivability of critical circuits shall have the additional classification using the suffix "-CI". Circuit integrity (CI) cables shall only be permitted to be installed in a raceway where specifically listed and marked as part of an electrical circuit protective system as covered in (F)(2).

(2) Electrical Circuit Protective System. Cables, specified in 760.176(C), (D), (E), and (F)(1), that are part of an electrical circuit protective system shall be identified with the protective system number and hourly rating printed on the outer jacket of the cable and shall be installed in accordance with the listing of the protective system.

Informational Note No. 1: Fire alarm circuit integrity (CI) cable and electrical circuit protective systems may be used for fire alarm circuits to comply with the survivability requirements of NFPA 72-2010, National Fire Alarm and Signaling Code, Sections 12.4.3 and 12.4.4, that the circuit maintain its electrical function during fire conditions for a defined period of time.

Informational Note No. 2: One method of defining circuit integrity (CI) cable or an Electrical Circuit Protective System is by establishing a minimum 2-hour fire resistive rating when tested in accordance with UL 2196-~~2001 (Rev. 2006)~~ 2012, Standard for Tests of Fire Resistive Cables.

Informational Note No. 3: UL guide information for electrical circuit protective systems (FHIT) contains information on proper installation requirements to maintain the fire rating.

Substantiation: UL 2196, the Standard for Tests for Fire Resistive Cables was revised in 2012. References to UL Standards in the NEC should reflect the current edition.

ARTICLE 770 — OPTICAL FIBER CABLES AND RACEWAYS

16-4 Log #1039 NEC-P16 **Final Action: Reject**

(770, Informational Note)

Submitter: Mike Holt, Mike Holt Enterprises

Comment on Proposal No: 16-21

Recommendation: Accept this proposal in principal by removing the note altogether.

Substantiation: This note was (maybe) worth having in 2011, but its usefulness is over. How long are we going to have a note explaining changes that were made in previous Code editions?

Panel Meeting Action: Reject

Panel Statement: There has been confusion concerning the terms grounding and bonding, as well as the application of grounding conductors and bonding conductors. The panel added user-friendly Figures 800(a) and (b) to Article 800 to illustrate and clarify the application of grounding and bonding conductors. The existing note of 770, including the proposed added text of Proposal 16-21, continues to be helpful and explains the changes made during the 2011 NEC revision cycle.

Number Eligible to Vote: 18

Ballot Results: Affirmative: 17

Ballot Not Returned: 1 Ballast, D.

16-5 Log #700 NEC-P16 **Final Action: Accept in Principle**

(770.2. Cable Routing Assemblies)

TCC Action: After further consideration, the Correlating Committee directs that the definition of "cable routing assembly," as revised in the Panel Action on this comment, be relocated to Article 100, in accordance with the NEC Style Manual.

Submitter: George Bish, Secure Watch Security

Comment on Proposal No: 16-23

Recommendation: Continue to Accept in Principle with the following changes:

1) Move the definition of Cable Routing Assemblies from 770.2 to 800.2

2) Change the definition to be: A single channel or multiple channels, as well as associated fittings, forming a structural system that is used to support~~,~~ and route ~~and protect high densities of wires and cables, typically~~ communications wires and cables, optical fiber cables, ~~and~~ data ~~(Class 2 and Class3)~~ cables associated with information technology and communications equipment, Class 2 and Class 3 cables.

Substantiation: Placing the definition 'Cable Routing Assembly" in 800.2 enhances correlation as the listing requirements are contained in 800.182 and the Panel Action on Proposals 16-71 and 16-131 moved the application requirements from 770.154 to 800.154.. This action is in keeping with the correlating Committee Note to Proposal 3-118 to locate the definition in a single article in Chapter 8 and the April 23-27, 2012 Correlating Committee Meeting Minutes CMP 3 Minute Item suggesting "...that 800.2 may be the most appropriate location for the definition.

Continued Acceptance in Principle of this proposal is also in keeping with the Correlating Committee's directive to correlate the Panel Actions regarding cable routing assemblies throughout Articles 725, 760, 770, and Chapter 8

This is one of a group of comments developed by the CMP3/CMP16 Joint Task Group formed at the direction of the Correlating Committee to locate a correlated definition of Cable Routing Assemblies in a single Article of Chapter 8 for use in Article 725, 760, 770, and Chapter 8.

The Task Group members were:

George Bish, Chair, representing Satellite Broadcasting & Communication Association

Harry Ohde, representing IBEW

James Brunssen, representing Alliance for Telecommunications Industry Solutions

George Straniero, representing National Electrical Manufacturers Association

Robert Walsh, representing International Association of Electrical Inspectors

Wendell Whistler, representing Intertek Testing Services

Panel Meeting Action: Accept in Principle

Add a new definition in 800.2 to read as follows:

Cable Routing Assembly. A single channel or connected multiple channels, as well as associated fittings, forming a structural system that is used to support and route communications wires and cables, optical fiber cables, data cables associated with information technology and communications equipment, Class 2 and Class 3 cables, and power-limited fire alarm cables.

Panel Statement: The panel accepts in principle the proposed recommendation but has included the phrase "and power-limited fire alarm cables" to the definition in support of CMP 3's request in the panel statement of Comment 3-41. The panel has also reinserted the word "connected" in front of "multiple" to correct an oversight in the recommendation since this word is contained in the current Code definition.

Acceptance in principle of Comment 16-5 as developed by the CMP 3/CMP

16 Joint Task Group locates the definition of "Cable Routing Assembly" in 800.2, a single section of Chapter 8, and provides a definition that is correlated for use in Articles 725, 760, 770 and Chapter 8 as directed by the Correlating Committee in their notes to Proposals 3-118 and 3-171.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.
Comment on Affirmative:
DORNA, G.: CMP 16 action on this Comment correlates with CMP 3 action on Comments 3-41 and 3-88.

16-6 Log #323 NEC-P16 **Final Action: Accept in Principle**
(770.2.Cable Routing Assembly)

TCC Action: See the Correlating Committee action on Comment 16-5 which relocates the definition of "Cable Routing Assembly" to Article 100.
Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 16-23
Recommendation: Accept proposal 16-23.
Substantiation: Proposal 16-23 recommended moving the definition of a cable routing assembly from 770.2 to 800.2. The panel accepted proposal 16-23 in principle in part because it decided to retain the definition of cable routing assemblies in 770.2 and repeat it in 800.2
The definition, listing requirements, applications and installation rules for cable routing assemblies do not need to be repeated in multiple articles. Having them all in Article 800 is sufficient.
The Correlating Committee, in its actions on proposal 3-118 and 3-171, directed that the definition of cable routing assembly be located in a single Article of Chapter 8. Acceptance of this comment will bring the panel action into conformance with the Correlating Committee directives.
Panel Meeting Action: Accept in Principle
Panel Statement: Refer to the panel action and statement on Comment 16-5 which meets the intent of the submitter.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17

TCC Action: See the Correlating Committee action on Comment 16-5 which relocates the definition of "Cable Routing Assembly" to Article 100.
Submitter: Robert W. Jensen, dbi-Telecommunication Infrastructure Design
Comment on Proposal No: 16-23
Recommendation: Accept proposal 16-23.
Substantiation: Proposal 16-23 recommended moving the definition of a cable routing assembly from 770.2 to 800.2. The panel accepted proposal 16-23 in principle in part because it decided to retain the definition of cable routing assemblies in 770.2 and repeat it in 800.2
The definition, listing requirements, applications and installation rules for cable routing assemblies do not need to be repeated in multiple articles. Having them all in Article 800 is sufficient.
The Correlating Committee, in its actions on proposal 3-118 and 3-171, directed that the definition of cable routing assembly be located in a single Article of Chapter 8. Acceptance of this comment will bring the panel action into conformance with the Correlating Committee directives.
Panel Meeting Action: Accept in Principle
Panel Statement: Refer to the panel action and statement on Comment 16-5, which meets the intent of the submitter.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-8 Log #1036 NEC-P16 **Final Action: Reject**
(770.2.Cable Routing Assembly and 800.2)

TCC Action: See the Correlating Committee action on Comment 16-5 which relocates the definition of "Cable Routing Assembly" to Article 100.
Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 16-23
Recommendation: Reject this proposal, or move the definition to Article 100.
Substantiation: Having the same definition in Articles 770 and 800 makes no sense, and violates section 2.2.2.1 of the style manual.
Panel Meeting Action: Reject
Panel Statement: Refer to the panel action and statement on Comment 16-2, which addresses the same issue.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-9 Log #1037 NEC-P16 **Final Action: Reject**
(770.2.Innerduct)

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 16-28
Recommendation: Reject this proposal, or move the definition to Article 100.
Substantiation: Having the same definition in Articles 770 and 800 makes no sense, and violates section 2.2.2.1 of the style manual.
Panel Meeting Action: Reject
Panel Statement: Innerduct is frequently used in optical fiber cable installations and having the definition in 770.2 enhances NEC usability. Further, Section 2.2.2.1 of the NEC Style Manual is not a "hard-and-fast rule; it is a general statement. Where NEC usability may be enhanced by having a definition in more than one article, it is permitted.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-10 Log #324 NEC-P16 **Final Action: Accept**
(770.2.Optical Fiber Cable)

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 16-29
Recommendation: Revise (or confirm) the actions on proposals 16-29 and 16-30 so the definition of optical fiber cable reads:
Optical Fiber Cable. A factory assembly or field assembly of one or more optical fibers having an overall covering.
Substantiation: The Communications Cable and Connectivity Association supports the actions of CMP 16 to revise the definition of optical fiber cable to reflect actual field practice.
The recommended text is from Jim Brunssen's affirmative ballot statement.
Panel Meeting Action: Accept
Panel Statement: The panel affirms that the definition of "Optical Fiber Cable" is as stated in this comment.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-11 Log #990 NEC-P16 **Final Action: Accept**
(770.2. Optical fiber Cable)

Submitter: Robert W. Jensen, dbi-Telecommunication Infrastructure Design
Comment on Proposal No: 16-29
Recommendation: Revise the definition of optical fiber cable (no change to the informational note):
Optical Fiber Cable. A factory assembly or field assembly of one or more optical fibers having an overall covering.
Substantiation: BICSI supports the actions of CMP 16 to revise the definition of optical fiber cable to permit blown fiber cables.
The recommended text is from Jim Brunssen's affirmative ballot statement.
Panel Meeting Action: Accept
Panel Statement: Also refer to the panel statement on Comment 16-10.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-12 Log #325 NEC-P16 **Final Action: Reject**
(770.3)

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 16-35
Recommendation: Accept proposal 16-35 in principle in part by accepting the following text:
770.3 Other Articles. Installations of optical fiber cables and raceways shall comply with 770.3(A) and (B). Only those sections of Chapter 2, ~~and~~ Article 300 and Chapter 4 referenced in this article shall apply to optical fiber cables and raceways.
Substantiation: The panel reject statement stated "To ensure that this change will not impact this article will take a review of the Chapters 1, 3, and 4 to determine that all applicable sections have been referenced in Article 770."
A review has been conducted; see Gerald Dorna's ballot comment which showed that no part of Chapter 4 applies to optical fiber installations.
The Communications Cable and Connectivity Association believes it is unreasonably burdensome to expect installers of optical fiber cables to be familiar with the parts of the code that are exclusively electrical and have no relevance to optical fiber cable installations.
Panel Meeting Action: Reject
Panel Statement: The panel recognizes that there is nothing in Article 770 that references sections of Chapter 4.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-13 Log #690 NEC-P16 **Final Action: Hold**
(770.3(C))

TCC Action: The Correlating Committee directs this comment be reported as "Hold."
The Correlating Committee action on Comment 16-5 changed the location of the definition of Cable Routing Assemblies to Article 100.
The installation requirements for cable routing assemblies in 800.110 and 800.113 do not apply globally and negate some of the requirements in Article 770. The Correlating Committee will appoint a task group to address installation issues regarding Cable Routing Assemblies throughout the Code.
Submitter: George Bish, Secure Watch Security
Comment on Proposal No: 16-37
Recommendation: Accept this proposal in principle as follows:
"(D) **Cable Routing Assemblies.** The definition in 800.2, the applications in <u>Table</u> 800.154(c), and the installation rules in 800.110 and 800.113 shall apply to Article 770."
Substantiation: The reference to the definition in 800.2 is appropriate as the definition has been deleted in 770 and placed in a single location in 800.2 per Correlating Committee directive. The Panel Action on Proposals 16-116 and 16-119 included cable routing assemblies in 800.110 and 800.113. This is a companion comment to the Task Group comment on Proposal 16-23.
Continued Acceptance in Principle of this proposal is in keeping with the Correlating Committee's directive to correlate the Panel Actions regarding cable routing assemblies throughout Articles 725, 760, 770, and Chapter 8
This is one of a group of comments developed by the CMP3/CMP16 Joint Task Group formed at the direction of the Correlating Committee to locate a correlated definition of Cable Routing Assemblies in a single Article of Chapter 8 for use in Article 725, 760, 770, and Chapter 8.
The Task Group members were:
George Bish, Chair, representing Satellite Broadcasting & Communication Association
Harry Ohde, representing IBEW
James Brunssen, representing Alliance for Telecommunications Industry Solutions
George Straniero, representing National Electrical Manufacturers Association
Robert Walsh, representing International Association of Electrical Inspectors
Wendell Whistler, representing Intertek Testing Services
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-14 Log #326 NEC-P16 **Final Action: Accept in Principle**
(770.3(D))

TCC Action: See Correlating Committee action on Comment 16-13.
Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 16-37
Recommendation: Accept proposals 16-37 in principle with the following text.
<u>**(D)**(new) **Cable Routing Assemblies.** The definition in 800.2, the applications in Table 800.154(c) and installation rules in 800.110 and 800.113 shall apply to Article 770.</u>
Substantiation: Proposal 16-23 recommended moving the definition of a cable routing assembly from 770.2 to 800.2. The panel accepted proposal 16-23 in principle in part because it decided to retain the definition of cable routing assemblies in 770.2 and repeat it in 800.2. As a consequence of its action on proposal 16-23 it accepted proposal 16-37 in principle in part.
The definition, listing requirements, applications and installation rules for cable routing assemblies do not need to be repeated in multiple articles. Having them all in Article 800 is sufficient. Hence this comment recommends referring to the definition of cable routing assembly in 800.2. A companion comment on proposal 16-23 recommends not repeating the definition in 770.2.
The Correlating Committee, in its actions on proposal 3-118 and 3-171, directed that the definition of cable routing assembly be located in a single Article of Chapter 8. Acceptance of this comment will bring the panel action into conformance with the Correlating Committee directives.
Panel Meeting Action: Accept in Principle
Panel Statement: Refer to the panel action on Comment 16-13, which meets the intent of the submitter.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-15 Log #991 NEC-P16 **Final Action: Accept in Principle**
(770.3(D) (New))

Ballot Not Returned: 1 Ballast, D.

16-16 Log #327 NEC-P16 **Final Action: Reject**
(770.24)

TCC Action: The Correlating Committee directs that this Comment and Proposal 16-40 be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 16-40
Recommendation: Continue to reject proposals 16-40 and 16-41.
Substantiation: The Communications Cable and Connectivity Association agrees with Gerald Dorna's ballot statement:
"The submitter's assertion that optical fiber cables need to be protected when installed other-then-parallel to framing members is totally unsubstantiated. Likewise the submitter's assertion that optical fiber cables require support when installed behind accessible panels is not substantiated. <u>These no-voltage cables</u> present no shock hazard and unlike electric power cables, they cannot initiate a fire. Article 770 already addresses the only hazard that optical fiber cables present, the hazard from the spread of fire."
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms it original action (at the ROP meeting) to accept Proposal 16-40 and 16-41.
The substantiation that fire and shock are only things to consider is incorrect. Fiber optic cables is used for life safety applications such as for fire alarm systems, some building system controls and industrial process controls.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 11 Negative: 6
Ballot Not Returned: 1 Ballast, D.
Explanation of Negative:
BRUNSSEN, J.: This comment should be accepted. The purpose of the NEC, as stated in Article 90, Section 90.1(A): "... is the practical safeguarding of persons and property from hazards arising from the use of electricity." Optical fiber cables contain no electrical power and hence pose neither a fire nor electrical safety hazard. Section 90.1 (B) states: "Compliance... results in an installation that is essentially free from hazard but not necessarily efficient, convenient, or adequate for good service or for future expansion of electrical use." Since there is no electrical power present and hence, no associated electrical hazard, the acceptance of Proposals 16-40 and 16-41 imposes additional requirements solely to help ensure "good service". The Panel Action to reject this comment, as well as the text of the Panel Statement, essentially expands the purpose and adequacy of the NEC beyond that stated in Sections 90.1(A) and 90.1(B), respectively. Hence, the comment should be accepted.
DAWSON, F.: Acceptance of comments 16-20 and 16-21 and rejection of comments 16-16, 16-18, 16-19, and 16-23 all regarding Article 770.24 would mandate that optical fiber circuits have the same level of physical protection as power circuits even though there has been no data to demonstrate that optical fiber cable possesses any capability to start a fire or presents any electrical shock hazard as it carries no electrical current or voltage. To require optical fiber cable to have the same physical protection as power cable that does have the capability to start a fire and can present an electrical shock hazard if damaged is unwarranted.
In addition, proposals 3-126 regarding Article 725.24(Class 1, 2 and 3 circuits) and 3-177 regarding Article 760.23(fire alarm circuits) which are both identical to the optical fiber cable proposals were rejected by CMP 3 at the ROP and those rejections were confirmed at the ROC by acceptance of comments 3-48 and 3-93 which recommended confirmation of the ROP action. This will create an inconsistency in the NEC as optical fiber cable used in control and fire alarm applications would require a higher level of protection than is required in Article 725 for Class 2 and 3 circuits and Article 760 for fire alarm circuits.
DEIKE, JR., R.: Optical Fiber cables should not be held to the same requirements for installation as electrical cable. There was no substantiation provided to document the fiber optic cable presents the same level of hazard to

personnel or property that electrical cable does. The level of protection required for the fiber optic cable should be determined by the end user.

DORNA, G.: The submitter of Proposal 16-41 also submitted identical proposals for 725.24 (Proposal 3-126) and 760.24 (Proposal 3-177) that were rejected by CMP 3. That reject was reaffirmed by CMP 3 acceptance of Comments 3-48 & 3-93 which recommended continuing rejection of Proposals 3-126 and 3-177. The rejection of Comments 16-16, 16-18, 6-19 & 16-23 and the acceptance of Comments 16-20 & 21 because optical fiber cables are used for fire alarm and control applications, will require a higher level of physical protection for optical fiber cables used for fire alarm and control applications than Articles 725 and 760 require for class 2, class 3 and fire alarm cables. That does not correlate.

IVANS, R.: This comment should be Accepted. Optical fiber cables are not required to be protected the same as power, Class 1, or life safety circuits, therefore adding a reference to all of the subsections in 300.4 is unnecessary. Section 90.1(A) states the purpose of the NEC is practical safe guarding of persons and property from hazards arising from the use of electricity. The requirements of 300.4 are intended to protect cables containing voltage and available current that present the risk of fire or electrical shock. Where there is only signal power, limited power or no power at all (optical fiber) in the cable, there is no reason to add excessive requirements. If optical cable mechanical protection needs to be addressed, specific requirements should be developed, not just impose requirements originally developed for electric light and power circuits. Addressing life safety issues would require an expansion of the scope and more extensive requirements dealing with signal integrity would need to be developed.

JOHNSON, S.: The proposed additional requirements are appropriate for power cables, not optical fiber cables. Optical fiber cables contain no electrical power and hence, pose neither a fire nor electrical safety hazard.

Comment on Affirmative:

BISH, G.: I agree with both the panel action and the panel statement to accept Proposal 16-40 and 16-41. Expansion of the use of fiber optics cables in Life Safety Systems is becoming more common place.

OHDE, H.: We agree with both the panel action and the panel statement to accept Proposals 16-40 and 16-41. 770.24 – Mechanical Execution of Work sets the guidelines for the installer to install optical fiber cables in a neat and workmanlike manner. 300.4 (A) through (G) provide some of the rules to be in compliance with a neat and workmanlike manner installation. These rules rule should be consistent for all electrical installations and not just for some. Expansion of the use fiber optics cables in the electrical industry has changed and will keep changing, as they will be used in fire safety applications.

(770.24)

TCC Action: The Correlating Committee directs that this Comment and Proposal 16-40 be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Note: When the ballot result does not confirm the TC action on a Proposal by a two-thirds affirmative vote, the Report on Proposals shall be published with a specific request for public comment on that Proposal. The Proposal is now being reconsidered by the TC as a public comment.
Submitter: David Clements, International Association of Electrical Inspectors
Comment on Proposal No: 16-40
Recommendation: Revise text to read as follows:

770.24 Mechanical Execution of Work.
Optical fiber cables shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by hardware including straps, staples, cable ties, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with 300.4 ~~(D)~~ <u>(A) through (G)</u> and 300.11.

Substantiation: In addition to the physical protection required in 300.4(D) regarding distance from parallel framing members, optical fiber cable also needs to be protected when installed other-than-parallel, to framing members such as perpendicular through bored holes and notches in wood framing, holes in metallic framing, in shallow grooves, under roof decking, etc. Cables also require support when installed behind accessible panels.

The reference needs to be to 300.4(A) through (G) not just to (D).

Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 11 Negative: 6
Ballot Not Returned: 1 Ballast, D.
Explanation of Negative:

BRUNSSEN, J.: This comment should be rejected. The purpose of the NEC, as stated in Article 90, Section 90.1(A), "… is the practical safeguarding of persons and property from hazards arising from the use of electricity." Optical fiber cables contain no electrical power and hence, pose neither a fire nor electrical safety hazard. Section 90.1 (B) states: "Compliance... results in an installation that is essentially free from hazard but not necessarily efficient, convenient, or adequate for good service or for future expansion of electrical use." Since there is no electrical power present, the acceptance of Proposals 16-40 and 16-41 amounts to imposing additional requirements solely to help ensure "good service". The Panel Action to accept this comment essentially expands the purpose and adequacy of the NEC beyond that stated in Sections 90.1(A) and 90.1(B), respectively. Hence, the comment should be rejected.

DAWSON, F.: See reason as for comment 16-16.

DEIKE, JR., R.: Optical Fiber cables should not be held to the same requirements for installation as electrical cable. There was no substantiation provided to document the fiber optic cable presents the same level of hazard to personnel or property that electrical cable does. The level of protection required for the fiber optic cable should be determined by the end user.

DORNA, G.: See my negative statement on Comment 16-16.

IVANS, R.: This comment should be Rejected. Optical fiber cables are not required to be protected the same as power, Class 1, or life safety circuits, therefore adding a reference to all of the subsections in 300.4 is unnecessary. Section 90.1(A) states the purpose of the NEC is practical safe guarding of persons and property from hazards arising from the use of electricity. The requirements of 300.4 are intended to protect cables containing voltage and available current that present the risk of fire or electrical shock. Where there is only signal power, limited power or no power at all (optical fiber) in the cable, there is no reason to add excessive requirements. If optical cable mechanical protection needs to be addressed, specific requirements should be developed, not just impose requirements originally developed for electric light and power circuits. Addressing life safety issues would require an expansion of the scope and more extensive requirements dealing with signal integrity would need to be developed.

JOHNSON, S.: See my explanation of Negative on Comment 16-16.

Comment on Affirmative:

BISH, G.: I agree with the panel action and believe the submitters substantiation explaining the need.

OHDE, H.: We agree with the panel action and believe the submitter has done an excellent job explaining the need for the expansion of 300.4 to include 300.4 (A) through (G). The installer knows precisely how to install cable in accordance 300.4 (A) through (G). Consistent code rules is the key for well written code and enforceable code. We have one set installation rules for one cable but not another type of cable.

16-21 Log #569 NEC-P16 **Final Action: Reject**
(770.24)

TCC Action: The Correlating Committee directs that this Comment and Proposal 16-41 be reported as "Reject" because less than two-thirds of the members eligible to vote have voted in the affirmative.
Note: When the ballot result does not confirm the TC action on a Proposal by a two-thirds affirmative vote, the Report on Proposals shall be published with a specific request for public comment on that Proposal. The Proposal is now being reconsidered by the TC as a public comment.
Submitter: Marcus R. Sampson, Lysistrata Electric
Comment on Proposal No: 16-41
Recommendation: Revise text to read as follows:

770.24 Mechanical Execution of Work.
Optical fiber cables shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by hardware including straps, staples, cable ties, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with300.4 ~~(D)~~ <u>(A) through (G)</u> and 300.11.

Substantiation: In addition to the physical protection required in 300.4(D) regarding distance from parallel framing members, optical fiber cable also needs to be protected when installed other-than-parallel, to framing members such as perpendicular through bored holes and notches in wood framing, holes in metallic framing, in shallow grooves, under roof decking, etc. Cables also require support when installed behind accessible panels.

The reference needs to be to 300.4(A) through (G) not just to (D).

Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 11 Negative: 6
Ballot Not Returned: 1 Ballast, D.
Explanation of Negative:

BRUNSSEN, J.: This comment should be rejected. See my statement associated with my negative ballot on Comment 16-20.

DAWSON, F.: See reason as for comment 16-16.

DEIKE, JR., R.: See my Explanation of Negative Vote on Comment 16-20.

DORNA, G.: See my negative statement on Comment 16-16.

IVANS, R.: This comment should be Rejected. Optical fiber cables are not required to be protected the same as power, Class 1, or life safety circuits, therefore adding a reference to all of the subsections in 300.4 is unnecessary. Section 90.1(A) states the purpose of the NEC is practical safe guarding of persons and property from hazards arising from the use of electricity. The requirements of 300.4 are intended to protect cables containing voltage and available current that present the risk of fire or electrical shock. Where there is only signal power, limited power or no power at all (optical fiber) in the cable, there is no reason to add excessive requirements. If optical cable mechanical protection needs to be addressed, specific requirements should be developed, not just impose requirements originally developed for electric light and power circuits. Addressing life safety issues would require an expansion of the scope and more extensive requirements dealing with signal integrity would need to be developed.

JOHNSON, S.: See my explanation of Negative on Comment 16-16.

Comment on Affirmative:

BISH, G.: See comment on Comment 16-20.

OHDE, H.: See our comment on Comment 16-20.

16-22 Log #906 NEC-P16 **Final Action: Reject**
(770.24)

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 16-42
Recommendation: Revise text to read as follows:

770.24 Mechanical Execution of Work. Optical fiber cables shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by hardware including straps, staples, cable ties, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with 300.4(D) and 300.11. <u>See also 300.22.</u> ~~Cable ties used to secure optical fiber plenum cables in other space used for environmental air (plenums) shall be listed as having low smoke and heat release properties.~~

Substantiation: CMP 3 accepted the requirements for cable ties in plenums and incorporate the language on requirements into 300.22 (C)(1). The addition of the language on cable ties here could create conflicts, especially if the language approved in 300.22(C)(1) is different from the language here. I have made a comment to CMP3 to request that the language addressing "smoke and heat release characteristics" be used in 300.22(C)(1).
Panel Meeting Action: Reject
Panel Statement: The reference to 300.22 in the submitter's recommendation is too broad. The panel action on Comment 16-17 is more appropriate because it refers to cable ties and other nonmetallic cable accessories. This panel action also maintains correlation with CMP 3 action on Comment 3-24 that is in agreement with the Correlating Committee's direction to correlate Articles 300, 770, 800, 820 and 830 on the subject of cable ties.
Number Eligible to Vote: 18

16-24 Log #329 NEC-P16 **Final Action: Accept**
(770.26)

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 16-45
Recommendation: Accept the proposal in principle with modified text as shown:
770.26 Spread of Fire or Products of Combustion.
Installations of optical fiber cables and <u>communications</u> raceways in hollow spaces, vertical shafts, and ventilation or air-handling ducts shall be made so that the possible spread of fire or products of combustion will not be substantially increased. Openings around penetrations of optical fiber cables and <u>communications</u> raceways through fire-resistant–rated walls, partitions, floors, or ceilings shall be firestopped using approved methods to maintain the fire resistance rating.
Informational Note: Directories of electrical construction materials published by qualified testing laboratories contain many listing installation restrictions necessary to maintain the fire-resistive rating of assemblies where penetrations or openings are made. Building codes also contain restrictions on membrane penetrations on opposite sides of a fire-resistance–rated wall assembly. An example is the 600-mm (24-in.) minimum horizontal separation that usually applies between boxes installed on opposite sides of the wall. Assistance in complying with 770.26 can be found in building codes, fire resistance directories, and product listings.
Substantiation: The panel rejected the proposal with the statement :
"Raceways are required to be fire stopped. The submitters substantiation to resolve the use of optical fiber raceway versus communications raceway is not reflected in the recommendation."
The recommended text reflects the panel actions to replace optical fiber raceways with communications raceways.
The firestopping of Chapter 3 raceways in covered in 300.21. Section 770.110(1) states:
(1) Raceways Recognized in Chapter 3. Optical fiber cables shall be permitted to be installed in any raceway included in Chapter 3. The raceways shall be installed in accordance with the requirements of Chapter 3.
If this comment is accepted, the text will correlate with 800.26, which requires the firestopping of communications cables and communications raceways, and with the panel action on proposal 16-169 which requires firestopping of CATV cables and communications raceways.
Panel Meeting Action: Accept

16-29 Log #331 NEC-P16 **Final Action: Accept in Principle**
(770.110)

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 16-57
Recommendation: Revise the panel action on proposal 16-57 follows:
770.110 Raceways and Cable Routing Assemblies for Optical Fiber Cables.
(A) Types of Raceways. Optical fiber cables shall be permitted to be installed in any raceway that complies with either (A)(1) or (A)(2), and in cable routing assemblies installed in compliance with (C).
(1) Raceways Recognized in Chapter 3. Optical fiber cables shall be permitted to be installed in any raceway included in Chapter 3. The raceways shall be installed in accordance with the requirements of Chapter 3.
(2) Communications Raceways. Optical fiber cables shall be permitted to be installed in listed plenum communications raceways, listed riser communications raceways and listed general-purpose communications raceways selected in accordance with the provisions of 770.113, 800.110, and 800.113, and installed in accordance with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply.
(B) Raceway Fill for Optical Fiber Cables. Raceway fill for optical fibers cables shall comply with either (B)(1) or (B)(2).
(1) Without Electric Light or Power Conductors. Where optical fiber cables are installed in raceway without electric light or power conductors, the raceway fill requirements of Chapters 3 and 9 shall not apply.
(2) Nonconductive Optical Fiber Cables with Electric Light or Power Conductors. Where nonconductive optical fiber cables are installed with electric light or power conductors in a raceway, the raceway fill requirements of Chapters 3 and 9 shall apply.
(C) Cable Routing Assemblies. Optical fiber ~~Communications wires~~ and cables shall be permitted to be installed in plenum cable routing assemblies, riser cable routing assemblies and general-purpose cable routing assemblies selected in accordance with the provisions of 800.113 and Table 800.154(c), and installed in accordance with (1) and (2).
(1) Horizontal Support. Cable routing assemblies shall be supported where run horizontally at intervals not to exceed 900 mm (3 ft), and at each end or joint, unless listed for other support intervals. In no case shall the distance between supports exceed 3 m (10 ft).
(2) Vertical Support. Vertical runs of cable routing assemblies shall be ~~securely~~ supported at intervals not exceeding 1.2 m (4 ft), unless listed for other support intervals, and shall not have more than one joint between supports.
Substantiation: "Communications wires and cables" is replaced by "Optical fiber cables" in the recommended text for 770.110(C) in order to correct an error.
The Correlating Committee directed that action on proposal 16-116 be rewritten to comply with 3.2.1 of the NEC Style Manual. "Securely" is on the list in Table 3.2.1, Possibly Unenforceable and Vague Terms. This proposal has the same style manual issue as proposal 16-116 so "securely" has been deleted from the recommended text.
The Correlating Committee directed that the panel clarify the statement "Remainder of proposed text remains unchanged." Panel action to accept this comment will provide the required clarification.
Panel Meeting Action: Accept in Principle
Panel Statement: Refer to the panel action on Comment 16-31, which meets the intent of the submitter.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 16 Negative: 1
Ballot Not Returned: 1 Ballast, D.
Explanation of Negative:
OHDE, H.: See our comment on Comment 16-31.

(770.110)

Submitter: Robert W. Jensen, dbi-Telecommunication Infrastructure Design
Comment on Proposal No: 16-57
Recommendation: Revise the panel action on proposal 16-57 follows:
770.110 Raceways and Cable Routing Assemblies for Optical Fiber Cables.
(A) Types of Raceways. Optical fiber cables shall be permitted to be installed in any raceway that complies with either (A)(1) or (A)(2), and in cable routing assemblies installed in compliance with (C).
(1) Raceways Recognized in Chapter 3. Optical fiber cables shall be permitted to be installed in any raceway included in Chapter 3. The raceways shall be installed in accordance with the requirements of Chapter 3.
(2) Communications Raceways. Optical fiber cables shall be permitted to be installed in listed plenum communications raceways, listed riser communications raceways and listed general-purpose communications raceways selected in accordance with the provisions of 770.113, 800.110, and 800.113, and installed in accordance with 362.24 through 362.56, where the requirements applicable to electrical nonmetallic tubing apply.
(B) Raceway Fill for Optical Fiber Cables. Raceway fill for optical fibers cables shall comply with either (B)(1) or (B)(2).
(1) Without Electric Light or Power Conductors. Where optical fiber cables are installed in raceway without electric light or power conductors, the raceway fill requirements of Chapters 3 and 9 shall not apply.
(2) Nonconductive Optical Fiber Cables with Electric Light or Power Conductors. Where nonconductive optical fiber cables are installed with electric light or power conductors in a raceway, the raceway fill requirements of Chapters 3 and 9 shall apply.
(C) Cable Routing Assemblies. Optical fiber ~~Communications wires and~~ cables shall be permitted to be installed in plenum cable routing assemblies, riser cable routing assemblies and general-purpose cable routing assemblies selected in accordance with the provisions of 800.113 and Table 800.154(c), and installed in accordance with (1) and (2).
(1) Horizontal Support. Cable routing assemblies shall be supported where run horizontally at intervals not to exceed 900 mm (3 ft), and at each end or joint, unless listed for other support intervals. In no case shall the distance between supports exceed 3 m (10 ft).
(2) Vertical Support. Vertical runs of cable routing assemblies shall be ~~securely~~ supported at intervals not exceeding 1.2 m (4 ft), unless listed for other support intervals, and shall not have more than one joint between supports.
Substantiation: "Communications wires and cables" is replaced by "Optical fiber cables" in the recommended text for 770.110(C) in order to correct an error.
The Correlating Committee directed that action on proposal 16-116 be rewritten to comply with 3.2.1 of the NEC Style Manual. "Securely" is on the list in Table 3.2.1, *Possibly Unenforceable and Vague Terms*. This proposal has the same style manual issue as proposal 16-116 so "securely" has been deleted from the recommended text.
The Correlating Committee directed that the panel clarify the statement "Remainder of proposed text remains unchanged." Panel action to accept this comment will provide the required clarification.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 16 Negative: 1
Ballot Not Returned: 1 Ballast, D.

Explanation of Negative:

OHDE, H.: We disagree with the panel action and believe that is should be Accept in Part. The deletion of the word "securely" in this case really is not a vague term but describes an action that will be required for the installer to securely support the optical fiber cable as opposed to just supporting the optical fiber cable. The deletion of the word "securely" provides no guidance and is now code rule is very generic.

16-32 Log #1038 NEC-P16 **Final Action: Accept in Principle**
(770.110)

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 16-57
Recommendation: Revise subsection (C) so that it applies to optical fiber cables instead of communications cables.
(C) Cable Routing Assemblies. ~~Communications wires and~~ Optical Fiber cables shall be permitted to be installed in plenum cable routing assemblies, riser cable routing assemblies and general-purpose cable routing assemblies selected in accordance with the provisions of 800.113 and Table 800.154(c), and installed in accordance with (1) and (2).
Substantiation: This seems to be a copy and paste error (a mistake that I am all too familiar with myself).
Panel Meeting Action: Accept in Principle
Panel Statement: Refer to the panel action on Comment 16-31, which meets the intent of the submitter.
Number Eligible to Vote: 18

Ballot Not Returned: 1 Ballast, D.

16-34 Log #332 NEC-P16 **Final Action: Hold**
(770.113(E))

TCC Action: The Correlating Committee directs that this panel action on this Comment be reported as "Hold" based on 4.4.4.6.2 of the NFPA Regulations Governing Committee Projects since the information accepted in this comment, to add an informational note, is new material that has not had public review.
Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 16-62
Recommendation: Revise text to read as follows:

Informational Note No.1: See 770.26 for firestop requirements for floor penetrations.

Informational Note No. 2: See 800.12 for information on using communications raceways as innerduct.

Substantiation: The new informational note adds clarity by guiding the reader to new section 800.12 which permits communications raceways to be used as innerduct in any type of Chapter 3 raceway.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 16 Negative: 1
Ballot Not Returned: 1 Ballast, D.
Explanation of Negative:

OHDE, H.: We disagree with the panel's action and believe that additional Information Note No. 2 is new material. In addition, the submitter's substantiation does not add clarity by guiding the reader to 800.12 but adds confusion. Too many informational notes defeat the true purpose of Informational Note. We believe the reader and the installer should have some knowledge of how to read and interpret the code.

16-35 Log #759 NEC-P16 **Final Action: Accept**
(770.133)

Submitter: James T. Dollard, Jr., IBEW Local 98
Comment on Proposal No: 16-66
Recommendation: Continue to Accept.
Substantiation: This comment is submitted on behalf of the high voltage task to provide additional substantiation as directed by the Correlating Committee.

The High Voltage Task Group (HVTG) was charged with developing recommendations throughout the NEC to provide the code user with prescriptive requirements for high voltage installations. The task group charge was to identify holes in the code with respect to installations operating at over 600-volts and address them with recommended requirements to allow for uniform installation and enforcement. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are currently being installed at DC voltages over 600V up to and including 1000V, 1200V, 1500V, and 2000V DC. These DC systems are expanding and have become a more integral part of many structures. Small Wind Electric Systems and Solar Photovoltaic (PV) Systems are employed regularly in, and on all types of structures from dwellings units, to large retail and high rise construction.

The first direction that the HVTG took was to simply suggest revisions in Chapter 6 for Special Equipment. It is extremely important to fully understand the outline form of the NEC. Section 90.3 mandates that Chapters 1 through 4 apply generally and Chapters 5, 6 and 7 are special and serve only to modify or supplement the rules in Chapters 1 through 4. The HVTG quickly realized that it was not feasible to address all of the installation requirements in Chapter 6. The work needs to be done throughout the NEC. The special systems in Chapter 6 are built primarily upon Chapters 1 through 4 with the Chapter 6 requirements providing only modifications or supplemental requirements. A quick review of the UL White-book for electrical products will uncover that UL has many products that are utilized in these systems rated at and above 600-volts including but not limited to, 600Vdc terminal blocks, 1000Vdc PV switches, 1500Vdc PV fuses, and 2000V PV wiring. Product listings provide permitted uses and restrictions on a given product. The NEC must recognize those products through installation requirements. Electrical safety in the home, workplace and in all venues depends upon installation requirements to ensure that all persons and property are not exposed to the hazards of electricity.
The success of this code hinges on three things (1) product standards, (2) installation requirements and (3) enforcement. The NEC needs to recognize emerging technologies that are operating at over 600-volts. Everyone needs to play a role in this transition. The present NEC requirements would literally require that a PV system operating at 750-volts DC utilize a disconnecting means rated at 5 kV. The manufacturers, research and testing laboratories and the NEC must work together to develop installation requirements and product standards to support these emerging technologies.

Moving the NEC threshold from 600 volts to 1000 volts will not, by itself, allow the immediate installation of systems at 1000-volts. Equipment must first be tested and found acceptable for use at the higher voltage(s). The testing and listing of equipment will not, by itself, allow for the installation of 1000 volt-systems. The NEC must include prescriptive requirements to permit the installation of these 1000-volt systems. It will take both tested/listed equipment and an installation code to meet the needs of these emerging technologies that society demands. The installation code should be the NEC.

Moving the NEC to 1000 volts is just the beginning. The desire to keep increasing efficiencies will continue to drive up the system voltages. We are beginning to see 1200, 1500, and 2000-volt systems. 2500 volts cannot be far down the road. Most equipment standards are still at 600 volts and will need to be upgraded also.

If the NEC does not adequately address systems over 600 volts, some other standard will. If we want to control the future safety of installations over 600 volts we need to address these issues today.

(770.179)

TCC Action: The Correlating Committee directs that the proposed revision be revised as follows in accordance with the NEC Style Manual: 770.179(F) Field-Assembled Optical Fiber Cables. Field-assembled optical fiber cable shall comply with 770.179(F)(1) or (2).
(1) Marking and Listing of Combination of Jacket and Optical Fibers. The specific combination of jacket and optical fibers intended to be installed as a field-assembled optical fiber cable shall be listed in accordance with 770.179(A), (B), or (D) and shall be marked in accordance with table 770.179
(a) The jacket of a field-assembled optical fiber cable shall have a surface marking indicating the specific optical fibers with which it is listed for use.
(b) The optical fibers shall have a permanent marking, such as a marker tape, indicating the jacket with which they are listed for use.
(2) Listing of Jacket Without Fibers. The jacket without fibers shall meet the listing requirements for communications raceways in 800.182(A), (B), or (C) in accordance with the cable marking.
Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 16-75
Recommendation: Revise 770.179(F):
770.179(F) Field-Assembled Optical Fiber Cables. Field-assembled optical fiber cable shall comply with 770.179(F)(1) through (4).
(1) The specific combination of jacket and optical fibers intended to be installed as a field-assembled optical fiber cable shall be listed in accordance with 770.179(A) Types OFNP and OFCP ~~(plenum)~~, 770.179(B) Types OFNR and OFCR ~~(riser)~~ or 770.179(D) Types OFN and ORC ~~(general-purpose)~~ and shall be marked in accordance with Table 770.179.
(2) The jacket of a field-assembled optical fiber cable shall have a surface marking indicating the specific optical fibers with which it is listed for use.
(3) The optical fibers shall have a permanent marking, such as a marker tape, indicating the jacket with which they are listed for use.
(4) The jacket without fibers shall meet the listing requirements for communications raceways in 800.182(A) Plenum Communications Raceways and Plenum Cable Routing Assemblies ~~plenum~~, 800.182(B) Riser Communications Raceways and Plenum Cable Routing Assemblies ~~riser~~ or 800.182(C) General-Purpose Communications Raceways and General-purpose Cable Routing Assemblies ~~general-purpose~~ in accordance with the cable marking.
Substantiation: The Communications Cable and Connectivity Association supports the actions of CMP 16 to provide for the listing and installation of field-assembled optical fiber cables and thereby reflect actual field practice.
The recommended changes to the text are intended to add clarity and comply with the Correlating Committee directive on this proposal.
Panel Meeting Action: Accept in Principle
Revise 770.179(F)(1) as follows:
(1) The specific combination of jacket and optical fibers intended to be installed as a field-assembled optical fiber cable shall be listed in accordance with 770.179(A), (B) or (D) and shall be marked in accordance with Table 770.179.
Revise 770.179(F)(4) as follows: (4) The jacket without fibers shall meet the listing requirements for communications raceways in 800.182(A), (B) or (C) in accordance with the cable marking.
Panel Statement: The panel has simplified the requirements by removing the subsection titles.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-38 Log #701 NEC-P16 **Final Action: Accept in Principle**
(770.179(E))

Submitter: George Bish, Secure Watch Security
Comment on Proposal No: 16-26a
Recommendation: Accept in Principle with the following changes:
770.179(E)(1) "Circuit integrity (-CI) cables ~~suitable for use~~ used in raceways shall be listed and marked specifically as part of an Electrical Circuit Protective System as covered in (E)(2)"
Delete Informational Note associated with 770.179(E)(1)
770.179(E)(2) "shall be identified with the protective system number and hourly rating printed on the outer jacket of the cable and installed in accordance with the listing of the protective system"
Delete substantiation Item #4.
Substantiation: In 770.179(E)(1) Circuit integrity cables used in raceways are required to be listed and marked. Use of the phrase "suitable for use" neither enhances nor contributes to the understanding of the requirement. In 770.179(E)(2) the addition of the phrase "installed in accordance with the listing of the protective system" provides a reminder to the Code user and reinforces the requirement of 110.3(B). This is a companion comment to similar comments on Proposals 16-85a, 3-165, 3-208 and 3-210. Incorporation of these suggested revisions will provide correlation across Articles 725, 760, 770 & 800.
The Informational Note following 770.179(E)(1) is redundant as the mandatory text of 770.179(E)(1) already states that circuit integrity cables used in raceways shall be marked with the designation "CI". Substantiation # 4 is no longer necessary as the Informational note is removed
This is one of a group of comments developed by the CMP3/CMP16 Joint Task Group formed at the direction of the Correlating Committee to correlate the Panel Action on Proposals 16-26a, 16-79, 16-85a, 16-137, 3-165, 3-208, and 3-210
The Task Group members were:
George Bish, Chair, representing Satellite Broadcasting & Communication Association
Harry Ohde, representing IBEW
James Brunssen, representing Alliance for Telecommunications Industry Solutions
George Straniero, representing National Electrical Manufacturers Association
Robert Walsh, representing International Association of Electrical Inspectors
Wendell Whistler, representing Intertek Testing Services
Panel Meeting Action: Accept in Principle
Revise 770.179(E) to read as follows:
770.179 (E) Circuit Integrity (-CI) Cable or Electrical Circuit Protective System. Cables that are used for survivability of critical circuits under fire conditions shall be listed and meet either (E)(1) or (E)(2) as follows:
Informational Note: The listing organization provides information for circuit integrity (-CI) cable and Electrical Circuit Protective Systems including installation requirements required to maintain the fire rating.
770.179(E)(1) Circuit Integrity (-CI) Cables. Circuit Integrity (-CI) cables, specified in 770.179(A) through (D), and used for survivability of critical circuits shall have the additional classification using the suffix "-CI. In order to maintain its listed fire rating, circuit integrity (-CI) cable shall only be installed in free air.
Informational Note : One method of defining circuit integrity (CI) cable is by establishing a minimum 2-hour fire resistance rating for the cable when tested in accordance with ANSI/UL 2196-2006, Standard for Tests of Fire-Resistive Cable.
770.179(E)(2) Fire-Resistive Cables. Cables, specified in 770.179(A) through (D) and 770.179(E)(1), that are part of an Electrical Circuit Protective System, shall be Fire-Resistive Cable, identified with the protective system number on the product or on the smallest unit container in which the product is packaged and installed in accordance with the listing of the protective system.
Informational Note: One method of defining an Electrical Circuit Protective System is by establishing a minimum 2-hour fire resistance rating for the system when tested in accordance with UL Subject 1724, Outline of Investigation for Fire Tests for Electrical Circuit Protective Systems.
Panel Statement: The panel accepts the submitter's recommendation in principle but has revised the requirement to provide clarity on the listing of CI cable and cable used in electrical circuit protective systems (ECPS). The following modifications were made:
• The cable is required to be listed in all cases. The listing requirement has been placed in the main paragraph.
• As a condition of listing, -CI cable must be installed only in free air. This has been stated.
• Electrical circuit protective systems do not necessarily have to be conduit but can be enclosed in other materials. This has been reflected in the revisions to 770.179(E).
• The revisions have corrected all references.
• Marking requirements have been changed to align with listing requirement. It is not always practical to surface mark the cable in a system as the cable manufacturer may not be the one who has a system evaluated.
• Information Notes were added and revised for clarity
The panel advises the correlating committee that the panel actions in this comment do not fully correlate with the related actions of CMP 3 on Comments 3-74, 3-109 and 3-111. While there is not a technical conflict between these different panel actions, the revisions provided by Panel 16 include a greater level of precision and clarity that is needed for these provisions. It is recommended that the correlating committee review these changes to determine if any changes are needed for correlation.
Number Eligible to Vote: 18

(800.2.Innerduct)

Submitter: Mike Holt, Mike Holt Enterprises

Comment on Proposal No: 16-87

Recommendation: Reject this proposal, or move the definition to Article 100.

Substantiation: Having the same definition in Articles 770 and 800 makes no sense, and violates section 2.2.2.1 of the style manual.

Panel Meeting Action: Reject

Panel Statement: Communications raceways are permitted to be used as innerducts. NEC usability is enhanced by having the definition in 800.2 as the item is closely associated with communications. Further, Section 2.2.2.1 of the NEC Style Manual is not a hard-and-fast rule; it is a general statement. Where NEC usability may be enhanced by having a definition in more than one article, it is permitted.

(800.24, 820.24, and 830.24)

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 16-99
Recommendation: Continue to reject proposals 16-99, 16-101, 16-165, 16-167, 16-224 & 16-226.
Substantiation: The Communications Cable and Connectivity Association agrees with Gerald Dorna's ballot statement:

"The submitter's assertion that communications cables need to be protected when installed other-then-parallel to framing members is totally unsubstantiated. Likewise the submitter's assertion that communications cables require support when installed behind accessible panels is not substantiated. Communications cables present minimal shock hazard and unlike electric power cables, they cannot initiate a fire. The uniqueness of communications circuits is recognized by 90.3 which exempts Chapter 8 from the general wiring requirements unless specifically referenced from Chapter 8. The submitter is trying to apply a uniform set of installation rules to power, communications and fiber optics without considering the inherent safety features of communications installations."
Panel Meeting Action: Accept in Part

Accept the recommendation for 800.24 (Proposals 16-99 and 16-101), and 820.24 (Proposals 16-165 and 16-167).

Reject the recommendation for 830.24 (Proposal 16-224 and 16-226).
Panel Statement: The panel took action on 830.24 to delete the reference to 300.4 because it is already contained in 830.3(E). See the panel action and statement on Comment 16-89.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 15 Negative: 2
Ballot Not Returned: 1 Ballast, D.
Explanation of Negative:

BISH, G.: I disagree with both the panel action and panel statement. I believe there should be a uniform set of installation requirements for cables referenced in 300.4.

OHDE, H.: We disagree with the panel action. We believe that the panel should have accepted Proposals 16-99, 16-101, 16-165, and 16- 167 on the ROP written ballot. We believe that there should be a uniform set of installation requirements for all cables as referenced in 300.4.

16-45 Log #539 NEC-P16 **Final Action: Accept**
(800.24)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions (ATIS)
Comment on Proposal No: 16-99
Recommendation: Continue to reject this proposal per Correlating Committee action.
Substantiation: The Correlating Committee acted correctly in reporting this proposal as "Reject". The proposal received less that the required two-thirds affirmative vote as the submitter failed to adequately substantiate the proposal as required by the "Regulations Governing Committee Projects" Section 4-3.3(d). This was noted by a number of the Committee members in their "Explanation of Negative" vote. The proposed additional requirements are appropriate for power cables, not communications cables. Communications cables and wires are much smaller than power conductors (typically 26 AWG copper), are powered from a power-limited source of 100 volt-amperes, and pose neither a fire nor electrical safety hazard.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 14 Negative: 3
Ballot Not Returned: 1 Ballast, D.
Explanation of Negative:

BISH, G.: See comment on Comment 16-44.

OHDE, H.: See our comment on Comment 16-44.

PIRKLE, W.: Submitter's comment only addressed additional installation requirements. Panel statement rejected comment on power and current, not on installation requirements.
Comment on Affirmative:

BRUNSSEN, J.: The Panel Action to accept is correct. The submitter of Proposal 16-99 has identified neither a fire nor electrical safety hazard to warrant expanding the requirements of 800.24. Communications wires and cables are typically smaller than power cables (26 AWG copper conductors), operate at power levels of 100 volt-amperes or less derived from a power-limited source, and pose neither a fire nor electrical safety hazard.

(800.24)

Note: When the ballot result does not confirm the TC action on a Proposal by a two-thirds affirmative vote, the Report on Proposals shall be published with a specific request for public comment on that Proposal. The Proposal is now being reconsidered by the TC as a public comment.
Submitter: David Clements, International Association of Electrical Inspectors
Comment on Proposal No: 16-99
Recommendation: Revise text to read as follows:

800.24 Mechanical Execution of Work.
Communications circuits and equipment shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by hardware, including straps, staples, cable ties, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform to 300.4 ~~(D)~~ <u>(A) through (G)</u> and 300.11.
Substantiation: In addition to the physical protection required in 300.4(D) regarding distance from parallel framing members, communication cable also needs to be protected when installed other-than-parallel to framing members such as perpendicular through bored holes and notches in wood framing, holes in metallic framing, in shallow grooves, under roof decking, etc. Cables also require support behind accessible panels.

The reference needs to be to 300.4(A) through (G) not just to (D).
Panel Meeting Action: Reject
Panel Statement: The submitter has identified neither a fire nor an electrical safety hazard to warrant expanding the requirements of 800.24. Communications wires and cables are typically smaller than power cables (26 AWG copper conductors), operate at power levels of 100 volt-amperes or less derived from a power-limited source, and pose neither a fire nor electrical safety hazard.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 13 Negative: 4
Ballot Not Returned: 1 Ballast, D.
Explanation of Negative:

BISH, G.: I disagree with both the panel action and panel statement and believe that the expansion of 300.4 to include (A) through (G) is appropriate.

CHAN, L.: Cables should be protected against physical damage by methods other than parallel to framing members and furring strips. As an inspector, I see all types of improper installed cables and 300.4 (A) through (G) gives the inspector more leverage when he performs an inspection.

OHDE, H.: We disagree with both the panel action and panel statement. We believe the submitter has done an excellent job explaining the need for the expansion of 300.4 to include 300.4 (A) through (G). The installer knows precisely how to install cable in accordance 300.4 (A) through (G). Consistent code rules is the key for well written code and enforceable code. We have one set installation rules for one cable but not the other.

PIRKLE, W.: Submitter's comment only addressed additional installation requirements. Panel statement rejected comment on power and current, not on installation requirements.

Comment on Affirmative:

BRUNSSEN, J.: See my statement associated with my affirmative ballot on Comment 16-45.

16-48 Log #568 NEC-P16 **Final Action: Reject**

16-49 Log #907 NEC-P16 **Final Action: Reject**
(800.24)

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 16-100
Recommendation: Revise text to read as follows:

800.24 Mechanical Execution of Work. Communications circuits and equipment shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by hardware including straps, staples, cable ties, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with 300.4(D) and 300.11. See also 300.22. ~~Cable ties used to secure communications plenum cables in other space used for environmental air (plenums) shall be listed as having low smoke and heat release properties.~~

Substantiation: CMP 3 accepted the requirements for cable ties in plenums and incorporate the language on requirements into 300.22 (C)(1). The addition of the language on cable ties here could create conflicts, especially if the language approved in 300.22(C)(1) is different from the language here. I have made a comment to CMP3 to request that the language addressing "smoke and heat release characteristics" be used in 300.22(C)(1).

Panel Meeting Action: Reject
Panel Statement: The reference to 300.22 in the submitter's recommendation is too broad. The panel action on Comment 16-17 is more appropriate because it refers to cable ties and other nonmetallic cable accessories. This panel action also maintains correlation with CMP 3 action on Comment 3-24 that is in agreement with the Correlating Committee's direction to correlate Articles 300, 770, 800, 820 and 830 on the subject of cable ties.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17

16-50 Log #1222 NEC-P16 **Final Action: Accept**
(800.24)

Submitter: Fred C. Dawson, E. I. Du Pont Canada Company / Rep. American Chemistry Council
Comment on Proposal No: 16-98
Recommendation: Continue to reject proposal 16-98.
Substantiation: The ACC supports the panel action. The proponent has not provided any data to support the recommendation.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-51 Log #1223 NEC-P16 **Final Action: Accept in Part**
(800.24, 820.24, and 830.24)

Submitter: Fred C. Dawson, E. I. Du Pont Canada Company / Rep. American Chemistry Council
Comment on Proposal No: 16-99
Recommendation: Continue to reject proposals 16-99, 16-101, 16-165, 16-167, 16-224, 16-226.
Substantiation: The ACC supports the panel action and agrees with comments from the panel members. Communications cables present minimal shock hazard and do not initiate fires. There is no reason for them to be protected or supported in the same manner as power cables.
Panel Meeting Action: Accept in Part

Accept the recommendation for 800.24 (Proposals 16-99 and 16-101), and 820.24 (Proposals 16-165 and 16-167).

Reject the recommendation for 830.24 (Proposal 16-224 and 16-226).

Panel Statement: The panel took action on 830.24 to delete the reference to 300.4 because it is already contained in 830.3(E). See the panel action and statement on Comment 16-89.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 15 Negative: 2
Ballot Not Returned: 1 Ballast, D.
Explanation of Negative:

BISH, G.: See comment on Comment 16-44.
OHDE, H.: See our comment on Comment 16-44.

16-52 Log #1067 NEC-P16 **Final Action: Reject**
(800.49 (New))

Submitter: Michael J. Johnston, National Electrical Contractors Association
Comment on Proposal No: 16-104
Recommendation: Continue to accept the proposal in principle and revise as follows:

800.49 Metallic Entrance ~~Conduit~~ Raceway Grounding. ~~Rigid metal conduit (RMC) or intermediate metal conduit (IMC)~~ Metallic raceways containing communications entrance wire or cable shall be connected by a bonding conductor or grounding electrode conductor to a grounding electrode in accordance with 800.100(B).

Substantiation: The proposal only provides a requirement for grounding RMC and IMC. There appear to be other metallic raceways that would also require grounding such as metallic wireways, EMT, FMC, LFMC and so forth, if those raceways are suitable for enclosing communications service entrance cables. The last sentence of Section 800.50(B) appears to indicate that metal conduits or other metal raceways could be installed for service-entrance communications wire or cables. The comment intends to build on the concepts introduced in the proposal and provides the same proposed grounding requirements for all metallic raceways installed for service entrance communications cable or wire. Note: For correlation, the same change should be made to proposals 16-46, 16-176, 16-234, 16-280.

Panel Meeting Action: Reject
Panel Statement: Metallic entrance conduit for communications entrance wire and cable is restricted to rigid metal conduit (RMC) or intermediate metal conduit (IMC). The point of entrance is so defined in 800.2 (see Proposal 16-88). The section identified by the submitter [800.50(B)] as appearing to indicate that metal conduits or other metal raceways could be installed for service-entrance communications wire or cables is incorrect. Section 800.50(B) addresses possible contact with electrical conductors and does not address entrance conduit.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-53 Log #1041 NEC-P16 **Final Action: Reject**
(800.100(B)(2)(3))

Submitter: Mike Holt, Mike Holt Enterprises
Comment on Proposal No: 16-110
Recommendation: Remove item (3) in its entirety.
Substantiation: 800.100(B)(2) tells me what do when I have no intersystem bonding terminal. Item 3 tells me that using the intersystem bonding terminal is an option if I don't have an intersystem bonding terminal. This is circular logic.
Panel Meeting Action: Reject
Panel Statement: An intersystem bonding terminal (IBT) may not exist; but one can be established and if the IBT is established by the user, then the rules in 250.94 must be followed as referenced in 800.100(B)(2)(3). For example, a telecommunications technician can use a meter-box clamp listed as an IBT to create a bonding connection.

16-57 Log #882 NEC-P16 **Final Action: Accept**
(800.110(C)(3))

Submitter: Terry Peters, The Society of the Plastics Industry
Comment on Proposal No: 16-122
Recommendation: Continue to reject proposal 16-122.
Substantiation: The submitter's recommendation to prohibit the installation of plenum cables in plenum raceways is absurd. Plenum raceways are designed to be used with plenum cables. The Society of the Plastics Industry supports the panel action to reject this proposal.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-58 Log #338 NEC-P16 **Final Action: Hold**
(800.113(E))

TCC Action: The Correlating Committee directs that this panel action on this Comment be reported as "Hold" based on 4.4.4.6.2 of the NFPA Regulations Governing Committee Projects since the information accepted in this comment, to add an informational note, is new material that has not had public review.
Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 16-119
Recommendation: Revise text to read as follows:
Informational Note <u>No.1</u>: See 800.26 for firestop requirements for floor penetrations.
<u>Informational Note No. 2: See 800.12 for information on using communications raceways as innerduct.</u>
Substantiation: The new informational note adds clarity by guiding the reader to new section 800.12 which permits communications raceways to be used as innerduct in any type of Chapter 3 raceway.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 16 Negative: 1
Ballot Not Returned: 1 Ballast, D.
Explanation of Negative:
OHDE, H.: We disagree with the panel's action and believe that additional Information Note No. 2 is new material. In addition, the submitter's substantiation does not add clarity by guiding the reader to 800.12 but adds confusion. Too many informational notes defeat the true purpose of Informational Note. We believe the reader and the installer should have some knowledge of how to read and interpret the code.

16-59 Log #410 NEC-P16 **Final Action: Accept in Principle**
(800.133)

Submitter: Stanley Kaufman, CableSafe Inc.
Comment on Proposal No: 16-124
Recommendation: Revise text to read:
800.133 Installation of Communications Wires, Cables, and Equipment. Communications wires and cables from the protector to the equipment or, where no protector is required, communications wires and cables attached to the outside or inside of the building shall comply with 800.133(A) through (~~C~~<u>B</u>).
Substantiation: CMP 16 accepted proposal 16-170 for the 2011 NEC. The proposal recommended moving 800.133(C) to 800.3(E). At that time the initial sentence in 800.133 should have been revised to recognize that 800.133(C) no longer existed. This comment fixes that error.
Panel Meeting Action: Accept in Principle
Change the word "through" to "and" at the end of the recommendation.
Panel Statement: The change is made as an editorial correction.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-60 Log #693 NEC-P16 **Final Action: Accept**
(800.133(A)(1)(b))

Submitter: George Bish, Secure Watch Security
Comment on Proposal No: 16-125
Recommendation: Continue to Accept this proposal.
Substantiation: Class 2 and Class 3 remote-control, signaling, and power-limited circuits in compliance with Parts I and III of Article 725 and power-limited fire alarm systems in compliance with Parts I and III of Article 760 are presently permitted in the same raceway, cable tray or enclosure with communications circuits. It is therefore logical that they also be permitted to occupy the same cable routing assembly.
Continued acceptance of this proposal is in keeping with the Correlating Committee's directive to correlate the Panel Actions regarding cable routing assemblies throughout Articles 725, 760, 770, and Chapter 8
This is one of a group of comments developed by the CMP3/CMP16 Joint

Task Group formed at the direction of the Correlating Committee to locate a correlated definition of Cable Routing Assemblies in a single Article of Chapter 8 for use in Article 725, 760, 770, and Chapter 8.

The Task Group members were:

George Bish, Chair, representing Satellite Broadcasting & Communication Association

Harry Ohde, representing IBEW

James Brunssen, representing Alliance for Telecommunications Industry Solutions

George Straniero, representing National Electrical Manufacturers Association

Robert Walsh, representing International Association of Electrical Inspectors

Wendell Whistler, representing Intertek Testing Services

DORNA, G.: This comment appears to be based on the ROP draft.

16-64 Log #579 NEC-P16 **Final Action: Hold**
(800.170, Informational Note)

TCC Action: The Correlating Committee directs that this panel action on this Comment be reported as "Hold" based on 4.4.4.6.2 of the NFPA Regulations Governing Committee Projects since the information accepted in this comment, to add an informational note, is new material that has not had public review.
Submitter: Thomas M. Burke, UL LLC
Comment on Proposal No: 16-134
Recommendation: Revise the Informational Note for 800.170 to add a reference to new standard UL 62368-1. Also, update the reference to UL 60950-1 to the latest edition.

Informational Note: One way to determine applicable requirements is to refer to UL 60950-1-200~~3~~ 7, *Standard for Safety of Information Technology Equipment*; UL 1459-1999, *Standard for Safety, Telephone Equipment*; ~~or~~ UL 1863-2004, *Standard for Safety, Communications Circuit Accessories*; or UL 62368-1-2012, *Audio/Video, Information and Communication Technology Equipment – Part 1: Safety Requirements.* For information on listing requirements for cable routing assemblies and communications raceways, see UL 2024-2011, *Standard for Optical Fiber and Communication Cable Raceways and Cable Routing Assemblies*.
Substantiation: This is one in a series of proposals to update NFPA 70 to add a reference to UL 62368-1.

ANSI/UL 62368-1, Audio/video, information and communication technology equipment – Part 1: Safety requirements, was published on February 17, 2012. This new standard will eventually replace (later this decade) both, UL 60065, Audio, Video, and Similar Electronic Apparatus-Safety Requirements, and UL 60950-1, Information Technology Equipment Safety - Part 1: General Requirements. In the meantime, multiple references to UL 60950-1 in the body of the Code should be supplemented by a reference to UL 62368-1 since similar equipment complying with, and Listed to both standards will be installed per the Code. In fact, equipment already is being Listed to UL 62368-1.

Additionally, UL 60950-1-2007 is the latest edition of that standard.
Panel Meeting Action: Accept in Principle
Accept the recommendation but revise title of UL 2024 to reflect "Communications", plural.
Panel Statement: The panel accepts the additional text in the informational note and has made a correction to the title of UL 2024.

Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-68 Log #1100 NEC-P16 **Final Action: Accept**
(810.1)

TCC Action: The Correlating Committee advises that article scope statements are the responsibility of the Correlating Committee and the Correlating Committee Accepts the panel action.
Submitter: Randy Ivans, Underwriters Laboratories Inc.
Comment on Proposal No: 16-141
Recommendation: Newly added text from the proposal "exceeding 1 m (39.37 in) in diameter or across" should be deleted.

This article covers antenna systems for radio and television receiving equipment, amateur and citizen band radio transmitting and receiving equipment, and certain features of transmitter safety. This article covers antennas such as wire-strung type, multi-element, vertical rod, flat, ~~and~~ or ~~dish~~ parabolic ~~exceeding 1 m (39.37 in) in diameter or across~~ and also covers the wiring and cabling that connects them to equipment. This article does not cover equipment and antennas used for coupling carrier current to power line conductors.

Substantiation: This proposal should be "Accepted In Part". Including flat antennas and correcting the term "dish" to "parabolic" should be accepted. However, there is no technical substantiation provided why parabolic antennas 1 m or less in diameter should be excluded from Article 810 or why these should be treated differently than parabolic antennas greater than 1 m in diameter. They are all subject to lightning transients. In addition, although Article 840 covers premises powered broadband systems that deliver broadband services that an antenna might provide, the requirements were specifically developed to cover only fiber to the premises systems where there is no metallic wiring or cable members conductively connected to cabling or devices outside of the building. In order for small parabolic antennas to be included in article 840, appropriate requirements would need to be developed to cover outside cabling and antennas that may be subject to lightning transients. Finally, installation criteria and requirements would need to be developed that somehow differentiate these small parabolic antennas from other antenna systems still covered under article 810.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-69 Log #1531 NEC-P16 **Final Action: Accept in Part**
(810.1 Scope)

TCC Action: The Correlating Committee advises that article scope statements are the responsibility of the Correlating Committee and the Correlating Committee Accepts the panel action.
Submitter: David M. Lettkeman, DISH
Comment on Proposal No: 16-141
Recommendation: Revise text to read as follows:
This article covers antenna systems for radio and television receiving equipment, amateur and citizen band radio transmitting and receiving equipment, and certain features of transmitter safety. This article covers antennas such as wire-strung type, multi-element, vertical rod, flat, ~~and~~ or a ~~dish~~ parabolic exceeding 1 m (39.37 in) in diameter or across and also covers the wiring and cabling that connects them to equipment. This article does not cover equipment and antennas used for coupling carrier current to power line conductors.
Substantiation: When grounded in accordance with this article small parabolic antennas could become, by simple definition, lightning rods. As they are not installed to the standards for lightning rods they pose a proven hazard to life and property. Many instances of injury and property damages can be directly attributed to grounding these antennas and providing a path for a surge to seek out this path to ground. Each year millions of dollars are spent to repair damages caused by such surges seeking out the ground mandated in this article. While recognizing the inherent danger from lightning and other possible high voltage surges, when there is no ground to the antenna the surge has no path to take. Most of these antenna installations are not mounted in high exposure situations which make them unlikely to become energized. Small parabolic antennas generally for personal use are defined by FCC 47CFR1.4000 as a dish which is less than one meter (39.37") or less in diameter. More than 50 million small parabolic antennas have been installed in the US alone with minimal substantiated cases of injury or damage when the installations were not grounded in accordance with Article 810. For over 25 years these antennas have a proven safety record when not connected to ground in accordance with Article 810 of the code.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Accept in Part
Panel Statement: Refer to the panel action on Comment 16-68. The panel accepts the change adding the words "flat" and "parabolic" and rejects the remainder of the recommendation. The requirements of Article 810 need to include all parabolic antennas. The rejected part would leave smaller parabolic antennas uncovered.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-70 Log #1532 NEC-P16 **Final Action: Reject**
(810.1 Exception)

Submitter: David M. Lettkeman, DISH
Comment on Proposal No: 16-141
Recommendation: Add text to read:

Exception: Parabolic antennas 1 m (39.37 in) or less in diameter or across, for personal use.

Substantiation: When grounded in accordance Article 810 small parabolic antennas may become, by simple definition, lightning rods. As they are not installed to the standards for lightning rods they pose a proven hazard to life and property.

Many instances of injury and property damages can be directly attributed to grounding these antennas and providing a path for a surge to seek out this path to ground. Each year millions of dollars are spent to repair damages caused by such surges seeking out the ground mandated in this article. While recognizing the inherent danger from lightning and other possible high voltage surges, when there is no ground to the antenna the surge has no path. Most of these antenna installations are not mounted in high exposure situations which make them unlikely to become energized. Small parabolic antennas generally for personal use as defined by the FCC 47CFR1.4000 as a dish which is one meter (39.37") or less in diameter. More than 50 million small parabolic antennas have been installed in the US alone with minimal substantiated cases of injury or damage when the installations were not grounded in accordance with Article 810. For over 25 years these antennas have a proven safety record when not connected to ground in accordance with Article 810 of the code. With this proven safety record parabolic antennas for personal use should be exempted from this Article.

Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: Refer to the panel action on Comment 16-69, which addresses the same issue.

The addition of this exception to the scope of the article is considered as new material.

(810.3)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions (ATIS)
Comment on Proposal No: 16-143
Recommendation: Reject this proposal.
Substantiation: The Panel Action on this proposal was based upon the Panel Action on Proposals 16-141, -259 and -260 which the Correlating Committee rejected. Hence, parabolic (dish) antennas will not be covered in Article 840 and the proposed revision to 810.3 is inappropriate and unnecessary. Additionally, the Proposal should be rejected based upon the comments expressed in the voting.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-73 Log #1101 NEC-P16 **Final Action: Accept**
(810.3)

Submitter: Randy Ivans, Underwriters Laboratories Inc.
Comment on Proposal No: 16-143
Recommendation: Newly added text from the proposal should be deleted and the paragraph returned to the original wording.

810.3 Other Articles. Wiring from the source of power to and between devices connected to the interior wiring system shall comply with Chapters I through 4 other than as modified by Parts I and II of Article 640. Wiring for audio signal processing, amplification, and reproduction equipment shall comply with Article 640. ~~For antennas exceeding 1m 139.37 in) in diameter or across c~~Coaxial cables that connect antennas to equipment shall comply with Article 820. ~~For antennas 1m (39.37 in) or less in diameter or across, coaxial cables that connect antennas to equipment shall comply with Article 840.~~
Substantiation: This proposal should be Rejected. There is no technical substantiation provided why parabolic antennas 1 m or less in diameter should be excluded from the requirements in Article 810 or why these should be treated differently than parabolic antennas greater than 1 m in diameter. They are all subject to lightning transients. It is not appropriate for any antennas to be installed in accordance with article 820 as a blanket requirement. For example, 820.93 (C) describes the use of a listed primary protector. This type of protector is not appropriate for antenna systems which, when protectors are used, would require an antenna lead-in protector specifically designed for antenna systems with surge current ratings.

In addition, although Article 840 covers premises powered broadband systems that deliver broadband services that an antenna might provide, the requirements were specifically developed to cover only fiber to the premises systems where there is no metallic wiring or cable members conductively connected to cabling or devices outside of the building. In order for small parabolic antennas to be included in article 840, appropriate requirements would need to be developed to cover outside cabling and antennas that may be subject to lightning transients. Finally, installation criteria and requirements would need to be developed that somehow differentiate these small parabolic antennas from other antenna systems still covered under article 810.
Panel Meeting Action: Accept
Panel Statement: The panel advises that the revisions made in the recommendation return the text to that of the 2011 NEC. This action agrees with that on Comment 16-72.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-74 Log #220 NEC-P16 **Final Action: Accept**
(810.6 (New))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 16-144
Recommendation: The Correlating Committee directs that the panel clarify the panel action on this proposal by revising the last sentence of the requirement to use proper terminology such as "bonding conductor" or "grounding electrode conductor."
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise the last sentence of 810.6 (New) as follows:

The antenna lead-in protector shall be grounded using a bonding conductor or grounding electrode conductor installed in accordance with 810.21(F).
Panel Statement: The panel accepts the direction of the Correlating Committee. The panel has clarified the panel action on this proposal by adding the terms "bonding conductor" and "grounding electrode conductor", as well as identifying the appropriate reference within 810.21.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

ARTICLE 820 — COMMUNITY ANTENNA TELEVISION AND RADIO DISTRIBUTION SYSTEMS

16-75 Log #221 NEC-P16 **Final Action: Accept**
(820.3(B) and 820.3(C) (New))

TCC Action: The Correlating Committee directs that the text of (J) be revised as follows:
"(J) Cable Routing Assemblies. The definition in Article 100, the applications in Table 800.154(c), and installation rules in 800.110 and 800.113 shall apply to Article 820."
See the Correlating Committee action on Comment 16-5 that relocated the definition of cable routing assembly to Article 100.
Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 16-161
Recommendation: The Correlating Committee directs the panel to reconsider and clarify the action on this proposal.

The Correlating Committee notes that the order of sections noted in the panel statement does not correspond with the titles of all of the available subdivisions within 820.3.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Revise 820.3 to read as follows:
820.3 Other Articles. Circuits and equipment shall comply with 820.3(A) through (J).
(A) Hazardous (Classified) Locations. CATV equipment installed in a location that is classified in accordance with 500.5 and 505.5 shall comply with the applicable requirements of Chapter 5.
(B) Wiring in Ducts for Dust, Loose Stock, or Vapor Removal. The requirements of 300.22(A) shall apply.
(C) Equipment in Other Space Used for Environmental Air. The requirements of 300.22(C)(3) shall apply.
(D) Installation and Use. The requirements of 110.3 shall apply.
(E) Installations of Conductive and Nonconductive Optical Fiber Cables. The requirements of Article 770 shall apply.
(F) Communications Circuits. The requirements of Article 800 shall apply.
(G) Network-Powered Broadband Communications Systems. The requirements of Article 830 shall apply.
(H) Premises-Powered Broadband Communications Systems. The requirements of Article 840 shall apply.
(I) Alternate Wiring Methods. The wiring methods of Article 830 shall be permitted to substitute for the wiring methods of Article 820.

Informational Note: Use of Article 830 wiring methods will facilitate the upgrading of Article 820 installations to network-powered broadband applications.
(J) Cable Routing Assemblies. The definition in 800.2, the applications in Table 800.154(c), and installation rules in 800.110 and 800.113 shall apply to Article 820.
Panel Statement: The panel accepts direction of the Correlating Committee and has provided the entire text of 820.3 for correlation with the actions on Proposal 16-161, 16-162 and 16-163. The panel notes the list of items in the panel statements of these proposals were incorrect and the panel action of this comment is shown correctly.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-76 Log #695 NEC-P16 **Final Action: Accept**
(820.3(H))

TCC Action: See Correlating Committee action on Comment 16-75.
Submitter: George Bish, Secure Watch Security
Comment on Proposal No: 16-163
Recommendation: Continue to Accept in Principle this proposal.
Substantiation: The Continued Acceptance in Principle of this proposal is appropriate as the definition "Cable Routing Assembly" now resides in 800.2, the listing requirements are contained in 800.182 and the applications are contained in Table 800.154(c).

Continued Acceptance in Principle of this proposal is also in keeping with the Correlating Committee's directive to correlate the Panel Actions regarding cable routing assemblies throughout Articles 725, 760, 770, and Chapter 8

This is one of a group of comments developed by the CMP3/CMP16 Joint Task Group formed at the direction of the Correlating Committee to locate a correlated definition of Cable Routing Assemblies in a single Article of Chapter 8 for use in Article 725, 760, 770, and Chapter 8.

The Task Group members were:
George Bish, Chair, representing Satellite Broadcasting & Communication Association
Harry Ohde, representing IBEW
James Brunssen, representing Alliance for Telecommunications Industry Solutions
George Straniero, representing National Electrical Manufacturers Association
Robert Walsh, representing International Association of Electrical Inspectors
Wendell Whistler, representing Intertek Testing Services
Panel Meeting Action: Accept
Panel Statement: The panel notes that the panel action on Proposal 16-163 is reflected in the panel action on Comment 16-75 as item (J).
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-77 Log #543 NEC-P16 **Final Action: Accept**
(820.24)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions (ATIS)
Comment on Proposal No: 16-165
Recommendation: Continue to reject this proposal per Correlating Committee action.
Substantiation: The Correlating Committee acted correctly in reporting this proposal as "Reject". The proposal received less that the required two-thirds affirmative vote as the submitter failed to adequately substantiate the proposal as required by the "Regulations Governing Committee Projects" Section 4-3.3(d). This was noted by a number of the Committee members in their "Explanation of Negative" vote. The proposed additional requirements are appropriate for power cables, not coaxial cables. Coaxial cables are much smaller than power cables (typically ¼ inch in diameter), contain no power and hence, pose neither a fire nor electrical safety hazard.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 14 Negative: 3
Ballot Not Returned: 1 Ballast, D.
Explanation of Negative:
BISH, G.: See comment on Comment 16-44.
OHDE, H.: See our comment on Comment 16-44.
PIRKLE, W.: Submitter's comment only addressed additional installation requirements. Panel statement rejected comment on power and current, not on installation requirements.
Comment on Affirmative:
BRUNSSEN, J.: The Panel Action to accept is correct. The submitter of Proposal 16-165 has identified neither a fire nor electrical safety hazard to warrant expanding the requirements of 820.24. Coaxial cables are typically smaller than power cables, operate at very small signal voltages (i.e., they contain no appreciable power), and pose neither a fire nor electrical safety hazard.

16-78 Log #544 NEC-P16 **Final Action: Accept**
(820.24)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions (ATIS)
Comment on Proposal No: 16-167
Recommendation: Continue to reject this proposal per Correlating Committee action.
Substantiation: The Correlating Committee acted correctly in reporting this proposal as "Reject". The proposal received less that the required two-thirds affirmative vote as the submitter failed to adequately substantiate the proposal as required by the "Regulations Governing Committee Projects" Section 4-3.3(d). This was noted by a number of the Committee members in their "Explanation of Negative" vote. The proposed additional requirements are appropriate for power cables, not coaxial cables. Coaxial cables are much smaller than power cables (typically ¼ inch in diameter), contain no power and hence, pose neither a fire nor electrical safety hazard.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 14 Negative: 3
Ballot Not Returned: 1 Ballast, D.
Explanation of Negative:
BISH, G.: See comment on Comment 16-44.
OHDE, H.: See our comment on Comment 16-44.
PIRKLE, W.: Submitter's comment only addressed additional installation requirements. Panel statement rejected comment on power and current, not on installation requirements.
Comment on Affirmative:
BRUNSSEN, J.: See my statement associated with my affirmative ballot on Comment 16-77 that also applies to Proposal 16-167.

16-79 Log #563 NEC-P16 **Final Action: Reject**
(820.24)

Note: When the ballot result does not confirm the TC action on a Proposal by a two-thirds affirmative vote, the Report on Proposals shall be published with a specific request for public comment on that Proposal. The Proposal is now being reconsidered by the TC as a public comment.
Submitter: David Clements, International Association of Electrical Inspectors
Comment on Proposal No: 16-165
Recommendation: Revise text to read as follows:
820.24 Mechanical Execution of Work.
Community television and radio distribution systems shall be installed in a neat and workmanlike manner. Coaxial cables installed exposed on the surface of ceiling and sidewalls shall be supported by the building structure in such a manner that the cables will not be damaged by normal building use. Such cables shall be secured by hardware including straps, staples, cable ties, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform to 300.4 ~~(D)~~ <u>(A) through (G)</u> and 300.11.
Substantiation: In addition to the physical protection required in 300.4(D) regarding distance from parallel framing members, community television and radio cable also needs to be protected when installed other-than-parallel to framing members such as perpendicular through bored holes and notches in wood framing, holes in metallic framing, in shallow grooves, under roof decking, etc. Cables also require support behind accessible panels.
The reference needs to be to 300.4(A) through (G) not just to (D).
Panel Meeting Action: Reject
Panel Statement: The submitter has identified neither a fire nor an electrical safety hazard to warrant expanding the requirements of 820.24. Coaxial cables used in 820 operate in a power-limited environment with a much lower electrical hazard than electrical branch circuits requiring compliance with 300.4 A-G. Also refer to the panel action and statement on Comment 16-47.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 13 Negative: 4
Ballot Not Returned: 1 Ballast, D.
Explanation of Negative:
BISH, G.: See comment on Comment 16-47.
CHAN, L.: Coaxial cables should be protected against physical damage by methods other than parallel to framing members and furring strips. As an inspector, I see all types of improper installed cables and 300.4 (A) through (G) gives the inspector more leverage when he performs an inspection.
OHDE, H.: See our comment on Comment 16-47.
PIRKLE, W.: Submitter's comment only addressed additional installation requirements. Panel statement rejected comment on power and current, not on installation requirements.
Comment on Affirmative:
BRUNSSEN, J.: See my statement associated with my affirmative ballot on Comment 16-77.

16-80 Log #567 NEC-P16 **Final Action: Reject**
(820.24)

Note: When the ballot result does not confirm the TC action on a Proposal by a two-thirds affirmative vote, the Report on Proposals shall be published with a specific request for public comment on that Proposal. The Proposal is now being reconsidered by the TC as a public comment.
Submitter: Marcus R. Sampson, Lysistrata Electric
Comment on Proposal No: 16-167
Recommendation: Revise text to read as follows:
820.24 Mechanical Execution of Work.
Community television and radio distribution systems shall be installed in a neat and workmanlike manner. Coaxial cables installed exposed on the surface of ceiling and sidewalls shall be supported by the building structure in such a manner that the cables will not be damaged by normal building use. Such cables shall be secured by hardware including straps, staples, cable ties, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform to 300.4 ~~(D)~~ <u>(A) through (G)</u> and 300.11.
Substantiation: In addition to the physical protection required in 300.4(D) regarding distance from parallel framing members, community television and radio cable also needs to be protected when installed other-than-parallel, to framing members such as perpendicular through bored holes and notches in wood framing, holes in metallic framing, in shallow grooves, under roof decking, etc. Cables also require support behind accessible panels.
The reference needs to be to 300.4(A) through (G) not just to (D).
Panel Meeting Action: Reject
Panel Statement: Refer to the panel action and statement on Comment 16-79, which is the same issue.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 14 Negative: 3
Ballot Not Returned: 1 Ballast, D.
Explanation of Negative:
BISH, G.: See comment on Comment 16-47.

CHAN, L.: See my explanation of negative vote on Comment 16-79.
OHDE, H.: See our comment on Comment 16-47.

BRUNSSEN, J.: See my statement associated with my affirmative ballot on Comment 16-78.

16-81 Log #908 NEC-P16 **Final Action: Reject**
(820.24)

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 16-166
Recommendation: Revise text to read as follows:
820.24 Mechanical Execution of Work. Community television and radio distribution systems shall be installed in a neat and workmanlike manner. Coaxial cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by hardware including straps, staples, cable ties, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with 300.4(D) and 300.11. <u>See also 300.22.</u> ~~Cable ties used to secure coaxial plenum cables in other space used for environmental air (plenums) shall be listed as having low smoke and heat release properties.~~
Substantiation: CMP 3 accepted the requirements for cable ties in plenums and incorporate the language on requirements into 300.22 (C)(1). The addition of the language on cable ties here could create conflicts, especially if the language approved in 300.22(C)(1) is different from the language here. I have made a comment to CMP3 to request that the language addressing "smoke and heat release characteristics" be used in 300.22(C)(1).
Panel Meeting Action: Reject
Panel Statement: The reference to 300.22 in the submitter's recommendation is too broad. The panel action on Comment 16-17 is more appropriate because it refers to cable ties and other nonmetallic cable accessories. This panel action also maintains correlation with CMP 3 action on Comment 3-24 that is in agreement with the Correlating Committee's direction to correlate Articles 300, 770, 800, 820 and 830 on the subject of cable ties.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-82 Log #1533 NEC-P16 **Final Action: Reject**
(820.100 Exception)

Submitter: David M. Lettkeman, DISH
Comment on Proposal No: 16-181
Recommendation: Add text to read:
Exception: For communications systems using coaxial cable ~~confined~~ <u>attached to or</u> within <u>a single building on</u> the premises and isolated from outside cable plant, the shield shall be permitted to be grounded by a connection to an equipment grounding conductor as described in 250.118. Connecting to an equipment grounding conductor through a grounded receptacle using a dedicated <u>bonding jumper or equipment</u> grounding conductor and permanently connected listed device shall be permitted. Use of a cord and plug for the connection to an equipment grounding conductor shall not be permitted.
Substantiation: Substantiation from 16-181: The term "grounding conductor" in this section should be changed to correlate with the other changes that were made.
While supporting proposal 16-181 there needs to be further clarification limiting the use of this type of connection. By adding the limitation of allowing this type of connection to a single building on the premises will help clarify its use.
Note: Supporting material is available for review at NFPA Headquarters.
Panel Meeting Action: Reject
Panel Statement: The panel, in accepting in principle proposal 16-181, intended to permit coaxial cable that is entirely confined within the building or structure (premises) to be grounded within the building or structure to an equipment grounding conductor. Such coaxial cable is considered unexposed to contact with power of 300 volts or greater and lightning. The submitter's suggested revision extends this permission to coaxial cable located on the exterior of the building or structure that is potentially exposed to power contact and lighting events. Such exposure can bring power or lightning currents within the building or structure, creating and electrical shock or fire hazard. Additionally, the phrase "or equipment grounding conductor" in the second sentence is incorrect as the panel has previously identified "bonding jumper" as the correct terminology.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-83 Log #883 NEC-P16 **Final Action: Accept**
(820.113(C)(3))

Submitter: Terry Peters, The Society of the Plastics Industry
Comment on Proposal No: 16-198
Recommendation: Continue to reject proposal 16-198.
Substantiation: The submitter's recommendation to prohibit the installation of plenum cables in plenum raceways is absurd. Plenum raceways are designed to be used with plenum cables. The Society of the Plastics Industry supports the panel action to reject this proposal.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-84 Log #339 NEC-P16 **Final Action: Hold**
(820.113(E), Informational Note)

TCC Action: The Correlating Committee directs that this panel action on this Comment be reported as "Hold" based on 4.4.4.6.2 of the NFPA Regulations Governing Committee Projects since the information accepted in this comment, to add an informational note, is new material that has not had public review.
Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.
Comment on Proposal No: 16-194
Recommendation: Revise text to read as follows:
Informational Note <u>No.1</u>: See 820.26 for firestop requirements for floor penetrations.
<u>Informational Note No. 2: See 800.12 for information on using communications raceways as innerduct.</u>
Substantiation: The new informational note adds clarity by guiding the reader to new section 800.12 which permits communications raceways to be used as innerduct in any type of Chapter 3 raceway.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 16 Negative: 1
Ballot Not Returned: 1 Ballast, D.
Explanation of Negative:
OHDE, H.: See our comment on Comment 16-58.

ARTICLE 830 — NETWORK-POWERED BROADBAND COMMUNICATIONS SYSTEMS

16-85 Log #499 NEC-P16 **Final Action: Accept in Principle**
(830.2.Network Interface Unit (NIU))

Submitter: Marcelo M. Hirschler, GBH International
Comment on Proposal No: 16-216
Recommendation: Revise text to read as follows:
Network Interface Unit (NIU). A device that converts a broadband signal into component voice, audio, video, data, and interactive services signals<u> and that provides isolation between the network power and the premises signal circuits</u>. ~~The NIU provides isolation between the network power and the premises signal circuits. The NIU~~ <u>These devices</u> may also contain primary and secondary protectors.~~.~~
Substantiation: I accept the concept that NEC definitions are not required to be in single sentences. However this definition contains the defined term "NIU" and the NEC manual of style does not permit the definition to contain the defined term. The proposed information will make the definition comply with the Manual of Style. If CMP16 believes that this information is a requirement it should place it somewhere else in Article 830, for example as a new section 760.4 or a similar new location, since NEC definitions shall not contain requirements.
Two examples of alternate approaches are:
Network Interface Unit (NIU). A device that converts a broadband signal into component voice, audio, video, data, and interactive services signals.
<u>**830.4 Network Interface Unit**.</u>
<u>**830.4.1** Network interface units provide isolation between the network power and the premises signal circuits.</u>
<u>**820.4.2** Network interface units are permitted to contain primary and secondary protectors.</u>
Network Interface Unit (NIU). A device that converts a broadband signal into component voice, audio, video, data, and interactive services signals. ~~The NIU provides isolation between the network power and the premises signal circuits. The NIU may also contain primary and secondary protectors.~~
<u>**Informational Note:** The NIU provides isolation between the network power and the premises signal circuits. The NIU may also contain primary and secondary protectors.</u>
The NEC Manual of Style states as follows:
2.2.2 Definitions. Definitions shall be in alphabetical order and shall not contain the term that is being defined. Definitions shall not contain requirements or recommendations.
Panel Meeting Action: Accept in Principle

Revise the recommendation to read as follows:
Network Interface Unit (NIU). A device that converts a broadband signal into component voice, audio, video, data and interactive services signals and provides isolation between the network power and the premises signal circuits. These devices often contain primary and secondary protectors.
Panel Statement: The panel agrees with the recommendation but the words "may also" are permissive and have been changed to "often".
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-86 Log #696 NEC-P16 **Final Action: Accept**
(830.3(F))

TCC Action: The Correlating Committee directs that the text of (F) be revised as follows:
"(F) Cable Routing Assemblies. The definition in Article 100, the applications in Table 800.154(c), and installation rules in 800.110 and 800.113 shall apply to Article 830."
See the Correlating Committee action on Comment 16-5 that relocated the definition of cable routing assembly to Article 100.
Submitter: George Bish, Secure Watch Security
Comment on Proposal No: 16-222
Recommendation: Continue to Accept in Principle this Proposal.
Substantiation: The Panel Action to Accept in Principle is appropriate as the definition "Cable Routing Assembly now resides in 800.2 and the applications are contained in Table 800.154(c).
Continued Acceptance in Principal of this proposal is in keeping with the Correlating Committee's directive to correlate the Panel Actions regarding cable routing assemblies throughout Articles 725, 760, 770, and Chapter 8
This is one of a group of comments developed by the CMP3/CMP16 Joint Task Group formed at the direction of the Correlating Committee to locate a correlated definition of Cable Routing Assemblies in a single Article of Chapter 8 for use in Article 725, 760, 770, and Chapter 8.
The Task Group members were:
George Bish, Chair, representing Satellite Broadcasting & Communication Association
Harry Ohde, representing IBEW
James Brunssen, representing Alliance for Telecommunications Industry Solutions
George Straniero, representing National Electrical Manufacturers Association
Robert Walsh, representing International Association of Electrical Inspectors
Wendell Whistler, representing Intertek Testing Services
Panel Meeting Action: Accept
Number Eligible to Vote: 18

Ballot Not Returned: 1 Ballast, D.

16-87 Log #545 NEC-P16 **Final Action: Reject**
(830.24)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions (ATIS)
Comment on Proposal No: 16-224
Recommendation: Continue to reject this proposal per Correlating Committee action.
Substantiation: The Correlating Committee acted correctly in reporting this proposal as "Reject". The proposal received less that the required two-thirds affirmative vote as the submitter failed to adequately substantiate the proposal as required by the "Regulations Governing Committee Projects" Section 4-3.3(d). This was noted by a number of the Committee members in their "Explanation of Negative" vote. The proposed additional requirements are appropriate for power cables, not network-powered broadband communications cables. Network-powered broadband communications systems consist of a cable to bring the signal and any needed power from the communications network to the Network Interface Unit, typically located on the exterior of the building or structure. From that point on within the building or structure, the premises wiring and cabling is identical to that for optical fiber cables, communications cables, and coaxial CATV cables of Articles 770, 800 and 820, respectively. The Network-powered broadband communications systems cable serving the Network Interface Unit is power-limited to 100 volt-amperes, and is considered neither an electrical safety nor fire hazard.
Panel Meeting Action: Reject
Panel Statement: The panel has concluded that reference to 300.4 within Article 830 is needed and is already provided in 830.3(E). Refer to the panel action and statement on Comment 16-89.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-88 Log #546 NEC-P16 **Final Action: Reject**

Submitter: David Clements, International Association of Electrical Inspectors
Comment on Proposal No: 16-224
Recommendation: Revise text to read as follows:
830.24 Mechanical Execution of Work.
Network-powered broadband communications circuits and equipment shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by hardware including straps, staples, cable ties, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform to 300.4 ~~(D)~~ <u>(A) through (G)</u> and 300.11.
Substantiation: In addition to the physical protection required in 300.4(D) regarding distance from parallel framing members, network-powered broadband communications cable also needs to be protected when installed other-than-parallel to framing members such as perpendicular through bored holes and notches in wood framing, holes in metallic framing, in shallow grooves, under roof decking, etc. Cables also require support when installed behind accessible panels.
The reference needs to be to 300.4(A) through (G) not just to (D).
Panel Meeting Action: Accept in Principle
Revise the last sentence of the recommendation to read as follows:
The installation shall also conform to 300.11.
Panel Statement: The panel accepts the recommendation in principle but recognizes that 830.3(E) already includes a requirement to follow 300.4. The panel has deleted the reference to 300.4 in its entirety from 830.24.

16-91 Log #909 NEC-P16 **Final Action: Reject**

(830.24)

Submitter: Marcelo M. Hirschler, GBH International

Comment on Proposal No: 16-225

Recommendation: Revise text to read as follows:

830.24 Mechanical Execution of Work. Network-powered broadband communications circuits and equipment shall be installed in a neat and workmanlike manner. Cables installed exposed on the surface of ceilings and sidewalls shall be supported by the building structure in such a manner that the cable will not be damaged by normal building use. Such cables shall be secured by hardware including straps, staples, cable ties, hangers, or similar fittings designed and installed so as not to damage the cable. The installation shall also conform with 300.4(D) and 300.11. See also 300.22. ~~Cable ties used to secure network-powered broadband communications plenum cables in other space used for environmental air (plenums) shall be listed as having low smoke and heat release properties.~~

Substantiation: CMP 3 accepted the requirements for cable ties in plenums and incorporate the language on requirements into 300.22 (C)(1). The addition of the language on cable ties here could create conflicts, especially if the language approved in 300.22(C)(1) is different from the language here. I have made a comment to CMP3 to request that the language addressing "smoke and heat release characteristics" be used in 300.22(C)(1).

Panel Meeting Action: Reject

Panel Statement: The reference to 300.22 in the submitter's recommendation is too broad. The panel action on Comment 16-17 is more appropriate because it refers to cable ties and other nonmetallic cable accessories. This panel action also maintains correlation with CMP 3 action on Comment 3-24 that is in agreement with the Correlating Committee's direction to correlate Articles 300, 770, 800, 820 and 830 on the subject of cable ties.

(830.100(B)(3)(2))

Submitter: James F. Williams, Fairmont, WV

Comment on Proposal No: 16-242

Recommendation: Revise text to read as follows:

830.100 Cable, Network Interface Unit, and Primary Protector Bonding and Grounding.

(B) Electrode.

(3) In Buildings or Structures Without an Intersystem Bonding Termination or Grounding Means.

(2) If the building or structure served has no intersystem bonding termination or has no grounding means, as described in 830.100(B)(2) or (B)(3)(1), to any one of the individual grounding electrodes described in 250.52(A)(7) and (A)(8), ~~or to~~ then a ground rod or pipe not less than 1.5 m (5 ft) in length and 12.7 mm (1/2 in.) in diameter, driven, where practicable, into permanently damp earth and separated from lightning conductors as covered in 800.53 and at least 1.8 m (6 ft) from electrodes of other systems shall be used. Steam or hot water pipes or lightning-rod conductors shall not be employed as grounding electrodes for protectors, NIUs with integral protection, grounded metallic members, NIUs with metallic enclosures, and other equipment.

Substantiation: I believe the intent is to require a "communications ground rod" if no other ground is available.

Panel Meeting Action: Reject

Panel Statement: When taken in context with the full Section 830.100(B), the order of preference is implicit in the order the alternatives are listed in the article.

Number Eligible to Vote: 18

(830.113)

Submitter: Frank W. Peri, Communications Cable & Connectivity Assoc.

Comment on Proposal No: 16-247

Recommendation: Revise the text of 830.113 to read as follows:

830.113 Installation of Network-Powered Broadband Communications Cables. Installation of network-powered broadband communications cables shall comply with 830.113(A) through (H).

(A) Listing. Network-powered broadband communications cables installed in buildings shall be listed.

(B) Fabricated Ducts Used for Environmental Air. The following cables shall be permitted in ducts as described in 300.22(B) if they are directly associated with the air distribution system:

(1) Up to 1.22 m (4 ft) of Type BLP cable

(2) Types BLP, BMR, BLR, BM, BL, and BLX cables installed in raceways that are installed in compliance with 300.22(B)

Informational Note: For information on fire protection of wiring installed in fabricated ducts see 4.3.4.1 and 4.3.11.3.3 in NFPA 90A-2009, S*tandard for the Installation of Air-Conditioning and Ventilating Systems*.

(C) Other Spaces Used For Environmental Air (Plenums). The following cables shall be permitted in other spaces used for environmental air as described in 300.22(C):

(1) Type BLP cable

(2) Type BLP cable installed in plenum communications raceways

(3) Type BLP cable supported by open metallic cable trays or cable tray systems

(4) Types BLP, BMR, BLR, BM, BL, and BLX cables installed in raceways that are installed in compliance with 300.22(C)

(5) Types BLP, BMR, BLR, BM, BL, and BLX cables supported by solid bottom metal cable trays with solid metal covers in other spaces used for environmental air (plenums) as described in 300.22(C)

(6) Types BLP, BMR, BLR, BM, BL, and BLX cables installed in plenum communications raceways, riser communications raceways or general-purpose communications raceways supported by solid bottom metal cable trays with solid metal covers in other spaces used for environmental air (plenums) as described in 300.22(C)

Informational Note: For information on fire protection of wiring installed in other spaces used for environmental air see 4.3.11.2, 4.3.11.4 and 4.3.11.5 of NFPA 90A-2009, *Standard for the Installation of Air-Conditioning and Ventilating Systems*.

(D) Risers — Cables in Vertical Runs. The following cables shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft:

(1) Types BLP, BMR, and BLR cables

(2) Types BLP and BLR cables installed in:

a. Plenum communications raceways

b. Plenum cable routing assemblies

c. Riser communications raceways

d. Riser cable routing assemblies

Informational Note: See 830.26 for firestop requirements for floor penetrations.

(E) Risers — Cables in Metal Raceways. The following cables shall be permitted in a metal raceway in a riser with firestops at each floor:

(1) Types BLP, BMR, BLR, BM, BL, and BLX cables

(2) Types BLP, BLR, and BL cables installed in:

a. Plenum communications raceways

b. Riser communications raceways

c. General-purpose communications raceways

Informational Note: See 830.26 for firestop requirements for floor penetrations.

(F) Risers — Cables in Fireproof Shafts. The following cables shall be permitted to be installed in fireproof riser shafts with firestops at each floor:

(1) Types BLP, BMR, BLR, BM, BL, and BLX cables

(2) Types BLP, BLR, and BL cables installed in:

a. Plenum communications raceways

b. Plenum cable routing assemblies

c. Riser communications raceways

d. Riser cable routing assemblies

e. General-purpose communications raceways

f. General-purpose cable routing assemblies

Informational Note: See 830.26 for firestop requirements for floor penetrations.

(G) Risers — One- and Two-Family Dwellings. The following cables shall be permitted in one-and two-family dwellings:

(1) Types BLP, BMR, BLR, BM, and BL cables and BLX cables less than 10 mm (0.375 in.) in diameter

(2) Types BLP, BLR, and BL cables installed in:

a. Plenum communications raceways

b. Plenum cable routing assemblies

c. Riser communications raceways

d. Riser cable routing assemblies

e. General-purpose communications raceways

f. General-purpose cable routing assemblies

Informational Note: See 830.26 for firestop requirements for floor penetrations.

(H) Other Building Locations. The following cables and raceways shall be permitted to be installed in building locations other than those covered in 830.113(B) through (G):

(1) Types BLP, BMR, BLR, BM, and BL cables

(2) Types BLP, BMR, BLR, BM, BL, and BLX cables installed in a raceway

(3) Types BLP, BLR, and BL cables installed in:

a. Plenum communications raceways

b. Plenum cable routing assemblies

c. Riser communications raceways

d. Riser cable routing assemblies

e. General-purpose communications raceways

f. General-purpose cable routing assemblies

(4) Types BLX cables less than 10 mm (0.375 in.) in diameter in one- and two-family dwellings

(5) Types BMU and BLU cables entering the building from outside and run in rigid metal conduit or intermediate metal conduit where the conduit is connected by a bonding conductor or grounding electrode conductor in accordance with 830.100(B)

Informational Note: This provision limits the length of Type BLX cable to 15 m (50 ft), while 830.90(B) requires that the primary protector, or NIU with integral protection, be located as close as practicable to the point at which the cable enters the building. Therefore, in installations requiring a primary protector, or NIU with integral protection, Type BLX cable may not be permitted to extend 15 m (50 ft) into the building if it is practicable to place the primary protector closer than 15 m (50 ft) to the entrance point.

(6) A maximum length of 15 m (50 ft), within the building, of Type BLX cable entering the building from outside and terminating at an NIU or a primary protection location

Substantiation: The proposal, as submitted, had a copy and paste error. Part of (B) Fabricated Ducts Used for Environmental Air was inadvertently omitted.

The missing text has been inserted. The panel action to reject the use of cable routing assemblies in plenums is included in the revised text by deleting 830.113(C)(3) in the original proposal.

Acceptance of this comment will bring the panel action into conformance with the Correlating Committee directives on this proposal.

Panel Meeting Action: Accept in Principle

Revise 830.113 to read as follows:

830.113 Installation of Network-Powered Broadband Communications Cables. Installation of network-powered broadband communications cables shall comply with 830.113(A) through (H).

(A) Listing. Network-powered broadband communications cables installed in buildings shall be listed.

(B) Fabricated Ducts Used for Environmental Air. The following cables shall be permitted in ducts as described in 300.22(B) if they are directly associated with the air distribution system:

(1) Up to 1.22 m (4 ft) of Type BLP cable

(2) Types BLP, BMR, BLR, BM, BL, and BLX cables installed in raceways that are installed in compliance with 300.22(B)

Informational Note: For information on fire protection of wiring installed in fabricated ducts see 4.3.4.1 and 4.3.11.3.3 in NFPA 90A-2012 Standard for the Installation of Air-Conditioning and Ventilating Systems.

(C) Other Spaces Used For Environmental Air (Plenums). The following cables shall be permitted in other spaces used for environmental air as described in 300.22(C):

(1) Type BLP cable

(2) Type BLP cable installed in plenum communications raceways

(3) Type BLP cable supported by open metallic cable trays or cable tray systems

(4) Types BLP, BMR, BLR, BM, BL, and BLX cables installed in raceways that are installed in compliance with 300.22(C)

(5) Types BLP, BMR, BLR, BM, BL, and BLX cables supported by solid bottom metal cable trays with solid metal covers in other spaces used for environmental air (plenums) as described in 300.22(C)

(6) Types BLP, BMR, BLR, BM, BL, and BLX cables installed in plenum communications raceways, riser communications raceways or general-purpose communications raceways supported by solid bottom metal cable trays with solid metal covers in other spaces used for environmental air (plenums) as described in 300.22(C)

Informational Note: For information on fire protection of wiring installed in other spaces used for environmental air see 4.3.11.2, 4.3.11.4 and 4.3.11.5 of NFPA 90A-2012, Standard for the Installation of Air-Conditioning and Ventilating Systems.

(D) Risers — Cables in Vertical Runs. The following cables shall be permitted in vertical runs penetrating one or more floors and in vertical runs in a shaft:

(1) Types BLP, BMR, and BLR cables

(2) Types BLP and BLR cables installed in:

a. Plenum communications raceways

b. Plenum cable routing assemblies

c. Riser communications raceways

d. Riser cable routing assemblies

Informational Note: See 830.26 for firestop requirements for floor penetrations.

(E) Risers — Cables in Metal Raceways. The following cables shall be permitted in a metal raceway in a riser with firestops at each floor:

(1) Types BLP, BMR, BLR, BM, BL, and BLX cables

(2) Types BLP, BLR, and BL cables installed in:

a. Plenum communications raceways

b. Riser communications raceways

c. General-purpose communications raceways

Informational Note: See 830.26 for firestop requirements for floor penetrations.

(F) Risers — Cables in Fireproof Shafts. The following cables shall be permitted to be installed in fireproof riser shafts with firestops at each floor:

(1) Types BLP, BMR, BLR, BM, BL, and BLX cables

(2) Types BLP, BLR, and BL cables installed in:

a. Plenum communications raceways

b. Plenum cable routing assemblies

c. Riser communications raceways

d. Riser cable routing assemblies

e. General-purpose communications raceways

f. General-purpose cable routing assemblies

Informational Note: See 830.26 for firestop requirements for floor penetrations.

(G) Risers — One- and Two-Family Dwellings. The following cables shall be permitted in one-and two-family dwellings:

(1) Types BLP, BMR, BLR, BM, BL and BLX cables less than 10 mm (0.375 in.) in diameter

(2) Types BLP, BLR, and BL cables installed in:

a. Plenum communications raceways

b. Plenum cable routing assemblies

c. Riser communications raceways

d. Riser cable routing assemblies

e. General-purpose communications raceways

f. General-purpose cable routing assemblies

Informational Note: See 830.26 for firestop requirements for floor penetrations.

(H) Other Building Locations. The following cables and raceways shall be permitted to be installed in building locations other than those covered in 830.113(B) through (G):

(1) Types BLP, BMR, BLR, BM, and BL cables

(2) Types BLP, BMR, BLR, BM, BL, and BLX cables installed in a raceway

(3) Types BLP, BLR, and BL cables installed in:

a. Plenum communications raceways

b. Plenum cable routing assemblies

c. Riser communications raceways

d. Riser cable routing assemblies

e. General-purpose communications raceways

f. General-purpose cable routing assemblies

(4) Types BLX cables less than 10 mm (0.375 in.) in diameter in one- and two-family dwellings

(5) Types BMU and BLU cables entering the building from outside and run in rigid metal conduit or intermediate metal conduit where the conduit is connected by a bonding conductor or grounding electrode conductor in accordance with 830.100(B)

Informational Note: This provision limits the length of Type BLX cable to 15 m (50 ft), while 830.90(B) requires that the primary protector, or NIU with integral protection, be located as close as practicable to the point at which the

cable enters the building. Therefore, in installations requiring a primary protector, or NIU with integral protection, Type BLX cable may not be permitted to extend 15 m (50 ft) into the building if it is practicable to place the primary protector closer than 15 m (50 ft) to the entrance point.
(6) A maximum length of 15 m (50 ft), within the building, of Type BLX cable entering the building from outside and terminating at an NIU or a primary protection location
Panel Statement: The panel agrees with the recommendation but has made grammatical corrections to the text as provided in the panel action. As a part of these changes the panel has updated the reference to NFPA 90A, *Standard for the Installation of Air-Conditioning and Ventilating Systems*.

BISH, G.: The original intent of Article 840 was to be able to address all premises-powered Broadband Communication Systems not just optical fiber type.

16-102 Log #1102 NEC-P16 **Final Action: Accept**
(840.1)

Submitter: Randy Ivans, Underwriters Laboratories Inc.
Comment on Proposal No: 16-259
Recommendation: Reject.
Wording in the 2011 NEC should be retained.
Substantiation: This proposal should be Rejected. The requirements in article 840 were specifically developed to cover only fiber to the premises systems where there is no metallic wiring or cable members conductively connected to cabling or devices outside of the building. In order to include other systems

that might deliver broadband services and are premises powered, appropriate requirements would need to be developed to cover those systems. For example, systems using parabolic antennas with cabling outside of the building may be subject to lightning transients that are not anticipated in the current article 840.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 16 Negative: 1
Ballot Not Returned: 1 Ballast, D.
Explanation of Negative:
BISH, G.: The original intent of Article 840 was to be able to address all premises-powered Broadband Communication Systems not just optical fiber type.

16-103 Log #1103 NEC-P16 **Final Action: Accept**
(840.1)

Submitter: Randy Ivans, Underwriters Laboratories Inc.
Comment on Proposal No: 16-260
Recommendation: Reject.
Wording in the 2011 NEC should be retained.
Substantiation: This proposal should be Rejected. There is no technical substantiation provided why parabolic antennas should be included as an example when there are no requirements in the article dealing with antennas or cabling installed outdoors that may be subject to lightning transients.
The requirements in article 840 were specifically developed to cover only fiber to the premises systems where there is no metallic wiring or cable members conductively connected to cabling or devices outside of the building. Although antenna systems might provide broadband services and be premises powered, in order for parabolic antennas to be included in article 840, appropriate requirements would need to be developed to cover outside cabling and antennas that may be subject to lightning transients. No such requirements have been proposed.
Finally, installation criteria and requirements would need to be developed that somehow differentiate these small parabolic antennas from other antenna systems still covered under article 810. Without such criteria and requirements, these antennas could be mounted on a 10 ft. mast on a roof top or on a 100 ft. tower next to a building and be subject to different requirements than antennas covered under article 810 that are in the same environment. No such requirements have been proposed.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 16 Negative: 1
Ballot Not Returned: 1 Ballast, D.
Explanation of Negative:
BISH, G.: The original intent of Article 840 was to be able to address all premises-powered Broadband Communication Systems not just optical fiber type.

16-104 Log #1104 NEC-P16 **Final Action: Accept in Principle**
(840.1, Informational Note)

Submitter: Randy Ivans, Underwriters Laboratories Inc.
Comment on Proposal No: 16-261
Recommendation: Informational Note No. 1 ~~2~~: A typical basic optical fiber system configuration consists of an optical fiber cable to the premises (FTTP) supplying a broadband signal to an ONT
that converts the broadband optical signal into component electrical signals, such as traditional telephone, video, highspeed internet, and interactive services. Powering of the ONT is typically accomplished through an ONT power supply unit (OPSU) and battery backup unit (BBU) that derive their power input from the available ac at the premises.
The optical fiber cable is unpowered and may be nonconductive or conductive.
Substantiation: If proposal 16-260 is rejected as suggested in another comment, this note should be changed back to Note No. 1.
Panel Meeting Action: Accept in Principle
Retain the wording of 840.1 Informational Notes as it appears in the 2011 NEC.
Panel Statement: The panel accepts the recommendation in principle because the recommendation in the comments mistakenly included text from the recommendation of Proposal 16-261 instead of the intended wording from the 2011 NEC.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-105 Log #549 NEC-P16 **Final Action: Accept**
(840.1, Informational Note 1)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions (ATIS)
Comment on Proposal No: 16-261
Recommendation: Reject this proposal per Correlating Committee action on Proposals 16-259 and 16-260.
Substantiation: The Correlating Committee acted correctly in rejecting the Panel Action on Proposals 16-259 and 16-260. Article 840 was specifically written to address premises-powered optical fiber based broadband communications systems and contains requirements specific to those systems. There are no parabolic antenna system-specific requirements in Article 840. As proposals 16-259 and 16-260 have been rejected, the proposed revisions to Informational Note No. 1 are unnecessary.
Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-106 Log #226 NEC-P16 **Final Action: Accept**
(840.1, Informational Note 2)

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 16-263
Recommendation: The Correlating Committee directs the panel to reconsider the panel action with respect to the Correlating Committee action taken on Proposal 16-260.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the Correlating Committee direction to reconsider and revised the panel action on Proposal 16-263 to Reject. There is no need for Informational Note 2 as the addition of parabolic antenna systems to Article 840 has been rejected. See panel action on Comments 16-98, 16-108 and 16-111.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-107 Log #227 NEC-P16 **Final Action: Accept**
(840.1, Informational Note 2)

Comment on Proposal No: 16-264
Recommendation: Reject this proposal per Correlating Committee action on Proposals 16-259 and 16-260.
Substantiation: The Correlating Committee acted correctly in rejecting the Panel Action on Proposals 16-259 and 16-260. As proposals 16-259 and 16-260 have been rejected, there is no need for renumbering Informational Note No. 2.
Panel Meeting Action: Accept

Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-110 Log #1106 NEC-P16 **Final Action: Accept**
(840.1, Informational Note 2)

Submitter: Randy Ivans, Underwriters Laboratories Inc.
Comment on Proposal No: 16-264
Recommendation: Informational Note No. 2 ~~4~~ : See 90.2(B)(4) for installations of premises-powered broadband communications systems that are not covered.
Substantiation: This proposal should be Rejected. It is not required to renumber the note if 16-260 and 16-263 are rejected.
There here is no technical substantiation provided why parabolic antennas should be included as proposed in proposals 16-260 and 16-263 when there are no requirements in the article dealing with antennas or cabling installed outdoors that may be subject to lightning transients.
The requirements in article 840 were specifically developed to cover only fiber to the premises systems where there is no metallic wiring or cable members conductively connected to cabling or devices outside of the building. Although antenna systems might provide broadband services and be premises powered, in order for parabolic antennas to be included in article 840, appropriate requirements would need to be developed to cover outside cabling and antennas that may be subject to lightning transients. No such requirements have been proposed.
Finally, installation criteria and requirements would need to be developed that somehow differentiate these small parabolic antennas from other antenna systems still covered under article 810. Without such criteria and requirements, these antennas could be mounted on a 10 ft. mast on a roof top or on a 100 ft. tower next to a building and be subject to different requirements than antennas covered under article 810 that are in the same environment. No such requirements have been proposed.
Panel Meeting Action: Accept
Panel Statement: The panel notes that the action of the recommendation returns the informational note numbering to that in the 2011 NEC.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-111 Log #1105 NEC-P16 **Final Action: Accept**
(840.1, Informational Note 3)

Submitter: Randy Ivans, Underwriters Laboratories Inc.
Comment on Proposal No: 16-263
Recommendation: Reject.
Wording in the 2011 NEC should be retained.
Substantiation: This proposal to add an informational note on parabolic antenna systems should be Rejected. There is no technical substantiation provided why parabolic antennas should be included as an example when there are no requirements in the article dealing with antennas or cabling installed outdoors that may be subject to lightning transients.
The requirements in article 840 were specifically developed to cover only fiber to the premises systems where there is no metallic wiring or cable members conductively connected to cabling or devices outside of the building. Although antenna systems might provide broadband services and be premises powered, in order for parabolic antennas to be included in article 840, appropriate requirements would need to be developed to cover outside cabling and antennas that may be subject to lightning transients. No such requirements have been proposed.
Finally, installation criteria and requirements would need to be developed that somehow differentiate these small parabolic antennas from other antenna systems still covered under article 810. Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-112 Log #552 NEC-P16 **Final Action: Accept in Principle**
(840.2.Fiber-to-the-Premises)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions (ATIS)
Comment on Proposal No: 16-266
Recommendation: Continue to accept this proposal.
Substantiation: The Correlating Committee correctly identified conflicting Panel Action on this proposal and Proposal 16-267 where the term "non-conducting" (hyphenated) and "nonconducting" were both accepted. The term "nonconducting" (unhyphenated) is used throughout the NEC and should be used here for consistency as well.
Panel Meeting Action: Accept in Principle
Panel Statement: Refer to the panel action and statement on Comment 16-113, where the entire paragraph is shown for clarity.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-113 Log #553 NEC-P16 **Final Action: Accept in Principle**
(840.2.Fiber-to-the-Premises)

Submitter: James E. Brunssen, Telecordia Technologies Inc. / Rep. Alliance for Telecommunications Industry Solutions (ATIS)
Comment on Proposal No: 16-267
Recommendation: Accept this proposal in principle. Revise submitter's text "non-conductive" to "nonconductive (unhyphenated).
Substantiation: The Panel Action should have been to Accept in Principle, where the Panel accepts the submitter's text but revises the term "non-conductive" (hyphenated) to "nonconductive" for correlation with the Panel Action on Proposal 16-266 and consistent use of the term "nonconductive" throughout the Code. This addresses the Correlating Committee directive to correlate the Panel Action on Proposals 16-266 and 16-267.
Panel Meeting Action: Accept in Principle
Revise 840.2 to read as follows:
840.2 Fiber-to-the-Premises (FTTP). Conductive or nonconductive optical fiber cable that is brought to the premises, is terminated at an optical network terminal (ONT), and establishes a connection to a communications network.
Panel Statement: The panel accepts the recommendation in principle but has shown the entire paragraph for clarity. The panel has retained the changes shown in the panel action on Proposal 16-267 but has corrected the improper hyphenation as suggested by the comment submitter.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-114 Log #228 NEC-P16 **Final Action: Accept**
(840.2. Fiber-to-the-Premises (FTTP))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 16-266
Recommendation: It was the recommendation of the Correlating Committee that this proposal be reconsidered and correlated with the "Accept" action taken on Proposal 16-267.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the Correlating Committee and has resolved the concern through action on Comment 16-113.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-115 Log #229 NEC-P16 **Final Action: Accept**
(840.2. Fiber-to-the-Premises (FTTP))

Recommendation: It was the recommendation of the Correlating Committee that this proposal be reconsidered and correlated with the "Accept" action taken on Proposal 16-266.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept
Panel Statement: The panel accepts the direction of the Correlating Committee and has resolved the concern through action on Comment 16-113.
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

16-116 Log #580 NEC-P16 **Final Action: Hold**
(840.170(A), Informational Note)

TCC Action: The Correlating Committee directs that this panel action on this Comment be reported as "Hold" based on 4.4.4.6.2 of the NFPA Regulations Governing Committee Projects since the information accepted in this comment, to add an informational note, is new material that has not had public review.
Submitter: Thomas M. Burke, UL LLC
Comment on Proposal No: 16-76
Recommendation: Revise the Informational Note for 840.170(A) to add a reference to new standard UL 62368-1.
Informational Note No. 1: One way to determine applicable requirements is to refer to UL 60950-1-2007, *Standard for Safety of Information Technology Equipment*, UL 498A-2008, *Current Taps and Adapters*, ~~or~~ UL 467-2007, *Grounding and Bonding Equipment*; or UL 62368-1-2012, *Audio/Video,*

Information and Communication Technology Equipment – Part 1: Safety Requirements.

Substantiation: This is one in a series of proposals to update NFPA 70 to add a reference to UL 62368-1.

ANSI/UL 62368-1, Audio/video, information and communication technology equipment – Part 1: Safety requirements, was published on February 17, 2012. This new standard will eventually replace (later this decade) both, UL 60065, Audio, Video, and Similar Electronic Apparatus-Safety Requirements, and UL 60950-1, Information Technology Equipment Safety - Part 1: General Requirements. In the meantime, multiple references to UL 60950-1 in the body of the Code should be supplemented by a reference to UL 62368-1 since similar equipment complying with, and Listed to both standards will be installed per the Code. In fact, equipment already is being Listed to UL 62368-1.

Panel Meeting Action: Accept
Number Eligible to Vote: 18
Ballot Results: Affirmative: 17
Ballot Not Returned: 1 Ballast, D.

CHAPTER 9 TABLES

6-77 Log #103 NEC-P06 **Final Action: Accept**
(Chapter 9, Notes to Tables, Note (10) (New))

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 6-112
Recommendation: The Correlating Committee directs that the accepted text comply with Section 3.1.1 of the NEC Style Manual relative to the use of mandatory text since these notes are part of the mandatory requirements for use of the table.

Use of the symbol "&" is not acceptable in Code text.

Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

Revise text to read as follows:

(10) The values for approximate conductor diameter and area shown in Table 5 are based on worst case scenario and indicate Round Concentric-Lay-Stranded Conductors. Solid and Round Concentric-Lay-Stranded and are grouped together for the purpose of Table 5. Round Compact-Stranded Conductors values are shown in Table 5a. If the actual values of the conductor diameter and area are known, they shall be permitted to be used.

Panel Statement: CMP-6 accepts the direction of the Correlating Committee to review Proposal 6-112 in accordance with Section 3.1.1 of the NEC Style Manual.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

6-78 Log #104 NEC-P06 **Final Action: Accept**
(Chapter 9, Table 5)

Submitter: Technical Correlating Committee on National Electrical Code®
Comment on Proposal No: 6-113
Recommendation: The Correlating Committee directs that the panel clarify their action on this proposal as to whether the repositioning of the column applies to the new or existing table.
Substantiation: This is a direction from the National Electrical Code Technical Correlating Committee in accordance with 3.4.2 and 3.4.3 of the Regulations Governing Committee Projects.
Panel Meeting Action: Accept

The approximate area columns are to appear to the left of approximate diameter columns.

Panel Statement: CMP-6 accepts the direction of the Correlating Committee to clarify the panel action. CMP-6 notes that the A2013 Draft is correct.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

6-79 Log #996 NEC-P06 **Final Action: Accept in Principle in Part**
(Chapter 9, Table 5)

Submitter: James F. Williams, Fairmont, WV
Comment on Proposal No: 6-114
Recommendation: Revise text to read as follows:

Chapter 9 Tables

Table 5 Dimensions of Insulated Conductors and Fixture Wires

Type: FFH-2, RFH-1, RFH-2, RFHH-2, RHH, RHH*, RHW, RHW*, RHW-2, RHW-2*, RHH, RHW, RHW-2, SF-1, SF-2, SFF-1, SFF-2, TF, TFF, THHW, THW, THW-2, TW, XF, XFF

Type: RHH*, RHW*, RHW-2*, THHN, THHW, THW, THW-2, TFN, TFFN, THWN, THWN-2, XF, XFF

Type: FEP, FEPB, PAF, PAFF, PF, PFA, PFAH, PFF, PGF, PGFF, PTF, PTFF, TFE, THHN, THWN, THWN-2, Z, ZF, ZFF, ZHF

Type: KF-1, KF-2, KFF-1, KFF-2, XHH, XHHW, XHHW-2, ZW

Substantiation: First group Type: missing RFHH-2, RHH (w/o *), RHW (w/o *), RHW-2 (w/o *)

Second group Type: OK
Third group Type: missing ZHF
Fourth group Type: OK

Panel Meeting Action: Accept in Principle in Part

Revise heading to read as follows:

Type: FFH-2, RFH-1, RFH-2, RFHH-2, RHH*, RHW*, RHW-2*, RHH, RHW, RHW-2, SF-1, SF-2, SFF-1, SFF-2, TF, TFF, THHW, THW, THW-2, TW, XF, XFF

Type: FEP, FEPB, PAF, PAFF, PF, PFA, PFAH, PFF, PGF, PGFF, PTF, PTFF, TFE, THHN, THWN, THWN-2, Z, ZF, ZFF, ZHF

Panel Statement: CMP-6 notes that the submitter intended to refer to Proposal 6-114.

CMP-6 does not accept the submitter's text to add RHH, RHW, or RHW-2 as these are already in the table title.

CMP-6 accepts the submitter's addition of RFHH-2 and ZHF as indicated in his recommendation.

CMP-6 revises two titles of Table 5.

Number Eligible to Vote: 10
Ballot Results: Affirmative: 10

8-59 Log #1597 NEC-P08 **Final Action: Reject**
(Chapter 9, Notes to Tables, Note (4))

Submitter: Scott Cline, Monterey Park, CA
Comment on Proposal No: 8-197
Recommendation: In Chapter 9 Table 1, Note (4) change the term "nipples" to "raceways."
Substantiation: We need to use the fully NEC defined term "raceways" to avoid any unintended omissions.

I somehow failed to communicate that the common industrial term "nipples" does not cover the full range of raceways to which this Note should apply.

The 2011 change of the term in 310.15(B)(3)(a)(2) from "nipples" to "raceways" was made to correct the unintended omission of certain raceways.

I cannot order an 18" EMT "nipple" and yet it should certainly fit this Note. Terms in the NEC may not define themselves, and so we cannot say that the 18" EMT is a "nipple" just because it is no more than 24 inches long. Also a 24 inch or shorter piece of any non-tubular (and therefore also non-"nipple") raceway (such as an 18" long piece of 4" by 4" wireway) should still be included.

Panel Meeting Action: Reject
Panel Statement: CMP-8 reaffirms its position to reject Proposal 8-197. Making this revision does not provide clarity. "Nipples" is a commonly used industry term, and appears multiple times in the NEC.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ANNEX A—PRODUCT SAFETY STANDARDS

1-110 Log #450 NEC-P01 **Final Action: Reject**
(Annex A)

Submitter: William Fiske, Intertek
Comment on Proposal No: 1-186
Recommendation: Delete the following text:

~~Batteries for Use in Light Electric Rail (LER) Applications and Stationary Applications, Subject 1973~~
~~Concentrator Photovoltaic Modules and Assemblies, Subject 8703~~
~~Connectors for Use in Photovoltaic Systems, Subject 6703~~
~~Distributed Wiring Harnesses, Subject 9703~~
~~Electric Vehicle Supply Equipment, Subject 2594~~
~~Enclosed and Dead-Front Switches for Use in Photovoltaic Systems, Subject 98B~~
~~Low-Voltage Fuses – Fuses for Photovoltaic Systems, Subject 2579~~
~~Molded-Case Circuit Breakers, Molded-Case Switches, and Circuit-Breaker Enclosures for Use With Photovoltaic Systems, Subject 489B~~
~~Multi-Pole Connectors for Use in Photovoltaic Systems, Subject 6703A~~
~~Photovoltaic Junction Boxes, Subject 3739~~
~~Photovoltaic Wire, Subject 4703~~
~~Rack Mounting Systems and Clamping Devices for Flat-Plate Photovoltaic Modules and Panels, Subject 2703~~
~~Solar Trackers, Subject 3703~~
~~Wind Turbine Generating Systems, Subject 6140~~
~~Wind Turbine Generating Systems – Small; Subject 6142~~
~~Circuit integrity (CI) Cable – UL Outline of Investigation for Fire Tests for Electrical Circuit Protective Systems, Subject 1724~~

Substantiation: An American National Standard, such as ANSI/NFPA 70, should not include references to publications that are not consensus standards. UL "Subjects," identified as "Outlines of Investigation" on the documents themselves, are not consensus standards. Moreover, it is by no means certain that any given Outline of Investigation will become a consensus standard in the near future. That is evidenced by the fact that Circuit Integrity (CI) Cable – UL Outline of Investigations for Fire Tests for Electrical Circuit Protective Systems, Subject 1724, that was added to Annex A in the 2008 NEC, is not yet a published UL Standard, more than four years after NEC 2008 was approved

by the NFPA Standards Council. That is the reason we recommend Subject 1724 be withdrawn from the NEC, in addition to recommending that the other Outlines of Investigation be withheld from Annex A and any Informational Notes within Code Articles until such time as they have attained consensus and been published as ANSI/UL standards.
Panel Meeting Action: Reject
Panel Statement: There is no requirement that the NEC or other model codes contain only references to consensus standards, and in fact the NEC and other model codes have referenced outlines of investigation for many years. The specified content provides relevant information for users of the Code.

Substantiation: An update to the proposed revisions to the UL standards listed in Informative Annex A Product Safety Standards of NFPA 70, is required to reflect the addition of the following new UL standard:
• Household and Similar Electrical Appliances, Part 2: Particular Requirements for Heating and Cooling Equipment, UL 60335-2-40
Panel Meeting Action: Accept
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

ANNEX D—EXAMPLES

6-80 Log #875 NEC-P06 **Final Action: Reject**
(Example D.1(d))

Submitter: C. Douglas White, Center Point Energy / Rep. Edison Electric Institute/Electric Light & Power Group
Comment on Proposal No: 6-117a
Recommendation: The panel should have accepted this in principle and relocate Table 310.15(B)(7) to this new example to Example D7
Retain Table 310.15(B)(7) deleted by proposal 6-49a:
Example for Sizing of Service Conductors for Dwelling(s): Service conductors and feeders for certain dwellings are allowed to be sized per 310.15(B)(7). If a 175 ampere Service Rating is determined as the service disconnect rating per 230.79, the required service conductor ampacity is: 83% x 175 amperes = 145.25 amperes. If no other adjustments or corrections are required for the installation, then per Table 310.15(B)(16), a 1/0 AWG Cu or a 3/0 AWG Al 75 degree C conductor would have the required ampacity. Similarly, the following table of conductor values were determined using 310.15(B)(7). However, these tabulated values would not apply if other adjustments or correction factors apply.

Table 310.15(B)(7) Conductor Types and Sizes for 120/240-Volt, 3-Wire, Single-Phase Dwelling Services and Feeders. Conductor Types RHH, RHW, RHW-2, THHN, THHW, THW, THW-2, THWN, THWN-2, XHHW, XHHW-2, SE, USE, USE-2

	Conductor (AWG or kcmil)	
Service or Feeder Rating (Amperes)	Copper	Aluminum or Copper-Clad Aluminum
100	4	2
110	3	1
125	2	1/0
150	1	2/0
175	1/0	3/0
200	2/0	4/0
225	3/0	250
250	4/0	300
300	250	350
350	350	500
400	400	600

Substantiation: Removal of Table 310.15(B)(7)does not add clarity or usability of the NEC. Relocating it into example D7 retains the established trade practice that has proven useful to the installers.
Note: the ROP Draft shows this as Example D7 but the ROP shows it as D.1(d).
Panel Meeting Action: Reject
Panel Statement: The addition of the table will add more confusion than clarity.
Number Eligible to Vote: 10
Ballot Results: Affirmative: 9 Negative: 1
Explanation of Negative:
WALL, C.: See my explanation on comment 6-57

2-122 Log #1479 NEC-P02 **Final Action: Accept**
(Example D.4(b))

Submitter: Charles R. Miller, Charles R. Miller Electrical Education and Training
Comment on Proposal No: 2-265
Recommendation: Revise text to read as follows:
Each dwelling unit is equipped with an electric range of 8-kW nameplate rating, four 1.5-kW separately controlled 240-V electric space heaters, and a 2.5-kW, 240-V electric water heater. Assume range, space heater, and water heater kW ratings equivalent to kVA. <u>Calculate the load for the individual dwelling unit by the standard calculation (Part III of Article 220).</u> A common laundry facility is available to all tenants *[see 210.52(F), Exception No. 1]*. Area of each dwelling unit is 840 ft^2.
Calculated Load for Each Dwelling Unit *(see <u>Part II and Part III of</u> Article 220)*

Substantiation: This example is confusing because the title of this example references the optional calculation but the calculation for the individual dwelling units is by the standard calculation (Part III of Article 220). Text is needed to clarify that the individual dwelling units are not calculated by the optional calculation, but by the standard calculation.
Panel Meeting Action: Accept
Number Eligible to Vote: 13
Ballot Results: Affirmative: 13

ANNEX H—ADMINISTRATION AND ENFORCEMENT

1-114 Log #1204 NEC-P01 **Final Action: Reject**
(H.80.15(B)(4))

Submitter: Michael L. Last, Na'Alehu, HI
Comment on Proposal No: 1-187
Recommendation: Add new text to read as follows:
H.80.15(B)(4)i. A member of an organization that represents the non-union electrical workforce.
Substantiation: In order to equally and fairly represent all segments of the electrical workforce, representatives of both the union and the non-union workforce should be considered for membership on the Electrical Board. This is not to imply that either one of the organization's representative is more qualified for membership, but only to provide for a mechanism whereby, if the major workforce is not represented by a labor (union) organization, these members of the workforce will be equally represented. Circumstances can arise where the entire electrical workforce (not just the primary one) are not affiliated with any labor organization. The way the proposal is presently written can appear to offer a distinct advantage to the labor (union represented) electrical workforce.
Panel Meeting Action: Reject
Panel Statement: The panel reaffirms its action on Proposal 1-187.
Number Eligible to Vote: 12
Ballot Results: Affirmative: 12

Errata

NFPA 70®

National Electrical Code® (Report on Proposals)

Proposed 2014 Edition

Reference: **12-109 (Log #1618) Panel Meeting Action**

The National Electrical Code Technical Correlating Committee notes the following error in the ROP on NFPA 70®, *National Electrical Code®*.

1. Proposal 12-109 starting on page 675 of the ROP has missing text in the panel action. Shown below is the proposal with the panel action as it should have been published.

Report on Proposals – June 2013 **NFPA 70**

12-109 Log #1618 NEC-P12 **Final Action: Accept in Principle**
(645)

Panel Meeting Action: Combining the following panel actions:
12-111, 12-111a, 12-112, 12-114, 12-127, 12-128, 12-131,12-134, 12-137, 12-138, 12-139 and, 12-142.
yields a revised Article 645 that reads as follows:

ARTICLE 645
Information Technology Equipment

Informational Note: Text that is followed by a reference in brackets has been extracted from NFPA 75-2009, *Standard for the Protection of Information Technology Equipment*. Only editorial changes were made to the extracted text to make it consistent with this *Code*.

I. General

645.1 Scope. This article covers equipment, power-supply wiring, equipment interconnecting wiring, and grounding of information technology equipment and systems in an information technology equipment room.

> Informational Note: For further information, see NFPA 75-2009, *Standard for the Protection of Information Technology Equipment*, which covers the requirements for the protection of information technology equipment and information technology equipment areas.

645.2 Definitions.
Abandoned Supply Circuits and Interconnecting Cables. Installed supply circuits and interconnecting cables that are not terminated at equipment and not identified for future use with a tag.

Critical Operations Data System. An information technology equipment system that requires continuous operation for reasons of public safety, emergency management, national security, or business continuity.

Information Technology Equipment (ITE). Equipment and systems rated 600 volts or less, normally found in offices or other business establishments and similar environments classified as ordinary locations, that are used for creation and manipulation of data, voice, video, and similar signals that are not communications equipment as defined in Part I of Article 100 and do not process communications circuits as defined in 800.2.

Information Technology Equipment Room. A room within the information technology equipment area that contains the information technology equipment. [**75:**3.3.9]

Remote Disconnect Control. An electric device and circuit that controls a disconnecting means through a relay or equivalent device.
